A.—I saw a younger member of the staff doing an operation on a septic finger. Now that is down my alley. He was doing that job all right.

Q.—Is that all you observed?

A.—That is all.

Q.—What examination was the doctor making of the child?

A.—A pretty good, thorough examination. I played around with him for quite a while, watching him with the child.

Q.—Was it just a physical examination?

A.—Just a physical examination.

Q.—Was the child sick?

A.—Well, there were several children in the course of the time I was there.

Q.—Did you see them all examined?

A.—I should say three or four; I saw him examining.

Q.—Do you recall what the people were suffering from?

A.—Not in the least.

Q.—Do you recall how many patients were there while you were there?

A.—Well, I observed that there was no overcrowding there. The patients seemed to come along in reasonable sequence. That is one thing which always impressed me, and of which I have always taken notice. I thought at that moment the organization was taking care of the patients at a reasonable rate.

ORGANIZATION SECTION

Jour. A. M. A.
Feb. 22, 1911

Q.—But you haven't any recollection as to how many patients you saw there?
A.—With that physician?

Q.—Yes.
A.—Three or four.

Q.—With any other physician?
A.—There was no crowding in the waiting room, I can say that. I will tell you I am a little sensitive about that. Up where I have lived I have had some experience with that, and it has left me a little sensitive on that score. In Boston I have seen overcrowding and there did not appear to be any here.

Q.—By the way, would you tell us how the doctors are taken on the staff at the Mayo Clinic?
A.—It would be difficult to say. Most of the appointments made during the days that I knew very much about it seemed to come from Dr. Will. Just what extent he discussed the details with the other people I couldn't say; I assume he did, however.

Q.—Did they come by invitation?
A.—The men who were brought from outside all did. Then there were additions to the staff from the younger men on fellowships. They carried them on a yearly basis and finally they were appointed. That was going on all the time.

Q.—Doctor, you made one answer this morning: I want to ask you this. You said you thought you rendered better service, or maybe that a man could render better service, where he was engaged with a group than he could individually; that you did a better quality of work?

A.—I am pretty sure I did.
Q.—Why do you think you work better with a group than by yourself?

A.—I can compare it, of course, with the conditions under which I worked in Boston and Michigan, which was frankly first place there, while at our office there and at Rochester. In the first place there was no waste motion; no loss of time, going from one patient to another, from hospital to hospital; a tremendous amount of wasted motion in the earlier days. Then I was constantly unable to get prompt opinion or advice when I wanted it. In the group there was very close articulation between yourself and the other physicians and specialists. And with me—I was free from the feeling that I had to pay any attention to the financial or economic status of the patient. I had no worry at all whether this patient, if I told him something he didn't like, whether he would go to somebody else and not pay his bill. Working in a group that is entirely removed, and I feel very clearly and so felt that I could give a very straightforward opinion. It is on sounder ground in treating and in viewing the patient in whom I had no financial or economic interest. They were just sick people to me to whom I gave my opinion. I did the best I could and if they didn't like it they could throw me out of the clinic, but I could be honest.

Q.—That is what you meant by your answer this morning, in that respect?
A.—Yes.

Q.—Doctor, you believe that no matter what the group is, whether producer group or consumer group, that whatever staff they have should be competent?
A.—Sure fire.

Q.—In other words, if there is not a competent staff there to render the services they claim or offer, that group would not be operating in the interest of the public or the group; is that true?

A.—Yes.

Q.—Have you any notion now about what you would consider to be a proper staff in a group?
A.—No, because it depends on local conditions. How large is the group of subscribers; at what distances do they live away from the clinic and away from each other. They must all have home visits. If I was dealing with a situation such as Ross-Loos where I might have to cross the city—it is only a hundred miles, from one end to the other of the City of Los Angeles is only a hundred miles—it might take me some time; and if I was working in a relatively compact space with no problem of distances I could get along with a much smaller staff. I don't want to put the size of the staff entirely on the basis of the number of patients.

Q.—In your studies and from your experience now, have you in your own mind any plan which could be a standard consumer plan, under your notion of complete medical care and good medical care; how such a plan could be set up?
A.—I should think it would be possible to have a standard. A committee from the eastern part of the country spent a good deal of time in trying to draw up principles from which a guide could be made on that subject. Michael Davis was chairman

of that committee, and we spent a good deal of time associated with groups and we drew up what you might call a draft of the salient features of the plan, and I think, of course, it was very well done.

Q.—Would you mind telling us who were on the committee?
A.—I am not sure of all of them. The committee was called first by Michael Davis, Kingsley Robert; Clifford Loos and Dr. Allan Butler of Boston; and then there was a gentleman from Little Rock, Trinity Hospital, whose name I can't remember.

Q.—Was that Dr. Shadid?
A.—Yes. Mr. Lewin—Ogden.

Q.—He had been with that hospital group for many years. There may have been one or two others but I doubt whether we ever had more than that number at any one meeting.

Q.—I notice the committee you named is a committee of doctors?
A.—Michael Davis is a doctor of philosophy.

Q.—He called the group together, but the group was a committee of doctors?
A.—Yes.

Q.—Do you think a committee of laymen would be able to formulate a plan for the distribution of medical care without consultation with doctors?
A.—Oh, no.

Q.—Is that plan that you adopted—has that been put into effect?
A.—That was not adopted; these were just recommendations.

Q.—Just recommendations?
A.—Yes; that is all. It was only a general method by which you might study the capacity of an organization.

Q.—Doctor, while you were here in Washington on that trip for Group Health, did you examine any of the clinics which were evidently similar to this you discussed this morning, here in Washington?

A.—No, sir.
Q.—Did you know or did you hear of our Harry N. Lewis Clinic?
A.—No.

Q.—Our American Compensation Accident Clinic?
A.—No.

Q.—Northeast Insurance Clinic?
A.—No.

Q.—Union Market Workmen's Compensation Clinic?
A.—No.

Q.—Washington Industrial Accident Clinic?
A.—No.

Q.—Washington Building Workmen's Clinic?
A.—No.

Q.—The First Aid Station?
A.—No.

Q.—None of those were brought to your attention while you were in Washington before?

A.—No.
Q.—Of course the industrial clinics which come to your mind have been in operation for a number of years, haven't they?

A.—Yes.
Q.—Doctor, you said your committee had made certain recommendations. Would you just glance at this (handing document to the witness) and see if this is a statement of the recommendations your committee made?

A.—No, sir.
Q.—Those are not?

A.—No.
Q.—Are you familiar with this?

A.—I could not say I am. I know this case from a different source than anything I have ever been associated with.

Q.—You haven't been associated with Group Life Federation of America, Incorporated?
A.—No.

MONDAY, FEBRUARY 10
DR. HUGH CABOT (CONTINUED)
(Dr. Cabot described improvement in hospital service.)

A.—I think perhaps the most striking thing is the improvement in the type of people who are in the position of trustee. In my earlier days it was likely to be a resting place for highly respectable, but quite dead, people, who spent their time doing other things. I have been very much struck by the improvement in the type of trustee and his ability to grasp the general situation. Then, of course, there has been an enormous improvement in the buildings. Even in my short time a great many of the hospitals were pretty shabby and shoddy places, where I didn't blame people very much if they took one look at them and then ran. Improved buildings have made them look like

places where you would be likely to get good care. And, finally, the improvement of the staff and the staff organization has been very striking.

Q.—Would you explain to us, while you are on that point, just a little bit as to what the board of trustees does in the ordinary hospital?

A.—In the ordinary hospital they are people who, in the first instance, must decide all of the problems, which include the financial, the economic and the general social problems in which hospitals are involved. They are charged with the business of the selection and the appointment of hospital administrators—hospital superintendents, as they were more commonly called in the past—and then finally, with the appointment of the staff. They are the people through whose hands all of the appointments must go. They must in some way obtain satisfactory information as to qualifications of the people that they appoint.

Q.—I think you stated you noticed that in that particular itself you have seen a better class or at least a more interested class of trustees?

A.—Yes, sir.

Q.—They seem to have recognized their responsibility and to have assumed it?

A.—Yes, sir.

Q.—To a higher degree than they did back in your early days of practice?

A.—Yes, sir.

Q.—Because, after all, it is a responsible thing, is it not, to operate a hospital under proper standards of care?

A.—I regard it as one of the most important responsibilities that the ordinary layman can be asked to take on.

Q.—And there is hardly any branch of hospital care that is not a subject of great importance, so far as the maintenance of proper standards in the hospital is concerned?

A.—No.

Q.—For instance, the equipment is essential, is it not?

A.—Yes, sir.

Q.—And it ought to be of the very best they can purchase?

A.—Yes, sir.

Q.—A board should be careful in the selection of its staff to get the best men possible for its staff?

A.—Yes, sir.

Mr. Lewin:—Are you speaking of its courtesy staff or its regular staff?

By Mr. Leahy:

Q.—Would you explain for the jury, apropos of that question or comment, what is the distinction between the duties or the rights or privileges of the regular staff in a hospital as opposed to the courtesy staff?

A.—Referring to hospitals which have the dual function of the care of the indigent and the care of patients who can pay, the ordinary distinction is that what is known as the permanent staff are people who are responsible for the care of patients who contribute little or nothing to the cost of their care. Of course these people may have private patients in the hospital, unless it is one of the common hospitals where there are no private patients. Those people are responsible for the care of the indigent and semi-indigent.

The courtesy staff are physicians of good repute who may use the hospital and all of its paraphernalia for the purpose of treating their paying patients, and they are generally regarded as part of the hospital staff, but not involved in the making of decisions which the permanent staff ordinarily makes or the policy which they refer to the administration.

Q.—In other words, Doctor, it is true, is it not, of the permanent or general staff of the hospital, that any particular doctor upon that particular staff may be called upon at any time by the hospital to take care of any indigent patient who may be entered therein?

A.—Yes, sir.

Q.—And if you were, for instance, as you have been, upon the permanent or regular staff of hospitals, called at any particular time of the day or night, if the hospital needed you for some patient who was suffering from a cause which required your specialty for treatment, you would go, would you not?

A.—Yes.

Q.—And there would not be any question of the pay, so far as you were concerned, from your poor patient?

A.—No, sir.

Q.—In other words, the care of the indigent in the general hospital which has means for such care lies with the general or permanent staff?

A.—Yes, sir.

Q.—But the courtesy staff consists of those doctors who have been given the privilege of entering the hospital to take care of their own private patients?

A.—Yes, sir.

Q.—For instance, the hospital would not call upon a member of the courtesy staff to attend such a person as I have just described, who was brought into the hospital, an indigent who needed treatment?

A.—No, sir.

Q.—That would go to the permanent staff?

A.—Yes, sir.

Q.—Are there some hospitals, Doctor, which are known as hospitals for intern training or resident training?

A.—Yes, sir.

Q.—Would you explain those to the jury, too, so that they will understand it?

A.—In general terms a hospital cannot satisfactorily train interns unless it is of considerable size. A small hospital which may be entirely sufficient for the care of a relatively small community, a hospital of 25 or 50 beds, is not a satisfactory place to give the early post-graduate training to those physicians who have finished their medical course but still have a good deal to learn through direct contact with patients. Those hospitals must be of reasonable size and give a reasonable variety of opportunity. For instance, a hospital, though it may be large, which has only one type of patient, that is to say, patients with mental diseases, would not be a satisfactory place for the training of interns except for specialists in mental diseases. It must be in truth and in fact a general hospital where they will get a fair cross-section of the various conditions which they will be called upon to treat. I am not clear just what standards of size have been determined and, in fact, you could not settle it on terms of size. One hospital with a hundred beds might be an unsatisfactory place for the training for interns if it was importantly concerned with one or two types of disease, whereas another hospital of the same size might be an entirely satisfactory place.

Q.—Is it true, Doctor, of the student of medicine as of the student of law that in the medical school he is grounded in the basic sciences of his own profession, but he does not get practical experience while he is still in the medical school?

A.—That is not today the truth, sir. It was true when I was a medical student, though not entirely. At the present time, in broad terms, the first two years of a medical course are largely in the fundamental sciences, and a good deal of work in the laboratories. But beginning in the third year and sometimes in the latter part of the second year they go to the hospital, see patients with the staff and with the instructors, and today, commonly during their fourth year, they play a moderate part in the care of patients. They are appointed as what is often known as clinical clerks, and they see the patients and take the history and make certain examinations, under supervision, of course, and they get a good deal of contact with patients during their third and fourth years. While they require more experience, they are relatively fairly well equipped, much better equipped than they were forty years ago to treat patients.

Q.—Do you recall, Doctor, how many medical schools there were in the United States, say twenty-five years ago?

A.—Well, roughly and generally speaking, a hundred and twenty to a hundred and thirty.

Q.—Do you know how many there are today?

A.—Seventy-two or seventy-three.

Q.—Do you recall now the reason why these others have dropped by the wayside, so that there has been a reduction from one hundred and twenty down to seventy-two or seventy-three?

A.—Oh, yes; I recall that very well. I was involved in the job there. It was based on a report made to the Carnegie Foundation by Mr. Abram Flexner in which he reviewed in a masterly fashion the existing schools in the United States. He pointed out that there were a great many schools which gave a pretty poor article of education and that probably should not properly be called medical schools at all; they were proprietary schools in which a small group of physicians undertook to form a faculty, the chief purpose of which was to obtain consultants for those same gentlemen from their students; and they were not to be compared with a group of medical schools many of which were associated with universities in which the instruction was relatively very much better.

The issuance of that report had a very profound effect and influence on two bodies: the American Association of Medical

Colleges and the American Medical Association, acting independently, but together, to bring pressure which resulted in the disappearance of some schools in the consolidation of a great many schools. In some states as many as two or three existing medical schools were consolidated generally under the general purview of the university, and the disappearance of schools between about 1911 or 1912 and 1924 or 1925 was relatively rapid.

Q.—Those seventy-two schools which are still training young doctors are all pretty much what they call Class A schools today, are they?

A.—Yes. They are classified as class A, but it would be a mistake to regard them as of equal value.

Q.—Do you have also a similar classification of hospitals with reference to their standards?

A.—There are two general classifications of hospitals: one started a good many years ago. I remember the early studies made about 1920 or 1921 under the auspices of the American College of Surgeons which had chiefly for its purpose to see that the hospitals were properly equipped, that they had proper laboratories, that they had reasonable staff organizations and that the opportunities for interns and for the students were such that they could get a sound view of the then practice of medicine. Then at a later date, which I could not accurately establish, the American Medical Association went into the question of the qualifications of these hospitals for intern training. Those two studies are a little differently weighted. The American College of Surgeons was concerned with physical equipment and standards of administration. They were not specifically concerned with the opportunities to train interns to the extent that the American Medical Association has been.

Q.—Do you recall over how many years the A. M. A. has been interested in seeing to it that proper standards have been maintained for the training of interns in hospitals?

A.—I should find it difficult to establish it more accurately than at least fifteen years.

Q.—Is that same period of time also the answer to the question as to the interest of the American Medical Association in the educational facilities which various medical schools render to the students?

A.—I don't think so, sir. I should say that the interest of the American Medical Association in medical education went very much farther back. This inspection and classification of hospitals was an outgrowth of their interest in the problem of medical education.

Q.—In your judgment, that interest is a beneficial one for the public, is it not? Is it in the public interest to see to it that the hospitals are kept to high standards of qualifications and that they are also required to maintain a proper curriculum and proper facilities for the education of the young doctor?

A.—There are two questions there. I will try to answer them separately.

Q.—Answer in your own way, Doctor.

A.—It is certainly in the public interest that a group of experts, such as the American Medical Association, should be interested in the conduct of hospitals. There can be no argument about that.

In regard to the curriculum, they are probably interested, but I believe it to be strictly the business of the university—and practically all of the medical schools of the country now are parts of universities—I think it is the business of the university to maintain their own standards, get all the advice and help they can from experts, but I still believe the public responsibility for the conduct of medical schools remains with the university and cannot be transferred to any other body.

Q.—But you think it is in the public interest for the A. M. A. to do the best it can to see that those standards established by those schools are high and in the public interest?

A.—Yes; in general terms they are no doubt in the public interest.

RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—You just testified, Doctor, that in your opinion you regard it in the public interest and beneficial to the public interest for the A. M. A. to take an interest in hospitals, to see that they live up to certain standards. Will you tell the jury what type of standards, in your opinion, the A. M. A. should be interested in, in order to be in the public interest?

A.—I should say the standards were those standards which pertain to the study and care of patients. In that field they are the undoubted experts. In other fields they might not be experts; but whether a given hospital is equipped and does, in fact, give good care to patients, is very much the business of a large and well developed medical organization.

Q.—How, in your opinion, should the American Medical Association manifest that interest in order to be in the public interest? Should it seek to control the hospitals or should it simply advise them?

A.—It does not occur to me that a professional association can control a hospital, as I use the word. The control must remain with the lay board. The lay board will naturally give great weight to the opinion of a professional association on professional questions; but there could, I take it, be no question of control. Control must remain with the governing body.

Q.—Would you regard the approval by the A. M. A. of a hospital for intern and resident training as a valuable and important thing to a hospital in these days?

A.—Oh, it is very important.

Q.—Why is that, Doctor?

A.—Because it establishes with the public, practically, through the governing body, the fact that this hospital is an organization that has an equipment and staff which will authorize you to assume that it will give good care. Such approval is undoubtedly of first class importance.

Q.—Then you would think the A. M. A. should be very careful with reference to giving or withholding approval of hospitals, would you not?

A.—Oh, I assume that any scientific body would of course reach an opinion with great care. It is the essence of science to be careful in the conclusions drawn from premises.

Q.—Has the courtesy staff of a hospital normally anything to do with the training of interns?

A.—I should say not. There may be hospitals in which the courtesy staff plays some part in training interns, but I do not happen to have known of one.

Q.—Would it, in your opinion, be in the public interest for the A. M. A. to insist as a condition of giving its approval to a hospital that that hospital confine itself, its regular and attending staffs, and its courtesy staff, solely to members of the American Medical Association?

Mr. Leahy:—I believe the subject of expert opinion, if your Honor please,—

THE COURT:—Are you arguing or are you objecting?

Mr. Leahy:—I am objecting, your Honor.

THE COURT:—I think it comes down to one of the principal issues in the case.

Mr. Lewin:—It is one of the subordinate issues in the case.

THE COURT:—Put your question once more, and I will see if it is proper.

By Mr. Lewin:

Q.—You testified, Doctor, that it was in the public interest for the A. M. A. to take an interest in hospital standards. Now I ask you whether it is in the public interest for the A. M. A. to insist, as a condition for giving its approval to a hospital, that all of the members of the staff of that hospital be members of the A. M. A.?

Mr. Leahy:—That is the question to which I objected.

THE COURT:—You have drawn in the public interest in your own questions, Mr. Leahy. I think perhaps it is proper.

Mr. Leahy:—It is secondly objectionable because of the use of the word "insist."

THE COURT:—I do not know what significance that word may have. The witness may answer the question.

Mr. Leahy:—Exception, your Honor.

The Witness:—I should be very doubtful as to whether any professional group ought to be in the position to declare that its members only are competent people in the profession. It is entirely within my knowledge that able physicians have gone on for years, or for their lifetime, without being members of the American Medical Association. So I should be very fearful of giving to any professional body the right to say that their members and their members only were capable of giving good care. I think it is a risky extension of power to any group.

By Mr. Lewin:

Q.—What interest, then, could the American Medical Association properly have in the character of the staffs of a hospital?

A.—I think they have a very important interest. They have, in the first place, the machinery to inspect and examine these hospitals, which can only be done by some well organized group without considerable exertion. They can have a staff of more or less expert people who spend a great deal of their time and come to know a great deal about technique in studying the hospitals. So that I think as a group of experts giving advice to governing bodies they have a very important function.

Q.—Should their interest be limited to advice, or should they go beyond that?

A.—I do not see how it can safely be anything but advice, because the control must lie with the governing board and cannot lie with a professional group, safely.

Q.—Dr. Cabot, while you were on the stand last Friday under cross examination you were asked these two questions and you gave these answers, which appear on page 388 of the record.

A.—Can you not put them separately instead of a "shotgun prescription"?

Q.—This is a question by Mr. Leahy (reading):

Q.—Suppose we are specific: Suppose or assume that the association with which this doctor is connected has been notified by the Federal District Attorney for the District of Massachusetts that they must desist from the practice in which they are then engaged, and you know this young man has made an application to your general hospital for hospital privileges, if you were advising the hospital, as a member of its staff, and so advised it that they ought to withhold the privileges from this young man pending the determination of the question, would you consider that good advice?"

And your answer was (reading):

A.—That would sound like good, reasonable advice.

Q.—Just what you would do?

A.—Yes."

Let me put this question to you: Suppose you had received notice of the objections of the District Attorney in that case to the group with which the doctor was associated, or that in his opinion the group might be regarded as a corporation practicing medicine without itself having a license, and that the group might be regarded as engaged in the insurance business without complying with the insurance laws: if you were advising a hospital as a member of its staff, how would this opinion of the District Attorney affect your advice to the hospital upon this doctor's application?

A.—That is a very difficult question. Such an opinion of a District Attorney could not possibly affect my opinion of the capacity of an applicant for the staff. My opinion of the applicant for the staff must depend upon his professional qualifications, and could not be based upon intricacies of law which do not run at all to his ability to look after sick people.

Q.—Then if that is all that you had learned from the District Attorney, what advice would you give the hospital in regard to the admission of this physician for courtesy staff privileges.

A.—I should advise them to proceed in entire disregard of the opinion, and examine the qualifications of this physician as they would examine the qualifications of any other physician who was a candidate for their staff.

Q.—And by qualifications, what kind of qualifications?

A.—Oh, I assumed that I was talking about professional qualifications. Knowing what it was he asked to be allowed to do, I should want to study what evidence there was that he was able to do those things.

Q.—Just what did you mean when you answered Mr. Leahy's question on Friday in the way in which you did?

A.—Perfectly frankly, I misunderstood him. I understood that the charges against this hospital were of an entirely different character. Let us be perfectly brutal and frank about it. I thought it was charged that this was an abortion.

Q.—And it was on that assumption that you gave the answer which you did give?

A.—Right.

Q.—Suppose that there are charges of any kind of illegality, or charges, rather, that it might be practicing medicine without a license or engaged in the insurance business without complying with the insurance laws, and the District Court of the United States for that district, after a full hearing, had categorically decided that such charges were completely unfounded, and then such a surgeon presented again his application to the hospital for courtesy staff privileges: what advice would you give the hospital in that situation?

A.—Certainly under those conditions any possible disability has been removed. But as I suggested to you, I should not regard a legal question of the methods of operation as having anything to do with my opinion as to the capacity of this physician to do work in the hospital within his qualifications. Those are entirely different questions, according to my mind.

Q.—Then, Dr. Cabot, on that question, the question of the qualifications that a doctor-applicant must possess in order, in your opinion, to be admitted to courtesy privileges at a hospital, at least in the first instance and under wraps, let me put this question to you. Suppose the applicant for courtesy staff privileges had graduated from the University of Oklahoma or from the University of Oklahoma Medical School, and had practiced privately in one of the large cities of the United States, both medicine and general surgery, for a period of about nine years; suppose, further, that after completing those nine years, that doctor had enrolled himself as a postgraduate student in the postgraduate school of surgery, in the University

of Pennsylvania, in Philadelphia, and suppose that he had completed satisfactorily the two-year postgraduate course and had received there his degree of Master of Medical Science, and suppose, further, that during that two-year course and as a part of it that same applicant held a residencehip in surgery at the Worcester, Massachusetts, City Hospital under a preceptor appointed for him under the postgraduate school in Pennsylvania; suppose, further, that while he held that residencehip he performed, satisfactorily to his preceptor, several hundred operations, some of them major and some of them minor, some of them in which he acted as an assistant and some of them in which he took the lead, and suppose that a great deal of that surgery was abdominal or pelvic surgery: what opinion would you give the hospital to which this surgeon applied for courtesy staff privileges as to whether, in the first instance, at least, he might safely be admitted to courtesy staff privileges in the hospital?

A.—I have a very definite opinion in regard to the course of the University of Pennsylvania Medical School. During my time at Ann Arbor, Mich., I was one of their regular preceptors and had, most of the time, one or more graduates under my care, and I am familiar with what they expected of them. I think those students got a very good training in general surgery. There are many special departments of surgery in which, of course, they did not get training. But I do not think that the University of Pennsylvania puts its stamp of approval on men who are not pretty well qualified to do general surgery. They are careful and diligent in their study and qualifications, and a man having received such a degree, I should feel required to admit him to the staff for the practice of general surgery, with reasonable limitations as to the more difficult and trying situations.

Q.—Suppose that applicant, Dr. Cabot, happened to be the general surgeon for a large group of patients associated in a prepayment clinic: would that influence your decision against advising the hospital to take him as you have stated?

A.—Oh, no. The only question with which I should be concerned would be his qualifications and the suggestion to the hospital of the extent to which they ought to provide supervision.

Q.—Would the fact that he was associated as a general surgeon for this group of patients have any bearing one way or the other in your opinion?

A.—No, sir. I assume that what the hospitals want of me is the value of my opinion, if it had any value, as to his qualifications. It does not seem to me important whether he is dealing with a group of patients or with his own private patients.

THE COURT:—Let me suggest that one or two of your questions have been repetitious. I do not want to take up too much time on these things. Please try not to repeat.

By Mr. Lewin:

Q.—And would the fact that the applicant has applied for a great many privileges at that hospital rather than confining his application to one or two types of surgery affect the advice you would give the hospital with reference to his application?

A.—It would depend on what those fields were. If he had asked the privileges in an unreasonably large group of special fields, I should doubt whether his training at the University of Pennsylvania justified granting his application with respect to all of them. I shouldn't hesitate at all to suggest to the staff some fields in which he was entirely competent; as to other fields, I should want to supervise his work carefully.

Q.—But would you hold against that man the fact that he had asked for broader privileges than perhaps those which you would accord him?

A.—Oh, I suppose most of us ask for more than we expect to get in most instances.

Q.—And do I understand you would recommend to the staff to admit him to those privileges to which you felt he was by reason of his training entitled, and deny him those privileges for which you felt he did not have adequate training?

Mr. Leahy:—Objected to.

THE COURT:—He may answer that question.

The Witness:—Oh, yes; I have no doubt I should do that.

By Mr. Lewin:

Q.—You may recall that on cross examination by Mr. Leahy you gave some testimony differentiating to some extent what you call the producer group from the consumer group of practice; and you were asked in effect on cross examination whether or not you would seek in advance, in forming a consumer type of group, advice solely from medical men. You testified that

in selecting a medical staff you would like the advice of a medical man. Let me ask you this: Whose advice would you seek in that situation with regard to the social and business side of the organization, as distinguished from the medical staff and medical equipment and facilities?

A.—Quite clearly the group has two or three very different problems with which it is faced. It is faced with problems which may be called strictly financial. Others I would define as economic, and certainly a group organization must take widely into account the social problems which are involved in this rather novel method of providing medical care. Now, in those problems, I take it nobody would suggest that an expert of the medical profession is also an expert in those other fields. As a matter of fact, I would think him less qualified than the average sound man in the street.

Q.—Then whose advice would you seek on the financial, economic and social questions arising in setting up such a prepayment clinic?

A.—I should try to obtain for my board, or for my organization, people who were properly regarded as wise counselors in those fields.

Q.—Would you go to laymen?

A.—Oh, yes; oh, certainly.

Q.—What type of advice would you seek from medical men only in forming such a consumer group?

A.—Advice concerning problems of medical organization, equipment and medical capacity. Clearly the medical profession are the only experts on whom the community may rely in those special fields; and clearly no one else is qualified to speak concerning them.

Q.—Now is there anything else you would seek; any other advice you would seek from the medical men?

A.—No.

Q.—And what types of information would you seek from the laymen in forming such a prepayment group?

A.—Of course, the lay group is concerned with the setup of the machinery about how a considerable number of people might obtain medical care by this rather modern method. Clearly that group must do its best to fit the plans which they make into the peculiarities of the community in which it is set up. Quite obviously the proper arrangement in a city, or in a district such as this here, should be quite different from what one would set up in an open country, such as in the West, or plain states. You could not make the same organization which would work equally as well under these very varying conditions, in different parts of the country.

Q.—Whom would you turn for advice of this nature: to laymen or doctors, in order to determine what kind of financing a prepayment group such as this should have?

A.—Laymen, I suppose. The doctors are or at least have the reputation of being the worst financiers in the world. It may not be quite correct, but they have that reputation.

Q.—To whom would you consult in determining the kinds of contracts which should be written for use in such a prepayment group?

A.—From my own personal experience, I should say lawyers handle such things, and generally produce documents which take care of such matters.

Q.—Would you think it was a reasonable thing in forming such a group, or in attempting to form one, to advise with persons who had formed other groups, other consumer prepayment groups in the country, and who were operating such groups?

A.—I suppose my weakness rises from approaching these problems by the scientific method, and, under the methods of science one assumes these things can't be done in vacuum. One looks to the experience of similar organizations elsewhere and from the accumulated evidence from which you can decide whether there are other organizations which fit your requirement, or whether there are some parts of one organization or some part of another which may be useful and applicable in your own structure, but where you have a more or less peculiar problem which must be set up it may be that the value of such other experiences will be diminished. However, I should want to base my decision on known existing practices of relatively similar operation.

Q.—And would you think it reasonable for the sponsors of such a group, before they launch the undertaking, to go to other groups and inspect their associations?

THE COURT:—Isn't that obvious that they would do so?

Mr. Lewin:—I hope so. It is to me.

THE COURT:—Well, from the doctor's previous answers isn't it quite obvious what the answer to such a question would be?

Mr. Lewin:—Well, your Honor, we are charged here with going into this thing with a half-baked organization, with not consulting with people who had knowledge on the subject, and therefore we want to make it clear.

THE COURT:—I don't want to be critical, but it seems to me that the testimony is not in the nature of expert testimony.

Mr. Lewin:—All right, your Honor.

By Mr. Lewin:

Q.—Now, Dr. Cabot, on cross examination, also I understood you to say, that you came down here to Washington on one occasion only to inspect the group health clinic, and to discuss its operation; is that correct?

A.—I didn't mean to convey that impression. I meant to convey the impression that I did come here on one occasion; I didn't mean to convey the impression that I only had been here once, or that I only came down on one occasion to the clinic.

Q.—Can you fix fairly definitely the first time you came, that is, the time when you went over to the clinic and saw it in operation; saw the pediatrician with the children, and the surgeon operating on the finger?

A.—I can fix it to this extent: I know that my brother, the late Dr. Richard Cabot, came down here on some occasion; it may have been at the opening of the clinic, about Nov. 1, 1937. That following that occasion he wrote me—we saw each other in those days rarely, living hundreds of miles apart—and he told me about it; and suggested to me that I ought to be interested in its development. Following that I had a letter from somebody here, maybe Mr. Kirkpatrick, to come down here. I couldn't say whether it was in December of 1937 or early in 1938, but it was relatively shortly after the occasion on which my brother was here.

Q.—Now let me, if I can, clear up one other point. Dr. Cabot, suppose a patient with very little income has a symptom of a complicated disease. Can he ordinarily obtain complete diagnosis and treatment from a single doctor?

A.—Not under modern conditions.

Mr. Leahy:—This is repetition, your Honor.

THE COURT:—I think so: I think you went into that on direct examination.

Mr. Lewin:—I am afraid there were several points that were not covered, your Honor.

By Mr. Lewin:

Q.—How many doctors might you expect such a man might have to obtain service from in order to be properly treated, under such circumstances?

A.—It wouldn't be unusual to require the services of from four to six more or less specialized people before you had the rounded evidence necessary to properly care for the patient.

Q.—And ordinarily would he be subjected to that number of individual fees?

A.—Oh, I think so, under normal conditions.

Q.—How many such doctors might such a person have to consult if he came to a clinic, like the Mayo Clinic?

A.—There the number would not be limited. He would be at once under the care of one of the general physicians, who would associate with themselves some of the younger men, the fellowship group, get the history and make the physical examination. He would then normally examine the patient himself. He would then call to his assistance any expert whom he thought could be helpful and might very easily call five or six. It would make no difference to him. He could call all the experts in the clinic if he thought they would be of any use at all. His business is to get the most rounded picture; it makes no difference how many people would be involved.

Q.—Would the amount of the fee that the patient would pay in the Mayo Clinic be determined by the number of men he received treatment from in the clinic?

A.—Oh, no.

Q.—Would you regard the fact that one of these group prepayment clinics did not hold itself out to do charity work for indigents as putting that clinic's operations in a class operating in what might be said to be against the public interest?

A.—Certainly not.

Q.—What is your reason for that?

A.—A group organization undertakes to do a perfectly definite thing, which is to provide complete medical care for its subscribers. It does not undertake to do anything else. Now, if it should spend the time of its staff in looking after people who are not subscribers then it would be guilty of an improper use of those funds, in my opinion.

Q.—Would you regard that clinic's operation as unethical, simply because it did not hold itself out to do charity work, but confined itself to its own subscribers?

A.—Certainly not.

Q.—Doctor, is it true that a doctor who devotes himself only to group practice, such as this, is neglecting his share of the responsibilities which the medical profession bears for the care of the indigent?

A.—I can't think so.

Q.—And what is your reason for that answer, Doctor?

A.—He is planning to give his services in a way which seems to him to enable him to make use of his training to the best advantage, and his arrangement with this group gives him a satisfactory opportunity to use his skill and his knowledge; and, after all, that I think is the opportunity which he should take advantage of; the chance to use his skill in the treatment of sick people.

Q.—Just how can the "fee-for-service," Doctor, afford to take care of the indigent, and assume a share of the burden of taking care of the indigent?

A.—The time-honored method is by levying an unconscionable and illegal, an unauthorized tax, an income tax, and surtaxes on a relatively small class of the population who are classified as rich. They pay large fees which, in the aggregate, authorizes him to spend his time in a very desirable way in looking after people who can pay him less than the cost, or nothing at all. He obtains funds from one group which enables him to carry on his work and live in decent fashion, while also looking after a group of people who can contribute nothing.

Q.—And the group practice, Doctor, under the prepayment plan, has not the same opportunity of soaking the rich for the benefit of the poor; is that what you mean?

A.—He is, as a rule, on a salary or some similar arrangement, under which, as I think very desirably, it makes no earthly difference to him whether the patient has money or no money; that is the business for the management; to organize the group, take care of those things. That settles the question for him.

Q.—Now suppose a doctor of one of these clinics, who is employed on a full-time basis, and can't take care of the indigent at a hospital, applies to the hospital for courtesy staff privileges: should the fact that he cannot serve on the regular staff and take care of the indigents prevent him from receiving courtesy staff privileges?

A.—Courtesy staff privileges, or staff privileges, are essential for him to carry on his proper medical practice. The practice he assumes to carry on there comes from the group by which he is employed. Certainly no stigma is attached because he practices on patients who have subscribed to this organization by which he is employed.

Q.—Now, Mr. Leahy also asked you on cross-examination what you thought of the American Medical Association Journal, and you replied that, in your opinion, it was the outstanding medical journal of the world. Now let me ask you whether in making that answer you were not referring to THE JOURNAL's activities—

Mr. Leahy (interposing):—I object to that question; to the direct character of the question.

THE COURT:—Yes, the question is leading.

Mr. Lewin:—I will be glad to reframe the question. I thought there was no question about it.

By Mr. Lewin:

Q.—Let me ask you, Dr. Cabot, in making that answer what particular activities of THE JOURNAL had you in mind?

A.—I was thinking of THE JOURNAL as a whole. For a great many years, the greater part of the whole of THE JOURNAL was devoted to the printing of scientific papers; it provided or contributed in providing, in its small beginnings, to the literature of medicine published in this country and foreign countries, and it was essentially a scientific journal. Now, in rather recent times there has been developed there another section, a subordinate section of the journal, which dealt with problems rather loosely referred to as medical economics.

Q.—What distinction do you draw between those two branches of THE JOURNAL?

A.—In its scientific phase, which has been throughout my lifetime its most important phase, it has stood solidly on scientific ground. It has selected from the papers offered, many of which are read at its annual meeting, documents of great value; but also from other sources papers which in the judgment of the editor were of high quality, and I think it perfectly safe to say that very few second or third rate articles on the science

have appeared, at least within my memory, in that journal. It has been in the habit, as is the habit of science, of allowing physicians who, having read a given article on the subject with which they are familiar, to write letters to THE JOURNAL sometimes polite and sometimes very impolite—pointing out their disagreement with statements made in those journals, and, I think, it has been the common practice of THE JOURNAL to submit such letters to the authors of the articles and, in that way, give reasonable opportunity for the presentation of opposite points of view and discussion. That is the normal method of science: you don't close the door and say here is a statement which nobody may dispute.

Now a quite different policy has been established in regard to the sections on medical economics. There, in the first place, many of the articles are prepared by members of the permanent staff of the A. M. A.

Q.—That is the salaried staff?

A.—Yes; and also from outside sources, but they are prepared often for the purpose of producing a perfectly definite point of view which may or may not represent the scientific view. Very seriously, as I think, there has been allowed no opportunity for discussion of these presentations. Many of them have been, in my judgment, and in the judgment of a good many other people, a pretty incomplete statement with very important omissions and yet, they are the source of information of a large number of busy physicians who cannot possibly go to original sources. Now, I have felt very strongly that it was essential that there should be a possibility of pointing out these omissions and weaknesses, and the differences of opinion which has been done regularly in the scientific portions of THE JOURNAL. This has been frowned upon and has been, I think, a very serious detriment to the proper presentation of the facts in these fields, using the normal scientific method of presenting the evidence and allowing criticism, where the evidence seems grossly incomplete. I would go so far as to say that there have been many articles published in that section of THE JOURNAL which would not stand up under criticism a moment and which if presented to a scientific body would be torn limb from limb.

Q.—Now, Doctor, you mentioned to some extent the function of the judicial council of the A. M. A., and I think you said that the Judicial Council passed on appeals from members of the local societies, who had been disciplined or expelled. Do you know whether there is any stay of the order of expulsion, or whether or not the local society, while the appeal is pending, whether or not the order of the local society does not stand and is effective pending the appeal, would the effect of the action of the Judicial Council, if it is favorable to the physician, be to reinstate him?

A.—I don't feel very clear about the precise limitations of that power. I would assume from what I know that the expulsion of a member did not really stick until it had been passed upon by the judicial council, if it was appealed to them; but I wouldn't like to be very dogmatic about that.

Q.—Who promulgates the rules and principles of ethics, medical ethics of the A. M. A.?

A.—It is done certainly under the supervision and authority of the delegates.

Q.—Of the A. M. A.?

A.—Yes.

Q.—And are those rules binding on the local societies, and upon the local members?

A.—I think they are intended to be.

Q.—Is there any machinery set up by the American Medical Association for applying those principles of medical ethics?

A.—I know on various occasions the questions have been referred to the Judicial Council for interpretation.

Q.—In your opinion should such principles of medical ethics lay down rules dealing with the economic side of the distribution of medical care?

Mr. Leahy:—I object; I don't think it is a proper subject for expert testimony.

THE COURT:—I don't think he completed the question.

Mr. Lewin:—I asked the witness, Doctor, in your opinion, should such principles of medical ethics lay down rules dealing with the economic side of the distribution of medical care?

THE COURT:—Both sides have been so liberal in asking the opinion of the Doctor; it has gone so far that I can't at this time say that the Doctor shouldn't answer this question.

Mr. Leahy:—All right, your Honor.

The Witness:—I have an uneasy feeling that when the ethics which are supposed to guide a profession undertake to invade fields of which they cannot have any particular knowledge, you are getting on pretty thin ice; and I dare say that the opinion of men who may be experts in the medical field

when applied to economic questions would not be very binding on anyone. I would frankly say that I should feel very much inclined not to be bound by them myself.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Doctor, you will agree with me, won't you, that the American Medical Association is composed of practically 115,000 doctors in the United States?

A.—The last knowledge I happened to have; the last annual. I happened to notice I think stated it at about 110,000, but I don't keep accurate track of that.

Q.—You would think that the opinion of 110,000 doctors should be worth consideration, wouldn't you?

A.—Yes.

Q.—Particularly, with reference to matters of the medical profession, isn't that right?

A.—I don't think I understand your question as it relates to "matters of the medical profession."

Q.—Well, with the practice of the medical profession.

A.—Yes.

Q.—Do you think their opinion is of value and that is in fact the only expert opinion with respect to the methods by which the profession should be conducted?

A.—In so far as that it confines itself only to the question of medicine, yes; but I should not take that opinion seriously when it involves questions of finances, economic or social readjustment.

DISAGREEMENT WITH PRINCIPLES OF ETHICS

Q.—Do you think that there are any principles of medical ethics as they have been adopted by the American Medical Association with which you cannot agree?

A.—Yes.

Q.—Which one?

A.—Well, I am interested in the very complete prohibition of what is known as "solicitation," the phrase, if I remember it; the provision that solicitation by individuals or groups, or by organizations is strictly forbidden.

THE COURT:—This question has nothing to do with this case, so far as I understand it.

Mr. Leahy:—Your Honor, it will be in the case.

Mr. Lewin:—Yes, your Honor, I think so.

THE COURT:—Well, if both sides agree, he may answer it.

By Mr. Leahy:

Q.—Well, Doctor, do you believe in a doctor advertising?

A.—I think I would like to answer the question. I think I observed in this group in California which was set up in the last few years, with a very broad offering of medical services—it was known as the California Physicians' Service, I think—that a very considerable sum of money was used for what you, if you were selling insurance, would be called solicitation. I was still more interested in a recent bill put forward by the Massachusetts Medical Society, concerning which there was published in the *New England Journal of Medicine* a statement of the purposes of the bill, in which it was directly stated that about 10 per cent should be used for solicitation. That being the case, I don't think that particular provision of the A. M. A. should be taken very seriously. Organized medicine has chucked it out of the window, and I think the rest of us need not concern ourselves about it.

Q.—You mean they have chucked what out the window?

A.—They have chucked out the absolute prohibition of the solicitation in medicine as a violation of ethics; chucked it out the window and, as I think, have very wisely adopted modern conceptions, and let their rule look out for itself.

Q.—Now, was there any other principle of ethics with which you disagreed?

A.—Yes, there was a principle of ethics which is less binding now, which forbade physicians to consult—I am not quite sure of the phrase, with irregular practitioners, the implication being that members who were not members of the medical profession should not be in consultation with men who are. Now for thirty-five years I have disagreed with that prohibition, and I have never embraced it.

Q.—How long has that particular principle of ethics of the American Medical Association been in force?

A.—Very long, indeed. There was a fierce controversy. Homeopathy was the principal *bête noire* of the American Medical Association, and then there came along a group known as osteopaths. There was a strict prohibition against consulting with these people.

Q.—Do you know whether that was ever adopted by the American Medical Association or not?

A.—I would not like to be too dogmatic about that. I know it was in the state, in the Massachusetts code, and I think still is.

Q.—The code of ethics of the American Medical Association is quite a long code, isn't it?

A.—Yes.

Q.—Do you know how long your profession has been acting under a code of ethics?

A.—Certainly for many years. The origin of the document which we now use goes back more than a century, and I suppose in pretty definite form, perhaps for a century and a half; and, of course, the fundamentals of the code of ethics—unless I have been grossly misinformed—was laid down by Hippocrates. The Hippocratic code contains an oath of the requirements of decent and professional probity which we are trying to get at.

Q.—Now, do you think that the individual professional man should advertise his wares?

A.—I do not.

Q.—You think it is when a group of individuals get together that that group should have the right to advertise; is that it?

A.—I think the point comes where the public interest is involved. Here are new methods by which it is suggested that the public may obtain good medical care at more or less definite rates. It seems to me absolutely essential that there should be a satisfactory method, and unprejudiced methods by which the public may obtain this information. The prohibition is likely to make it difficult or impossible for the public to obtain information on which they can come to a conclusion.

Q.—Does the Mayo Clinic advertise?

A.—You put me in an awkward position, sir. There have been times when I thought they had come pretty close to the line.

Q.—Now, does the Mayo Clinic solicit people to come to it?

A.—No.

Q.—Does the Lahey Clinic in Boston solicit patients to come to it?

A.—I should be unwilling to say that it did not.

Q.—Does it advertise in the papers asking for or soliciting patients to come there?

A.—No.

Q.—Can you name a producer clinic that advertises?

A.—I don't think so, sir.

Q.—The only advertising clinics now which you say ought to have the privilege of advertising are these consumer clinics that grew up in the last ten years?

A.—No, sir.

Q.—Do you know any consumer clinic which has not tried to advertise?

A.—I think I do; the group with which I have been associated myself.

Q.—Well, excluding your group.

A.—I should be unable to say what was the practice of consumer groups; it would assume an omniscience which is beyond me.

Q.—Well, you do believe in the consumer method, do you?

A.—I very much want to see it tried on an experimental basis.

Q.—Well, have you any data yet from your experience or your readings about which you can state to the jury that the consumer group type of practice of medicine is an assured successful one?

A.—Well, I am very interested to note that the Northern Pacific Railroad has had a group method of medical care since 1882, and the evidence I believe is to the effect that it is successful.

Q.—Well, Doctor—

Mr. Lewin: I don't think he has finished his answer.

Mr. Leahy: Very well.

The Witness:—Then I think the group, the Stanocola Group, in Baton Rouge, Louisiana, has been doing this work, and that is a consumer group.

Q.—Well, on your various trips to Washington didn't you learn that there were eight groups which were similar in organization to the Northern Pacific group and the Stanocola Group which you have just told us about?

A.—I don't think I got the information in Washington.

Q.—You didn't know that they had been operating in Washington for years?

A.—Who?

Q.—These groups. Didn't you while you were here studying Group Health know that for instance the Market Compensation Accident Clinic had been in operation here for years?

A.—No, sir. Never heard of it.

Q.—Did you know the Union Market Workmen's Compensation Clinic had been in operation here for years?

A.—No, sir.

Mr. Lewin:—Your Honor, all of these questions were asked before.

THE COURT:—I think it is repetition.

By Mr. Leahy:

Q.—You didn't know then that any of those group clinics were operating?

A.—No, sir.

Q.—Well, those are a different type from Group Health?

A.—I don't know a thing about it, sir.

Q.—Well, is the Northern Pacific Clinic similar to Group Health?

A.—No. It is under different conditions; it couldn't be.

Q.—It is an employment group, isn't it, the Northern Pacific, attempting to take care of its employees?

A.—Oh, no, no.

Q.—What is it?

A.—The Northern Pacific isn't attempting to take care of the employees; the employees are attempting to take care of the employees.

Q.—With the cooperation of the Northern Pacific?

A.—I couldn't say how much cooperation they have had.

Q.—And is the Stanocola Clinic which you mentioned also a clinic which is restricted to the employees of the Standard Oil Company?

A.—Employees and their dependents.

Q.—Employees and their dependents. And do you know now whether the Standard Oil Company cooperates with their employees in attempting to take care of them for injuries received or suffered in the service?

A.—Of course, the Standard Oil Company is responsible for those things which come under the Compensation Act, so there must be some reasonable articulation between those things which the company is required to do and those things which the association provides.

Q.—But now the clinic of the type of G. H. A. is built along a different theory, isn't it?

A.—I should not think so, sir.

Q.—Well, the Group Health or any of these consumers clinics take in anyone who will subscribe for the service. Isn't that true?

A.—Well, I rather thought it was intended to confine it to a group of people who were here in Washington employed by the Government.

Q.—That's right. Also any one of that group who will subscribe to the service is entitled to the service?

A.—Therefore it is just like the Northern Pacific.

Q.—But state who is entitled to the service. Is it the sick man or the well man, do you know, upon entrance?

A.—I suppose anybody that subscribes therefore becomes entitled to the service. I suppose they wouldn't take him at the moment if he happened to be sick abed, they would think they had better wait and let him get well.

Q.—Well, why would they do that? Isn't the sick man the one who needs medical care when he is sick?

A.—Oh, quite.

Q.—What do the groups do for the sick man then when he is sick?

A.—Look after him.

Q.—They don't look after him though if he is sick when he wants to join?

A.—I think they require their members not to overload themselves with an unreasonable number of sick men at the time of admission.

Q.—Why do they do that?

A.—In order that the funds contributed by the various subscribers will be prudently used.

Q.—In other words, otherwise the funds of the organization wouldn't be sufficient to take care of an overloaded group of sick people?

A.—They must have an average cross-section of the population, and it is upon that basis that they assume ability to do the job.

Q.—Well, what proportion, have you any statistics upon it, does this consumer group take in people who are ill and who want to join the association for care because they are ill?

A.—You refer to this particular group in Washington?

Q.—Yes.

A.—I couldn't answer, sir.

Q.—How about any other group that you know about?

A.—The custom in groups that I know to admit patients is for some of them require a physical examination for admission. If that patient has certain disabilities, those are made exceptions for which further payment must be made. They try to get a group of average people; many of them except people over a certain age, just as insurance companies do; and there are various other exceptions.

Q.—Now, who is going to take care of the sick person or the sick people who cannot belong to the consumer group without overloading it?

A.—Oh, there is no prohibition of their being looked after by the consumer group. The only prohibition that I am aware of is that they cannot be looked after under this particular contribution which is regarded as sufficient.

Q.—You have just told us, Doctor, that the consumer group cannot overload itself with too many sick people, haven't you?

A.—At average admission rate fee, sir.

Q.—If they do, they must charge additional fees. Is that right?

A.—Yes, sir.

Q.—Or else leave the general doctor to take care of him?

A.—Yes.

Q.—That's right, isn't it?

A.—Yes.

Q.—In other words, if the group on physical examination—haven't you found it to be the practice, that where the member of that group is suffering from some ailment requiring treatment, he isn't admitted?

A.—It would be very hard for me to generalize. I know that they are frequently admitted with these conditions specified for which either extra payment or treatment outside should be obtained.

Q.—Have you ever studied the by-laws of the Group Health Association of the District of Columbia, Doctor?

A.—No, sir.

Q.—Has any one ever presented them to you for your advice?

A.—I don't think so.

Q.—Doctor, you stated that in your judgment if the American Medical Association insisted that all hospitals should have on their staffs only members of the American Medical Association, that that would be going outside the field of the American Medical Association.

A.—I don't remember saying anything that I should understand means that, sir. Could we read my answer?

Q.—I will put the question so we won't take up time in going back to it:

Do you think that the American Medical Association, composed as it is of all these doctors, should keep in close contact with the affairs and the administration of the hospitals throughout the country?

A.—Oh, yes, sir.

Q.—You think that it is in the public interest?

A.—I clearly think so.

Q.—Do you think it is in the public interest that they should inspect the hospitals in order to determine whether or not those hospitals are maintaining the standards?

A.—I think it is important that they should inspect them in order to have an opinion which they may then place at the service of the public, as represented by the trustees.

Q.—Do you think that the American Medical Association would have or would be within its proper sphere of activity if it sought to establish a policy in the hospitals by persuasion, advice, that the members of the hospital should be members of the American Medical Association?

A.—Well, I should think they would cut pretty close to the line of trying to mind somebody else's business.

Q.—With respect to what?

A.—With respect to telling an organization what it should do. I don't quite like the notion that a group can advise these trustees for the public interest what they may do and what they may not do. That doesn't smell good to me.

Q.—Well, didn't you tell us that the board of trustees usually sought the advice of the medical profession as to those members who ought to be appointed on the staff?

A.—Oh, quite. They seek their advice. That is the point, they are not required to follow it. I think they must retain their own independence of action.

Q.—That is the point which I wish to bring out, Doctor. If the board of trustees in a hospital asks the medical profession with respect to the appointments upon its staff in a given

hospital, is it contrary to the public interest, in your judgment, that the medical society of that particular locality should recommend its own members?

A.—Oh, no.

Q.—Or should recommend that the board should try to select its members on its staff from its medical society?

A.—As long as it remains in the field of recommendation they are on perfectly sound ground.

Q.—In other words, the trustees should always have the jurisdiction to appoint. Isn't that right?

A.—I think they must, sir.

Q.—Yes. But there is no harm in some one making a recommendation or suggestion to the trustees and stating the reason for such advice, is there?

A.—No. I think it is very important they should.

Q.—Now, Doctor, you have discussed your answers, haven't you, since you gave them last Friday to counsel for the prosecution?

A.—Yes.

Q.—You went all over what you said last Friday to the jury in preparation for your re-direct examination this morning on the stand, didn't you?

A.—Oh, Lord, no.

Q.—Didn't you read over your testimony?

A.—No.

Q.—Did you have it read over to you?

A.—Indeed not.

Q.—Have you discussed the answers which you gave to certain points in the questions?

A.—Certain answers were discussed, yes.

Q.—And one of those answers which was discussed with you was the answer with reference to what in your judgment was the necessary advice you should seek from doctors in forming a group association?

A.—I don't think so.

Q.—You will recall that you made this answer on Friday last, that you considered that any group which was about to organize a group for medical care needed the advice of physicians?

A.—Oh, yes.

Q.—Do you still stick to that answer?

A.—Sure fire.

Q.—All right. Now, they need the advice of physicians with reference to what?

A.—To the problems involved in medical care and the necessary equipment to give it.

Q.—Now, who ought to give that advice?

A.—The members of the medical profession.

Q.—Do you think that if a group were to organize itself here in the city of Washington that it would be wise for the group to discuss those questions you just gave us with the Medical Society of the District of Columbia or its members?

A.—I wouldn't be fussy about discussing it with the society.

Q.—Or the various members thereof?

A.—I should discuss it with the physicians whose opinions I value.

Q.—Would you think that any particular reason existed why the members who are promoting the group should not discuss it with any members of the local society?

A.—No, no.

Q.—Can you think of any reason now why a group attempting to form a group for the distribution of medical care should avoid discussing it with the members of the local medical association?

A.—Well, just as before, they must discuss it with physicians. It isn't in my opinion necessary that all of those physicians should be members of the medical society. There may be some very wise people, there have been all over the country, who are not members, and I should regard their judgment as of interest. Certainly a majority of the people they consult will be members of the medical society.

Q.—Well, is there any reason which exists to your mind why a member of the local medical society should not be called in for advice?

A.—No.

Q.—In other words, membership in the local society ought not to exclude a member as one who could advise on those questions you have just told us?

A.—No.

Q.—What particular problems were there in connection with the establishment of a group health plan, consumer group, which would require a discussion with others than doctors?

A.—Oh, the whole problem of finance, that is to say, the methods of raising money, how much—what size of fund you ought to have in order to make it possible to do the things

that ought to be done; the very difficult problem of charges in regard to the subscribers and for his dependents at various levels. Those are questions in which the medical expert has no particular qualification.

Q.—Who do you think should determine what equipment is required, a doctor or a businessman?

A.—The kind of equipment should certainly be determined by a physician. The precise details of purchase for instance, and so forth, are business problems.

Q.—Who would determine the quality of care which should be given to the members of the group?

A.—It cannot be determined by anybody but physicians, sir.

Q.—Who would determine the number which should constitute the staff in order to give complete medical care?

A.—Well, I should have to say God only knows. I don't think anybody is capable of doing it in the present state of our knowledge.

Q.—Who could best approach it, the doctor or the businessman?

A.—Well, there are a number of people who are not physicians who could bring to that discussion evidence as to the number and kinds of physicians that have in fact been used in other organizations, and I think there are some opinions in this country by people who are not physicians in whom I should be interested. As a rule, however, it is a medical problem.

Q.—Doctor, you mentioned on your re-direct examination some of the articles in the American Medical Journal which you stated would be torn limb from limb. Could you name some of those articles?

A.—Well, there was a series of articles which dealt importantly with the development of compulsory health insurance in England and in other countries. I read them with care, it being a field in which I have long been interested. There were very important omissions there which I think would have raised violent comments if they had been presented before a scientific body as a scientific paper. They were obviously intended to drive home a particular point which it was the desire of the organization to drive home.

Q.—Who wrote the articles, do you know?

A.—Well, a good many of them were written by members of the paid staff and I assume came under the purview of Dr. Fishbein as editor.

Q.—Were they editorials?

A.—There were editorials referring to them but I was at the moment thinking largely of articles such as might have properly been presented at scientific meetings.

Q.—Could you tell us about how long ago they were written?

A.—Well, they began to appear in the middle 20s. I couldn't fix the date accurately. But of course they went on for a number of years, probably over a period of ten or more years. And they have been more or less appearing since.

Q.—Now, were there any others than on group compulsory insurance?

A.—Yes, there were comments on group organizations and the attempts to experiment in the formation of groups, in which it seemed to me that a very biased opinion was expressed, and one intended to convey to the busy physician through the only source which he is likely to read, a very incomplete opinion.

Q.—Now, Doctor, one other question. Do you mean to say that if you knew that a doctor was connected with some organization which the District Attorney had told you was engaged in illegal practice, that you would advise the hospital upon whose staff you were a member, to accept a doctor who was thus engaged in furthering what the District Attorney had declared to be illegal?

A.—Well, I wasn't aware that an opinion by a district attorney constituted a legal prohibition. It is an opinion, is the answer.

Q.—But you, in disregard of that opinion, would still recommend that doctor?

A.—I should recommend them to examine his qualifications, and if he had the qualifications, I see no reason why he shouldn't be admitted to the hospital, the same as any other physician is.

Q.—Even though by recommending him you would be assisting in the continuation of a practice which the district attorney had declared in his judgment to be illegal?

A.—I should want to know what the facts were, not what somebody's opinion was.

Q.—Then you wouldn't regard the district attorney's opinion in the matter at all?

A.—I don't believe I would, sir.

Q.—Suppose you had the supporting opinion of the responsible prosecuting officer for that particular city and they both agreed that it was illegal, would you still admit that doctor, or recommend his admission to the hospital?

A.—Well, my experience with such opinions has been that they stood about as good a chance of being wrong as right, and I wouldn't want to be bound by them until they had something further behind them.

Q.—And you wouldn't consider then that it would be well to wait until you found out whether the District Attorney and the responsible prosecuting municipal officer were right or wrong?

A.—I don't think it would bear upon the qualifications of a physician, which is, after all, the point on which I am giving advice.

Q.—Supposing the physician was qualified but he wasn't licensed to practice, would you still recommend his admission to the hospital?

A.—I don't suppose he could if he wasn't licensed—

Q.—Well, he has all the qualifications. Would you recommend him if he didn't have a license?

A.—If I did recommend him it would have no effect. He couldn't practice.

Q.—Well, would you?

A.—No. Of course I wouldn't.

Q.—But you still maintain that you would recommend a doctor who was qualified even though you had the responsible opinion of those two men in the community that the practice in which he was engaged was illegal?

A.—Well, the things are of entirely different order. One is a legal fact, he is licensed by the proper authority. The other is an opinion given by an officer of the law but having no standing with me until it has gone further than that.

Q.—Let us go one step further and let us say the question of whether or not the practice was legal or illegal was then before a Judge in the Court in that particular community. You would still in that state of the case recommend that the doctor should be admitted to the practice in the hospital? Or would you say "Let us wait and find out about this practice?"

A.—I have regarded it as due respect to a Court not to act in a matter while questions were before the Court. I think that is quite different from acting in the presence of an opinion. If it is before the Court I think I should be required to wait until that Court had issued a judgment.

Q.—That's all.

FURTHER RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—These articles that you criticized appeared in the American Medical Association Journal and were the articles dealing with medical economics. Is that right?

A.—I suppose that ought to cover the definition. They deal with kindred matters.

Q.—Did those articles in your opinion represent the individual advice and opinion of 110,000 individual doctors?

Mr. Leahy:—I object to the question as too leading.

THE COURT:—Obviously, Mr. Lewin, he said they were written by particular persons.

Mr. Lewin:—Mr. Leahy asked this witness whether he would give weight to the opinion of 110,000 doctors. Obviously his question was addressed to these economic questions.

THE COURT:—I think we will save time to let the doctor answer.

The Witness:—Can the question be read again?

(The pending question as above recorded was read by the reporter.)

The Witness:—Oh, no. Obviously, it is out of the question.

By Mr. Lewin:

Q.—And would you say, speaking generally, that this section of THE JOURNAL which deals with medical economics or organization, and all that sort of thing, that those views there expressed represent the individual views of 110,000 doctors?

A.—Oh, no.

Q.—Suppose that the A. M. A. indicates to a hospital that the hospital may be withdrawn from its approved list for intern training and resident training unless it confines its staff to members of the A. M. A., would you think that went beyond advice and recommendation?

A.—I should think it was a grossly improper procedure intending to do something which is wholly against public interest.

Q.—You wouldn't include that sort of a situation in the desirable advice and opinion that you think hospitals ought to seek from the medical profession?

THE COURT:—Mr. Leahy has already asked him that and he has already answered it, Mr. Lewin. One answer covers both the questions.

By Mr. Lewin:

Q.—You were asked your opinion on certain principles of the medical ethics of the A. M. A. I want to ask you what your opinion is of this principle of the medical ethics of the A. M. A. dealing with contract practice. It is as follows:

"Certain features or conditions if present make a contract unethical, among which are"—

and then they list seven criteria, and the seventh is:

"If the contract becomes because of any of its provisions contrary to sound public policy."

Would you care to comment upon the desirability of that kind of principle?

A.—Why yes. It is news to me that a medical association or any other professional association is a proper judge for me of what is in the public interest. I don't think they are endowed with the ability to decide. I shouldn't pay the slightest attention to it.

Q.—You shouldn't pay the slightest attention to it.

A.—Not the slightest.

Mr. Lewin:—Well, I think in deference to your Honor's request I will retire from examination.

THE COURT:—Anything more?

Mr. Leahy:—I just want him to identify one article, if your Honor please.

FURTHER RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Doctor, are you familiar with this article in the *American Magazine* (indicating)?

A.—Yes.

Q.—"Give the patient a break?"

A.—Yes.

Q.—You have read that article?

A.—Yes.

Q.—Are those your views as expressed in the article?

A.—In general terms, yes, sir.

Mr. Leahy:—May it be identified as Defendants' Cabot Cross-Exhibit No. 1?

(The magazine entitled *American Magazine* was marked Defendants' Cross-Exhibit No. 1, for identification.)

DR. BOWMAN C. CROWELL

DIRECT EXAMINATION

By Mr. Kellcher:

Bowman C. Crowell, Chicago, said he had devoted the most of his life to pathology.

He is associate director of the American College of Surgeons, which has something over thirteen thousand fellows.

Q.—How is fellowship in the American College of Surgeons obtained?

A.—First on application and the presentation of proper credentials. Do you wish me to explain?

Q.—Yes. Will you explain what the credentials are?

A.—The applicant must have been graduated from medical school for at least seven years and have filled out the formal application blank giving references to surgeons who are acquainted with him and his work. That application is presented to local credentials committees. If approved by them, after having seen the applicant and talked with him—if approved by them, he has to submit to certain other qualifications and presentation of records of surgical work that he has done.

Q.—When was the American College of Surgeons founded?

A.—In 1913. The articles of incorporation were in 1912.

Q.—Who was the leader in founding the organization?

A.—Dr. Franklin H. Martin. There were four or five among those who founded it. Dr. Franklin H. Martin was one; Dr. John B. Murphy, Dr. Edward Martin of Philadelphia, Dr. A. J. Ochsner, and one or two others.

Q.—Now, Dr. Crowell, will you describe to the jury in a general and brief way the nature of the activities of the American College of Surgeons?

A.—The College was founded for the purpose of improving the standard of the practice of surgery. It has engaged in a number of activities. One of its prime activities has been the standardization of hospitals, which was undertaken in 1918 for the improvement in the conditions surrounding the surgeon where he has to do his work for the benefit of the patients.

He said the American College of Surgeons inspects hospitals and approves those that meet its standard. It does not require that hospitals approved by it have on their staffs only members of the American College of Surgeons or of the American Medical Association. It is an international organization and approves hospitals other than those in the United States.

He then described in general terms the work of the American College of Surgeons.

THE MEDICAL SERVICE BOARD

Q.—Now, Dr. Crowell, did the American College of Surgeons ever have what was known as a medical service board?

A.—It did.

Q.—By whom was that board appointed?

A.—By the president of the organization at that time.

Q.—Who was the president at that time?

A.—As I recall it, it was Dr. Bentley Squier.

Q.—What was the purpose and what were the duties of the Medical Service Board of the American College of Surgeons?

A.—To study the provision of more adequate medical service to the communities.

Q.—What were the circumstances leading up to the appointment of this board by the president?

A.—General interest in the subject of the provision of more adequate medical service to the communities throughout the country and the desire of the board of regents to furnish to its fellows and the hospitals which were looking to it for guidance certain principles which might properly guide them.

Q.—Who were the members of the board?

A.—May I read them?

Q.—Is that the report of the board that you have there?

A.—This is the report of the Medical Service Board.

Q.—Will you refer to that and tell us who the members of the board were?

Mr. Burke:—Will you tell us in what year that whole thing happened?

By Mr. Kelleher:

Q.—When was this board appointed?

A.—On July 15, 1933.

The report to the board of regents was made on June 10, 1934, by the following committee: Dr. Robert B. Greenough, of Boston, chairman; myself as secretary; Dr. G. Harvey Agnew, of Toronto; Dr. Charles A. Dukes, of Oakland; Dr. Franklin H. Martin, of Chicago; Dr. C. Jeff Miller, of New Orleans; Eugene H. Pool, of New York; Arthur M. Shipley, of Baltimore; Dr. J. Bentley Squier, of New York; and Dr. S. Marx White, of Minneapolis.

Q.—I believe your testimony in naming the members has already indicated that they were all doctors?

A.—Yes, sir.

Q.—Were they all surgeons?

A.—No, sir.

Q.—Were they all engaged in private practice?

A.—No, sir.

Q.—Which doctors were not engaged in private practice?

A.—Dr. Agnew, myself, and Dr. Martin, although Dr. Martin had been in private practice previously.

Q.—Is it your testimony now that the rest of the members of the committee were engaged in private practice?

A.—Yes.

Q.—Did the board—the Medical Service Board—conduct the study for which it was appointed?

A.—It did.

Q.—What was the nature of the study which the board conducted?

A.—They were familiar with the findings of some other committees which had been studying this same subject—

Q. (interposing).—The findings of what committee?

A.—I was referring there particularly to the Committee on the Costs of Medical Care.

Q.—What is that committee, Dr. Crowell?

A.—I am unable to state by whom that committee was appointed; I have forgotten.

Q.—Do you know who the chairman of the committee was?

A.—No. No, I don't remember its personnel. It was a well recognized committee at the time.

Q.—Did the Medical Service Board make a report to the board of regents?

A.—It did, sir.

Q.—Was the report of the Medical Service Board unanimous, or were there any dissenters?

A.—To the best of my memory, unanimous.

Q.—Did you vote in favor of the report of the Medical Service Board?

A.—I don't recall that any formal vote was taken. It was generally conceded that this was the opinion of those who were on the committee as they sat around the table.

Q.—Did the board of regents take any action on the report of the Medical Service Board?

A.—It approved the report of the Medical Service Board.

Q.—What was the vote of the board of regents in approving the report of the Medical Service Board?

A.—I don't recall that there was any dissension.

Mr. Kelleher:—I will ask to have this paper marked for identification.

(Paper entitled "Report of Medical Service Board" was marked as United States Exhibit 7 for identification.)

(Counsel for all parties approached the bench and conferred with the Court. The conference was not recorded. Counsel then returned to the trial table, and the trial was resumed as follows:)

Mr. Kelleher (reading):

"Report of Medical Service Board.

"On July 15, 1933, on authorization of the Executive Committee of the Board of Regents of the American College of Surgeons, Dr. J. Bentley Squier, President, appointed a Medical Service Board to study the provision of more adequate medical service to the whole community. The Medical Service Board consists of Robert B. Greenough, Boston, Chairman; Bowman C. Crowell, Chicago, Secretary; G. Harvey Agnew, Toronto; Charles A. Dukes, Oakland; Franklin H. Martin, Chicago; C. Jeff Miller, New Orleans; Eugene H. Pool, New York; Arthur M. Shipley, Baltimore; J. Bentley Squier, New York; S. Marx White, Minneapolis.

"On June 10, 1934, the Medical Service Board made a report to the Board of Regents of the College which was approved by that Board. The report is a statement of principles which should be observed in the development and conduct of prepayment plans for medical and hospital service, and does not propose any specific plan. The report follows:

"Report of Medical Service Board of the American College of Surgeons, June 10, 1934.

"The Medical Service Board of the American College of Surgeons respectfully submits the following report to the Board of Regents.

"1. The American College of Surgeons affirms its interest and its desire to cooperate with other agencies looking toward the provision of more adequate medical service to the whole community.

"2. The College believes that it is the duty of the medical profession to assume leadership in this movement and to take control of all measures directed to this end.

"3. Encouragement should be given to the trial of new methods of practice designed to meet these needs, and a careful evaluation of their success should be the duty of the medical profession before they are offered for general adoption. All such new and experimental methods of practice must be conducted strictly in accordance with the accepted code of ethics of the medical profession in order that the interests of the patient and of the community may be protected.

"4. The College recognizes for immediate study four groups of the population for whom more adequate medical service should be made available, as follows:

"a. The indigent.

"b. The uneducated and credulous members of the community.

"c. Those who because of limited resources are unable, unaided, to meet the costs of serious illness and hospitalization.

"d. Those living in remote districts where adequate medical service is not obtainable.

"5. The care of the indigent sick should be a direct obligation upon the community and (unless otherwise compensated by intangible benefits such as staff and teaching appointments, opportunity and experience) physicians fulfilling this public service should receive remuneration.

"6. The College should work in cooperation with other medical groups in order to dispel the ignorance and credulity of the public, and to bring the people to a proper realization of the protective and curative resources of modern medicine.

"7. The American College of Surgeons recognizes that the periodic prepayment plan providing for the costs of medical care of illness and injury of individuals and of families of moderate means offers a reasonable expectation of providing them with more effective methods of securing adequate medical service.

"A number of different plans for the organization of such services have been proposed, although few have been in operation long enough to permit definite conclusions in regard to their success. It is to be desired that these experiments be continued. Conditions differ to such a degree in different parts of the country that a specific plan which is practicable in one place may require modification of details in other communities. The varying restrictions imposed by present insurance laws in different states further complicate the problem.

"Periodic prepayment plans providing for the costs of medical service may be divided into two classes:

"A. Payment for medical service.

"B. Payment for hospitalization.

"Plans for the payment of hospitalization alone (class B) without provision for payment for medical service may be considered the first project to be undertaken in the average community.

"The American College of Surgeons believes that certain general principles can and should be established, the observance of which will tend to obviate known difficulties and dangers which may threaten the success of these special forms of medical service. These principles are as follows:

"a. Periodic prepayment plans for medical service should be free from the intervention of commercial intermediary organizations operating for profit. After deduction of the clerical costs of operation of the fund and such accumulation of reserve as may be advisable in the interest of the contributors or may be legally imposed, the full amount paid by the contributors should be available for medical and hospital services.

"b. In the interest of the patient, the organization of plans for the periodic payment of medical and hospital costs must be under the control of the medical profession. The medical profession must act in concert with the hospitals and such other allied services as may be involved in the individual project, together with a group of citizens representative of the whole community and of industry who are interested in the successful operation of the plan.

"e. The principle of free choice of the physician and hospital by the patient must be assured to the end that the responsibility of the individual physician to the individual patient shall always be maintained. When hospitalization is required, this choice must of necessity be limited to the physicians and surgeons who hold appointments on the staffs of the hospitals participating in the plan or to those physicians and surgeons who are acceptable to the hospital. It is further recommended that only approved hospitals be admitted to participation in such a plan.

"d. The compensation of the physician and of the hospital should be estimated with due regard to the resources available in the periodic payment fund and should be based upon the specific services rendered.

"e. The organization and operation of any plan of this type must be free from any features not in accordance with the code of ethics of the medical profession which code has been established for the protection of the patient.

"f. The medical organization participating in such a plan must assume the responsibility for the quality of service rendered.

"8. Periodic prepayment plans for medical and hospital service should eliminate many of the conditions which have brought about the development of industrial contract practice. Until such plans have been more widely established certain general principles are here formulated with a view to the elimination of the commercial features of such forms of medical service.

"a. The Minimum Standard for Industrial Medicine and Traumatic Surgery of the American College of Surgeons should be accepted.

"b. Physicians and surgeons, qualified as in paragraph 2 of the above Minimum Standard, may properly be employed on a full-time or a part-time basis by industrial organizations to provide medical and surgical service for their employees, as follows:

"i. To provide emergency service and first aid in injury or disease, and to provide adequate medical or surgical care for industrial injuries and diseases. Medical and surgical care of the families of employees, and of employees themselves, except for emergency and industrial injuries and diseases, should be provided by the industrial physician only in remote districts where other adequate medical service is not available.

"ii. To provide preemployment and periodic physical examinations.

"iii. To study the hazards of the particular industry and to cooperate with other agencies in effecting such measures as may be needed for the prevention of injury and disease.

"iv. To keep accurate records such as may be required by local workmen's compensation laws, and so complete as to serve for scientific investigation of industrial hazards with a view to their further prevention. These records are privileged communications, subject always to due process of law.

"c. The sale of a contract by an industrial organization to an individual physician or group of physicians for medical and/or hospital service for its employees encourages commercial competition and is to be condemned.

"d. Unethical practices in publicity, advertising, solicitation, and competition, either of a professional or of a financial nature, must be eliminated.

"e. The accepted code of ethics of the medical profession, which is designed to protect the best interests of the patient, should apply to industrial medical service as to all other forms of medical practice."

By Mr. Kelleher:

Q.—Now, Dr. Crowell, I have just a few questions about this report. Will you refer to the first sentence of subparagraph a of paragraph 7, which reads:

"Periodic prepayment plans for medical service should be free from the intervention of commercial intermediary organizations operating for profit."

I should like an answer to this question: Was it the intent of the Medical Service Board to recommend against the use, in a prepayment plan, of a nonprofit organization to handle the administrative and clerical matters of the plan?

A.—You say, Was there intent to recommend against it?

Q.—Yes.

A.—I would not so interpret this paragraph.

Q.—In other words, that paragraph is limited to the intervention of commercial intermediary organizations operating for profit?

A.—As I read it, sir.

Q.—Now, will you refer to that part of subsection d, which says that the compensation of the physician should be based upon the specific services rendered and tell us what is meant by that language as used by the board?

A.—That the payment to the physician who participates in this plan should be proportionate to the service that he actually rendered and that he should not derive benefit—financial benefit—merely on account of being on the staff of a hospital which happens to render this service, unless he personally renders it. That is my interpretation of it.

Q.—You were a member of the board?

A.—I was a member of the board, sir.

Q.—Was it intended by that language to prevent the doctor from accepting a salary for his services in such a plan, provided the salary was commensurate with the services rendered by the doctor?

A.—I am not of the opinion, sir, that that condition was specifically considered in the preparation of this paragraph.

Q.—Did the board make any statement of principle concerning the propriety of a doctor's associating himself with prepayment plans on a salary basis?

A.—Not to my recollection.

Q.—Why not?

A.—Because the board was concerning itself with a statement of principles and not details of any specific plans.

Q.—Did the board consider that the question of whether a doctor should be paid a salary was a matter of detail, depending upon the particular type of plan?

A.—I should say so.

Q.—Now, will you refer to paragraph 8 of the report and tell the jury what form of medical service is meant by the language in the last sentence of that paragraph, reading "such forms of medical service"?

Mr. Leahy:—On what page is that?

Mr. Kelleher:—It is on page 3, the first paragraph at the top of the page.

The Witness:—There is a sentence there with two "such's" in it. The first "such":

"Until such plans have been more widely established . . ."

That means a periodic prepayment plan for medical and hospital service. Then:

" . . . the elimination of the commercial features of such forms of medical service."

I would say that refers to industrial contract practice.

AFTER RECESS, MONDAY, FEBRUARY 10

DR. BOWMAN C. CROWELL, DIRECT EXAMINATION
—RESUMED

By Mr. Kelleher:

Q.—Dr. Crowell, I have only one other question. Will you refer to subparagraph C, under paragraph A to the report of the Medical Service Board, and tell us whether the Board intended by that paragraph to condemn prepayment plans in which doctors participated on a salary basis?

A.—My impression of that paragraph is that it refers only to industrial contract practice and not to prepayment plans in general.

Q.—Will you tell us whether any of the principles set forth in subparagraphs A to E, under paragraph 8, were intended to apply to prepayment plans?

A.—They were dealing with industrial medical practice, and not the general prepayment plans under consideration.

CROSS EXAMINATION OF DR. CROWELL

By Mr. Leahy:

Q.—Doctor, would you explain to the jury, please, what you mean by industrial medical practice?

A.—Medical practice that is provided by industries or industrial organizations to provide emergency service and first aid in injuries or disease, to provide adequate medical or surgical service for industrial injuries and diseases.

Q.—Has that been quite prevalent and common?

A.—Industrial medical practice?

Q.—Yes.

A.—Yes, sir.

Q.—Over how many years?

Mr. Kelleher:—I object, your Honor, because Mr. Leahy's question goes beyond the scope of the direct examination.

THE COURT:—I think I will sustain objection to the second question. The first one I think is proper in clearing up an understanding of what industrial practice is.

By Mr. Leahy:

Q.—Doctor, did you have under consideration when this report was drafted any particular group scheme?

A.—No, sir. I was one member of this board. Whether other members of the board had any particular plans under discussion I do not know.

Q.—Have you any memory now of any discussion when you were formulating this report about any particular group plan?

A.—No, sir.

Q.—Did you have the general subject of group plans under discussion?

A.—Naturally the general subject was under discussion, of group plans. As I interpret it, the whole report was based on that; not on specific plans.

Q.—Would you kindly take the report, Doctor, as you have it before you, and let us look at paragraph 3 on the same page. Do you catch it down there—the second line from the bottom?

A.—Yes, sir.

ORGANIZATION SECTION

JOUR. A. M. A.
FEB. 22, 1941

Q.—Take the second—well, I will read it so that you will understand my question (reading):
 "Encouragement should be given to the trial of new methods of practice designed to meet these needs, and a careful evaluation of their success should be the duty of the medical profession before they are offered for general adoption."

What did you mean in there, that the "evaluation of their success should be the duty of the medical profession"?
 A.—As I stated, in paragraph 2, preceding it, sir, the College believes it is the duty of the medical profession to take control of all measures and that the plans that were drawn up or that would be drawn up should be acceptable to the medical profession.

Q.—And it was the medical profession which constituted those people in the community who were capable of evaluating the success of these plans?
 Mr. Lewin:—We object, if your Honor please, on the ground that the question goes beyond the scope of the direct examination.

THE COURT:—Can you repeat it, Mr. Leahy?
 Mr. Leahy:—I can repeat it, yes, your Honor. I will reframe the question.

By Mr. Leahy:

Q.—Was it the thought contained in this paragraph that the medical profession was the profession, and the doctors were the people, who could evaluate the success of such plans?
 Mr. Lewin:—Another objection, your Honor. The paragraph speaks for itself without ambiguity.

Mr. Leahy:—We had the same point up on direct and the question was asked as to what was the intent.
 THE COURT:—Objection overruled.

The Witness:—That means I may answer it?
 THE COURT:—Yes; you may answer it.

A.—It was felt that the medical profession were the arbiters as to the success of these plans.

By Mr. Leahy:

Q.—The next sentence reads that this new method of practice must be conducted strictly in accordance with the accepted code of ethics of the medical profession. What code of ethics is referred to there?

A.—The code of ethics that is accepted by the medical profession in places where these plans are in force.

Q.—Is there, Doctor, any code of ethics which is published for the medical profession other than the code of ethics of the American Medical Association?

A.—I made my reply as I did, sir, inasmuch as I have referred to the fact that our organization is an international one, and in the United States of America the code of ethics and the principles of ethics of the medical profession evolved by the American Medical Association I would say were generally accepted.

Q.—The sentence further proceeds to state that these methods must be conducted strictly in accordance with those ethics, in order that the interests of the patient and of the community may be protected. What do you mean by that?

Mr. Lewin:—I think it speaks for itself.
 THE COURT:—I do, too, Mr. Lewin. I think the whole article speaks pretty well for itself; but you have set the pace here.

Mr. Lewin:—No, your Honor. Where there was ambiguity we asked him to clear up the ambiguity. I thought that was perfectly proper practice. But here he is referring to something as to which there can be no argument about its meaning.

Mr. Leahy:—I did not see any ambiguity about it.
 Mr. Lewin:—You should have objected, then.

Mr. Leahy:—I do not want to object to anything you want to bring out.

Mr. Lewin:—Let us see if you stick to that throughout this case.

THE COURT:—I am afraid, gentlemen, that I shall have to be the judge of that. You may answer the question. After all, we have some understanding of the English language. I mean, it does not take a doctor or lawyer to have a reasonable understanding of the English language; and when you read perfectly plain, simple words laid down in a grammatical way, we ought to be able to judge what it means.

Mr. Leahy:—I will reframe the question, your Honor, to bring out the thought.

By Mr. Leahy:

Q.—Was it not the intent of that sentence, Doctor, that any method of practice which was being conducted contrary to the

code of ethics of the medical profession would not be conducted in the interests of the patient and of the community?

Mr. Lewin:—We make the same objection, your Honor.

THE COURT:—I have already permitted him to answer it. It is difficult to draw a line. When you conduct a line of examination it is pretty hard to restrict the cross examination.

Mr. Lewin:—Yes, your Honor, but—

THE COURT:—We will not argue it any further.
 The Witness:—I would prefer answering that in the positive; that is, that if conducted in accordance with the accepted code of ethics of the profession, it was felt that that would safeguard the interests of the patient and the community.

By Mr. Leahy:

Q.—Now, will you go to Section 4? You refer there to the fact that adequate medical service should be made for the uneducated and credulous members of the community. To whom were you referring when you said the credulous members, and what does that mean?

Mr. Lewin:—We object to that, on the same ground, that "credulous" is a perfectly good English word.

THE COURT:—Objection overruled.
 A.—I don't believe I can elucidate that any more than the word itself.

By Mr. Leahy:

Q.—Does it refer to those members of the community who might be easily misled by advertising claims for service which will be rendered to them?

A.—I think those are included under that phrase.

Q.—Those who easily believe representations as to what they will get for what they will pay?

A.—Exactly.

Q.—Does it not take into consideration also the fact that the ordinary layman or member of the public is himself unable to judge of the character or quality of medical service which he will get from an advertiser or solicitor?

Mr. Lewin:—There is nothing on the direct that went into that, and this witness has not been qualified as an expert on psychology or anything of that sort.

THE COURT:—Objection overruled. Answer the question, Doctor.

A.—I would not say that the public as a whole were not competent to choose their own medical care.

By Mr. Leahy:

Q.—Would you say that there were a sufficient number of the public such that you would classify them as the uneducated and credulous who must be protected against such representations?

A.—There is that element in the community; otherwise it would not have been referred to.

Q.—Do you recall that your group or your board studied that matter before this report was made up?

A.—It was known to the members of the board that in some of the industrial communities the type of people were of such a level that they had difficulty in using judgment as to the selection of those who should care for them from a medical standpoint.

Q.—Do you refer to the same people in the sixth paragraph where again you repeat that the College should work in cooperation with other medical groups in order to dispel the ignorance and credulity of the public?

A.—Yes, sir.

Q.—When you state in paragraph 7 of the report that your College recognizes that the periodic prepayment plan provided for the costs of medical care of illness and injury to individuals in families of small means offers a reasonable expectation of providing them with more effective methods of securing adequate medical service, you refer, do you not, to such a periodic prepayment plan as being conducted in accordance with the accepted code of ethics of the medical profession?

A.—Yes, sir.

Q.—Now, will you turn to page 2. Do you recall what your committee had in mind in making the statement in this report—

"The varying restrictions imposed by present insurance laws in different states further complicate the problem."

That is the last sentence of the first paragraph.
 A.—I cannot state with authority as to that phrase, but the insurance laws of the states differ, I am informed, and arrangements for prepayment plans that are made must conform to the laws of the states in which they are promulgated.

Q.—But you do not recall now any particular insurance laws that were discussed in the committee?

A.—No, sir.

Q.—Pass on, then, to subparagraph B on page 2:

A.—In the interest of the patient the organization of plans for the periodic payment of medical and hospital costs must be under the control of the medical profession."

What does that intend?

A.—It intended to obviate the prepayment plans being put under the guidance of commercial organizations.

Q.—You mean, commercial organizations of laymen?

A.—Yes, sir.

Q.—In other words, was it the intent of the recommendation of your board when it made its report to the Academy that the medical profession should be the profession which controlled these plans?

A.—Yes, sir.

Q.—Going down to the last sentence of paragraph C, what did your committee intend by writing into that paragraph:

"It is further intended that only approved hospitals be admitted to participation in such a plan?"

A.—It was intentionally written as "approved hospitals" without stating what the approving body would be. We are an international organization.

Q.—By the way: what countries are included? Let us get that clear, please.

A.—It was founded by the surgeons of the United States and Canada, but there are also Fellows in many other different parts of the world—in Mexico, in many of the South American countries, Cuba, Puerto Rico, England, Scotland, Wales; others in India, China, and so on.

Q.—Therefore, what you intended was to leave whatever approving board or organization there might be in each of the various countries to give its approval?

A.—Yes, sir.

Q.—Coming down to the United States, what were the approved hospitals, or what was the body which approved in the United States?

A.—It is not stated, sir.

Q.—What did you intend?

A.—It was intentionally, I would say, left vague. It was not desired to make the American College of Surgeons itself—not intended to place that College in the position of being the sole approving body.

Q.—Was there any other approving body at the time, in 1933 or 1934, when you made this report?

A.—Yes; the American Medical Association.

Q.—Was there any other association, other than the American Medical Association, besides your own which approved hospitals?

A.—Not to my knowledge. The American Hospital Association is an organization of itself, but I believe membership in it is on a different basis from that of either the American Medical Association or the American College of Surgeons.

Q.—Doctor, would it then be correct to state that in so far as that particular sentence affected hospitals of the United States when it used the adjective "approved" it meant only hospitals approved either by your Academy or by the American Medical Association?

A.—I think that is the logical interpretation.

Q.—Let us pass to subparagraph B on the same page:

"The organization and operation of any plan of this type must be free from any features not in accordance with the code of ethics of the medical profession."

Did you there refer to the same code you had referred to earlier in your report, to wit, the code of ethics of the American Medical Association?

A.—Yes, sir.

Q.—Just one question on F:

"The medical organization participating in such a plan must assume the responsibility for the quality of service rendered."

What does that refer to, Doctor, when it says that the medical organizations must assume the responsibility for the quality of service rendered?

A.—My interpretation of that, sir—and this is a strictly personal interpretation—would be that it was assumed from what has gone before that there will be medical organizations which will organize these prepayment plans, and those medical organizations are responsible for seeing that the plans work in conformity with the ideals and assume responsibility for the quality of service rendered.

Q.—It was not intended in that recommendation that you made to the Academy to recommend that any lay group, lay

board of trustees or lay board of directors should assume the responsibility for the quality of service rendered, was it?

A.—I do not see that that was stated here anywhere.

Q.—Would such an inference, in your judgment, be contained in paragraph F?

A.—It would seem to me that that is obvious, sir.

Q.—In other words, it was the medical profession which should take charge of the quality of service; is that right?

A.—As I see it, sir.

Q.—O. K. Now, let us go to page 3 of the second column, paragraph C.

"The sale of a contract by an industrial organization to an individual physician or group of physicians for medical and/or hospital service for its employees encourages commercial competition and is to be condemned."

What does it mean by selling contracts by an industrial organization to an individual physician, Doctor?

A.—That is where they are engaging in industrial practice under their contract to provide complete medical and hospital care.

Q.—By an individual physician?

A.—Yes.

Q.—What does it mean where it says "encourages commercial competition"?

A.—One doctor might underbid another in order to get the contract for the care of those in the industry.

Q.—You consider that any such practice as that is not in accordance with the public interest, do you not, Doctor?

A.—It says here that the board considered it something to be condemned.

Q.—Take paragraph D:

"Unethical practices in publicity, advertising, solicitation, and competition, either of a professional or of a financial nature, must be eliminated."

What practices were you referring to there? Did you have some in mind in the board as you sat around and drafted that paragraph?

A.—Only those referred to. It seems to me that is obvious, sir—unethical practices, unethical advertising, unethical solicitation, unethical competition.

Q.—Either of a professional or of a financial nature?

A.—Yes.

Q.—Do you recall now, or have you any independent recollection of, Doctor, any discussions which were had in the board before that paragraph was drafted?

A.—I have no recollection of any details of it, sir. You will gather from a reading of the whole document that the board had permanently in mind observing the ethics of the medical profession; and this is just one other phase of it.

Q.—And that is why you wanted that paragraph E, is it?—

"The accepted code of ethics of the medical profession, which is designed to protect the best interests of the patient, should apply to industrial medical service as to all other forms of medical practice."

A.—Yes, sir.

Q.—The same code of ethics you had in mind before?

A.—Yes.

Q.—Doctor, could you tell us how much care was spent by your board in the preparation of this report to the Board of Regents?

A.—As stated here, the board was appointed in July, 1933, and rendered its report in June, 1934.

Q.—For practically a year, then, you had the matters and things about which you reported under discussion and deliberation?

A.—Yes, sir.

Q.—And were the doctors who composed the board, Robert B. Greenough, yourself, Dr. Agnew of Toronto, Dr. Dukes of Oakland, Dr. Martin of Chicago, Dr. Miller of New Orleans, Dr. Pool of New York, Dr. Shipley of Baltimore, Dr. Squier of New York and Dr. White of Minneapolis—were they surgeons of long experience and standing?

THE COURT:—He has already answered that. He gave a list of four of them who were not. It is in the record. He himself is not a surgeon.

Mr. Levin:—He is a pathologist.

By Mr. Leahy:

Q.—Were they doctors of standing, then, and of long experience?

A.—They are doctors; yes.

Q.—By the way: Are the members of the college to which you belong also members of the American Medical Association?

A.—The American College of Surgeons. Not all, sir. It is an international organization.

Q.—Those in the United States are members of the American Medical Association also, are they?

A.—There may be a few exceptions to that, sir.

Q.—But the majority are, are they?

A.—Yes.

Q.—Now, Doctor, on direct examination you spoke about the approval of hospitals, I think. Your organization does inspect and approve hospitals, does it not?

A.—Yes.

Q.—How long has it been doing that?

A.—Since 1918.

Q.—What is the purpose of the inspection?

A.—To elevate the general standard of the practice of surgery, to improve care for the patients, to improve the conditions in the hospital where the doctors have to do the work, so that they may be in position to render medical care to the patients.

Q.—How frequently does the organization inspect hospitals?

A.—It is a continuous process, sir. There is no stated interval in which an individual hospital will be inspected.

Q.—In other words, does the hospital know in advance that it is going to be inspected?

A.—Yes, sir.

Q.—But the time depends on the convenience or the opportunity which your particular inspectors may have to make the examination?

A.—Yes, sir.

Q.—Would you say it is as frequently as a year or two years or three years, or how long?

A.—Certainly not all hospitals are visited every year. There is some communication with all hospitals each year. There are hospitals which not only conform to our standards, but their practice is far above our minimum standards, and it is not necessary to visit them at frequent intervals. It is the hospitals that need the help, or that we feel need the help, of the college that are visited at most frequent intervals.

Q.—Could you tell the jury about how many hospitals there are in the United States?

Mr. Lewin:—Your Honor, may I say something?

THE COURT:—Yes.

Mr. Lewin:—Intrinsically we have no objection to this, but it violates the rules of cross examination. Mr. Leahy is going to have an opportunity to present his case and call this witness as his witness. This has all been put into the record.

THE COURT:—I will sustain the objection to that question. Am I in error in my recollection that on direct examination you went into the fact that they approved hospitals?

Mr. Kelleher:—That is correct, your Honor.

Mr. Leahy:—I think I have a right to exhaust it, then.

Mr. Kelleher:—We went into the question of approval, but he has asked this witness how many hospitals there are in the United States.

Mr. Leahy:—I was just trying to follow the question, when he said they obviously could not examine every hospital every year.

Mr. Lewin:—It is not very important, but we could go on forever if we followed that practice.

I will withdraw my objection. Go ahead. I am awfully sorry.

Mr. Leahy:—Shall I proceed, or does your Honor—

THE COURT:—I have sustained the objection.

By Mr. Leahy:

Q.—In the approval of hospitals, Doctor, by your organization, is there any grading made of the hospital or classification made, such as an A hospital or B hospital?

A.—Not so designated, sir. The hospital is either approved or professionally approved. Professional approval means that in some respect they did not quite come up to our standards but they have given evidence that they are seeking to do so.

Q.—Then do you publish a report on those approved hospitals?

A.—We publish a list each year, sir.

Q.—I will show you a volume and just ask you whether you can identify that as one of your lists?

A.—It is.

Q.—Is that indicative of the lists that are published each year?

A.—Similar lists are published each year; yes, sir.

Mr. Leahy:—May that be marked for identification?

THE COURT:—Yes.

(List of hospitals identified by the witness was marked Defendants' Exhibit Crowell, Cross Examination, No. 1, for identification.)

By Mr. Leahy:

Q.—Doctor, with reference to your membership, is your membership scattered pretty widely throughout the United States?

A.—Yes.

Q.—Is each locality or area in the country represented? Does your membership go to the Far West, Middle West, South, East, and North?

A.—All parts.

Q.—I noticed you answered a question this morning on direct as to the qualifications of a Fellow in your college. Did you state that the minimum requirement is to admit a member after seven years?

A.—Seven years after graduation.

Q.—Do you admit on application where an applicant has been practicing for seven years since his graduation?

A.—If he has the other qualifications.

Q.—Then there must be additional qualifications, must there not, to the time of practice?

A.—Decidedly.

Q.—And you make a very close investigation into the man, do you not?

A.—Yes.

Q.—Into his qualifications?

A.—Yes, sir. By me, you mean the organization?

Q.—I mean the organization. Does the applicant usually submit references or sponsors when he makes his application?

A.—He does.

Q.—Are those contacted?

A.—They are communicated with.

Q.—And you try to find out as much as you can, do you not, to see that the man is qualified beyond the number of years he has practiced since his graduation?

A.—Yes.

Q.—Do moral qualifications enter into it?

A.—Ethical.

Q.—Ethical qualifications enter into it?

A.—Yes.

Q.—You were asked the question, I think, upon direct this morning, Doctor, whether or not you had any requirement that the members on the staff of the hospitals which your organization approves should be members of your organization. Do you recall that question?

A.—Yes.

Q.—Of course you have no such requirement, have you?

A.—No, sir.

Q.—Because you are an international organization, are you not?

A.—Yes.

Q.—And it is restricted purely to surgeons, is it not?

A.—Fellowship in the College?

Q.—Yes.

A.—Yes, sir.

Q.—And upon the staff of any hospital there are others than surgeons, of course, are there not?

A.—Yes.

Q.—Therefore you could not require, could you, under the rules of your organization, that the staffs of hospitals be composed only of surgeons?

A.—No, sir.

Q.—Do you have any requirement at all that the surgeons on the staff should be members of the county associations here in the United States?

A.—Not so stated, sir.

Q.—How would you put it? You put it for me.

A.—They should be practitioners of medicine, licensed to practice medicine in their respective communities, in good standing.

Q.—Do you recommend that the members of your association or that the staffs of surgeons in the hospitals be composed of members of your Society or College?

A.—Will you restate that, please?

Q.—I say, do you attempt to recommend to the various hospitals that in the selection of surgeons to the staffs of those hospitals they select from the accepted membership or Fellowship of your College? I mean, in the United States.

A.—I would say no. The College at no time, that I know of, has recommended directly the personnel of any hospital. We expect the hospitals to conform to our standards. We do not dictate personnel.

Q.—Where you find a surgeon on the staff of a hospital who is not a Fellow of the College, with respect to him what are your minimum standards?

A.—We deal with the hospital as a whole rather than with the individual members of its staff, sir.

Q.—In the approval of various hospitals do you take into consideration the personnel of the staff at all? .
A.—The accomplishment of the hospital as a whole.
Q.—Do you consider the staff members at all?
A.—We do have a list of the staff members.
Q.—Do you make any investigation of them as to their ability or their qualifications before you approve a hospital?
A.—I would say, rarely.
Q.—You accept them, do you, as they are on the staff?
A.—I am afraid I am getting a little deeper into this than I am qualified to answer.
Q.—Then I will not ask you any further questions.
A.—I am not directly in the hospital department of the College.

RE-DIRECT EXAMINATION

By Mr. Kelleher:

Q.—In your knowledge has any surgeon been excluded or expelled from membership in the American College of Surgeons for participation in a prepayment plan?
A.—Not to my knowledge.
Q.—Has the American College of Surgeons ever threatened to withdraw its approval of a hospital because the members of the staff of the hospital were engaged in a prepayment plan, to your knowledge?
A.—Not to my knowledge.
Q.—Has the American College of Surgeons ever withdrawn approval of a hospital because of the participation of the staff of the hospital in a prepayment plan?
A.—Not to my knowledge.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—You would, however, would you not, threaten to withdraw the approval if there were members on the staff of the hospital engaged in unethical practices?
A.—If it came to our knowledge.
Mr. Leahy:—Yes. That is all.
Mr. Kelleher:—We now offer in evidence certain excerpts from "Proceedings of the House of Delegates of the American Medical Association, June 11th to 15th, 1934." The volume containing the proceedings falls within Exhibit 2, which is the stipulation.

THE COURT:—Do you wish to read it?

Mr. Kelleher:—I have indicated the parts which we intend to offer by slips and by pencil notations in the volume. I suppose I had better show it to defendants' counsel.

Mr. Kelleher:—May I state for the record that the Government is offering in evidence portions of the proceedings of the House of Delegates, in 1934, appearing on pages 42, under the heading, "Resolution on the Apparent Attempt of the Board of Regents of the American College of Surgeons to Dominate and Control Medical Practice," and the portion of the proceedings appearing on page 49, under the heading, "Report of the Judicial Council"?

THE COURT:—That is the one I passed on?

Mr. Kelleher:—That is the one you passed on, yes.

Dr. George Edward Follansbee presented the following report:

"A resolution introduced by Drs. Charles J. Whalen, Illinois, calls attention to a recent action by the Medical Service Board of the American College of Surgeons, approved by its board of regents, advocating publicizing a procedure for furnishing medical and hospital care for certain classes of the population. No consideration appears to have been given to policies or procedure previously adopted by the American Medical Association, of which the College of Surgeons are members. The American Medical Association is the one organization representing the entire body of physicians constituting the medical profession, and by virtue of that fact is the only organization qualified to speak for the varying interests and policies of the profession as a whole.

"Recurring proposals concerning the entire practice of medicine from small sections of the profession, without due regard to the policies of the entire profession, as represented by the American Medical Association, when presented to the public through other channels than the representative body are confusing to the public mind, are harmful to the profession, and give aid and assistance to those bodies and individuals who are attempting to revolutionize medical practice. The Judicial Council therefore recommends the adoption of the resolution as follows:

"WHEREAS, The American Medical Association, including 100,000 members, is the only democratic body representing the organized profession of this country through delegates regularly elected through county and state medical societies; and

"WHEREAS, Other medical organizations and groups representing selected groups of specialists who have from time to time issued pronouncements of policies in the field of medical economies and medical practice, which do not represent the views of organized medicine and which purport to guide the medical profession and the public in the administration of medical affairs; and

"WHEREAS, The House of Delegates of the American Medical Association has repeatedly condemned the issuing of said announcements on poli-

cies which seriously embarrass the attempts of this organization to secure adequate care for the health of the American people and to protect the ideals of the medical profession; and

"WHEREAS, The Board of Regents of the American College of Surgeons assembled in Chicago on June 10 promulgated a policy, including a prepayment plan for medical care, restricting so-called private hospitals to the members of the staffs of such hospitals, and to physicians acceptable to such staffs; and

WHEREAS, This action of the Board of Regents has been spread to the people of the United States through the public press on the opening day of the annual session of this House of Delegates: Now, Therefore, Be it

Resolved, That the House of Delegates of the American Medical Association expresses its condemnation of such practice and of this apparent attempt by the Board of Regents of the College of Surgeons to dominate and control the nature of medical care and practice; and be it further resolved that the House of Delegates requests the board of trustees of the American Medical Association and the judicial council to ask the Board of Regents of the American College of Surgeons, who are themselves members of this American Medical Association, to explain the reason for their action and to justify the attempt of a small group within a specialistic organization to legislate for all the medical profession in this country, truly represented only by the American Medical Association."

"The report of the Judicial Council was adopted on motion of Dr. C. E. Humiston, Illinois, seconded by Dr. Albert Soland, Section on Radiology, and carried unanimously."

TESTIMONY OF RAYMOND R. ZIMMERMAN

DIRECT EXAMINATION

Raymond R. Zimmerman said in answer to questions that he is employed by the Council of Personnel Administration here in Washington.

The Council is a division of the United States Civil Service Commission. It is made up of the directors of personnel of the various departments and agencies of the Federal Government. It concerns itself with the personnel problems; the human problems of the Government. He has been with the Council since August 1939. During 1936, 1937 and 1938 he was director of personnel of the Federal Home Loan Bank Board, connected with the Home Owners Loan Corporation, as director of personnel of the Federal Loan Bank Board.

The personnel department concerns itself with problems, questions of employments, wages, promotion; questions of training, questions of policy, questions of employment policy; labor policy, questions of working conditions, questions of employee health—the human problems of the organization. Before that he was in charge of personnel matters for the Continental Oil Company in Oklahoma.

He obtained his present post with the Government in the Council on Personnel Administration through appointment by the Chairman of the Council, which is under the Civil Service Commission. He described his training and qualifications in such work.

THE H.O.L.C.

Q.—I wonder if you could tell us now just generally what the Home Owners Loan Corporation is.

A.—Well, the Home Owners Loan Corporation is an independent instrumentality of the Federal Government. It was created by Act of Congress in 1933. And it was organized—it was set up, created, for the purpose of refinancing distressed home loans.

Q.—How was it financed?

A.—The initial stock contribution I think was supplied by the Federal Reserve—no, by the R. F. C., Reconstruction Finance Corporation.

Q.—Reconstruction Finance Corporation?

A.—That's right. The original capital was \$200,000,000. That was the initial capital.

Q.—And did it raise additional monies by the issuance of bonds?

A.—Oh, yes.

THE COURT:—I don't think you need to go into any detail on that.

Mr. Levin:—Not much more than that. A little bit more.

THE COURT:—Very well.

Mr. Levin:—Your Honor, I think everybody might be interested to know who held the bonds. I think the other side might want to make some point of that, I don't know.

By Mr. Levin:

Q.—Do you know who bought the bonds of the H. O. L. C.?

A.—The bonds were sold to the public.

Q.—Now, just describe briefly again the nature of the business of the H. O. L. C. What does it do?

A.—It was engaged, as I say, in refinancing distressed home loans.

Q.—Does it lend money and acquire mortgages?

A.—Yes.

Q.—Charge interest on those loans?

A.—That's right. That's right. The revenues of the Home Owners Loan Corporation come from the interest charged on these mortgages, these home mortgages.

Q.—Is it self-sustaining financially? Does it earn its expense money?

A.—Yes. Entirely.

Q.—Entirely?

A.—In other words, it is not supported by taxation; no funds appropriated.

Q.—In 1937 and 1938 were its expenses taken out of money appropriated by Congress or taken out of its earnings?

A.—Taken out of earnings entirely.

Q.—I see. Can you tell us whether or not through 1937 and the early part of 1938 it was under the jurisdiction of the Comptroller General or the General Accounting Office as to its expenditures?

A.—I think it went under the—

Mr. Leahy:—Isn't that a question of law, if your Honor please?

THE COURT:—Of course it is.

Mr. Lewin:—It is a question of fact also.

THE COURT:—He might state it but let us not go into it.

Mr. Leahy:—May I just state this, if your Honor please, if it is or if it isn't, whatever it is, it is under some law, and that law is the best evidence.

THE COURT:—If you are serious about the objection, I will sustain it.

Mr. Lewin:—All right.

By Mr. Lewin:

Q.—About how many employees did the Home Owners Loan Corporation have in 1937?

A.—Well, it varied during the year.

Mr. Leahy:—All over the United States, you mean, Mr. Lewin?

Mr. Lewin:—That is what I asked first but I am going to come down to Washington in a moment.

By Mr. Lewin:

Q.—Do you know what the total number of its average employees was in 1937?

A.—It was between 15,000 and 16,000, in that neighborhood. It varied from month to month. Home Owners Loan Corporation is a liquidating organization. Its staff is decreasing.

Q.—Yes. About how many of those employees in 1937 were working here in Washington?

A.—About, between 1,300 and 1,400. There were more than that on the home office payroll but one division was located in regional offices, although it was carried on the payroll of the Washington office, the auditing department.

Q.—Now, have you ever interested yourself as a personnel man throughout the period of your experience in reducing the expenses of your employer which result from accidents to the employees?

A.—Yes. That was a responsible part of my work with the oil company. Its safety work is an important part of the job in a business that is hazardous.

Q.—Yes. Were the H. O. L. C. employees in 1937 and 1938 and 1936 subject to any Civil Service requirements?

Mr. Leahy:—Will you read that question?

(The pending question, as above recorded, was read by the reporter.)

By Mr. Lewin:

Q.—Or regulations?

Mr. Leahy:—Isn't that a question of law also, if your Honor please?

THE COURT:—Yes, sir, but maybe he can advise the Court about it. The Court doesn't know.

The Witness:—Am I to answer it?

By Mr. Lewin:

Q.—The Court is going to permit you to answer it, yes.

A.—Yes. Rules and regulations governing federal workers; hours of work; rates of pay; hours of leave; sick leave and annual leave; regulations of that sort, the employees of the Home Owners Loan Corporation were.

Q.—What is sick leave for a government worker or for a worker of the H. O. L. C.?

A.—Well, it is—it is a period of time is given with pay to the employee who actually—who is ill and cannot work, up to 15 days a year; and we speak of it as a sick leave.

Q.—About how much sick leave is a government worker entitled to?

Mr. Leahy:—He stated fifteen days.

THE COURT:—He stated it.

Mr. Lewin:—I didn't hear that.

The Witness:—Fifteen days is the maximum that they are entitled to in a year. However, that leave is cumulative.

By Mr. Lewin:

Q.—But of course he has to be sick, I presume, before he is entitled to the sick leave?

A.—That's right. And he must certify that he is sick.

Q.—Did you make any studies for a Federal Home Loan Bank Board of the losses to the business by reason of the amount of sick leave taken by the employees?

A.—Yes, sir. As a part of record keeping, regular record keeping, we kept track of the amount of time lost through sickness, and we interpreted those costs to the management of the organization.

Q.—Was that work done under your direction?

A.—It was.

Q.—Had you before that time studied the whole problem of the cost to an employer in business of the amount of sick leave that his employees take?

A.—Well, I was, and am generally familiar with the amount of sick leave that is taken by employees in private industry. Is that your question?

Q.—Yes. Are there studies of that question that have been prepared by employers?

A.—I think most private employers keep pretty accurate records of their costs.

Q.—Had you any access to the study made by the American College of Surgeons on that question?

A.—Yes. I read—didn't make a careful study of it, but I know that it made the observation that there was—

Mr. Leahy:—I object. The best evidence is the report.

THE COURT:—Objection sustained.

Mr. Lewin:—I just asked whether he was familiar with that study.

THE COURT:—I think he has answered the question.

By Mr. Lewin:

Q.—Were you familiar with the studies of Westinghouse on that subject?

A.—Yes, sir.

Q.—When was that study made, was it 1937?

A.—'36.

Q.—'36?

A.—It was over a period of years, but they released their figures in '36.

Q.—Did you at my request look at your records to ascertain the average number of H. O. L. C. employees working here in Washington through the three months period October, November, and December of 1936?

A.—Yes, I did. Some time ago.

Q.—Yes. Now, can you tell me what that average figure was?

A.—No, sir—

Mr. Leahy:—I object. The record is the best evidence.

Mr. Lewin:—Well, now, your Honor, this is a well-recognized exception. These records are extremely voluminous. I am perfectly willing to have my brother have full access and he can count the number of employees and make his own computation.

THE COURT:—If it is a matter that is not in printed form in the nature of some official report, I think it necessarily involves calculations, summations, and I think the witness, if he has himself engaged in that, can state it, can state the results he has found, from authentic records.

Mr. Leahy:—Would your Honor kindly ask if he has done that personally?

THE COURT:—I think he said he had, Mr. Leahy.

By Mr. Leahy:

Q.—Did you do this personally, Mr. Zimmerman, make this investigation and the study of the records, or did somebody else do it and report to you?

A.—I didn't post the leave cards.

Q.—Did you examine the leave cards and make this compilation in order to talk about it now, yourself, or did you have somebody else do it and report to you?

A.—It was done under my supervision. The leave clerks posted the records and made summarization of it for me.

Q.—Then you are taking somebody else's summarization?

A.—Yes. Regular monthly reports.

Mr. Lewin:—He said he had this study made under his direction; which is very usual to have his clerks do it. He couldn't do it all himself.

Mr. Leahy:—If your Honor please, it all depends on how we use this word "supervision." It is a great big question.

It is one thing to say in a section "I want this thing done," and it is another thing to supervise the doing of it to see how it is done.

As I understand it, he has nothing to do with it excepting he told the clerk or two clerks to go ahead and make the compilation; if the two clerks made the examination they ought to be here to tell us about it. I object to the testimony from this witness.

By Mr. Lewin:

Q.—Were these records taken from records kept under your supervision?

A.—Yes, sir.

Q.—Did you designate the employees who were actually to make the postings?

A.—Yes, sir.

Q.—Did you tell them what they should do and to what records they should look for the information?

A.—No. I think they knew that.

Q.—Did you tell them what period of time you wanted them to make the study of?

A.—Yes.

Mr. Lewin:—Your Honor, I submit there is no question but that is admissible.

Mr. Leahy:—I think he has just taken what he assumed some other clerks knew; he doesn't know what the records are, he just made a blanket assumption that they knew some records and brought back some things.

The Witness:—These records are audited.

THE COURT:—There seems to be a reasonable way to get at it. You have to accord the party the right of cross-examination and, if Mr. Zimmerman himself didn't do the work but is presented here as a witness to give the result, it denies the other side the right of cross-examination as to how the work was done and as to the accuracy of it.

That is the objection to it, as I see it.

Mr. Lewin:—It falls under a very well recognized exception of complicated voluminous records.

THE COURT:—Yes, with the results given by the ones who did the work.

You see, otherwise the defendants here don't have, for instance, the right, of course, which the law gives them of cross-examination to test the accuracy of that work.

Mr. Lewin:—Well, we are perfectly willing to have counsel go with us down to the H. O. L. C. to give us the books and let them sit down there and make these computations themselves.

THE COURT:—I will say this to counsel in order that it may be helpful in determining their final position about it, I am inclined to think that the information we want, properly presented here in evidence, is admissible, but the question is whether you want to go to these original sources for it, take the time for it.

Mr. Leahy:—I think your Honor indicated the positive rule of law on the question when you stated to counsel that when it was attempted in any case to prove records of this character, it was the one who made the compilation itself who was there on the stand, not someone else who received it.

I don't wish to be technical, it is the last thing in the world I want to do besides going down there and looking at the records. I am not going to do that. But, if your Honor please, I don't know what records were studied. He said "I assumed the clerks knew the records." I don't know how they were kept or anything about it and I would like to know that.

THE COURT:—I put this merely by way of suggestion, if counsel would rather step to the bench I will make my suggestion up here. Please step up here.

Mr. Lewin:—I will restate the question.

By Mr. Lewin:

Q.—Mr. Zimmerman, do you know the average number of the employees in Washington of the H. O. L. C. during the calendar months October, November, and December of 1936?

A.—Not from memory.

Q.—Could your memory be refreshed by showing you the memorandum that you made of it?

A.—Yes, sir.

Q.—Did you make this memorandum, or have it made? (indicating.)

A.—Yes, sir (examining paper).

Q.—Who physically made this compilation? I suppose the stenographer wrote it down, but who prepared it?

THE COURT:—He has already stated the actual work was done by certain clerks or subordinates that he designated for that work.

I think that is answered, Mr. Lewin.

Mr. Lewin:—My brother here had some further question about it.

Mr. Leahy:—It is only this, that it is rather difficult to refresh one's recollection when one never had the recollection to be refreshed.

THE COURT:—I understand this is the result of that examination that he directed.

By Mr. Lewin:

Q.—Refer to that paper and answer the question.

THE COURT:—You may offer the paper yourself if you wish. We will receive the paper if he identifies that as the correct figure.

The Witness:—The average number of employees in the home office in Washington the last three months of 1936 was 1,534. That is exclusive of 477 that were working in the field but on the Washington office.

By Mr. Lewin:

Q.—So that if you took this 400 and some, how many does that leave you as the average you had working in Washington?

A.—The total number on the payroll was 2,011, less 477, leaves a net of actual employees working in Washington of 1,534.

Q.—Now, can you give us similar testimony for the year 1937?

A.—It is here (examining paper); total number of the payroll for this three months, 1,768. Working in the field, 428. It left actually employed 1,340. 1,340. 1,534.

Q.—Mr. Zimmerman, can you give us the average for the 12 months, 1937?

Mr. Leahy:—Is that for the whole year?

Mr. Lewin:—Yes.

The Witness:—Average for the year 1937 was 1,405, actually employed in the home office.

By Mr. Lewin:

Q.—Have you had studies made under your direction upon which you could make reports each month to the Federal Home Loan Bank Board as to the amount of sick leave that was being taken by the employees, and the amount that that sick leave cost the corporation in dollars and cents?

A.—That was a regular monthly report that went to the management.

Q.—I see. I hand you what purports to be such reports and ask you whether they are true copies of the reports that were submitted each month to the Federal Home Loan Bank Board.

A.—These are copies of the monthly report that went forward, summarizing the lost time from sickness.

Q.—Yes. Now, did you make studies to show what the losses were on the average in those last three months of 1936?

A.—We did.

Q.—Will you tell the jury what those losses were in dollars?

Mr. Leahy:—I object to that as being entirely immaterial and irrelevant, if your Honor please.

None of the issues in this case are broad enough to include testimony of that character.

Mr. Lewin:—Didn't you argue that to the jury?

Mr. Leahy:—I didn't argue it at all.

Mr. Lewin:—I beg your pardon. He argued to the jury that somebody had made a claim that the cost to the Home Owners Loan Corporation was \$500,000. Do you remember those words?

Mr. Leahy:—I was answering what you said, when, if, and as.

Mr. Lewin:—And I have answered what you said by evidence.

THE COURT:—What is there in the indictment that is connected with that?

Mr. Lewin:—I will give it to you (examining papers). The allegations of the indictment to support this very well are those connected with Group Health Association, and which describe that corporation and its functions and its business.

THE COURT:—Well, read the particular one that relates to this question if you can find it.

Mr. Lewin:—There is no allegation in the indictment that the average number of employees of the Home Owners Loan Corporation was any amount.

THE COURT:—I hardly see the relevancy of it. Of course there were certain motivations that actuated the organization of Group Health, but what they are is unimportant and we will take a lot of unnecessary time if we got into it.

For the purposes of this trial we take Group Health to be a legal organization with the right to function along these lines of the prepayment group plan.

Now, that is all we are interested in. I am not going to extend this trial into any unnecessary features. We might just as well go back 130 years and find out what actuated the birth of the American Medical Association. We aren't concerned with that now.

Don't you see?

Mr. Lewin:—Yes, your Honor. I just don't want to be in the position after that opening statement of Mr. Leahy's—

THE COURT:—But you cannot try this case on the opening statement of Mr. Leahy. If you are going to, I will have to direct a verdict now, don't you see?

Mr. Lewin:—No, I don't, your Honor.

THE COURT:—That is one thing I think we had better wait for now. We are trying the case on the indictment now. The burden is on the Government to prove the indictment and we are going to keep reasonably within the limitations of that indictment.

Mr. Kelleher:—Is it your Honor's position that in showing the organization of Group Health we should not go into the financing of that Group Health?

THE COURT:—We are going into it only so far as it is reasonably necessary relative to this case. I am not going into all the details of any organization any further than is necessary to keep it a pertinent question here.

This case opens up so many avenues of inquiry that there has to be a limitation.

Mr. Lewin:—Your Honor, we feel we have absolutely nothing to conceal.

THE COURT:—There is nothing to conceal, so far as the aspects of Group Health are concerned, which I have stated, and we are not entering into any conjectures or suspicions one way or the other about it. We are simply going to keep within reasonable limitations here.

This indictment is your chart.

Now, let us go along with it.

I will sustain that objection.

Mr. Lewin:—All right.

By Mr. Lewin:

Q.—Did you have occasion to consider how this financial expense, whatever it might be, might be reduced on behalf of your employer?

Mr. Leahy:—I object to the question as immaterial.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Specifically, did you have occasion to consider an employee medical health plan?

A.—Yes, sir.

Q.—For the employees of the H. O. L. C. here in Washington?

A.—Yes, sir.

Q.—What study of such a subject did you make initially of yourself?

A.—Of Group Health practice?

Q.—Yes.

A.—Well, I first familiarized myself with—with the plan of the Standard Oil of Louisiana at Baton Rouge.

Dr. Adams, a medical director, described his plan to a group of us at the American Management Association in 1935. And it was there that I received first detailed information as to how the employees cooperative of this character could function in an organization.

He described to us that it was—

Mr. Leahy:—I object to what he described.

By Mr. Lewin:

Q.—Was he a doctor of medicine?

A.—He was.

Q.—What connection did he have with the Stanocola group you mentioned?

A.—He was the medical director of the Stanocola group plan.

Q.—Did the speech you heard him give deal with the subject of prepayment plans?

Mr. Leahy:—I object.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—Did you have a conversation with Dr. Adams after you had heard his explanation?

A.—I did.

Q.—What was the subject matter of the conversation?

Mr. Leahy:—I object.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—Why did you go up and have a talk with Dr. Adams after his speech?

Mr. Leahy:—I object, as being immaterial.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Did you make a trip down to inspect the Stanocola plan?

A.—I did.

Q.—Did you do that before Group Health Association was formed?

A.—I did.

Q.—About when did you go?

A.—In January 1937.

Q.—And how much time did you spend down there?

A.—Two days.

Q.—And just what did you do?

A.—Well, I inspected their plan from stem to stern.

Q.—Stem to stern.

A.—Visited—I talked first with the medical officers, the staff, visited the clinic, observed it in operation, talked with some of the patients, talked with the management of the company, the vice-president and general manager.

Q.—Of the Standard Oil Company of Louisiana?

A.—That's right. Went out into the refinery and talked with some of the supervisors, trying to make up my mind whether they had a good thing or not. I was looking it over.

Q.—Did you seek advice from the doctors who were on the staff of the Stanocola?

A.—Yes. We told them that we had a similar problem.

Mr. Leahy:—I object.

Mr. Lewin:—What is your Honor's ruling on that?

THE COURT:—It has been answered. I wouldn't attempt to get the results of the conversation, because, necessarily, that is just hearsay. I assume that is the basis of Mr. Leahy's objection.

Mr. Leahy:—Yes, but I think his objection is premature. I asked whether he was getting advice from these doctors on the subject of the medical plans and prepayment groups.

By Mr. Lewin:

Q.—What is your answer to that?

THE COURT:—He said he was.

By Mr. Lewin:

Q.—Can you name some of the doctors you discussed it with down there at the Stanocola?

A.—Dr. Irwin was their medical director. There was a Dr. Morris.

Q.—Did you meet Dr. Boyzet?

A.—Yes. Dr. Boyzelle, I believe it was.

Q.—How fully did you discuss it with these doctors? Don't tell us what you said, but how fully did you go into it?

A.—The size of their organization; their costs; their services; their dues to members; took a look at their budget; took a look at the physical equipment of their clinic. We asked all the—

Mr. Leahy:—I object.

THE COURT:—Yes. Don't tell the conversation.

By Mr. Lewin:

Q.—Did you go into the results of its operations?

A.—Yes.

Q.—How long had it been operating when you saw it?

A.—Oh, I was there in 1937. It was started in 1921.

Q.—What conclusion did you arrive at as a result of your inspection as to its results?

Mr. Leahy:—I object, as immaterial, if your Honor please, what his conclusion was.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Now, did you have occasion to meet a gentleman named Mr. R. V. Rickcord?

A.—Yes, sir.

Q.—When did you meet Mr. Rickcord and under what circumstances?

A.—It was in the early part of 1930, to my recollection.

Q.—Did he come to see you?

A.—He did.

Q.—Who was Mr. Rickcord?

A.—Mr. Rickcord was an employee of the Twentieth Century Fund?

Q.—Twentieth Century Fund. What is the Twentieth Century Fund?

A.—Or, the Good Will Fund. One of the two.

Q.—Are they affiliated, those two funds?

A.—Yes, they are. I understand they are.

Q.—What is the Twentieth Century Fund, and what is the Good Will Fund?

A.—The Twentieth Century Fund is a philanthropic institution, foundation. It was financed by the—by Mr. Filene, Boston merchant.

Q.—How is it governed?

A.—By a Board of Trustees.

Q.—Do you know the names of any of the members of the Board of Trustees as of that time?

A.—I remember their letterhead. The first one was Newton D. Baker and the last one on the list was Roscoe Pound.

Q.—And Roscoe Pound was many years the Dean of the Harvard Law School?

A.—Right.

Q.—Newton D. Baker, of course, was the Secretary of War. Were there other men of equal attainments on that board?

A.—Henry S. Denison is a name I recall. New England manufacturer. Henry Brewer, president of the Bowery Savings Bank. I don't remember the names of all of them, but I have the names of some of them. Morris Leeds of Philadelphia is one.

Q.—The present Attorney General of the United States?

A.—No, sir.

Q.—Was he later?

A.—I don't know.

Q.—Was the Solicitor General of the United States a member of that board?

A.—Not at that time.

Q.—Do these funds and foundations you have mentioned publish reports and studies from time to time?

A.—They do.

Q.—Were you at that time familiar with any of their studies?

A.—Not intimately at the time I first met Rickcord, no.

Q.—After meeting him, did you have occasion to familiarize yourself with any of the studies of those foundations?

A.—Yes. I received from him, a week or so later, a copy of a report that they published, called How to Budget Health.

Q.—Was that the report that you studied?

A.—It was a study that had been made by that organization.

Q.—What had been Mr. Rickcord's experience with such matters, if any, up to that time?

Mr. Leahy:—He could know that only by hearsay. I object, if your Honor please.

THE COURT:—The objection is sustained.

By Mr. Lewin:

Q.—Had Mr. Rickcord been in personnel work?

A.—He had.

Q.—With what companies?

A.—Brooklyn Edison.

Mr. Leahy:—We still have to object.

Mr. Lewin:—I suppose we all learn from hearing about these things. I don't know how anybody can—

Mr. Leahy:—We can only get testimony in court on what we know.

THE COURT:—I think the objection may be sustained.

By Mr. Lewin:

Q.—Did you and Mr. Rickcord have any discussions during the year 1936 after you met him?

A.—Yes, sir.

Q.—What things did you discuss?

A.—He came to my office to get some information on costs—health—sick leave costs. The first time I had met him, he was directed to come to us, I understand—

Mr. Leahy:—I object. I object.

THE COURT:—Put your next question.

By Mr. Lewin:

Q.—What was the subject matter of your discussions?

Mr. Leahy:—I object. Again, it is immaterial and hearsay.

Mr. Lewin:—This man participated in those discussions.

THE COURT:—Even so, I do not see the relevancy or the materiality of it. The objection is sustained.

Mr. Lewin:—Your Honor, I wonder if you recall these charges of godfather and godmother.

Mr. Leahy:—He is still on that talk, your Honor.

Mr. Lewin:—You are going to hear a lot about that talk before I am through with this case.

THE COURT:—I have the indictment before me. I am going to hold you as close as I can to that. I do not see anything in the indictment about this.

Mr. Kelleher:—The indictment alleges it was organized, and these are the circumstances leading up to the organization.

THE COURT:—I have ruled that the motives which brought about this organization are not relevant. If you wanted to go off into by-ways, it might be argued as appropriate, but I think it is too remote.

Mr. Lewin:—I should like to show, your Honor, that this was carefully worked out; that it was not a half-baked plan for medical advice, and all the rest of it. I haven't a thing to hide, and I should like the jury to know it.

THE COURT:—I do not imagine the jury is suspecting you of hiding anything.

Mr. Lewin:—What other basis could there be for that opening statement?

Mr. Leahy:—You must be frightened to death.

Mr. Lewin:—I am not frightened; I am shocked by it.

Mr. Leahy:—I am glad it has some effect.

Mr. Lewin:—If there is going to be anything exposed in this case, it is going to be that opening statement, from stem to stern.

THE COURT:—Let us get along. Let us not try Mr. Leahy just now. Let us get along.

I see on my copy of the indictment, on page 14 of the defendant's copy, that group health has a certain description here, and I think we ought to stick reasonably within the limits of that description.

By Mr. Lewin:

Q.—As a result of those talks with Mr. Rickcord and of your trip to Stanocola and of your reading these studies on the subject of prepayment plans, what did you do in the fall of 1936?

A.—I had some conversations with officers of the Home Owners Loan Corporation.

Q.—About how many such meetings did you have?

A.—Oh, there must have been four or five—six.

Q.—What did you discuss with them?

Mr. Leahy:—I object.

THE COURT:—The objection is sustained.

By Mr. Lewin:

Q.—Did Mr. Rickcord attend these meetings?

A.—Some of them—all of them, I guess. Yes, all of them.

Q.—Did he make any suggestions as to what you gentlemen might do?

Mr. Leahy:—I object.

THE COURT:—The objection is sustained.

By Mr. Lewin:

Q.—As a result of these conferences with the officers of the Home Owners Loan Corporation, what, if anything, did you determine to do?

A.—We determined to organize a group health plan—cooperative.

Q.—Who is Mr. John Fahey?

A.—Chairman of the board.

Q.—Chairman of the board of the Federal Home Loan Bank?

A.—Yes.

Q.—Up to this time had you approached Mr. Fahey on this subject at all?

A.—I had not.

Q.—Did you make any approaches to him after you had these discussions among the subordinate executives?

A.—Not until we presented the matter to the board and pointed out that some initial financial system—

Mr. Leahy:—I object.

THE COURT:—Yes. I would not go into that.

By Mr. Lewin:

Q.—Who is Mr. Luke Keeley?

A.—He was president of the Employees Credit Union.

Q.—Was he an employee of the H. O. L. C.?

A.—He was.

Q.—What is a credit union?

A.—A credit union is an employees' bank, a financial institution that is chartered and supervised by the District of Columbia or the Federal Government.

Q.—It is a small loan bank?

A.—An institution into which employees may deposit their savings, and loans are made to members of the credit union.

Q.—Do you know what the extent of such loans is?

Mr. Leahy:—I object; it is immaterial.

THE COURT:—The objection is sustained.

By Mr. Lewin:

Q.—Did Mr. Luke Keeley come into these discussions?

A.—He was present in one of the meetings.

Q.—Did the Credit Union take any position with regard to the subject matter of the discussion?

A.—The executive committee voted that—

Mr. Leahy:—I object; the best-evidence rule.

By Mr. Lewin:

Q.—Were you a member of the Credit Union?

A.—I was.

Q.—Will you tell us what position the credit union took?

Mr. Leahy:—I object; the best-evidence rule; also, it is immaterial.

Mr. Lewin:—This seems to be a little different from that protestation Mr. Leahy made a little while ago.

THE COURT:—I will sustain the objection. I think it all trespasses upon the general nature of my ruling, Mr. Lewin.

Mr. Lewin:—I thought not. I thought I was observing your Honor's ruling.

THE COURT:—I think it is all very much of the same order. After all, it is not all these preliminary elements that finally went into the formation of Group Health, for the reasons I have indicated.

By Mr. Lewin:

Q.—Did you participate with Mr. Keeley in the formation of a report to the Home Owners Loan Association bank board on the studies that you had been discussing?

A.—Yes, sir, we drafted a letter.

Q.—Is this the letter, dated Sept. 22, 1936 (handing a paper to the witness)?

A.—It is.

THE COURT:—Whom is that to, please?

Mr. Lewin:—This was to the members of the board—the Federal Home Loan Bank Board—and it is signed by the Washington H. O. L. C. Federal Credit Union, by Luke E. Keeley, President.

I ask that it be marked for identification.

(Letter of Sept. 22, 1936, from Washington H. O. L. C. Federal Credit Union, by Luke E. Keeley, President, to Federal Home Loan Bank Board, was marked as U. S. Exhibit 9 for identification.)

(Mr. Lewin handed U. S. Exhibit 9 for identification to counsel for the defense.)

Mr. Leahy:—I pass this to the Clerk and ask that he in turn pass it to your Honor.

THE COURT:—(After examining paper) What about it?

Mr. Leahy:—We object, if your Honor please, because it is right within your Honor's ruling.

THE COURT:—I sustain the objection.

By Mr. Lewin:

Q.—Did you approach the Bank Board itself with any recommendations for the establishment of a prepaid clinic among the employees?

Mr. Leahy:—Can't we get down to it? I do not like always to be put in the position of objecting. Your Honor has indicated the line. This puts me in a bad light.

Mr. Lewin:—I do not think it puts you in a bad light. I think you have put yourself into a bad light.

Mr. Leahy:—I don't care much what you think.

Mr. Lewin:—I should like to show, your Honor, that this was an employee plan.

Mr. Leahy:—We agree to that. Let us admit. It was an employee plan, a group plan of the employees, if that is what you want us to admit. Then we can get on.

Mr. Lewin:—I don't want you to admit it unless it is true, but I happen to be able to prove it.

THE COURT:—If it is admitted, you do not need to prove it.

By Mr. Lewin:

Q.—What was the attitude of the Home Loan Bank Board toward the plan?

THE COURT:—Are you objecting or not?

Mr. Leahy:—Yes, your Honor, I am objecting.

THE COURT:—I sustain the objection. I do not like to have to insist, Mr. Lewin, upon my rulings being respected, but it does seem to me that all this falls under the same ruling that I have made. Of course, I might be ruling on individual questions of a general nature—

Mr. Lewin:—I think perhaps my trouble is that I do not understand it. I have now got a concession from the opposing side with which I am content, on one issue.

THE COURT:—I just want you to understand the background of my ruling. There is an allegation here on page 14 of the transcript of the indictment which describes Group Health. The general nature of that organization is appropriate undoubtedly as it is described here. The question as to the motives which actuated the organization of Group Health is unimportant. Group Health is not a part of this suit.

Mr. Lewin:—That is true.

THE COURT:—I will repeat what I have already said: that the propriety of organizing it and the legality of it are not in issue here in this case. If that is so, why make it an issue? Don't you see? All these questions go into things that deal with the actuating motives for the organization of it, the propriety of its being organized. I do not think they are relevant.

I have some responsibility to keep this case within reasonable limits. I think these questions would open up a very broad avenue of inquiry, which I should like to have omitted, if it can possibly be done.

Mr. Lewin:—I wonder if your Honor would elaborate upon your ruling and inform us whether this grant of \$40,000, which the H. O. L. C. made in order to get Group Health started, is in issue.

THE COURT:—It is not in issue so far. I, of course, cannot anticipate too far ahead and determine what turn the case will take. At the present moment, however, it is not in issue.

Let me disabuse your mind of one thing. The statements that counsel make do not make issues in the case. The issues are made on the allegations of the indictment and the plea of not guilty. I am not permitting counsel on one side or the other to make the issues in this case; they are going to be made upon this indictment and the plea of not guilty and then the subordinate issues upon the testimony which is relevant to this indictment.

That is the way the matter presents itself to me at the present time.

I myself do not want to sit here and make rulings on the admissibility of evidence unless it is obviously out of order. I want counsel to try their own cases in their own way, but when objections are made I have to rule upon them. If testimony is permitted to go in here and open up these questions, I cannot permit counsel on one side to present something that raises a subordinate issue of fact and not permit the other side to raise it.

So, I cannot bind myself as to what my rulings will be in the future. It all depends on what develops.

Mr. Lewin:—I think your Honor's discussion of the issues has been very helpful. I assure you I am going to try to stay within that ruling. During the evening I shall revamp a great deal the presentation of this case in the light of your Honor's ruling and shall eliminate much of it.

THE COURT:—I do not want to mislead counsel on one side or the other. I would not suggest for a moment what my ruling would be on any particular question. I am giving you what I think is a very sound view of the proper course that the case should take, but I will not go any further than that.

Mr. Kelleher:—Your Honor, may I suggest this: that certain of the documents of the defendants which the Government intends to offer contain references to this grant. Perhaps it might be helpful if there were some present ruling as to the relevancy of this grant.

THE COURT:—I cannot go too far about that. I have got to take up these questions as they arise. I have indicated perhaps more than a court would usually do what my general view of the situation is, for the guidance of counsel, but I do not want to be bound and I do not want to bind counsel too tightly as to what they should do. They know their cases better than I do. I am not attempting to direct them.

Mr. Lewin:—I can see now that I was offending against your Honor's ruling and did not realize it. I am sorry. I think we can cut it down very materially and be prepared to proceed accordingly tomorrow.

TUESDAY, FEBRUARY 11, MORNING
TESTIMONY OF RAYMOND R. ZIMMERMAN
(CONTINUED)

DIRECT EXAMINATION—RESUMED

By Mr. Lewin:

Q.—Mr. Zimmerman, after Group Health was incorporated on Feb. 24, 1937, did you participate in efforts of that corporation to get a medical director to handle the medical affairs of that group?

A.—Yes, I did.

Q.—Tell the jury what steps you took to find a medical director for Group Health.

A.—The first thing we did was to go and see the Surgeon General of the Army, General Reynolds. That was about 48 hours after we knew we would be financed, that we had the money. We went to General Reynolds and explained the features of our plan, all of the elements, and asked his assistance in locating and finding a man competent to give leadership to the plan as medical director.

Q.—Can you fix the approximate time of that interview?

A.—Yes, it was on March 24th.

Q.—1937?

A.—'37.

Q.—And were you able to obtain assistance from Surgeon General Reynolds?

A.—He offered assistance. He said that he would be—

Mr. Leahy (interposing):—I object to what he said.

THE COURT:—What who said?

Mr. Lewin:—Surgeon General Reynolds.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—What assistance did he offer?

A.—He brought to our attention the name of Colonel Glenn R. Jones, a medical officer with whom he had a long acquaintance and whom he thought would be an ideal man for the position.

Q.—Now before you tell us more about Colonel Jones, did you make any efforts to find anyone else who might be suitable as a medical director?

A.—The next day we had a talk with Admiral Rossiter.

Q.—Who was Admiral Rossiter?

A.—The Surgeon General of the Navy.

Q.—What position does he now hold here in the city of Washington?

A.—I am not certain. In connection with the Gallinger Hospital, I believe.

Q.—The Gallinger Hospital: is that a Government hospital?

A.—Yes.

Q.—Did you ask Admiral Rossiter for assistance?

A.—We had the same kind of a discussion with him as with General Reynolds, and he told us—

Mr. Leahy (interposing):—I object to what he told you.

THE COURT:—Don't tell that; don't repeat the conversation.

By Mr. Lewin:

Q.—What did he do as a result of your conversation with him?

A.—He searched some of his files; made some telephone calls.

Q.—Did he suggest anybody for medical director?

A.—He made several suggestions, none of which were pursued because—

Mr. Leahy (interposing):—I object.

THE COURT:—Yes, sustained.

By Mr. Lewin:

Q.—Now, returning to Glenn R. Jones, what qualifications, if any, did he have for the position of medical director?

A.—Colonel Jones seemed to be an ideal man for this type of job. He was trained in George Washington University, taught there, and later went into the Army. He had been the commanding officer of the base hospital at Camp Devens, Massachusetts. I had served there as an officer and knew something of the work there, although I didn't know him; I knew the problems. He had served with distinction under General Wood at Camp Funston in the organization of the hospital there. He had received a distinguished service medal for that work.

Q.—What recommendation did General Reynolds give to Colonel Jones?

Mr. Leahy:—I object.

THE COURT:—What is that?

(The pending question, as recorded, was read by the reporter.)

Mr. Lewin:—This isn't offered for the truth; for the fact. The fact that he was recommended. I am later going to prove

that Group Health was deprived of Colonel Jones' services. I want to show the fact of what these people believed to be the qualifications of the man.

THE COURT:—It comes within the rule announced yesterday. All these preliminaries only go to show why the particular man was selected. You see we are going off on a lot of remote, collateral issues.

Mr. Lewin:—I agree completely, and I have taken it to heart, your ruling of yesterday. But I want to point out to your Honor that this strikes right into the heart of the restraints. The charge in the indictment is that this man was prevented from going along with Group Health; it is one of the restraints charged.

THE COURT:—Well, if you can show the restraint, show it.

Mr. Lewin:—We want to show that Colonel Jones was the first of the proposed medical directors whose services Group Health was deprived of because of the activity of the defendants.

THE COURT:—Well, if there is a restraint, if you can show the restraint, do so. It doesn't make any difference whether he was the first or the fourth. It doesn't make any difference whether he was competent or not. If they offered restraints, show them; whether the man was a good man or a bad man is not at this time directly in point.

By Mr. Lewin:

Q.—What attitude did Colonel Jones manifest toward your proposition?

Mr. Leahy:—That calls for a conclusion on the part of the witness.

THE COURT:—Yes, sustained.

By Mr. Lewin:

Q.—What did Colonel Jones say about your proposition?

Mr. Leahy:—Objected to as calling for hearsay.

THE COURT:—Sustained.

Mr. Lewin:—We are going to show that Colonel Jones became one of the co-conspirators in this case. We want to show at first that he was in favor of the proposition and then against it for good substantial reason; because he joined forces with the opposition.

Mr. Leahy:—That is an entirely new charge. I stand on my objection; it is pure hearsay.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—Did you offer Colonel Jones the medical directorship?

A.—We did.

Q.—Did he accept it, the medical directorship?

A.—He said that he wanted—

Mr. Leahy (interposing):—I object.

THE COURT:—Will counsel step up?

(Counsel for both sides approached the bench and conferred with the Court.)

By Mr. Lewin:

Q.—Do you know Major General Ireland?

A.—No, sir.

Q.—Do you know whether Group Health offered him the medical directorship?

A.—I never heard of it.

Q.—Now passing the Colonel Jones incident for the moment, what other efforts did you make to get a medical director: Did you have a conversation with Dr. Thomas E. Neill, the president of the District Medical Society?

(The witness testified in reply to questions that the conversation was some time in April or May 1937, in the home of John Childress, an officer of the Home Owners' Loan Corporation, interested in Group Health. They went at invitation of Childress. The witness arrived after the interview had started.)

Q.—Now, will you tell the jury what was said to Dr. Neill in regard to Group Health and its medical directorship and what Dr. Neill replied?

A.—Well, we were discussing the whole problem; the method or plan of what we intended to do. One statement I remember that Dr. Neill made was that while he was interested he couldn't make a decision about accepting the directorship until he knew the attitude of the District Medical Society.

Q.—Did Dr. Neill come as your medical director?

A.—He did not.

(The witness then stated that a medical director was secured in May; Dr. Brown had been recommended by the medical director of the Veterans Bureau, Dr. Griffith. Dr. Brown had been employed in the Veterans Administration. When employed he was compensated with a salary. His first task was to develop a floor plan for the clinic, assist in the establishment of a clinic; the determination of the necessary equipment, and at the same

time he was working aggressively in trying to assemble a medical staff. During the summer of 1937 he obtained Dr. Raymond D. Selders, a surgeon.)

Q.—Now, did you in the early summer of 1937 meet with the defendant Dr. Woodward, of the American Medical Association?

A.—Yes. He came to my office.

Q.—Will you tell the jury the circumstances under which he came to your office: had you met him before?

A.—No, I had not. It was in early June, as I recall, he came to my office.

Q.—Now tell the jury just as nearly as you can recall what was said to Dr. Woodward by you and what he said to you. How did he introduce himself?

A.—He introduced himself as a doctor from Chicago, and as being in the employ of the American Medical Association; that he was also a lawyer; that he had previously lived in Washington and was acquainted here. He told me at the outset that he was familiar with what was going on here and discussed the matter of a loan from the Home Owners' Loan Corporation.

Q.—To whom?

A.—To Group Health Association.

Q.—A loan or a grant?

A.—He considered it a loan, spoke of it as a loan, and said that if Home Owners' Loan Corporation could make a loan of this character why couldn't it make loans to other organizations, other departments of the Government, or other units in the Home Owners' Loan Corporation? I told him that it was clear that he wasn't familiar with the act which created the Home Owners' Loan Corporation; that Home Owners' Loan couldn't make a loan of that character to anybody, and had not made a loan to Group Health Association, and could not make a loan to anybody else; and he asked for a copy of the act and I gave it to him.

Q.—Did he ask for anything else?

A.—Yes, he said he was on his way to Atlantic City to attend a meeting of the American Medical Association and wanted to take a copy of that contract with him which the Home Owners' Loan had with Group Health Association.

Q.—Did you give him a copy of the contract?

A.—No.

Q.—Did you have a copy of the contract?

A.—No, I did not.

Q.—Did you obtain one for him?

A.—No, I did not.

Q.—What did you tell him with regard to the contract?

A.—I told him the contract was in the office of the secretary of the Corporation; I couldn't supply him with it.

Q.—Did he say anything else about Group Health Association at that time?

A.—Yes, we talked about it for a while.

Q.—What did he say?

A.—Well, he said that the District Medical Society was deeply concerned about the whole matter and that it was going to be a subject of discussion at the Atlantic City meeting.

Q.—Did he say anything further as to the attitude of the American Medical Association and the District Medical Society toward Group Health Association?

A.—He made it clear that they were opposed to it; that they weren't in favor of it—

Mr. Leahy (interposing):—I object—that is a conclusion: What did he say?

By Mr. Lewin:

Q.—As nearly as you can recall, give Dr. Woodward's words on that subject, and you can describe his attitude as well.

A.—His attitude was clearly antagonistic. He made it clear that he was not in favor—

Mr. Leahy (interposing):—Just give us what he said.

THE COURT:—Yes; what was said by the doctor.

The Witness:—He said the whole plan was going to be given a going-over at the American Medical Association.

By Mr. Lewin:

Q.—Did he say anything about what would happen to Group Health Association after this meeting of the American Medical Association?

A.—He predicted that it would be the end of it.

Mr. Leahy:—I object to that.

Mr. Lewin:—What is the matter with that? Isn't that the substance of what he said? He predicted that it would be the end of it. How can you get it any closer?

THE COURT:—Are those his words, in substance: I don't expect him to give the exact words.

The Witness:—Yes.

THE COURT:—That may stand.

In reply to questions the witness stated he attended a meeting of the executive committee of the District Medical Society around June of 1937.

Q.—Now how did you happen to go to that meeting?

A.—I don't recall, definitely. I was called and invited to attend. I think it was Mr. Penniman. It could have been Dr. Brown.

Q.—Who is Mr. Penniman?

A.—He was the president of the Association.

Q.—Do you remember Dr. Conklin being there?

A.—I think he was there.

Q.—Was the defendant F. X. McGovern there?

A.—I am not sure.

Q.—Do you know Dr. McGovern; did you know him before that time?

A.—I don't think so.

Q.—Was Dr. William M. Sprigg there?

A.—I don't remember who the gentlemen were. I was invited to be present. I hadn't arranged the meeting and wasn't clear as to the purpose of the meeting until after I got there; I can't remember the names of the people there.

Q.—Was Dr. Neill there?

A.—I don't remember that.

Q.—What subjects were discussed at that meeting?

A.—The meeting was called for the purpose of explaining to the group that Group Health was about to operate; the kind of plan it was, and how it was intended to function.

Q.—And was that explanation made by you?

A.—The speakers were Mr. Penniman and Dr. Brown; Mr. Penniman spoke first and Dr. Brown then. I didn't speak.

Q.—Did the members of the executive committee ask questions?

A.—Yes.

Q.—Was it a friendly meeting?

A.—Yes, not unfriendly; it was a pleasant meeting.

Q.—How long did it last, approximately?

A.—I don't remember; not too late.

Q.—Where did the meeting take place?

A.—In the office of the District Medical Society.

Q.—Some time later did you have occasion to attend another meeting with representatives of the defendant District Medical Society?

A.—When they came to meet with the Board of Trustees of Group Health Association; I attended that meeting.

Q.—Can you remember any of the doctors who came from the District Medical Society to attend the meeting with your board?

A.—A Dr. Macatee.

Q.—Was Dr. Conklin there?

A.—Again I wouldn't be sure.

Q.—Dr. Groover?

A.—Yes, he was there.

Q.—Dr. Verbrycke?

A.—I don't remember; again I wasn't an officer of the Association, and I was invited to attend.

Q.—Do you remember who was present for the trustees of the Group Health Association?

A.—Well, the meeting was well attended. My judgment would be that the majority were there; some could have been absent.

Q.—Do you know whether arrangements were made to take down the conversations or discussions there?

A.—Yes, I remember that notes were taken.

Q.—What was the subject matter of the discussion at that meeting?

By Mr. Lewin:

Q.—Tell us what the subject matters were that were discussed there; was Group Health Association discussed again?

A.—Yes.

The witness testified that Group Health Association, Inc., was opened the first of November 1937. He saw Dr. Neill again after the clinic was opened, in his office on a Saturday afternoon, with Mr. Penniman, Mr. Kirkpatrick and Mr. Loomis.

Q.—Who sought the interview, if you know: Dr. Neill or the Group Health Association officials?

A.—I think the Group people. I didn't arrange the meeting.

Q.—What was the subject matter discussed?

A.—I don't believe I can remember the details of the meeting; I haven't refreshed my memory.

Q.—Was the meeting concerned with Group Health Association?

A.—It was.

Q.—Mr. Zimmerman, did you have occasion to ascertain what the salaries of the various members of Group Health Association were about the time the clinic opened, Nov. 1, 1937?

A.—Yes, I knew at the time.

Q.—Mr. Zimmerman, will you tell the jury what percentage of the members of Group Health Association, as of Nov. 1, 1937, when your clinic opened, earned \$4,000. or less?

A.—Eighty-four per cent earned \$4,000 or less.

Q.—What per cent would you say earned less than \$2,000 a year?

A.—Fifty-eight per cent, fifty-nine per cent—58.9—58.8.

Mr. Lewin:—Your Honor, with the exception of the subject matter which is subject to your Honor's ruling, I have finished the direct examination of this witness. I can conclude it with the privilege of bringing him back?

THE COURT:—I suggest I consider that point through the noon recess, and if I change my ruling I will give you an opportunity to recall this gentleman on that one ground; which, of course, would give the other side an opportunity to cross-examine on it.

CROSS EXAMINATION

By Mr. Leahy:

Q.—As director of personnel what were your duties?

A.—Well, as director of personnel I concerned myself with questions of employment policy; personnel policy; standards of employment; questions of pay; questions of salary administration; questions of hours of work and working conditions; and questions of employee health; questions of training; and some of the questions of organization.

Q.—Did you have the authority to hire and fire?

A.—No. That authority rests in the chairman of the Board.

Q.—You had no authority whatsoever about that. Why, do you think?

A.—Well, it is a legal point, sir.

Q.—Well, now, you know what I mean. Let me put it in everyday language. Could you say to Clerk John Brown, hand him a red ticket and say, "You are through work two weeks from today?"

A.—I could say that sort of thing to an employee in my own division but not to employees outside of my own division.

Q.—How big was your division?

A.—Less than a hundred.

Q.—Outside the division did you have any authority to say to John Brown, "Your services will terminate on such-and-such a date?"

A.—No, sir.

Q.—It was only the chairman of the Board who had that authority?

A.—No. You asked—your question related to who had the appointing power. You are talking now about who had the responsibility of discharge.

Q.—Well, I asked the question, probably it wasn't technically put as a director of personnel would put it, but I asked the question Who had the authority down there to hire and fire?

A.—That's right.

Mr. Lewin:—I object to this line of questioning, your Honor.

THE COURT:—I don't see the materiality of it.

Mr. Leahy:—Shall I approach the bench a moment?

THE COURT:—Well, if you wish to express it. You may have some reason that I cannot think of.

Mr. Leahy:—I would like to.

THE COURT:—Very well.

(Counsel for both sides approached the bench and conferred with the Court in a low tone of voice.)

The Witness:—Before you begin, I think I should correct a former statement. I think I answered you that I had authority to discharge an employee that worked in my own division. The correct statement would be that I had authority to recommend it, but the power to employ and discharge lies in the Board and not in any subdivision of the Board.

By Mr. Leahy:

Q.—Well, now, you mentioned the chairman of the Board at first. Who was that chairman?

A.—John H. Fahey.

Q.—Is he still chairman?

A.—Yes, sir.

By Mr. Leahy:

Q.—Can you give us the exact date now, and, if it was given, will you repeat it, of the employment of Dr. Brown as the medical director?

A.—My recollection is that it was June 5th, or 7th. It was the early part of June. I cannot give the correct date. I haven't refreshed my mind.

Mr. Lewin:—I am sorry. I thought he had given it.

By Mr. Leahy:

Q.—Had the arrangements been made for his employment before the actual contract was signed?

A.—What contract?

Q.—For his employment as medical director. You had met Dr. Brown before June 7?

A.—Yes.

Q.—Did you employ him personally?

A.—I did not.

Q.—At all events, then, you went to Dr. Neill's home on the information of Mr. John Childress? Is that right?

A.—That's right.

Q.—And he is the assistant to John H. Fahey, isn't he, or wasn't he then?

A.—I think that is his title, "assistant to."

Q.—And he likewise was interested, was he not, with you, in this G. H. A.?

A.—As a member. I wouldn't say that he was an active—that his interest was more than one of a member. I don't remember his working on any committees, if that is your point.

Q.—Do you recall what interest prompted him to call you to interview Dr. Neill as the medical director or possible medical director of Group Health?

Mr. Lewin:—I am afraid I will have to object to this, your Honor.

THE COURT:—Objection sustained.

By Mr. Leahy:

Q.—Was Childress there at Dr. Neill's home?

A.—It was at Mr. Childress' home.

Q.—At Mr. Childress' home?

A.—Yes, sir. He was present.

Q.—Who else was there besides Mr. Childress and yourself and Dr. Neill?

A.—Mr. Penniman was there.

Q.—Anybody else now whom you can recall?

A.—I don't recall.

Q.—How long were you there?

A.—Not more than an hour, I don't think. I came a little late, as I recall.

Q.—Your recollection is that you were there at least an hour with Dr. Neill?

A.—No, I won't say that.

Q.—Can you give us your recollection as to how long you were there that day?

A.—I would say in the neighborhood of an hour.

Q.—Were any notes taken of the interview?

A.—None that I know of. I didn't take any.

Q.—It was a friendly meeting?

A.—Certainly.

Q.—At Mr. Childress's house. And isn't it a fact that it there developed that Mr. Childress was a personal friend of Dr. Neill's?

A.—It didn't develop there. It was known.

Q.—It was known?

A.—That's right.

Q.—And Mr. Childress as a friend of Dr. Neill was interested in turn to see if Dr. Neill would be interested to become the director of G. H. A.?

A.—That's it.

Q.—And you explained the general plan, didn't you?

A.—I did not.

Q.—Well, some one in your presence. Isn't that true?

Q.—I think it was done, but it was done before I got there. Q.—Do you recall of Dr. Neill's having said anything more than that he would want to find out what the attitude of the District Medical Society was on it?

A.—No, I don't recall.

Q.—Do you recall that he then said at that meeting, "Why, I have just been elected president and am president-elect of the Medical Society of the District of Columbia?"

A.—I didn't hear him say that.

Q.—Did you hear Dr. Neill say anything in substance to the effect that he would look into the matter and that if Group Health was legal, if it was ethical, if it was economically sound, that the job of medical director was just the job he was looking for? Did you hear him say that?

A.—No, I didn't hear him say that.

Q.—Did he say anything in substance to that effect?

A.—Well, as I testified a minute ago, the substance of what I heard him say was that before he would consider the medical directorship, that he would have to know the attitude of the District Medical Society toward that type of practice.

(The witness then was queried as to the meeting at the office of the District Medical Society.)

A.—I remember that Dr. Groover talked.

Q.—Dr. Groover? Is that whom you said?

A.—Yes.

Q.—You know he is dead, do you not?

A.—I do. Oh, I have the recollection—there was quite general participation in the discussion, but I don't remember who made the principal statements.

Q.—That was a friendly meeting?

A.—I wasn't acquainted with many of those doctors and I don't remember.

Q.—To your knowledge had you ever met or seen any of those doctors on the executive committee before that evening?

A.—I had seen some of them, but I wasn't personally acquainted, I don't think, with any of them.

Q.—Had you ever talked with them or been in a group who were talking with them before this meeting?

A.—I don't think so.

Q.—Had you known Dr. Neill before you met him at Mr. Childress's house?

A.—No. I knew who he was, but I didn't know him.

Q.—Now, this meeting was a friendly discussion, was it not, as to what the plan of G. H. A. was?

A.—It was friendly for the most part. A little spirited in spots, but not more than you would expect.

Q.—There was discussion back and forth about the merits pro and con; is that right?

A.—Right. And sometimes the meeting was controversial.

Q.—Sometimes the meeting would get a little warm in spots as the controversy would develop about the merits of this point or the demerits of that point; is that right?

A.—That's right.

(After some discussion as to the conversation at this meeting dealing with estimates of cost, the examination continued.)

Q.—But in connection then with the clinic, was there any question raised as to whether you could equip a clinic, lease the quarters, hire a staff of doctors, hire nurses, on the rates that you were going to charge?

A.—I don't recall.

Q.—Well, don't you remember that they asked you broadly—not you, but I mean Mr. Penniman or Dr. Brown or some one in your presence and yourself—asked you how you were going to finance a clinic with all the equipment which you said you were going to put in there?

A.—My recollection of that meeting, sir, is that there wasn't very much discussion on that point.

Q.—Well, don't you remember one member of the executive committee saying to Dr. Brown, "Doctor, will you show us the contract on which you got this money?" and Dr. Brown said, "No, I won't." Do you remember that?

A.—I think I do, but I could be wrong.

Q.—What is your best recollection? Was or was not that request made to Dr. Brown and did he or did he not make that answer?

A.—I am not sure. I think that the request was made to see the contract there, but I am not sure.

Q.—And is your best recollection that the request was not acceded to and that he did not permit the contract to be seen?

A.—That's right. I don't think it was.

Q.—Now, don't you remember this, too, at that meeting, when the executive committee had listened to the outline of your plan and they found that the plan provided for those only who were able to pay dues and they said to either Mr. Penniman or Dr. Brown or to you: "Well, what are you going to do with the poor chap who cannot pay or who isn't able to join your association? Who is going to take care of him?" And do you remember Dr. Brown making the answer: "Oh, we will throw them over on you." Do you remember that?

A.—I remember that the subject—the point was raised. I don't remember exactly what Dr. Brown's comment was.

Q.—Well, it was to the effect that the District Medical Society's members would take care of those you didn't want. Isn't that right?

A.—I cannot testify to that.

Q.—You have no recollection on it at all?

A.—I remember that there was some pleasantry in a comment that Dr. Brown made right at this time and on this point. It was in connection with Dr. Brown making the point that a group of this sort wasn't a charitable organization; it was organized for the purpose of making charity unnecessary. That was the spirit of the point that he was making.

Q.—Well, do you remember that when charity did become necessary that he said then it would be for the District Medical Society members to take care of the charity?

A.—(No answer.)

Q.—See if I can refresh your recollection this way, Mr. Zimmerman: Don't you remember then Mr. Penniman making the statement, "Well, nobody can play golf in a golf club unless he pays his dues"?

A.—Yes.

Q.—You remember that?

A.—Yes. I had forgotten, but I do remember now.

Q.—And wasn't it in that connection that he said those who paid the dues we will take care of, and those who cannot you members of the District Medical Society will take care of?

A.—I remember the point was brought out it was only those who were members of the association who would receive the benefits. Although I do remember, too, that the statement was made by Brown or Penniman—the point was brought out—that the staff would want to be cooperative and helpful in connection with charity cases after hours. That point was brought out. But it was an incidental point, their making any claims that they were going to do charity work, I am sure.

Q.—Now, was the meeting at G. H. A. headquarters a sort of adjourned meeting of this one at the headquarters of the District Medical Society?

A.—I would say that it was. It was suggested that the medical people come back to the Group Health trustees with a suggested plan.

Q.—Now, did you meet any members of the executive committee in between the meeting of the executive committee about which we have just talked and the second meeting at Group Health headquarters?

A.—I don't think I did.

Q.—Do you recall whether you attended a luncheon at the Raleigh Hotel with Mr. Penniman?

A.—And Dr. McGovern.

Q.—Dr. McGovern.

A.—I did, but I don't remember when it was. It could have been in between, and if it was, I did meet with one of their members.

Q.—How did you happen to be present at that luncheon?

A.—Mr. Penniman called me on the telephone and asked me if I would like to have lunch with him and Dr. McGovern.

Q.—Now, do you remember what Dr. McGovern was asking for at that luncheon from Mr. Penniman? Try to think.

A.—Well, I know what my feelings were there when we came away from the luncheon. I was very much at a loss to know what the purpose of the meeting was.

Q.—I want to know what Dr. McGovern asked Mr. Penniman, the president of the association, at that meeting.

A.—I don't recall that he asked for anything. We talked about horses and golf and dogs and everything else.

Q.—Did he ask how you were going to obtain funds to finance the clinic?

A.—I have heard that he did ask that, but I didn't hear him ask that, ask about the contract. I didn't hear him make that request, and was surprised when I was told that he claimed that he had asked for the contract at that time.

Q.—Well, what did you do at that meeting, at the luncheon, just talk golf and dogs and horses?

Mr. Levin:—Had lunch, I guess. That is what you usually do at luncheons.

The Witness:—It wasn't an important luncheon.

Q.—Let me see if I can refresh your recollection again. Do you remember a discussion at that luncheon and Mr. Penniman saying to Dr. McGovern, "You have no more right to see that contract than you would to see a contract between an express company and the owner of a store on F Street"?

A.—No, I don't remember that.

Q.—Don't even remember the lunch. All right. Now, do you remember how long after that day when you were at the Raleigh Hotel that the meeting occurred at the Home Owners Loan headquarters?

A.—I can't answer that. Sorry. I don't remember.

(The witness was queried as to events leading to the opening of the clinic of Group Health Association.)

Q.—Had you leased the quarters for the clinic when you appeared before the executive committee of the District Medical Society?

A.—I don't remember.

Q.—Was Group Health any further along than having just been organized, its charter taken out, its by-laws prepared, and the medical director appointed when you met the executive committee of the District Medical Society?

A.—Well, I think all those things that you mentioned had been done prior to that meeting. Whether we were further along, yes, I would say we were further along.

Q.—Can you now tell whether you had made arrangements to lease the quarters for your clinic?

A.—I don't know the date of the lease.

Q.—Did you have anything to do with the arranging of the lease?

A.—No, sir.

Q.—Did you have anything to do—

A. (continuing).—Wait a minute. Did I have anything to do with it? Some discussions. I was invited to take part in discussions, and I looked, with a committee, at two or three places.

Q.—Then you had just as much to do with it as any other member of the committee?

A.—No, I didn't sign the contract and I wasn't a party to the negotiations on price.

Q.—Did you go up to see the proposed site before it was selected?

A.—I did.

Q.—And you went to other sites, didn't you?

A.—That's right.

Q.—You assisted, then, in the selection of the location?

A.—I took part in it. It was not my decision. I don't think I was present when the decision was made. There was a responsible committee that was dealing with that problem. I don't think I was very helpful.

(The witness was queried as to his meeting with Dr. W. C. Woodward.)

Q.—Were any notes taken of the meeting at all?

A.—I dictated a memorandum of the meeting after he left. I called Mr. Penniman to say that I had had—that Dr. Woodward had been in my office. I found that he was not in his office, was out of town, and I wanted him to know that I had had this visit. I made a memorandum. Is that what you mean by making notes? There was a memorandum written.

Q.—Did you make it just as soon as Dr. Woodward left your office.

A.—Yes, I would say within an hour.

Q.—Where is that memorandum, Mr. Zimmerman?

A.—I don't know.

Mr. Lewin:—I have it. Would you like to have it?

Mr. Leahy:—Yes.

(There was further discussion of the conference with Dr. Woodward.)

Q.—And this is a memorandum that you made and transmitted—was it to Mr. Penniman, W. F. Penniman?

A.—It was a matter of letting him know. I was not an officer of the organization and I felt that a thing of this sort—I felt that he had called on the wrong person.

Q.—Did you tell him so?

A.—My recollection is that I told him I was not an officer of Group Health.

Q.—Did you tell him to go over to see Mr. Penniman to get the contract?

Mr. Lewin:—Why don't you ask him to read this memorandum now?

Mr. Leahy:—Now, please. We are having a good time together. Don't interrupt us.

Mr. Lewin:—I think it would be much more fair. Here is the memorandum right in his hands.

Mr. Leahy:—Who handed it to him?

Mr. Lewin:—You did, at my request.

By Mr. Leahy:

Q.—Read it over, Mr. Zimmerman, and refresh your recollection.

Mr. Lewin:—And let us have it read to the jury.

Mr. Richardson:—Oh, no.

Mr. Lewin:—Why do you want to keep it from the jury?

By Mr. Leahy:

Q.—Have you read it?

A.—I told him he ought to talk to our Medical Director.

Q.—Who was your Medical Director on June 5?

A.—Dr. Brown—if he had been employed then. Yes; I guess he was. I don't remember the date he reported for work, but he had been selected and approved. He was the Medical Director; yes.

Q.—You told him that he ought to go and see your Medical Director, and then he asked you the question, "You mean, Dr. Brown?" And then you answered, and he said, "I know him, having met him at the Veterans Administration?"

A.—No; he said that he knew him.

Q.—And then did you tell him that Dr. Brown would be at the American Medical Association convention at Atlantic City?

A.—That is right.

Q.—You knew that?

A.—I had been told that he was going to attend.

Q.—After having seen this memorandum, Mr. Zimmerman, do you recall now that there was a discussion about money from the Federal Home Loan Bank Board which Group Health Association had received?

A.—With whom?

Q.—With Dr. Woodward.

A.—Yes. As I testified a minute ago, we opened up on that note.

Q.—You opened up on what?

A.—He made the point that he understood a loan had been made, and he was concerned that they would make other loans. That was the first part of our conversation. And I told him it was not a loan.

Q.—You knew it was not, did you not?

A.—Yes, sir.

Q.—Did you tell him what it was?

A.—I don't know that I did.

Q.—Why didn't you want to tell anybody about what that was? Why was Group Health Association trying to keep secret this contract which it had with the Federal Home Loan Bank Board?

Mr. Lewin:—Maybe there is something in the memorandum that explains that.

A.—It was very clear from the attitude of Mr. Woodward that he was not friendly nor did he intend to be helpful to us, and he told me that he was a lawyer representing the American Medical Association, and I suspect that I was a bit guarded in my conversation.

By Mr. Leahy:

Q.—What was there in the transaction that you were afraid of, whether he was a lawyer or not?

Mr. Lewin:—He did not testify that he was afraid of anything.

Mr. Leahy:—He said he was guarded.

Mr. Lewin:—Yes; but he didn't say he was afraid. He is not afraid.

By Mr. Leahy:

Q.—Why were you guarded, whether he was a lawyer or a judge or who it was that was talking with you about this transaction?

A.—I think there were plenty of people who were familiar with the nature of that contract. It was discussed with people frankly and freely who we thought could be helpful and would be helpful to us.

Q.—In other words, you discussed it frankly and freely with people that you thought would be helpful to you?

A.—Medical people, people interested in the business arrangements of this organization, the administration plan.

Q.—Who were the people that you discussed it with?

A.—Oh, there were plenty of them.

THE COURT:—I think that is sufficient.

(Mr. Leahy then took up the question of the contract between G. H. A., Inc., and H. O. L. C.)

Q.—Do you think that was cooperation—refusing to give the District Medical Society or the American Medical Association information as to how you could make this an economic success?

A.—I would say that the details of the contract were not half as essential as were the principles of the plan.

Q.—In other words, you did not consider the ability to put the principles into effect as important enough to impart them to the District Medical Society or the American Medical Association; is that right?

A.—We knew what could be done and we knew what had been done, and we went ahead and did it, and it is running.

Q.—But you refused to tell the District Medical Society or the American Medical Association what you had done to finance these principles you are talking about; is not that right?

A.—No.

Q.—Didn't you just tell us that the contract of the Association or the terms of it were nobody's business?

A.—No, sir; I didn't say that.

Q.—What did you say?

A.—I told Dr. Woodward that I didn't have the contract. (The witness was asked about a visit to the office of Dr. Neill.)

Q.—Do you recall now when that was.

A.—No. I recall it was a Saturday afternoon.

Q.—Do you remember where it was?

A.—It was in his office.

Q.—Do you remember where his office was at that time?
 A.—No; I don't remember.
 Q.—Was anybody with you?
 A.—Yes. I was in a party that went there.
 Q.—Who was in that group?
 A.—Mr. Penniman, I think, Mr. Kirkpatrick and, I think, Mr. Loomis.

Q.—Who was Mr. Kirkpatrick?
 A.—He was the vice-president of Group Health Association.
 Q.—What position did he hold in the Home Owners Loan Corporation?

A.—He was in the Accounting Division.
 Q.—Who was Mr. Loomis?
 A.—He is assistant to the chairman of the Board.
 Q.—Who is the chairman of the Board?
 A.—John Fahey.

Q.—What was the purpose of your going to see Dr. Neill on that occasion?

A.—I have forgotten. I don't remember the purpose of the meeting now. It seems to me it was some case—

Q.—Is it as hazy in your mind now as the luncheon at the Raleigh Hotel?

A.—I don't remember specifically. There are others that can testify better to this. I was not responsible for calling the meeting.

Q.—Have you any memory now of anything that took place at the meeting which you can tell us about?

A.—Yes. I can testify to this very definitely, that Dr. Neill was now in a critical frame of mind toward Group Health.

Q.—What made him critical? What did he say to indicate that?

A.—He was opposing the principle of prepayment at that time, which surprised me very much.

Q.—That is one thing. You remember that?

A.—I do, very definitely.

Q.—Anything else?

A.—That is all I recall.

Mr. Leahy:—Dr. Neill, will you stand, please?
 (The person addressed stood as requested.)

By Mr. Leahy:

Q.—Do you recognize Dr. Neill?

A.—Yes, sir.

Mr. Leahy:—Now you may be seated, Dr. Neill.

By Mr. Leahy:

Q.—Mr. Zimmerman, is it your recollection that when you met Dr. Neill at Mr. Childress' home you asked him if he would be interested in becoming Medical Director?

A.—No; I didn't ask him.

Q.—Did some one in your presence?

A.—No.

Q.—Let me see if I can refresh your recollection further. Is it not a fact that when you were at Mr. Childress's house in the group which was talking with Dr. Neill, Dr. Brown had already been appointed Medical Director?

A.—I would say that there would have been no purpose to that meeting, then. We were looking for a Medical Director.

Q.—Were you not looking for a surgeon?

A.—My recollection is that they were going to need a surgeon, but that they were looking for a medical director at that time.

Q.—Was it not in connection with your wish to have Dr. Neill act as the surgeon of G. H. A. that you and the others were present there that evening?

A.—That is not my recollection.

Q.—You said that Dr. Neill left. Do you recall the reason for his leaving?

A.—No; I didn't hear.

Q.—See if you can refresh your recollection. Do you not remember that Dr. Neill said that he had to attend and preside at a meeting of the District of Columbia Medical Society at that very time.

A.—My impression was, sir, that he had to go on a case. I don't know it, and he could have told the others and I did not hear it. We were in a large room.

Q.—But you have no memory of Dr. Neill's saying anything about his having to attend a meeting of the District Medical Society?

A.—No.

Q.—And you have no recollection, as he left, of his saying, in substance, "Gentlemen, if this is legally, ethically, and economically sound it is the job I would like."?

A.—No; I don't remember his saying that.

Mr. Leahy:—Dr. Woodward, will you stand up, please?
 (The gentleman addressed stood as requested.)

By Mr. Leahy:

Q.—Is that the gentleman who came to see you that morning in your office?

A.—I think so. I have not seen the doctor since.

Q.—See if I can refresh your recollection a little more about that meeting, Mr. Zimmerman. Do you recall that when Dr. Woodward came to see you at your office he asked you if he might see a copy of the contract?

A.—My recollection is that he asked for a copy of it.

Q.—Did you then say, "I will have to go out and consult counsel before I answer that question"?

A.—No; I don't remember that.

Q.—Do you remember that you did leave the room at any time, leaving Dr. Woodward in your office?

A.—No. Did I leave the room? If I did, I had forgotten it. I don't think I talked with any one; I didn't consult any one.

Q.—You have no recollection?

A.—I went outside—I think I stepped into the outside room, now that you remind me; but I had forgotten it. I stepped outside the door to the secretary's office.

Q.—What for?

A.—Frankly, I don't know.

Q.—Did you not make a telephone call?

A.—No; I don't think so.

Q.—What was there that took you away from the conference with Dr. Woodward, out into your secretary's room?

A.—I believe that was the time that I learned that Mr. Penniman was not in his office. I thought that that type of meeting should be held with the president of the organization, and not with some person who was not officially connected with Group Health.

Q.—Do you remember now that you did telephone Penniman's office?

Q.—I could have.

Q.—Well, didn't you?

A.—I am not sure that I did; but I know that shortly after—I either did then or I did after Dr. Woodward left. The point is, for the jury, that I got in touch with Mr. Penniman's office either before Dr. Woodward left or immediately after, to advise him of the substance of our conversation.

Q.—And the point, also for the jury, is that you did leave the room and go to your secretary's room for a purpose which you cannot now recall?

A.—Just like stepping to the door.

Q.—You did step out of the room?

A.—If you say I did. I had forgotten it.

Q.—I don't say anything. I wasn't there.

RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—Mr. Zimmerman, I would like you to refer to this memorandum of yours to Mr. Penniman, dated June 5, 1937, which was shown you by Mr. Leahy, and I will ask you to look at the next to the last sentence of that memorandum. Just read it to yourself (handing a document to the witness).

I want to know whether that refreshes your recollection as to the substance of anything Dr. Woodward said to you about what he expected to do.

A.—No; I don't remember his exact words.

Q.—I did not ask you for that. I asked you whether it refreshes your recollection as to the substance of what he indicated to you in his conversation he expected to do.

A.—As I testified a minute ago, he said he was going to Atlantic City to a meeting of the A. M. A., and this whole subject was going to get a careful working over.

Q.—What did he say he expected to do, if anything?

A.—I don't think he said specifically what he was going to do.

Mr. Lewin:—Your Honor, I would like to offer that report in evidence. It is a report from Mr. Zimmerman to Mr. Penniman that was referred to by counsel on cross examination.

Mr. Leahy:—I object, if your Honor please.

Mr. Lewin:—You recall that Mr. Leahy went into the subject very fully about what Mr. Zimmerman reported to Mr. Penniman, or attempted to report to him.

Mr. Richardson:—That does not help it any.

Mr. Kelleher:—Another thing, your Honor: he went into detail as to whether he had written any memorandum and why he had written it, and we think the jury is entitled to see the memorandum, to see what the purpose of it was.

THE COURT:—Counsel on both sides have taken it up as a means of refreshing the recollection of the witness.

Mr. Lewin:—Mr. Leahy pressed the witness on cross examination as to his communication to Penniman—

Mr. Leahy:—I did not press any such thing.

Mr. Lewin:—Oh, yes. He even made statements about his going out into the office to speak to his secretary.

THE COURT:—Step here a minute, Mr. Leahy.
(Counsel for both sides approached the bench and conferred with the court in a low tone of voice.)

By Mr. Lewin:

Q.—Mr. Zimmerman, you were asked on cross examination about the amount of the dues which Group Health Association charged its members. Will you tell the jury what those dues were initially?

The Witness:—Two dollars and twenty cents a month for individual members, and \$3.30 a month for family members.

By Mr. Lewin:

Q.—What type of service was given members in return for those dues?

A.—What we called a substantially complete medical service, including hospitalization and examination.

Q.—How much hospitalization was given a member or his dependents in return for those dues?

A.—Twenty-one days, I believe, for any single illness.

Q.—What site was finally selected for a clinic?

A.—On I Street between Thirteenth and Fourteenth streets.

Q.—Why was that site selected? Did it have any advantages?

A.—It was centrally located, and it was a nice modern building. It seemed to be about what we wanted.

Q.—Were the floors of that building leased by Group Health Association?

A.—Yes; one floor.

Q.—Were alterations made in the building?

A.—Yes.

Q.—What was the purpose of making such alterations?

THE COURT:—I do not think I would go so much into detail, Mr. Lewin.

A.—To make it suitable for our purposes, is all.

By Mr. Lewin:

Q.—You said that Group Health Association was acquiring its medical equipment and apparatus during the summer?

A.—That is right.

Q.—Who was the active man in making those selections?

A.—Dr. Brown, the Medical Director.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Are you familiar with the medical services which Group Health agreed to render for the dues which you have just mentioned?

THE COURT:—I think we are going to waste time on that. Was there not a written contract with the members?

Mr. Leahy:—I just wanted to identify it. That is the very thing I had in mind, your Honor.

THE COURT:—Very well.

By Mr. Leahy:

Q.—Will you kindly look this over (handing a document to the witness) and see if you can identify it as the by-laws?

Mr. Kelleher:—The by-laws are already in evidence, your Honor, under a stipulation, as Exhibit 1.

THE COURT:—I think that is true, is it not?

Mr. Leahy:—I did not know they were, your Honor. If they are, all right.

Mr. Burke:—The stipulation is in evidence.

THE COURT:—It will be understood now that they are in evidence. Both sides agree they are in evidence.

By Mr. Leahy:

Q.—There was just one question that I wanted to ask you with reference to that matter of Dr. Woodward's chat with you, and this is a concluding question. Did you say to Dr. Woodward that Dr. Brown would have a copy of the contract at the American Medical Association meeting in Atlantic City the following day?

A.—No; I did not.

Q.—You are sure about that?

A.—Yes. I said that Dr. Brown would be there.

Mr. Leahy:—That is all.

TESTIMONY OF ELSIE P. SADLER

DIRECT EXAMINATION

By Mr. Kelleher:

Elsie P. Sadler stated she was employed with the Home Owners Loan Corporation on July 26, 1937, as a clerk-stenographer. She attended a meeting of the board of trustees of G. H. A. on the evening of that day by order of Mr. Penniman. She was assisted by Roseannette Barrent.

Mr. Kelleher:—I will ask the reporter to mark this transcript for identification.

(Transcript of notes of meeting of July 26, 1937, was marked U. S. Exhibit No. 10 for identification.)

CROSS EXAMINATION

By Mr. Leahy:

Q.—Miss Sadler, did you say that you were employed as a clerk-stenographer down at H. O. L. C.?

A.—Yes, sir.

Q.—What do you do? What are your duties?

A.—I was secretary to Mr. Penniman's assistant, doing stenographic work in the office.

Q.—Did you both transcribe what each one said at the meeting?

A.—We made one transcription, but we checked our notes together before we wrote it.

Q.—Did you make the transcription of Miss Barrent's notes?

A.—I typed—I checked my notes with her notes and we sat together. We took the notes and checked our notes and we wrote what both of us had.

Q.—I am now showing you page 15. What does the "and so forth, and so forth" mean at the bottom?

A.—We sat at the end of a large table, and there were certain things said that we were not able to hear. We took every word that we could hear, but there was just an occasion or so when we were not able to hear.

Q.—Do you know for how long that occasion would last, or how much was said?

A.—Not very much.

TESTIMONY OF WILLIAM FREDERICK PENNIMAN

DIRECT EXAMINATION

By Mr. Kelleher:

William Frederick Penniman stated he was Deputy Governor of the Federal Home Loan Bank System, since January, 1938. He was in the Home Owners Loan Corporation in 1937, and went over to the new position in 1938. He was the Assistant General Manager in charge of the Pacific Coast area. He first came with the H. O. L. C. in November, 1933. Previously he had been living in New York. He was with the investment house of Blythe & Company, 120 Broadway, New York.

He had participated in the formation of G. H. A. in the early part of 1937 and was elected president.

Mr. R. T. Berry was elected secretary-treasurer.

Mr. W. C. Kirkpatrick was elected vice president.

He had participated in conferences with the Surgeons-General of the Army and Navy in an effort to locate a medical director.

The conference with Dr. Neill was prior to the employment of Dr. Brown as medical director?

Q.—Will you tell us what you recall concerning the conversation between you and Dr. Neill?

A.—The engagement was arranged for by Mr. Childress at his home, and Mr. Horace Russell, Mr. Zimmerman and I met him there at Mr. Childress's home and we discussed Group Health.

Q.—When you say you discussed Group Health, will you tell us whether you explained to him the nature of the organization?

A.—Oh, yes.

Q.—Tell the jury what you told Dr. Neill about G. H. A.

A.—We told him that it was the group practice of medicine whereby these employees would be able to get full medical service at a given rate per month, the purposes for which we were attempting to establish Group Health, and that we were very anxious to get just as competent a medical director as possible, and that we would be very happy indeed to have Dr. Neill serve as Medical Director.

Q.—Let me ask you this before we go on any further. What purpose did you tell him that G. H. A. was organized for?

A.—In order to give medical service to employees at a stipulated rate.

Q.—Did you explain to him that G. H. A. contemplated group practice?

A.—Yes.

Q.—Did you explain to him that doctors were to be employed on a salary basis?

A.—Yes.

Mr. Leahy:—Don't lead him. Ask him what was said.

By Mr. Kelleher:

Q.—What did you tell Dr. Neill about the method by which employees would pay for the services of G. H. A.

A.—What the employees who were members would pay?

Q.—Yes.

A.—That they would pay on a monthly basis—dues on a monthly basis.

FEBRUARY 11, AFTERNOON

Thereupon

DIRECT EXAMINATION—RESUMED

By Mr. Kelleher:

Q.—Did you explain to Dr. Neill the duties of a medical director of G. H. A.?

A.—Yes, we went into it very thoroughly with Dr. Neill. We were particularly anxious to have him as the medical director and, in making the offer, we went into the subject very thoroughly as to what we would expect the doctor to do.

Q.—And you told him that in detail?

A.—Yes. Our idea of the medical director was that he would be in charge of the staff and nurses and have everything to do with the medical side of it.

Q.—Will you please tell us what Dr. Neill said to you?

A.—My recollection is that he said he didn't see anything wrong with the setup, with what we wanted to do. He had some ideas and made some reference to a type of service being offered by the Potomac Electric, or Chesapeake & Potomac Telephone Company—I don't remember which—in which either he or his partner was interested, but that his final decision would have to rest with the attitude of the District Medical Society.

Q.—Did Dr. Neill become medical director of G. H. A.?

A.—No, he didn't.

Q.—Who did become medical director?

A.—Dr. Henry Rolf Brown.

Q.—Who suggested Dr. Henry Rolf Brown to you?

A.—Mr. Griffith, or Dr. Griffith of the Veterans Administration.

Q.—When did Dr. Brown become medical director?

A.—I think he officially assumed his duties in the early part of June 1937.

Q.—Did you in the latter part of May, or early part of June 1937, receive a letter purporting to be signed by Dr. J. Russell Verbyrck, Jr.?

A.—I recall such a letter.

Q.—I show you exhibit No. U. S. 11 for identification and ask you whether this is the letter which you received, purporting to come from Dr. Verbyrck.

A.—That is the letter.

Mr. Kelleher:—I offer Exhibit 11 for identification in evidence, (handing letter to Mr. Leahy).

"Mr. W. F. Penniman,
1869 Wyoming Avenue,
Washington, D. C.

May 29, 1937.

"Dear Mr. Penniman:

"Group Health Association, Inc. has been brought to the attention of the Medical Society of the District of Columbia. The Medical Society has had a part in the formation of the present beneficent organizations such as Group Hospitalization, the Central Admitting Bureau, and the Physicians and Dentists Service Bureau, and the approval and help of the Society has been a vital factor in the success of these organizations.

"May I ask, since your organization so deeply affects health problems in the city, if you will be good enough to submit a copy of your charter and by-laws, with a copy of the contract with your members?

"Thanking you for your cooperation, I am,

"Very truly yours,

"J. Russell Verbyrck

"Chairman of Committee on Economics,

"Medical Society of the District of Columbia."

By Mr. Kelleher:

Q.—What was your discussion with Dr. Verbyrck after you telephoned him about this letter?

A.—The letter, as you read it, asks for a copy of the by-laws, a copy of the contract, and charter, and in my discussion with Dr. Verbyrck over the telephone—and I purposely called him because I felt I could better explain to him over the telephone the details than I could in a letter—I explained to him that the by-laws of the Association had been distributed to the members, every member had one, and I thought he would have no difficulty in getting a copy of the by-laws. As to the matter of the charter, it was a public record; he could get that without any trouble, but the contract, which I understood he wished to have, I told him I was without authority to give him that.

Q.—On June 24, 1937 did you attend a meeting of the executive committee of the Medical Society of the District of Columbia?

A.—Yes.

Q.—Who attended with you for G. H. A.?

A.—Dr. Brown and Mr. Zimmerman.

Q.—Do you recall who presided at the meeting?

A.—My recollection is Dr. Conklin presided; I think he was the one; I am not sure about that.

Q.—Can you tell us who was present at the meeting in addition to you, Mr. Zimmerman, Dr. Brown, and Dr. Conklin?

A.—There were quite a group. I doubt if I could recall the names of them. I met a great many just at that meeting that evening.

(On inquiry the witness included also Drs. J. L. Thompson, F. X. McGovern, William M. Sprigg, Verbyrck, R. Arthur Hooe, H. C. Macatee, Thomas E. Neill, Sterling Ruffin.)

Q.—Anybody else who you can recall?

A.—Yes, I think there was one whose name I can't recall now; he was identified as an x-ray specialist.

Q.—Dr. Groover, now deceased?

A.—Yes, that is his name; Dr. Groover was there.

Q.—Now will you tell us what occurred at that meeting?

A.—Well, as I recall it, the meeting was designed primarily to acquaint the District Medical Society with our purposes, and what we were aiming to do.

Q.—Whose purposes?

A.—Group Health Association. We wanted them to have full information concerning it; and the primary purpose was to solicit the aid of the District Medical Society in helping us to get organized with the proper medical staff, et cetera. We wanted them to know as much about it as we could.

The witness stated he addressed the meeting, also Dr. Brown and Mr. Zimmerman.

Q.—Did any of the doctors have anything to say?

A.—I think there were some questions asked and we endeavored to answer them.

Q.—Who asked the questions?

A.—I remember Dr. Hooe, and Dr. Groover, asked some.

Q.—Dr. McGovern?

A.—I think so; I am not sure.

Q.—When you say "asked questions" do you mean about Group Health Association?

A.—Yes, and we answered them to the best of our ability.

Q.—Did Dr. Conklin, too, to the best of your recollection?

A.—Yes.

Q.—Dr. Neill?

A.—I don't recall that Dr. Neill did.

Q.—Now you have already testified that Dr. J. Lawn Thompson was present at the meeting. Did you, subsequent to the meeting, talk with Dr. J. Lawn Thompson?

A.—Yes, Dr. Thompson visited me in my office; or came by to see me and said he wanted to talk with me.

Q.—How long after the meeting was this visit of his?

A.—I should say within ten days or two weeks, not very long.

Q.—Ten days or two weeks?

A.—Yes, and he said he wanted to talk with me about Group Health; that he was very much concerned.

Mr. Leahy (interposing):—I object to the conversation of Dr. Thompson outside the presence of the defendants.

(Counsel for all parties approached the bench.)

By Mr. Kelleher:

Q.—Mr. Penniman, in July, 1937, did you receive a letter which purported to be signed by Dr. F. X. McGovern?

A.—Yes, I did receive such a letter

Q.—Did you telephone Dr. McGovern and discuss that letter?

A.—Yes.

Q.—I show you U. S. Exhibit 12 for identification and ask you if this is the letter purporting to be signed by Dr. McGovern that you received.

A.—Yes, it is.

Mr. Kelleher:—I offer Exhibit No. 12 for identification in evidence.

Mr. Leahy:—No objection, your Honor.

(Letter July 15, 1937, McGovern to Penniman, previously marked U. S. Exhibit 12 for identification, was received in evidence.)

Mr. Kelleher:—The letter is as follows: (Reading.)

"The Medical Society of the District of Columbia,

"1835 I Street, Northwest,

"Washington, D. C.

"July 15, 1937.

"Mr. W. F. Penniman, President,
Group Health Association, Inc.,
Home Owners' Loan Corporation,
Washington, D. C.

"Dear Mr. Penniman:

"At the recent meeting held in the Medical Society Building, when you, Mr. Zimmerman and Dr. Brown were present and discussed with us the plans and purposes of your organization, you were kind enough to say that your board of trustees would receive a committee from the Society for further discussion on the problem.

"The committee of the Society having this matter in charge finds itself unready to discuss the matter intelligently with you without further explanation. I am therefore requested to request, and I do respectfully ask, that you furnish me with copies of (a) your contract with Home Owners' Loan Corporation; (b) your adopted constitution and by-laws;

(c) your form or forms of application; and (d) any form of contract or agreement setting forth the service to be rendered to members and their dependents.

"Thanking you, I am

"Very truly yours,

"F. X. McGovern, M.D.

"Chairman, Subcommittee of Executive Committee."

By Mr. Kelleher:

(Mr. Perriman again described the luncheon with Dr. McGovern and Mr. Zimmerman at the Raleigh Hotel.)

A.—It was a very pleasant affair. We talked about a good many things, with particular reference to his request that we give him the documents which he had asked for. I told him that the matter of securing the charter was not a difficult thing; that it was a public record. I also told him we could not give him the contract. We talked pretty much during the lunch hour on general subjects.

Q.—Did Dr. McGovern tell you why he wanted these documents?

A.—He did in his letter.

Q.—Did you attend a meeting on July 26, 1937 with certain representatives of the Medical Society?

A.—Yes.

(Mr. Penniman described the meeting in the board room of the Federal Loan Bank.)

Q.—What was the nature of the discussions at this meeting?

A.—They had promised or asked if we would receive a committee. We said, "Of course, we would be delighted to have them," and it was a continuation of the previous discussion; and I think Dr. Macatee took the lead, and we went into considerable detail about this type of practice. Dr. Groover took a part in which he spoke of the type of this practice in other countries. It was a pretty general discussion. I took the general impression from the meeting that they would like to have us carry on with the Association but let their doctors do the practicing.

Q.—What did they propose that the Association would do?

A.—We were to have the membership; we were to collect the membership fees; to act as a kind of collection agency; we were to collect dues and when the members were sick they were to be attended by the local doctors.

Q.—Now, Mr. Penniman, you told us Dr. Brown was appointed as medical director. What were his first duties as director?

A.—Well, they started off as a combination of duties. The first thing was to try and organize his staff, and while doing that, to arrange for the purchase of the equipment; and he assisted in the location of space, adequate space.

Q.—Who determined what equipment the clinic should have?

A.—Dr. Brown.

Q.—Will you describe the next duty of Dr. Brown after he had located the clinic and determined upon the equipment of the clinic, that the clinic needed?

A.—He was busily engaged in selecting a staff.

Q.—Will you describe the procedure which he followed in obtaining a staff?

A.—Well, I don't know that I can give it to you exactly, because we depended on him to get the staff. He, being a medical man, had his own way. He did write, and contacted some doctors; wrote to several doctors, did the investigating of their qualifications pretty thoroughly and when he arrived at the conclusion that a person contacted did have the necessary qualifications the question was brought to the board with respect to the salary to be paid the individual.

Q.—Did Dr. Brown make any recommendation as to salaries?

A.—Yes, he did.

Q.—And did the board of trustees accept his recommendations?

A.—They did.

Q.—Who was the first doctor that Dr. Brown obtained for G. H. A.?

A.—Dr. Raymond E. Selders.

Q.—Did the doctor, that is, Dr. Brown, did he select Dr. Selders?

A.—Yes.

Q.—And did Dr. Brown recommend the salary which should be paid Dr. Selders?

A.—Yes.

Q.—What action did the board of trustees take on his recommendation?

A.—Approved it.

Q.—What other doctors were obtained by Dr. Brown prior to the opening of the clinic?

A.—I am not sure that I can give them to you in the exact order in which they were selected, but Dr. Allan E. Lee was

selected by Dr. Brown and Dr. Scandifio was selected by Dr. Brown. There was a Dr. Hulbert selected by Dr. Brown. The nurses on the staff were selected by Dr. Brown.

Q.—In what field is Dr. Allan E. Lee?

A.—He was a general internist.

Q.—What is that?

A.—Engaged in the general practice of medicine.

Q.—And in what field was Dr. Scandifio?

A.—He was a pediatrician.

Q.—What is that?

A.—A baby doctor.

Q.—When did the clinic of G. H. A. open?

A.—Officially in Nov. 1, 1937.

Q.—What occurred on the evening prior to the opening of the clinic?

A.—Well, we had a dinner at the Mayflower Hotel.

Q.—That is here in Washington?

A.—Yes.

Mr. Leahy:—I don't like to object but I can't see the materiality of that.

THE COURT:—I can't see the materiality of all these details, in connection with the opening of the Group clinic.

Mr. Kelleher:—I propose to show the materiality by subsequent questions to the witness. I think this is most important, your Honor.

THE COURT:—Will counsel step to the bench?

(Counsel for both sides approached the bench and conferred with the Court, in a low tone of voice.)

By Mr. Kelleher:

Q.—Whom did you mean?

A.—The board of trustees sponsored the dinner.

Q.—Of G. H. A.?

A.—Yes.

Q.—Did Dr. Richard Cabot address the meeting?

A.—Not at the dinner; it was at a later meeting, a separate meeting that he did.

Q.—Who is Dr. Richard Cabot?

A.—He is a very prominent physician from Boston, Mass.

Q.—Is he related to Dr. Hugh Cabot?

A.—Yes, I think so.

Q.—A brother?

A.—Yes.

Q.—Did you invite any of the local doctors to that dinner?

A.—Yes.

Q.—Will you tell us whom you invited?

A.—We invited a number of them, as I recall.

THE COURT:—May I suggest that you merely ask the witness as to the specific persons.

(Mr. Kelleher then asked the physicians specifically invited.)

Mr. Kelleher:—I offer Exhibit 13 for identification in evidence (handing letter to Mr. Leahy).

(Exhibit 13 for identification, Mary G. Lynch to W. F. Penniman, dated Oct. 26, 1937, was received in evidence.)

Mr. Kelleher:—The letter is as follows:

"DR. THOMAS E. NEILL
"1824 Massachusetts Avenue,
"Washington, D. C.

"October 26, 1937.

"Mr. William F. Penniman,
Group Health Association, Inc.,
1328 I Street, Northwest,
Washington, D. C.

"My dear Mr. Penniman:

"Dr. Neill will be unable to attend the dinner at the Mayflower Hotel on October 30, 1937, and has asked me to let you know.

"Very truly yours,

"Mary G. Lynch,

"Secretary to Dr. Neill."

By Mr. Kelleher:

Q.—Mr. Penniman, did you invite the hospitals' representatives to that meeting?

A.—Yes, I think we sent invitations to all the hospital superintendents; the superintendents of all the hospitals.

Q.—Who attended?

A.—Colonel Randall was the only one, I remember.

Q.—With what hospital was he connected?

A.—With the Homeopathic.

Q.—Do you recall whether any of the other hospitals were represented?

A.—I don't recall that any others were there.

Q.—Mr. Penniman, after the clinic had opened on November 1, did Dr. Lee and Dr. Scandifio tender their resignations to the Medical Society?

A.—Yes.

ORGANIZATION SECTION

JOUR. A. M. A.
FEB. 22, 1941

Q.—Did you have a conversation with Mr. B. B. Sandidge, of the Emergency Hospital, concerning this matter?

A.—I did.

Q.—Who is Mr. Sandidge?

A.—He is the superintendent of the Emergency Hospital.

Q.—Can you place the date of that conversation?

A.—That was shortly after the clinic opened. It must have been around the 10th of November, 1937, around that neighborhood.

Q.—Did you call Dr. Sandidge?

A.—Yes.

Q.—Will you tell us what you told Dr. Sandidge, or Mr. Sandidge?

Mr. Leahy.—I object.

Mr. Kelleher.—On what grounds?

Mr. Leahy.—Pure hearsay.

Mr. Lewin.—Your Honor knows our position with regard to the hospitals; that they were forced into this conspiracy by the defendants.

THE COURT.—Yes, but why reach it by hearsay; why not get it from them?

Mr. Lewin.—We are entitled to get it from someone who came into the conspiracy.

THE COURT.—That is the same question again. I suggest you defer that evidence for the moment, until I rule tomorrow on the question.

Mr. Kelleher.—Your Honor, may I call attention to the fact that the indictment does name the hospitals.

THE COURT.—I understand that; I am quite familiar with the indictment. Let us pass that up until tomorrow morning when I will rule on it.

By Mr. Kelleher:

Q.—All right. Now, did you have a meeting with Dr. Neill in November, 1937?

A.—Yes.

Q.—That is Dr. Thomas E. Neill?

A.—Yes.

Q.—Can you place the date of that?

A.—The latter part of November, about the 25th, 26th, 27th, I think, of November.

Q.—Where was this meeting?

A.—At his office.

Q.—And who was in attendance, in addition to Dr. Neill and yourself?

A.—Mr. Horace Russell.

Q.—Who is Mr. Horace Russell?

A.—He was a member of the board of trustees.

Q.—Of G. H. A.?

A.—Yes.

Q.—Who else?

A.—Mr. Ivan Carson; Mr. R. T. Berry; W. D. Kirkpatrick, Mr. Zimmerman.

Q.—Will you tell the jury the substance of the conversations at that meeting with Dr. Neill?

A.—We called upon Dr. Neill—

Q.—Just a second: I want you only to state the matters you told Dr. Neill and what he said to you.

A.—I told Dr. Neill of the incident that had occurred at the Garfield Hospital, which we thought was pretty terrible; that I had come to talk with him because he was the president of the District Medical Society, and we felt very definitely that he should know about this situation.

Q.—Did you tell him what this situation was?

A.—Yes.

Q.—What did you tell him?

A.—We told him that this patient had been carried to Garfield in a very serious condition.

Q.—Did you tell him the name of the patient?

A.—Yes, I did.

Q.—What was it?

A.—Mary Frances Stuart.

Q.—Who was she?

A.—The laboratorian of Group Health Association. She had been found unconscious in her home and was hurried to Garfield Hospital where it was found that she needed an emergency operation. I told him that while she was in the room waiting there that they had a debate in the corridor of Garfield as to whether or not any doctor could attend her and when while she was in that condition one doctor made the statement that he couldn't attend this person—he said that in a loud voice—if she was connected in any way with Group Health Association. Dr. Lee, whose patient she was, found out that nothing had been done there, and he told the Group that he was on the courtesy staff of Garfield and he entered her as his patient, and she was operated on. I told Dr. Neill what I

thought of such a situation and that I thought the patient should have received better treatment because it was an emergency situation, where time was the essence.

Q.—What did Dr. Neill say?

A.—Dr. Neill said he didn't know anything about it. I don't recall that Dr. Neill gave us any encouragement, because he launched off into another subject, and made the statement to me that if all the members of the Supreme Court and all the members of Congress, if you were to put them all in one room, they couldn't competently select a doctor. I was thereupon forced to reply, "If that is true, Dr. Neill, how in the name of God can a poor layman select the right kind of doctor?"

Q.—Did Dr. Neill know, or did you tell Dr. Neill who the doctor was that was involved in the Mary Stuart case?

A.—Yes.

Q.—What was his name?

A.—Dr. Schoenfeld.

Q.—Now, Mr. Penniman, did you write a letter to Dr. Neill concerning this conference?

A.—Yes.

Q.—And did you receive a reply from Dr. Neill?

A.—I did, yes.

Q.—I show you Government Exhibit No. 13 for identification, which purports to be the original of a letter from you to Dr. Thomas E. Neill, dated Nov. 22, 1937: Does that letter appear to bear your signature?

A.—That is correct; it does.

Q.—Did you mail this letter?

A.—I did.

Q.—I now show you Government's Exhibit No. 14 for identification, which purports to be a letter from Dr. Thomas E. Neill to you, dated Nov. 24, 1937. Is this the letter which you received, and I am referring now to Exhibit 14 for identification, in evidence.

A.—That is right.

Mr. Kelleher.—I offer Government's Exhibits 13 and 14 for identification, in evidence.

(Mr. Kelleher read letters to the jury, as follows):

"Group Health Association, Incorporated,
"1328 Eye Street, N. W.,
"Washington, D. C.
"November 22, 1937.
"Person.
"Dr. Thomas E. Neill, President,
"Medical Society of the District of Columbia,
"1824 Massachusetts Avenue,
"Washington, D. C.

"Dear Dr.:
"It was good of you to give so generously of your time to the representatives of the Group Health Association, when they called on you at your office on Saturday afternoon.
"It has been my experience that when a group of men are gathered to discuss any subject, varying opinions as to what was said often-times result, notwithstanding the sincerity of all present. Wishing to avoid this in this instance, I have deemed it advisable to confirm in substance the highlights of our discussion as understood by us, as follows:

"1. That the hospitals are maintained for the patient and not for the doctor, therefore, no hospital is justified in refusing admission to any patient in need of hospital care, regardless of race, color or creed, or membership in any association.
"2. That there are at present some 400 doctors, licensed to practice in the District of Columbia, who are not members of the Medical Society of the District of Columbia, some of whom are on the courtesy staff of local hospitals. This confirms our opinion that membership in the District Medical Society by a licensed physician is not a condition precedent to being accepted and placed on the courtesy list of the local hospitals.

"3. That consideration of the applications of duly licensed physicians applying to any of the local hospitals for courtesy privileges is based upon merit and competence of the physician making the application.
"4. That to falsely charge a physician with incompetence subjects the accuser or accusers to suit for libel. This statement was made in connection with your reference to one of our doctors, but whose name you did not wish to disclose.

"Dr. Raymond E. Selders' application for courtesy privileges has been submitted to several of the local hospitals.
"A careful and thorough investigation of Dr. Selders' qualifications was made before his acceptance as a Member of the Medical Staff of the Group Health Association. This included a careful review of his education, and his years of experience. We have checked his record from Texas to Massachusetts and have unqualified statements from physicians with whom he has worked, and in whose integrity we have implicit confidence.

"Both as President of the Medical Society of the District of Columbia and a prominent physician of long standing in this community, it is we think very proper that you should be thoroughly conversant with every activity, the purpose of which is to give medical care, to the end that the highest standard of ethics of the medical profession may be maintained.

"For this reason, we are delighted to have had this talk with you. I also wish to confirm our understanding that what was said by you to us was in confidence and in nowise intended for purposes of publication.

"Sincerely yours,
"William F. Penniman,
"President."

"The Medical Society of the District of Columbia.

"Washington.

"November 24, 1937.

"Mr. Wm. F. Penniman,
President, Group Health Association Inc.,
1328 I Street, N. W.,
Washington, D. C.

"My Dear Mr. Penniman:

"Thank you for your letter of November 22nd.

"I was very glad to have the opportunity of putting a few facts before the group of men that came to my office with you on Saturday. I think a full understanding of what we must adhere to by you and your committee will save a great deal of unpleasantness in the future.

"I shall be very glad to discuss in person with you any point, under the same conditions.

"I wish to thank you and through you the rest of the men present for the very frank way they expressed their opinions.

"With kind regards.

"Very sincerely yours,
Thomas E. Neill."

By Mr. Kelleher:

Q.—Mr. Penniman, I would like to clear up one thing about the conference with Dr. Neill. Did you tell Dr. Neill how Dr. Schoenfeld happened to get into the Mary Frances Stuart case?

A.—Would you repeat the question?

Mr. Kelleher:—Would you read the question?

(The pending question, as above recorded, was read by the reporter.)

Mr. Leahy:—Would that be material, based wholly on hearsay? Anything he said to Dr. Neill wouldn't be admissible.

Mr. Kelleher:—He went into everything this morning.

THE COURT:—It is just a part of a conversation that is already in.

By Mr. Kelleher:

Q.—Do you understand my question?

A.—Yes. I told Dr. Neill Dr. Schoenfeld was the surgeon who was going to perform the operation and told him Dr. Schoenfeld was ready, but he was the one who made the statement he couldn't do it if she was connected with Group Health Association.

Q.—Did you tell him who had requested Dr. Schoenfeld to operate?

A.—Yes, I told him that Dr. Lee was a member of Garfield Hospital, was on the courtesy staff, and that he and the medical director had arranged for it.

Q.—Did you tell Dr. Neill why Dr. Lee did not himself perform the operation?

A.—Well, I presume I did, because I could very easily have said in the course of this general conversation that Dr. Lee was not a surgeon.

Q.—Why didn't Dr. Selders perform the operation?

A.—Dr. Selders wasn't—

THE COURT:—The question is what the conversation was.

THE WITNESS:—I told him that Dr. Selders had not been admitted to the courtesy staff of the hospital and had gotten Dr. Schoenfeld to do it.

By Mr. Kelleher:

Q.—Did you explain to Dr. Neill who Dr. Schoenfeld was?

A.—Yes.

Q.—What did you tell him?

A.—I told him he was a member of the courtesy staff and was a member of the District Medical Society and that he had called him to perform this operation.

Q.—Mr. Penniman, after Dr. Lee and Dr. Scandiffio had submitted their resignations to the local society, did they take any other action in that regard?

A.—Yes, they—after Dr. Lee had been notified that he was no longer a member—

Mr. Leahy:—I object. Hearsay.

By Mr. Kelleher:

Q.—Would you just tell what those gentlemen did?

A.—They withdrew their resignations.

Q.—They did?

A.—Withdrew it from the District Medical Society.

Q.—Did you attend a hearing of the executive committee of the Medical Society of the District of Columbia on Dec. 6, 1937?

A.—I did.

Q.—What was the purpose of that hearing?

A.—That was the hearing that had been given Dr. Scandiffio and Dr. Lee on charges preferred against them by this C. C. and I. M. Committee of the Medical Society, and they were given the right to this hearing before being expelled from the society.

Q.—And what were the charges against Dr. Lee and Dr. Scandiffio?

Mr. Leahy:—I object. The writing would be the best evidence.

THE COURT:—Yes. I think that is true. If there is a record, I mean, if there are formal charges, they are the best evidence.

By Mr. Kelleher:

Q.—Who was present at this meeting on December 10?

Mr. Leahy:—Tenth or sixth?

Mr. Kelleher:—Excuse me. Thank you, Mr. Leahy.

By Mr. Kelleher:

Q.—December 6?

A.—December 6. Those, I presume, are members of the executive committee of the District Medical Society.

Q.—Will you give us the names of those you recall who were there? Let us go over the list of names.

Mr. Leahy:—Let him tell first.

THE WITNESS:—Well, it was Dr. Reede who served as chairman, I think.

(Mr. Penniman listed the names of those who were present.)

A.—Well, there were three attorneys, Mr. Fenning, Mr. Hoover, and Mr. Leahy, the gentleman over there (indicating).

Q.—Whom did they appear for?

A.—Well, I imagine they represented the District Medical Society.

Then there was Dr. Scandiffio and there was Dr. Lee.

I was there; Mr. Zimmerman, Dr. Brown; there was Mr. Luke Keeley, Mr. Horace Russell, Mr. E. K. Newman.

Q.—Mr. York?

A.—And A. S. York, yes, sir.

Q.—Who appeared as counsel for Drs. Lee and Scandiffio?

A.—Russell, Keeley, Newman and York.

Q.—What occurred at this meeting on December 6? Did anybody testify?

A.—I think Dr. Lee was on the witness chair most of that meeting.

Q.—And was he examined by counsel for the Society?

A.—Yes.

Q.—Were the hearings transcribed by a reporter?

A.—Yes.

Q.—How long did the first session last?

A.—I think until—it started about 8 o'clock and I think it adjourned about 11:30.

Q.—Before adjournment was a date set for another hearing?

A.—Yes. They set—I think that was Monday, and I think they set the following date for Friday the 10th, December 10.

Q.—Yes. Now, you have told us that Dr. Lee testified at this hearing. Did you see Dr. Lee early in the week of the first hearing?

A.—Subsequent to the first hearing?

Q.—Yes.

A.—Yes, Dr. Lee was in my office.

Q.—Will you describe his appearance, please?

Mr. Leahy:—I object as immaterial.

THE COURT:—Objection sustained.

By Mr. Kelleher:

Q.—Did you talk with Dr. Lee?

A.—Yes. Yes, I did. At length. Dr. Lee was quite perturbed.

Mr. Leahy:—You answer the question.

THE COURT:—Just answer the question.

By Mr. Kelleher:

Q.—Did you talk to him about the expulsion proceedings?

Mr. Leahy:—I object as immaterial.

THE COURT:—Sustained.

Mr. Kelleher:—Your Honor, this is offered on the same ground as this other conversation which your Honor is considering. I suppose you will reserve your final ruling?

Mr. Leahy:—This isn't on the same ground at all.

Mr. Keller:—Yes, it is.

Mr. Leahy:—You now want to make Dr. Lee a defendant. You will have the jury in it pretty soon.

Mr. Levin:—I don't think that is a proper expression.

Mr. Leahy:—Any counsel who has tried five cases ought to know it is absolutely inadmissible on the ground of hearsay.

THE COURT:—I sustained the objection, so I don't see what the argument is about.

Mr. Leahy:—I don't either.

THE COURT:—These personal tilts before me don't convince me one way or the other as to the admissibility of evidence. They are not very helpful.

By Mr. Kelleher:

Q.—Did you see Dr. Lee later in the week?

Mr. Leahy:—I object as immaterial.

Mr. Kelleher:—I am just asking him whether he saw him.

THE COURT:—Well, it is immaterial. Objection sustained.

Mr. Kelleher:—Your Honor, I do believe the second meeting may be admissible for another reason, if I could pursue the inquiry with Dr. Lee and the witness.

THE COURT:—Well, if counsel want to object, perhaps you had better come to the bench. I will be glad to listen to you.

By Mr. Kelleher:

Q.—Mr. Penniman, did you see Dr. Allan E. Lee on the afternoon of Friday, December 10?

A.—Yes.

Q.—Did Dr. Allan E. Lee make a telephone call in your office?

A.—Yes.

Q.—Did you hear him make that call?

A.—I did.

Q.—Whom did he call?

A.—Dr. Hooe.

Q.—Is that Dr. R. Arthur Hooe?

A.—That is correct.

Q.—Did you attend a meeting of the executive committee of the District Medical Society that evening?

A.—I did.

Q.—When you came into the building where the meeting was being held, did you see Dr. Lee talking with anybody?

A.—I saw Dr. Lee in the corridor.

Q.—With whom was he talking?

A.—Dr. Hooe.

Q.—Did you watch Dr. Lee talking with Dr. Hooe?

A.—Well, I observed it. I made no attempt to listen to what was said. I observed that the two were talking.

Q.—You didn't hear the conversation?

A.—No, I did not.

Q.—What occurred after the conversation between Dr. Lee and Dr. Hooe?

A.—Dr. Hooe went back in some little office right off the corridor, and shortly thereafter asked Dr. Lee to come in the room.

Q.—Did you see Dr. Hooe come back out of the room?

A.—Yes.

Q.—Did he beckon Dr. Lee to come in?

A.—Told Dr. Lee to come in, and he followed.

Q.—After you saw Dr. Lee go into the room with Dr. Hooe what occurred?

A.—He shut the door.

(There was laughter in the courtroom.)

THE COURT:—Now, possibly some of you haven't been here before, but those in the audience please understand, I think it better not to laugh. Suppress your feelings, please.

By Mr. Kelleher:

Q.—Did the executive committee meeting commence after that?

A.—Yes.

Q.—What occurred at the start of the meeting?

A.—Dr. Hooe, as I recall it, made the statement to the chairman of the executive committee that Dr. Allan E. Lee, having now tendered his resignation to Group Health Association, the C. C. and I. M. Committee recommended withdrawal of the charges, and I think it was put to a vote of the executive committee and they voted to withdraw the charges and reinstate Dr. Lee.

Q.—Who made this statement to the executive committee?

A.—Dr. Hooe was chairman of the C. C. and I. M. Committee.

Q.—Yes, but who announced this to the executive committee?

A.—I don't recall just who did it. I was present, I heard it made, heard the statement made.

Q.—What occurred at the second meeting?

A.—They—I think the second meeting they put Dr. Scandiffio on the stand.

Q.—When did you testify?

A.—I think mine was the third.

Q.—When was the third meeting held?

A.—Well, that was—the following week—sometime during the following week. This being Friday the 10th—I don't remember the exact date.

Q.—Did Dr. Brown testify at any of these hearings?

A.—Yes. Yes, he did.

Q.—Did you attend any other hearing of the executive committee after the third hearing?

A.—No. I was out of the city.

Q.—Mr. Penniman, did you write and mail any communications to any of the Washington hospitals concerning staff privileges for the medical staff of G. H. A. or any of its members?

A.—Yes.

Q.—Did you address a communication to the president of Homeopathic Hospital?

A.—Yes.

Mr. Kelleher:—Will you mark this for identification?

(A letter dated Nov. 8, 1937, from William F. Penniman to Col. Joseph Randall, was marked Government Exhibit 15 for identification.)

Mr. Kelleher:—And this.

(A letter from J. B. Gregg Custis to William F. Penniman, dated Nov. 9, 1937, was marked Government Exhibit 16 for identification.)

By Mr. Kelleher:

Q.—I show you here Government Exhibit 15 for identification, which purports to be a carbon copy of a letter from you to Col. Joseph Randall, President of the Board of Trustees, Homeopathic Hospital, dated Nov. 8, 1937. Is this a carbon copy of an original letter which was written and mailed by you?

A.—That's right.

Q.—Did you receive a reply to that letter of Nov. 8, 1937?

A.—Yes.

Q.—Is this the reply which you received (indicating)?

A.—Yes.

Mr. Kelleher:—I offer Government's Exhibits 15 and 16 for identification, in evidence.

(Counsel examined paper.)

Mr. Burke:—Exhibit 15 is a carbon copy dated Nov. 8, 1937.

Exhibit 16, an original letter dated Nov. 9, 1937 from J. B. Gregg Custis, M. C., Executive Officer, Board of Trustees, National Homeopathic Hospital, to Mr. Penniman.

Mr. Leahy:—Show that to the Court.

May we just approach the bench for a moment, your Honor?

THE COURT:—Yes.

Mr. Kelleher (reading):

"November 8, 1937.

"Col. Joseph Randall, President,
Board of Trustees,
Homeopathic Hospital,
3146 19th Street, N. W.,
Washington, D. C.

"Dear Col. Randall:

"For your information, I am attaching hereto a copy of a letter addressed to the Homeopathic Hospital requesting permission to admit patients who are members of the Group Health Association to the hospital upon the request of the Medical Director.

"Also, a request to permit Dr. Raymond E. Selders, Surgeon, who is attached to the staff of the Group Health Association, to attend these patients while hospitalized.

"For your further information, there is attached a record of Dr. Selders' education, training and experience.

"Your assistance in obtaining prompt and favorable action will be very much appreciated.

"Very truly yours,
William F. Penniman,
President."

"Mr. William F. Penniman,
Group Health Association, Inc.,
1328 Eye Street, N. W.,
Washington, D. C."

It is on the letterhead of the National Homeopathic Hospital. (Reading.)

"My dear Mr. Penniman:

"At a Board of Trustees Meeting held on November 4, 1937, it was voted that until the Group Health Association, Inc. was approved by the Medical Society of the District of Columbia, the National Homeopathic Hospital could not make any contract or enter into any agreement with it.

"Very truly yours,

(signed) J. B. Gregg Custis, M.D.,
Executive Officer, Board of Trustees."

By Mr. Kelleher:

Q.—Mr. Penniman, in writing to these hospitals did you intend to take any arrogant attitude toward the hospital?

Mr. Leahy:—I object.

THE COURT:—Objection sustained.

By Mr. Kelleher:

Q.—Mr. Penniman, did you, as you state in this letter, also address a letter to the National Homeopathic Hospital?

A.—Yes, sir.

(Mr. Penniman stated he had addressed letters to all the hospitals.)

(Original letters and copies of letters from Penniman to various hospitals and officers of various hospitals were marked U. S. Exhibits Nos. 17 to 29, inclusive, for identification.)

Mr. Kelleher:—Your Honor, I am now through with the matters that your Honor will permit us to go into at this time, but I would like to reserve the right to recall Mr. Penniman.

THE COURT:—Yes. That may be done.

Mr. Kelleher:—That is all, Mr. Leahy.

Mr. Leahy:—May I ask one of the Deputy Marshals to telephone the reporters' office to return certain exhibits that were removed from the court room?

THE COURT:—Yes.

CROSS EXAMINATION

By Mr. Leahy:

(Mr. Penniman went over again the record of his various positions.)

(He was interrogated as to his relationship with Mr. Zimmerman and various conferences that were held.)

Q.—What was the occasion of your first seeing any member of the District Medical Society with reference to G. H. A.?

A.—At the time we visited them at the Society's headquarters.

Q.—That was sometime following the receipt of this letter from Dr. Verbrycke, was it not?

A.—I think it was.

Q.—At the time you received this letter you were president, were you not, of G. H. A.?

A.—That is correct.

Q.—Had you as president of G. H. A. attempted to contact the Medical Society of the District of Columbia in any way before the receipt of this letter?

A.—Not officially; no.

Q.—Unofficially?

A.—No.

Q.—In no way had you tried?

Mr. Lewin:—He told you about the Neill visit. It is confusing. The questions have got to be based on the evidence. This gentleman has already testified that he went to see Dr. Neill at Mr. Childress's home before this meeting.

THE COURT:—That evidence is there.

Mr. Lewin:—Yes; but now the question is phrased on an entirely different supposition, which is not correct.

THE COURT:—He has a right to phrase it on a different supposition.

Mr. Lewin:—He cannot misquote the evidence, can he?

THE COURT:—I do not know that he is misquoting it. If the witness misunderstands the question, then it can be clarified on direct examination. I think that is the better way.

By Mr. Leahy:

Q.—Will you answer the question?

A.—The last question I do not get. You said, "Unofficially?" and I said, "No." Not the District of Columbia Medical Society; no.

Q.—Had you contacted anybody who was officially connected with the District Medical Society, before the receipt of this letter?

A.—I think so. I think I had an interview with Dr. Neill. He was connected with the District Medical Society.

Q.—Can you tell us the date of that visit?

A.—As near as I can recall, sir, it was in April or May; I am not sure.

Q.—Did you make any memorandum of that visit?

A.—I don't think so; no. It was a very informal visit at Mr. Childress's home, and we just had an informal discussion with Dr. Neill.

Q.—Mr. Childress was the assistant to Mr. John H. Fahey, Chairman of the Board, was he not?

A.—That is correct.

Q.—And he was interested also in Group Health Association?

A.—He was interested; and Dr. Neill was quite a close personal friend of his. He offered that as a suggestion.

Q.—Had you ever met Dr. Neill personally before that occasion?

A.—I don't believe I had.

Q.—Had you discussed him with Mr. Childress?

A.—Oh, yes.

Q.—It was at Mr. Childress's suggestion, then, that you went up to see Dr. Neill?

A.—It was at Mr. Childress's suggestion that Dr. Neill met us at his home.

Q.—Group Health had been incorporated on Feb. 24, 1937, had it not?

A.—I think so; yes.

Q.—Had its by-laws been published shortly after that time?

A.—Yes.

Q.—Those by-laws purport in a general way to determine the contract between the subscriber to the service and the service which Group Health rendered? Is that right?

Mr. Lewin:—We have the by-laws in evidence.

By Mr. Leahy:

Q.—Had they been printed shortly after the incorporation?

A.—Yes.

Q.—Many copies printed?

A.—Yes; we had quite a number of them.

Q.—You had distributed them, had you not, among the membership?

A.—With the membership; yes.

Q.—Do you recall about how many you had distributed?

A.—Our membership at that time was around 900, and I think each one had a copy of the by-laws.

Q.—When Mr. Childress asked you to meet Dr. Neill at his home that night did you know that you were going at that time to discuss with Dr. Neill the possibility of his being asked to become the Medical Director of Group Health?

A.—Oh, absolutely. That was the purpose of the meeting.

Q.—Did you bring a copy of the by-laws with you?

A.—I don't remember whether we had them or not.

Q.—Did anyone in the group bring a copy of the by-laws?

A.—I don't recall.

Q.—Did any one of the group leave a copy of the by-laws with Dr. Neill so that he could read them?

A.—That I don't recall.

Q.—Did you not think, if you were going to see a person who was to be employed as Medical Director, you should give him the by-laws which constituted the contract for the service that was to be rendered?

A.—I feel that perhaps Dr. Neill should have asked for a copy of the by-laws. I don't recall that he did. If he were going to become the Medical Director he would have wanted to see a copy of the by-laws, I think.

Q.—Do you recall whether he asked for one now?

A.—I don't recall that he did.

Q.—But your best recollection is that no one left one with him?

A.—That is my best recollection.

(The witness was closely interrogated as to the details of the conversation with Dr. Neill.)

Q.—Did you indicate to him that you had the money available at that time to buy the equipment?

A.—No; I don't believe we did. I don't remember that particularly.

Q.—You already had the money, had you not?

A.—I am not sure just when the money was made available. I think the money was made available sometime in March of 1937. I cannot tell you whether it was just prior or subsequent to the availability of the money that I met with Dr. Neill.

Q.—At all events, nothing was said about that point, in accordance with your best recollection?

A.—No. I don't think the question was raised at all.

(The witness was questioned on the letter from Dr. Verbrycke.)

Q.—The Central Admitting Bureau? Did you know about that?

A.—I am not as familiar with that. I know there is a Central Admitting Bureau.

Q.—And the Physicians and Dentists Service Bureau?

A.—I don't know that at all.

Q.—(Reading):

"And the approval and help of the Society has been a vital factor in the success of these organizations." Did you know that the Medical Society had cooperated in the formation and continuation of those organizations?

A.—No; I did not.

Q.—(Reading):

"May I ask, since your association so deeply affects health problems in the city, that you will be good enough to submit a copy of your charter and by-laws with a copy of the contract with your members."

Did you ever submit a copy of the charter?

A.—No, sir.

Q.—Was that contained in the copy of your by-laws?

A.—No. That was explained to him over the telephone—that if he wanted the charter, that was a matter of public record. It had been filed, and he had no difficulty in seeing that.

Q.—Did you have a copy of your charter available?

A.—I did not. The secretary of the association may have had it. I personally did not.

Q.—You had available copies of the by-laws?

A.—Oh, yes. We had plenty of them.

Q.—You could have mailed him a copy of the by-laws in accordance with his request, could you not?

A.—Surely, without any trouble at all. I told him over the telephone, however, that there had been some nine hundred

copies distributed, and I thought he would have no difficulty. As a matter of fact, we had already heard that a number of the copies were already in the hands of the doctors.

Q.—Did you have any particular reason why you did not accede to the request of Dr. Verbrycke as chairman of the Committee on Economics of the Medical Society of the District of Columbia?

A.—None whatsoever, except that if I am not mistaken it was during the course of this conversation that we asked him to permit us to come over and talk to the District Medical Society. I am not so sure—it is a little vague, but I think it was in this telephone conversation that arrangements were made for representatives of Group Health to visit the District Medical Society and some of its members.

Q.—When you visited the District Medical Society in accordance with that arrangement, which you think may have been made over the telephone at that time, did you bring the by-laws with you then?

A.—I don't know that we had them.

Q.—Did anybody in your group bring the by-laws?

A.—I think they may have had a copy. It was just a small pamphlet.

Q.—But did you bring them?

A.—I did not purposely bring them; no.

Q.—Did Dr. Brown bring them?

A.—I could not answer that.

Q.—Did you see him give a copy to anybody at the meeting?

A.—No.

Q.—They were asking about a copy, were they not?

A.—Not at the meeting.

Q.—Were they not discussing the by-laws or the contract at that meeting?

A.—I don't think so. I think I made the first statement and gave a general outline, and I think that then there were some questions asked. I think Dr. Neill asked some questions with reference to the by-laws which I endeavored to answer to the best of my ability.

Q.—Was not the District Society, through the chairmen of some of its committees, trying to get a copy of those by-laws as late even as July 15?

A.—That is right.

Q.—Why didn't you supply them with a copy, Mr. Penniman?

A.—Because he could get all the copies he wanted.

Q.—He could go and get them himself? Was that the spirit?

A.—I don't know that that was intended to be the spirit; but the idea was that we felt they had plenty of them. They had some of the copies.

Q.—Did you supply them with a list of the members of G. H. A.?

A.—No.

Q.—But you would expect Dr. McGovern, who was writing to you on July 15—

A.—Did he ask for a list?

Q.—He asked for a list.

A.—For a list of the members?

Q.—No; he asked for a copy of your by-laws.

A.—But you said, a list of the members.

Q.—How would he know who was a member of the G. H. A.?

A.—He didn't ask for that.

Q.—Did you tell him?

A.—No.

Q.—You told him that you had distributed 900 copies of by-laws among 900 Government clerks, but you did not tell him what 900 out of the 100,000, did you?

A.—No, because we had heard that some of the doctors had them. We had gotten reports back that some of the doctors had them and had discussed it; so it was not anything that was secretive.

Q.—At all events, up to this time you have not supplied the District Medical Society with a copy of your by-laws?

A.—I have not, personally.

Q.—Have you ever supplied the District Medical Society with a copy of the contract?

A.—Just what contract do you refer to?

Q.—The contract with the Home Owners Loan Corporation which was asked for on July 15, under Exhibit 12.

A.—No, sir.

Q.—Have you ever supplied the District Medical Society with a copy of your adopted constitution?

A.—The by-laws?

Q.—Yes.

A.—No; I have not.

Q.—Have you ever supplied a copy of the form or forms of application for membership?

A.—No.

Q.—Have you ever supplied any form of contract or agreement setting forth the service to be rendered to members and their dependents?

A.—That would be all in the by-laws.

Q.—So your answer is that you have never supplied that information, either?

A.—I did not.

Q.—You will note under Exhibit 12 that Dr. McGovern was asking for the information in his official capacity as chairman of the executive committee. Is not that true?

A.—I think so.

Q.—And Dr. McGovern had written on the stationery of the Medical Society of the District of Columbia?

A.—That is right.

Q.—Whereas, in Exhibit No. 11, Dr. Verbrycke wrote on his personal stationery; nevertheless, he signed the request, did he not, in his official capacity as chairman of one of the committees?

A.—That is right.

(The witness was then closely interrogated on the conversation with Dr. Neill.)

Q.—Of course when you outlined the plan of G. H. A., that outline did not convey the information that it was a prepayment service?

A.—Oh, yes.

Q.—Did Dr. Neill object to the prepayment notion?

A.—There was no indication during the evening's conversation that he objected to it.

Q.—He advised you that he and his partner were engaged in some form of contract practice with the Potomac Electric Power Company?

A.—I am a little vague about that; either that he was or his partner was; but I am not sure just which it was. There was some reference to it.

Q.—With one or two organizations of contract practice in the District of Columbia?

A.—Yes.

Q.—Did he say anything to you in substance that you can recall to this effect, Mr. Penniman, that if the G. H. A. were economically sound, if it were ethically and legally sound, the job which you were offering him was just the job he was looking for?

A.—To the best of my recollection there was no question at that time brought up about the legality of Group Health. I don't believe that was in question at all.

Q.—Did he say anything to you in substance to the effect of the question which I have just put to you?

A.—Not with respect to legality, that I remember.

Q.—Did he say anything with reference to the ethical side of it?

A.—I cannot recall that he did. The remark that he made as he was leaving was that he had to leave because of some engagement—I think it was a patient—and that his further action would have to depend upon the attitude of the District Medical Society. I think that is about the last remark I remember his making. I don't remember his saying anything about legality or the ethics of it. He did say that he saw nothing wrong with it, and that there were other practices such as he was interested in.

Q.—Do you recall at the time that he left you with any indication that he would talk with you further about it?

A.—I think we got the impression that he would, because he said it would depend upon the attitude of the District Medical Society. Naturally he did call attention to the fact that he was becoming its president on July 1st.

Q.—Did you ever get in touch with him again about it?

A.—I don't know that I did.

Q.—Do you know anybody who did, representing the G. H. A.?

A.—No, I do not. I think we were waiting for a call from him.

Q.—Mr. Childress never spoke to you about the matter again, did he?

A.—He may have, in just general conversation, wanting to know what progress we were making.

(Mr. Penniman was questioned about the brochure issued by G. H. A., Inc. and the first meeting with the District Medical Society.)

Q.—So, at the outset you assured them that you wanted to give them full information about the organization?

A.—Yes.

Q.—Then why didn't you do it?

A.—We did, that evening. We discussed the by-laws. I gave them—so far as the charter is concerned, I did not give them that.

Q.—You did not give them the by-laws or the charter or the contract under which they were to function?

A.—There was no objection to giving them the by-laws or copy of the charter, if they did not already have it and if it were not obtainable. But so far as the contract that existed between Group Health Association and the Federal Home Loan Bank Board was concerned, I made it pretty clear that that was something we had no authority to give. That had to come from the Board itself.

Q.—Did you advise the Board that the District Medical Society would like to see a copy of the contract?

A.—I don't recall that I did, sir.

Q.—Did you make much effort to make good your assurance, which you gave the Executive Committee that night, that you wanted them to have full information about this matter?

A.—Just as I am giving full information now. I am trying to answer all the questions and go into as much detail with the purposes of the Association as is possible.

Q.—You knew all the answers were contained right within those by-laws?

A.—I knew the by-laws.

Q.—And you knew those answers were right inside those by-laws?

A.—Yes.

Q.—Then why did you not give them?

A.—They had the by-laws.

Q.—Did you see a copy of the by-laws at that meeting?

A.—No.

Q.—Why do you make the statement to the jury that they had a copy of the by-laws?

A.—Because we had gotten reports from several of the members that they had given copies to the doctors.

Q.—To whom?

A.—To local doctors here.

Q.—Can you say now to this jury that a single member of the Executive Committee whom you met there that night had ever had a copy of your by-laws?

A.—No; I could not, because I did not see them have it.

Q.—Even assuming that they had it, don't you think, in accordance with the assurance which you extended the Executive Board in the spirit of cooperation, that you ought to have given them a copy of the by-laws?

Mr. Lewin:—Your Honor, we think this has gone far enough, and we object.

THE COURT:—That is argumentative.

What is the next question, please.

By Mr. Leahy:

Q.—Mr. Penniman, there was quite a discussion back and forth there, was there not, about the possibility of Group Health economically succeeding on the dues which you stated?

A.—That evening?

Q.—Yes.

A.—That is correct.

Q.—And somebody there pulled out a piece of paper and started figuring on the table?

A.—I think they did; yes.

Q.—Who was that?

A.—I am not sure. I think it was Dr. Groover. I am not sure. I know some one did.

Q.—Was he not trying to figure on the table, while you all were there, whether or not on dues of \$2.20 per member or \$3.30 as family dues, that organization could give medical service at that price?

A.—That is right. He had it all figured. He was figuring the whole evening.

Q.—Did there not come a time when he said that he knew that medical service of good quality could not be rendered at that price?

A.—I think he expressed that as his opinion.

Q.—Did there seem to be others in the group who expressed the same opinion?

A.—I don't recall. I recall this one gentleman took a very active part in reading off his figures and indicating that it would not do. But it has been done and it is now operating.

Q.—It has not been done on dues, has it?

A.—Yes.

Q.—Has it, Mr. Penniman?

A.—Except for the purchase of equipment.

Q.—How big an exception was that?

A.—\$40,000.

Q.—How big an exception did you make otherwise?

A.—How big an exception other than dues?

Q.—Yes.

A.—None.

Q.—Any contributions from any other association?

A.—From other associations?

Q.—Yes.

A.—No; not that I know of.

Q.—None from the Good Will Fund?

A.—No.

Q.—None from any other association?

A.—None that I know of.

Q.—Who paid the salary of the administrator from August 1938?

A.—That was beyond my time. I don't know what the contract was.

Q.—You were still president, you said, until September or October 1937?

A.—Yes.

Q.—I mean, until 1938.

A.—Oh, no.

Q.—Were you a member in 1938?

A.—Yes.

Q.—Were you on the board of trustees in 1938?

A.—Yes.

Q.—But you do not know who paid the rent on the office occupied by the administrator for Group Health?

A.—After I assumed this new position—

Q.—Just answer that question, please.

A.—No; I don't know what the contract was.

Q.—You knew you were not paying his salary?

A.—I didn't pay any of the salaries.

Q.—I mean, Group Health.

A.—I don't know what arrangements were made. I didn't see the contract.

Q.—Do you know Mr. Taylor?

A.—Oh, very well.

Mr. Kelleher:—Your Honor, I think we have gone far enough with this. It is exactly the sort of thing that your Honor ruled on yesterday. The witness has gone into it far enough.

THE COURT:—He says he does not know anything about the terms of the employment. He said so very definitely. If I misinterpret him he can correct me.

The Witness:—That is correct, your Honor.

By Mr. Leahy:

Q.—See if I understand correctly. You did know that he was the administrator of G. H. A.?

A.—Yes.

Q.—You did know he had a separate office?

A.—Yes.

Q.—But you do not know who paid his salary or who paid the rent?

A.—I would not go so far as to say that. I would not know who paid his salary. I heard that some arrangement had been made, but the details of it I could not tell you about.

Q.—I am not asking for details, but just a broad answer. Who was it you heard paid his salary?

Mr. Kelleher:—Objection, your Honor, as incompetent.

THE COURT:—He may answer that.

A.—I don't believe I can answer, except from hearsay.

By Mr. Leahy:

Q.—You do not want to answer it?

A.—I would answer it in a minute, sir, if I had the information.

THE COURT:—Put your next question.

By Mr. Leahy:

Q.—The meeting on June 24, 1937, Mr. Penniman—do you recall about when it broke up?

A.—Well, I think it lasted for a couple of hours. We went there about 8 o'clock and it was about 10 when we left.

Q.—You were all friendly when you dispersed, were you not?

A.—Yes, very.

Q.—The discussion you had was back and forth as to different notions of what could and what could not be done?

A.—Very friendly.

(Mr. Penniman was next interrogated on the luncheon with Mr. Zimmerman and Dr. McGovern; also the meeting with the District Medical Society.)

By Mr. Leahy:

Q.—You did invite Mr. Zimmerman to the luncheon, did you not?

A.—Yes.

Q.—Did you tell Dr. McGovern you were going to have Mr. Zimmerman present?

A.—I certainly did.

Q.—Are you sure about that?

A.—Yes, sir; quite sure.

Q.—What did you talk about—horses and dogs?
 A.—Well, yes; talked horses and dogs, and we were going to play golf together. We talked about Group Health.
 Q.—Did you talk anything about Group Health?
 A.—Oh, yes, as near as I can recall.
 Q.—Did Dr. McGovern talk to you about the request contained in the letters?
 A.—He did.
 Q.—Did he ask for a copy of the by-laws?
 A.—He may have, sir, during the course of a very general friendly conversation; he may have said it.
 Q.—Did you tell him to go get a copy from one of your 900 members whom you did not name?
 A.—Not in that way; no.
 Q.—Did he ask you for a copy of the contract under which you would render service to your members or subscribers?
 A.—It would be in the by-laws.
 Q.—Did he ask you for a copy of the contract under which you would obtain funds?
 A.—I think he did, or in his letter. I think he brought the question up, as I recall.
 Q.—What did you say to him?
 A.—Practically the same thing that I had said to Dr. Verbrycke, as near as I can remember. I told him that I could not give him the contract, because I did not have the authority to give it, but if they wanted the charter it was a matter of record and they could get that; and that there were copies of the by-laws that had been pretty generously distributed and there would be no difficulty in his getting them.
 Q.—Did you ascribe as the reason why you could not accede to his request for a copy of the contract the fact that you had no authority to give it to him?
 A.—A Federal Home Loan Bank Board contract; yes.
 Q.—Did you say anything, in substance, to this effect, Mr. Penniman, not that you did not have any authority to give the contract, but that he, Dr. McGovern, or nobody else had any right to see it any more than he would have a right to see a contract between the owner of a department store and an express company, if any such existed?
 A.—I can't remember that. It may have come up in the conversation, but I don't specifically remember that statement at all.
 Q.—Did you make any memorandum at all of this conversation that you had with Dr. McGovern?
 A.—No; I didn't think it was necessary. It was a very friendly gathering. I didn't take notes and put them in my pocket.
 Q.—But, at all events, Dr. McGovern left without getting the information he had asked for?
 A.—Yes; but with an explanation.
 Q.—The explanation which you have just given us; is that right?
 A.—Yes; that is right.
 Q.—Did not Dr. McGovern tell you at this meeting that the committee could not intelligently discuss G. H. A. with you unless you supplied them with the information he asked for?
 A.—He may have; I don't recall specifically.
 Q.—I ask you to look at Dr. McGovern's letter, and I ask you if that is not the reason why he asked you to supply him with the information, so he could intelligently talk to you about it?
 A.—He says he is unready to discuss it intelligently.
 Q.—He states on July 15, does he not, that at the recent meeting held in the Medical Society Building, when you, Mr. Zimmerman, and Dr. Brown were present and discussed the plans and purposes of your organization, "you were kind enough to say that your board of trustees would receive a committee from the society for further discussion. The committee of the Society having this matter in charge finds itself unready to discuss the matter intelligently with you without further information. I am therefore directed to request," and so forth. You knew, then, the purpose of his request from that letter?
 A.—Yes. I think we knew the purpose.
 Q.—You mentioned one other occasion when I think you said you saw Dr. Neill, Mr. Penniman. Can you give me the date on which you saw him?
 A.—At his office?
 Q.—Yes.
 A.—I think it was in November.
 Q.—On the occasion of that visit you went up there with several members of the board of trustees, did you not?
 A.—That is correct.

Q.—How many did you take along with you on that occasion?
 A.—I took as many of the board as we could find. I mentioned their names.
 Q.—Some five or six?
 A.—I think so; yes.
 Q.—Did you go up to Dr. Neill's office to discuss the case of this young lady who had been admitted to Garfield Hospital and operated on by Dr. Schoenfeld?
 A.—Yes.
 Q.—Is that the purpose you went there for?
 A.—That is the purpose.
 Q.—Why didn't you say something about it in the confirmation of your visit and in that letter?
 A.—We did not discuss that question at all. He said he did not know anything about it; and then we got off of the subject and on to how poor the hospitals were in Washington, and about the selection of the medical staff, and then I asked a specific question by which I wanted to refresh his mind for the record—
 Q.—If I am wrong, please correct me. I thought you stated that the purpose of the visit of yourself, together with as many of the members of the board of trustees as you could get, was to go to Dr. Neill about this incident at Garfield Hospital.
 A.—That is right.
 Q.—The very next day you wrote a letter as to what occurred there, did you not?
 A.—Not altogether; not all of it. I only gave the highlights.
 Q.—But the purpose no longer constituted a highlight for the purpose of this letter?
 A.—Because Dr. Neill told us he did not know anything about it.
 Q.—Answer the question. Did that constitute any highlight for the purpose of this letter?
 A.—It is not so incorporated in there.
 Mr. Leavin:—Let him complete his answer. He was in the middle of his answer when Mr. Leahy cut him off.
 Mr. Leahy:—I did not want to cut him off. If I do, you hold me up. I get anxious to go ahead.
 The Witness:—Maybe the witness is a little slow.
 Mr. Leahy:—I am sorry, Mr. Penniman.
 The Witness:—The real purpose was—it was arranged the very next day after the incident at Garfield that we go up for the purpose of discussing that case, and of course after we discussed it or started to talk to him about it and told him that as the president of the District of Columbia Medical Society we thought he ought to know about a thing of that kind, he said he did not know anything about it and had not heard about it; and I am inclined, as I recall now, to think that he said that he would look into it and would find out, that he had not heard about it. Then we got on to a very interesting subject, the specific question as to whether or not hospitals were operated for the patients or the doctors, and answers to specific questions, the fourth one, I think, on the last page, with reference to falsely charging a physician in a suit for libel. That statement was made by Dr. Neill; he made that point. So they were just highlights of the subjects we discussed that I put into the letter.
 By Mr. Leahy:
 Q.—Why did you consider it necessary to write to Dr. Neill a résumé of what you considered to be the highlights of the discussion?
 A.—Did I start off in the beginning of the letter by stating my reasons?
 Q.—Yes; you did. You said:
 "It was good of you to give so generously of your time to the representatives of Group Health Association when they called on you at your office on Saturday afternoon. It has been my experience that when a group of men are gathered to discuss any subject varying opinions as to what was said often times result, notwithstanding the sincerity of all present. Wishing to avoid this in this instance I have deemed it advisable to confirm in substance the highlights of our discussion as follows"—
 And then you related them.
 A.—That is correct.
 Q.—Did you personally make this appointment to see Dr. Neill?
 A.—I think I did.
 Q.—What did you tell him when you called him up?
 A.—I told him we wanted to come up to see him.
 Q.—What else?
 A.—I think he said he would be glad to see us. He was very nice about it.

Q.—Did you ask to see him officially, in his official capacity, as president of the Medical Society?

A.—No; I don't think so.

Q.—Was anything said about that?

A.—I don't think so. At the time we called up Dr. Neill he was certainly very gracious, and we told him we would like to come up to see him about a matter, and he said to come on up.

Q.—Let me see if I can refresh your recollection. The day that you saw Dr. Neill was a Saturday, was it not?

A.—That is correct.

Q.—This was a Saturday afternoon you asked to see him?

A.—Yes.

Q.—And when you called up he said, all right, he would forget about its being Saturday afternoon and stay right there and would be glad to see you?

A.—He was very nice about it; yes.

Q.—Did he say that this is "off the record and not official and not to be publicized?"

A.—Yes.

Q.—And the meeting in his office was then supposed to be a chat between you and him—and when I say "you," I mean you and your group, not in any official capacity at all, but just as gentlemen sitting around the table and discussing a subject about which gentlemen might disagree. Is that right?

A.—That is right.

Q.—And there was not supposed to be any publicity about it whatsoever, was there?

A.—No.

Q.—That is what you meant, was it not, when you wrote in your letter the next day:

"I also wish to confirm our understanding that what was said by you to us was in confidence and in no wise intended for the purpose of publication."

A.—That is right.

Q.—Why did you think it was necessary, in a confidential chat which was supposed to be off the record, between you gentlemen, and not in your official capacity, to make a record which could be produced?

A.—I was careful to send it to him under personal cover.

Q.—Did you keep a copy?

A.—Yes, in my personal files.

Q.—Was there any reason for that?

A.—I said it was not for publication, and it has never been published.

Q.—It has not been published now, has it, according to your idea of publication?

A.—I don't believe so.

Mr. Lewin:—This witness was required by the Government of the United States to appear here under subpoena to testify.

Mr. Leahy:—Was he required to keep a copy in his files so that he would know about it?

Mr. Lewin:—He was required to bring all relevant documents that bore on this charge.

By Mr. Leahy:

Q.—Did you keep a copy that you made of this letter in the official files of G. H. A.?

A.—I don't think we did. I think I kept it in my own personal files.

Q.—How did the prosecution get hold of the copy?

A.—I didn't give it to them. I don't know how they got it.

Q.—You don't know how they got this (indicating)?

A.—Is not that the original?

Q.—Yes.

A.—I don't know how they got the original.

Mr. Lewin:—That was subpoenaed from the District Medical Society.

By Mr. Leahy:

Q.—If this was a confidential chart, not for purposes of publication and not in your official capacities, how did you address your letter to him as president of the District Medical Society, and address it to the office of the Medical Society of the District of Columbia?

Mr. Lewin:—We object to that as incompetent, irrelevant and grossly immaterial.

THE COURT:—The witness has said that it was a confidential chat between these gentlemen. If there are circumstances which might bear on that statement, I think they have a right to know what they are.

Mr. Lewin:—What difference does it make whether it is official or not?

THE COURT:—It goes to the question of credibility and the credence to be given to the testimony of the witness.

Mr. Lewin:—Is he planning to show that it is not confidential?

THE COURT:—I do not know what he is planning to show. I am only passing on each question as it arises.

Mr. Lewin:—What possible bearing can it have on the issues of the case?

THE COURT:—Objection overruled.

The Witness:—This was not sent to the Medical Society. I don't believe. I think if you will look at the address on there you will find it is 1824 Massachusetts Avenue. I think that is Dr. Neill's office.

By Mr. Leahy:

Q.—It is sent to him as president of the Medical Society of the District of Columbia?

A.—Yes. We went to see him in his capacity as president of the Medical Society.

Q.—You did?

A.—Yes. We told him that in the beginning, in the very first opening statement, that "We are coming to you because you, as president of the District Medical Society, should know about a situation of this kind."

Q.—I want to ask you this, and I am going to try to put it as clearly as I can so that I will not be misunderstood. When you called Dr. Neill and asked to see him, did he not say to you that Saturday that he would not see you in his official capacity, but that he would be glad to see you and would take away his Saturday afternoon and remain at his office to chat with you off the record in a confidential way?

A.—No.

Q.—That you say he did not say?

A.—I don't recall that he said that at all.

Q.—Did Dr. Neill appear to have any knowledge at all about the incident concerning which you said you went to see him?

Mr. Lewin:—He has already testified to that.

THE COURT:—That has been covered.

By Mr. Leahy:

Q.—He said he would look into it?

A.—That is my recollection.

Mr. Lewin:—He has testified to that, too. I think there ought to be some limit to this.

THE COURT:—Yes; I think there is quite a little repetition here.

Mr. Leahy:—I did not know that he had said that. It is just one question, if it is repetitious.

By Mr. Leahy:

Q.—From what source had you received your information about what you told Dr. Neill?

A.—I got it from Dr. Brown and it was confirmed by Dr. Lee.

Q.—What is Dr. Lee's full name?

A.—Allan E. Lee. I think his initial is "E."

Q.—Did Dr. Allan E. Lee talk with you personally about it?

A.—He did, personally.

Q.—Dr. Lee, I think you stated, at that time was on the staff of G. H. A.?

A.—Yes, sir.

Q.—And he had hospital privileges, did he not?

A.—That is right.

Q.—At Garfield Hospital?

A.—That is correct.

Q.—Courtesy privileges?

A.—Right.

Q.—The same as any one of these 400 doctors whom you mentioned in your letter?

A.—That is right.

Q.—And you told Dr. Neill that Dr. Lee had brought this lady to the hospital?

A.—Yes.

Q.—And then there was some discussion about—what? What was it you told him?

A.—There was some discussion that if she were in any way connected with Group Health Association, this Dr. Schoenfeld said, "I can't have anything to do with her." And she was upstairs then in a critical condition.

Q.—Was that statement made to Dr. Neill, that Dr. Lee was in the hospital at that time when the discussion took place?

A.—Oh, yes.

Q.—He was right there?

A.—Dr. Neill was not. You mean, Dr. Lee was?

Q.—Yes.

A.—Dr. Lee was present and heard it.

Q.—And Dr. Lee had the courtesy privilege to treat patients in that hospital?

A.—Yes; not surgical, however. He was not a surgeon.

Q.—But Dr. Lee had engaged Dr. Schoenfeld to perform the operation?

A.—I would not know that. Arrangements had been made for Dr. Schoenfeld to perform the operation. She was carried there in an ambulance and Dr. Schoenfeld was to be there and do the operating.

Q.—Did you tell Dr. Neill what time she got to the hospital?

A.—Yes.

Q.—What time was it?

A.—I described that she was found unconscious on the floor of her bathroom while she was dressing, and they rushed her right to Garfield Hospital.

Q.—What time of the day?

A.—Early in the morning, about seven-thirty.

Q.—Did you have information as to when she was operated on?

A.—No.

Q.—You did not find that out?

A.—It was during the day, because—

Q.—All right.

Mr. Leavin:—Let him finish.

A.—I think Dr. Lee made a statement to these doctors and they said, "We can't touch her if she is connected with Group Health." He said, "I am on the courtesy staff and I am bringing this patient in as my patient."

By Mr. Leahy:

Q.—Then what happened?

A.—They said, "If that is the case, it is all right." And then the young lady was operated on that morning.

Q.—As soon as the hospital found out that Dr. Lee was bringing the lady to the hospital as his patient, Dr. Schoenfeld operated on her; is that right?

A.—I think that is correct; yes.

Q.—I don't quite get you then, what would cause you to go up to Dr. Neill to report.

A.—Because she was in a critical condition and the doctors were arguing that they could not go up if she was a member of the Group Health Association.

Q.—As soon as the hospital found out that Dr. Lee's patient was upstairs, Dr. Schoenfeld went up?

A.—Yes; but Dr. Lee was late getting there.

Q.—I thought you said he was there?

A.—She was taken in an ambulance, right from the house. Dr. Lee was called to the house and found her, and she was taken in the ambulance, and then arrangements had been made and Dr. Lee came in 30 or 40 minutes later and found that nothing had been done, and that is when he heard the conversation in the corridor of Garfield Hospital, and then Dr. Schoenfeld said in a loud voice, for the benefit of several of the doctors around there, "If she is a member of Group Health I'm sorry, but I can't do anything about it."

Q.—But he did operate on her?

A.—Then it was Dr. Lee said, "I am registering her here as my patient. I am on the courtesy staff."

Q.—I do not quite follow what you told Dr. Neill you went up to see him about. She was still a patient of Group Health when—

THE COURT:—I think you have gone over that. I think it is quite argumentative. I think this is a good point at which to stop. We will take our adjournment now until ten o'clock tomorrow morning.

(To be continued)

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Change in Status.—H. R. 3204 has been reported to the House, making additional appropriations for the fiscal year 1941 urgently required for the Work Projects Administration and certain other federal agencies. This bill, among other things, proposes an appropriation of \$525,000 to enable the Surgeon General of the Public Health Service to assist state and local health authorities in health and sanitation activities (1) in areas adjoining military and naval reservations, (2) in areas where there are concentrations of military and naval forces, (3) in areas adjoining government and private industrial plants engaged in defense work and (4) in private industrial plants engaged in defense work. This appropriation, too, will be used to provide emergency health and sanitation services in government industrial plants engaged in defense work and in areas adjoining United States military and naval reservations outside the United States.

Bills Introduced.—S. 783, introduced by Senator Murray, Montana, proposes to amend the Selective Training and Service Act of 1940. This bill is apparently a substitute for another bill introduced by Senator Murray dealing with the deferment under the Selective Training and Service Act of medical students, interns and residents. In addition, the bill provides that any individual selected for training and service who is a graduate of a medical school and is eligible as such a graduate for the examinations given by the National Board of Medical Examiners or who was so eligible at the time of his graduation, or who is a graduate of a school of dentistry or holds a degree of doctor of dental surgery or doctor of dental medicine and who holds a license to practice medicine, surgery or dentistry in any state, territory or possession and is engaged in such practice at the time of his selection and whose physical and mental fitness for such training and service has been satisfactorily determined, shall, in lieu of induction into the land or naval forces of the United States, be commissioned an officer in the Medical Department Reserve, Officers' Reserve Corps and ordered into active military service as provided by law. S. 797, introduced by Senator Walsh, Massachusetts, provides for the establishment of a National Physical Fitness Institute in the Federal Security Agency. This institute would be authorized (1) to select, prepare and conduct research with respect to tests and testing instruments for the purpose of testing physical fitness; (2) to select, prepare and conduct research with respect to follow-up procedures, forms of reports and methods of cooperating with

agencies engaged in medical and health work, for the purpose of conserving and increasing the physical fitness of the American people; (3) conduct research for the purpose of determining the most efficient and practical methods of conserving and increasing physical fitness; (4) train specialists in the work of conserving and increasing physical fitness; (5) prepare reports and bulletins with respect to the conservation and increase of physical fitness for use by organizations and the general public; (6) on request, investigate the needs of organizations and industries for, and, to the extent possible with its personnel, cooperate with such organizations and industries in providing physical fitness services for their members and employees, and (7) cooperate with departments and other agencies of the government in programs designed to conserve and increase the physical fitness of their officers and employees. S. 839, introduced by Senator Sheppard, Texas, proposes to authorize the appointment of female dietitians and female physical therapy aides in the Medical Department of the Army. This bill provides that the Secretary of War is authorized and directed to provide for the appointment in the Medical Department of the Army of such number of female dietitians and female physical therapy aides as he may determine to be needed in the administration of laws providing for the hospitalization in army hospitals of officers, warrant officers and enlisted men of the regular army.

STATE MEDICAL LEGISLATION California

Bills Introduced.—S. 1125 proposes to authorize the governing body of a city or county to employ one or more licensed optometrists to attend to such optometric conditions as the governing board of the city or county may designate. S. 1032 proposes to create a medical research board to engage in research particularly in those fields having to do with cancer, diseases of the heart and kidney ailments. The board is to consist of the respective heads of the schools of medicine of the University of California, Stanford University and the University of Southern California and two physicians appointed by the governor. A. 671 proposes that on the trial of any person charged with driving while intoxicated evidence shall be admissible as to the amount of alcohol in the defendant's blood at the time of the commission of the alleged offense as shown by a clinical analysis of the defend-

ant's breath, urine or other bodily substance. S. 1129 proposes to make it a misdemeanor to employ on full time a physician and surgeon or an osteopath for a salary, wage or stipend of less than \$100 a month. S. 977 and A. 1301 propose to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. The bills propose to define naturopathy as "the treatment of the sick and afflicted by the use of such substances as light, air, water, clay, heat, rest, diet, herbs, electricity, massage, Swedish movements, suggestive therapeutics, magnetism, physical and mental culture." A. 1349, to amend the medical practice act, proposes to authorize the issuance of a "herb practitioner's certificate." A. 1507 proposes to create a State Board of Medical Laboratory Personnel Examiners to examine and license applicants for licenses to practice as clinical laboratory technicians or clinical laboratory technologists. A. 1570 proposes to require cooks, bus boys, waiters, waitresses, dish washers, dish dryers, and domestic servants to obtain certificates from the State Board of Health that they are not infected with any communicable disease. A. 1760 proposes that no employer or insurance company shall contract with any physician, hospital or other person for the medical or surgical care or hospitalization of any injured person on the basis of such physician, hospital or other person receiving a percentage of the gross premiums collected by such insurance company, on the basis of any percentage of such employer's pay roll, or on the basis of any fixed charges which are less than the reasonable value of such services as fixed by rates adopted by the Industrial Accident Commission. A. 1853, to amend the workmen's compensation act, proposes in effect to permit drugless practitioners to render at the expense of the employer such medical aid as an injured worker may require. A. 1988, to amend the workmen's compensation act, proposes in effect to permit osteopaths or chiropractors to render at the expense of the employer such medical aid to injured workmen as their industrial injuries may require. A. 2089, to amend the medical practice act, proposes to eliminate the right of the examining board to issue a drugless practitioner's certificate.

Connecticut

Bill Introduced.—H. 773 proposes to appropriate \$100,000 to the state department of health for the biennium ending June 30, 1943 for research and study of the cause and control of cancer.

Georgia

Bill Introduced.—H. 273 proposes to provide for a board of trustees to control, operate and manage any county hospital owned or controlled by any county having a population of from fifty to sixty thousand inhabitants. The bill specifically vests in the board the right to determine and specify what physicians and surgeons shall be admitted to practice in the hospital, and only such physicians and surgeons shall be admitted to practice in such a hospital as have first obtained a permit from the board so to do.

Idaho

Bills Introduced.—S. 22 proposes to enact a separate naturopathic practice act and to create a board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy as defined in the bill. This bill was reported unfavorably to the senate, February 5. S. 41 proposes to repeal the present osteopathic practice act and to enact a new one in its stead, which would if enacted, permit licensed osteopaths to practice "surgery and obstetrics and the use of antiseptics, anesthetics, narcotics and biologics." H. 117 proposes to grant to hospitals treating a person injured through the fault of another liens on any cause of action, suit, claim, counterclaim, demand, compromise or settlement accruing to the injured person because of his injuries. H. 124, to amend the chiropody practice acts, proposes, among other things, to define chiropody to mean "the diagnosis, mechanical, electrical, medical or surgical treatment of the human foot and leg, provided that chiropodists be limited in their practice to the human foot and leg." The bill further provides that "surgical treatment, as herein used, shall be held to mean

the surgical treatment of abnormal nails, corns, callosities, bunions and other minor foot ailments and shall not include the amputation of the foot or leg, surgery of the leg, or the use of any anesthetic other than local anesthetics."

Iowa

Bill Introduced.—H. 168 proposes to condition the issue of a license to marry of the presentation by each party to the proposed marriage of a physician's certificate that the party is free from syphilis or is not in a state of that disease whereby it may become communicable as nearly as can be determined by a thorough physical examination and such standard microscopic and serologic tests as are necessary for the discovery of syphilis.

Maine

Bill Introduced.—S. 295 proposes to create a state board of eugenics which is to be authorized to order the sexual sterilization of any person living in the state who is feeble-minded, insane, syphilitic, a habitual criminal, a moral degenerate or a sexual pervert and is thereby a menace to society in that he or she may produce offspring having an inherited tendency to the social inadequacies noted.

Maryland

Bill Introduced.—H. 247 proposes to prohibit the employment of any food handler unless he presents a certificate from the county health officer that he is free from trachoma, active tuberculosis of the lungs, open skin tuberculosis, syphilis, gonorrhea, open external cancer or barber's itch.

Michigan

Bills Introduced.—H. 110 proposes to authorize the organization and operation of nonprofit osteopathic service corporations whereby osteopathic service may be provided at the expense of such corporations to such persons or groups as become subscribers to such plans under contracts which will entitle each subscriber to definite osteopathic service, by licensed osteopaths in their office, in osteopathic hospitals and in the home. H. 117, to amend the workmen's compensation act, proposes to make compensable "any disease contracted by any employee or person engaged in public health work." H. 131 proposes to prohibit the retail sale or distribution of barbituric acid, chloral hydrate or paraldehyde except on the prescription of a licensed physician, surgeon, osteopathic physician, dentists or veterinarians. The bill proposes to require the practitioners mentioned to keep a record of all "such dispensations or prescriptions." The bill also proposes to make it the duty of every physician, surgeon, osteopathic physician, dentist, veterinarians, druggists, pharmacists or hospitals, when dispensing any barbituric acid, chloral hydrate or paraldehyde to mark on the dispensing container the name, address of the patient, the date, the quantity of drugs and the name of the person dispensing the same.

Montana

Bill Introduced.—S. 70 proposes to prohibit the operation of a maternity hospital without first obtaining a license from the state board of health. The bill proposes to define a maternity hospital as any place receiving within a period of six months for care or treatment during pregnancy or during delivery or within ten days after delivery more than one woman.

New Jersey

Bill Introduced.—S. 29 proposes a procedure whereby hospitals may be reimbursed for care rendered to indigent persons injured in automobile accidents.

New Mexico

Bills Introduced.—S. 34 proposes to make it the duty of all surgeons, physicians and other persons licensed by the state to treat the sick or injured, who may treat or operate on any person for or on account of any gunshot wound, to report the fact of such treatment within twenty-four hours thereafter to the nearest or most available peace officer in the state. S. 38 proposes to make it the duty of "every physician, surgeon or other person licensed by the state of New Mexico to treat sick or injured persons to forthwith and

without delay visit and treat any person who may call on them for treatment where such afflicted person resides, within 2 miles of the office of such physician, whenever, in the judgment of such physician, surgeon or other person licensed by the state of New Mexico to treat the sick or injured, such visit can be made without probable injury to other patients of such physician, surgeon or other person licensed by the state of New Mexico to treat the sick or injured."

New York

Bills Introduced.—A. 574 proposes to require every physician immediately to give notice to the appropriate health officer of every case of infantile paralysis under his care. The bill also proposes to create in the state department of health a division of infantile paralysis, which is to be charged with the duty of conducting investigations of the cause, mortality rate, methods of treatment, prevention and cure of infantile paralysis and allied diseases, including the nature and extent of available facilities for the diagnosis and treatment of these diseases. The division is to cooperate with local health authorities, physicians, hospitals, clinics and voluntary associations in the development of suitable facilities for the diagnosis, treatment and control of infantile paralysis. S. 521 and A. 620 proposes that in New York City a domestic servant to continue his or her employment must possess the certificate of a licensed physician certifying that in his opinion he or she is not infected with syphilis or is not in a state of that disease whereby it may become communicable.

Oklahoma

Bill Introduced.—H. 180 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party has been given a standard serologic examination not more than fifteen days prior to the date of application and that in the physician's opinion the person is either not infected with syphilis or, if infected, is not in a state of that disease which may become communicable to the marital partner.

Oregon

Bills Introduced.—H. 150, to amend those provisions of the medical practice act relating to the practice of osteopathy, proposes (1) to create a separate examining board for osteopaths and (2) to authorize a separate osteopathic examining board to examine and license applicants for licenses to practice osteopathy. H. 203 proposes a system of compulsory health insurance.

Texas

Bills Introduced.—H. 121 proposes to prohibit the operation of a hospital, sanatorium or infirmary without a license from the state department of health. H. 122 proposes to authorize the organization and operation of nonprofit corporations to establish, maintain and operate nonprofit hospital service plans whereby hospital care may be provided by such corporations through hospitals with which the corporations have contracted to subscribers to such hospital service plans.

Washington

Bills Introduced.—S. 12 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of the certificate of a licensed physician stating that the party has been given such examination, including a standard serologic test, as may be necessary for the discovery of syphilis and that in the opinion of the physician the party is either not infected with syphilis or, if so infected, is not in a stage of that disease which is or may become communicable to the marital partner. S. 95 proposes to enact a separate naturopathic practice act and to provide for the examining of applicants for licenses to practice naturopathy by a naturopathic examining committee. The bill proposes to authorize the licensing without examination of persons who have been licensed to practice naturopathy, or any other system equal thereto, for at least two years by a state board or committee of examiners of another state. It is not clear whether individuals receiving a license in this manner are to be subject to the basic science act. A literal interpretation of the bill would require their licensing without passing the examinations given by the examining committee in the basic sciences. H. 226, to amend the chiroprody practice act, proposes to define the practice of chiroprody as "the diagnosis and the medical, surgical, mechanical . . . manipulative and electrical treatment of . . . ailments of the human foot, excepting amputation of the foot or toes or the administration of an anesthetic other than local and excepting treatment of systemic conditions or the results and complications thereof."

Wisconsin

Bill Introduced.—A. 149 proposes to require the state department of public welfare to provide in either a state or a county hospital of its selection chiropractic service for the insane for those who request it by their guardian or next of kin. The chiropractic services in such hospital are to be rendered by chiropractors selected by the department from a list furnished by the board of directors of the Wisconsin Chiropractic Association.

Wyoming

Bills Introduced.—S. 33 proposes to provide for the administration on public health in the state by creating county and district departments of health. H. 128, to amend the medical practice act, proposes that the board of medical examiners shall act on an application for a license by reciprocity within six months from the time of its presentation, "but nothing herein shall prevent the applicant from practicing within the state at any time after the application has been made and the certificate presented to the board."

Bill Passed.—H. 120 passed the house, February 10, proposing to require a physician licensed to practice medicine attending a pregnant woman for conditions relating to her pregnancy during gestation or at delivery to take or cause to be taken a sample of her blood at the time of first professional visit or within ten days thereafter, and to submit the sample to an approved laboratory for a standard serologic test for syphilis.

WOMAN'S AUXILIARY

Oklahoma

Mrs. Rush Wright of Poteau, president, Le Flore County auxiliary, presided at the November meeting at the home of Mrs. F. P. Baker, Talihina. Guest speakers were Dr. F. P. Baker, superintendent of the state sanatorium, who talked on "Tuberculosis," and Dr. Noel Kaho, who gave a patient's view of the hospital and reviewed one of his own stories written for children. The members of this group have taken up Red Cross work as their special project.

There are 152 members of the auxiliary to the Oklahoma County Medical Society, of which Mrs. F. Maxey Cooper, Oklahoma City, is president. This group is making layettes for underprivileged children in the Crippled Children's Hospital as its special project. The auxiliary entertained for the wives of physicians who attended the Oklahoma City Clinical Society Conference in November.

Mrs. Edward D. Greenberger of McAlester, president of the Pittsburg County auxiliary, had the November meeting at her home. Its special projects are providing cod liver oil for needy children, sending flowers to out-of-town hospitalized patients and sewing for the Red Cross. The guest speaker at the meeting was Mrs. Walter J. Dell, who talked on "Human Milk Stations" and *Hygia* articles.

Mrs. J. W. Rogers of Tulsa is president of the auxiliary to the Tulsa County Medical Society, which has 136 active and 11 honorary members. The November meeting was held in the home of Mrs. Harry B. Stewart, where a talking moving picture on "Tuberculosis" was presented. In December the auxiliary had a toy shower, the toys being given to underprivileged children in Tulsa hospitals. It is acquainting the public with the "Doctors at Work" radio program with the use of posters.

ALABAMA

New Infantile Paralysis Center at Tuskegee.—A new Infantile Paralysis Center at Tuskegee Institute, Tuskegee, was dedicated on January 15 with special ceremonies in the institute chapel. The center, which adjoins the John A. Andrew Memorial Hospital, was financed by a grant of \$161,350 from the National Foundation for Infantile Paralysis. The basement floor of the three story building includes a gymnasium, equipment for massage, whirlpool, arm and leg baths, and electrotherapeutic machines of the latest type. A separate room contains a stainless steel Hubbard treatment tank especially for small children. The treatment pool is 25 by 30 feet, with a capacity of more than 20,000 gallons and maintained at a temperature of 92 F. The first floor includes a sound proof lobby, business office, office and treatment room for the chief surgeon, a tiled plaster room, laboratory facilities, a brace fitting room, a small children's ward which has been acoustically treated, head nurse's office and nurses' lounge. The third floor is given over entirely to two and four bed wards for patients. Tuskegee's first specific work for the crippled began in 1937, when Dr. John Watson Chenault, now director of the new center, became head of the Tuskegee Crippled Children's Center established through the cooperation of the Children's Bureau, the provisions of the Social Security Act, the Rosenwald Fund, the Alabama Department of Education and Dr. James N. Baker, Montgomery, state health officer. The speakers at the dedication included Mr. Basil O'Connor, New York, president of the National Foundation for Infantile Paralysis; Dr. Chenault; Dr. Midian O. Bousfield, Chicago, director, Negro health, Julius Rosenwald Fund; Dr. John A. Kenney, medical director, John A. Andrew Memorial Hospital, and Frederick D. Patterson, Ph.D., president of Tuskegee. Greetings from President Roosevelt were read by Mr. O'Connor.

CALIFORNIA

Public Lectures.—The Los Angeles County Medical Association sponsored a series of lectures on February 6 at the Los Angeles County Public Library. The speakers were Drs. William H. Grishaw on "Diabetes"; Charles W. Tidd, "Modern Concepts of Mental Illness," and Madeleine A. Fallon, "The Blood in Health and Disease." All are of Los Angeles.

Hospital News.—A new wing will be constructed at the Samuel Merritt Hospital, Oakland, to cost \$150,000. The building will be called the Fabiola Wing to perpetuate the name of Oakland's first private hospital. The plans have been speeded up through a recent transaction in the superior court of Alameda County by which the Fabiola Hospital Association turned over its current assets to Merritt Hospital. The action of the court in approving the transfer of the property ended a long struggle carried on by the directors of Fabiola Hospital, which, according to *Modern Hospital*, was closed eight years ago because of financial adversity resulting from the large amount of charitable work done.

COLORADO

Outbreak of Botulism.—Two deaths from botulism were reported in the bulletin of the state board of health for January. A man and his wife ate home canned peppers December 14. The man showed symptoms of botulism poisoning December 15 and died the following day. His wife was admitted to the hospital December 17, suffering with the same disorder, and died December 19. Botulism antitoxin was administered to her intravenously at 6:30 a. m. December 18 and at 9:30 a. m. December 19. The peppers were received at the state board of health laboratory December 21. *Clostridium botulinum* was demonstrated in the peppers.

Annual Registration Due Before March 1.—Every licensee of the State Board of Medical Examiners of Colorado is required by law to register annually before March 1 with

the secretary-treasurer of the board and to pay a fee of \$2, if a resident of Colorado, or \$10, if a nonresident. Failure to pay this fee within the time stated automatically suspends the right of a licensee to practice while delinquent. If he nevertheless continues to practice, he is subject to the penalties provided by law for practicing medicine without a license. Failure to pay this fee for three consecutive years results in the automatic cancellation of a delinquent practitioner's license to practice.

ILLINOIS

Society News.—Dr. Herbert E. Schmitz, Chicago, addressed the Winnebago County Medical Society at Rockford, February 11, on "Diagnosis and Treatment of Cancer of the Uterus." —The McLean County Medical Society was addressed at Bloomington, February 11, by Dr. Harold O. Jones, Chicago, on "Tubal Pregnancy." —Dr. George Crile Jr., Cleveland, discussed jaundice before the Sangamon County Medical Society in Springfield February 6.

Outbreak of Measles.—Reports from the state department of health indicate that an outbreak of measles in Illinois is reaching epidemic proportions. During the first five weeks of 1941, 5,512 cases were reported, more than four times the number of cases on record for the entire year of 1939 and more than half the total number of cases recorded for 1940. During the week ended February 3 the total for the state numbered 1,339 as against 30 for the corresponding week last year. The largest number of cases has been reported from the north central section of the state.

Chicago

Illegal Practitioner Fined.—G. M. Davis pleaded guilty in December to practicing medicine without a license and was fined \$100 and \$20 costs by Judge James G. Gullett of Elizabethtown, sitting in the Cook County court, newspapers reported.

Public Lecture on Cancer.—Dr. Alexander Brunschwig, associate professor of surgery and roentgenology, University of Chicago, the School of Medicine, delivered a public lecture at the Chicago Woman's Club February 12 on "The Story of Cancer Research." The talk was given under the auspices of the cancer research committee of the Chicago Woman's Club and the Chicago Medical Society.

Tumor Clinic at Henrotin Hospital.—The dedication of a new tumor clinic at Henrotin Hospital took place January 19 with Mr. Frank A. Miller, president of the board of directors of the hospital, presiding. The speakers included Drs. Joe Vincent McEigs, Boston; Bowman C. Crowell, John A. Graham and Charles B. Puestow. The new clinic has special quarters for the examination, diagnosis and treatment of patients suffering from neoplastic diseases. High voltage roentgen therapy equipment has been installed in a lead lined room, and radium in the form of needles and tubes is also available. Private and charity patients will be accepted for diagnosis and treatment. Special tumor conferences will be held at the hospital on the third Wednesday of each month. Dr. Henry L. Jaffe has been made director of the new clinic.

MICHIGAN

New School of Public Health—Dr. Vaughan Named Professor.—Henry F. Vaughan, D.P.H., health commissioner of Detroit, has been appointed professor of public health at the University of Michigan, where since 1922 he has been special lecturer in public health administration. Dr. Vaughan will also cooperate in planning for a new building and organization of a school of public health which, it is hoped, will be placed in operation this fall. Cooperating in the project will be the W. K. Kellogg Foundation, Battle Creek, and the Rockefeller Foundation, New York, each agreeing to provide \$500,000 for the establishment of the school. Not more than one half of the total sum of \$1,000,000 will be available for site, building and equipment, the remainder to be used over a ten year period for its initial expenses of operation. Dr. Vaughan received his degree in public health at the University of Michigan in 1916. He served as associate professor of public health at Wayne University from 1915 to 1937 and has been professor of preventive medicine and public health at Wayne since 1937 and commissioner of health of Detroit since 1918. During the World War Dr. Vaughan was in charge of the sanitary department at Camp Upton, Long Island, N. Y., and Camp Wheeler, Georgia, and was a member of a pneumonia commission appointed by the surgeon general. He was chairman of the Committee on Municipal Health Organization of President Hoover's Conference on Child Health and

Foreign Letters

LONDON

(From Our Regular Correspondent)

Dec. 31, 1940.

The Prevention of Infection in Air Raid Shelters

The evacuation of children from cities in which they are exposed to air raids has been described previously. But in spite of every inducement by the government a large number of children remain because their parents are unwilling to let them go or to go with them. Compulsory general evacuation has been suggested, but, as befits a democracy, the government has decided against it. There is now to be one exception to the policy of voluntary evacuation. Under the defense regulations the minister of health is taking power to require the medical examination in an area defined by an order, of any child who is thought to be suffering or to be in such a state of health as to be likely to suffer in body or mind as a result of war conditions. If the examination shows this, there will be power to send the child away under the government evacuation scheme. Such children will, if necessary, be cared for in hostels in the country. The chief danger to health for children who remain in London and other areas is infection arising from living in air raid shelters. To minimize this danger the minister of health is taking power for the medical examination of children in shelters with the object of watching their health and enabling direct medical advice to be given to parents. He is also taking power to examine any person in a shelter who is thought to be suffering from an infectious disease or to be verminous and to require isolation, removal to a hospital or cleansing.

Scheme of Compensation for War Injuries to Civilians

A scheme has been in existence for compensating civil defense volunteers and civilian workers for injuries due to enemy action. It has now been improved and extended so as to include all adults whether "gainfully occupied or not." The scheme rounds off the government plan for compensating all civilians who suffer loss of property or personal injury through air raids or other hostile acts. No such measure of protection for civilians against war risks has been devised in any other country. The compensation is comparable to the maximum amount payable under the workmen's compensation act. The injury allowances at present payable to civil defense volunteers and gainfully occupied persons will be increased to the following weekly rates: married men, \$7; single men not in a hospital, \$7; in a hospital, \$5; women not in a hospital, \$5.50; in a hospital, \$3.50. To persons not gainfully occupied the following will be paid weekly: married men not in a hospital, \$4; in a hospital, \$2; single men not in a hospital, \$4; in a hospital, \$2; women not in a hospital, \$3; in a hospital, \$1.50.

The government felt that special consideration should be given to a widow in view of the immediate cessation of her husband's earnings and that provision should be made for the widow of a civil defense volunteer or of a civilian worker comparable to that for the widow of a serving soldier. They therefore decided that such a widow should be paid an inclusive allowance of \$10 weekly for the first ten weeks after her husband's death by a war injury. The government considers that the scheme is preferable to a supplementary state insurance measure, which would have many difficulties. The experience so far of air raid casualties is that most of the injured were not occupied in earning a living.

Though a great advance, the scheme has aroused protest from women leaders, mostly members of Parliament, against the differentiation in the rates to be paid to nonearning men and

women, whatever case there may be for differentiation in payments for lack of earnings. But such differentiation as they object to is common to all our schemes of social service.

Immunization Against Diphtheria: American Help

Crowded air raid shelters and the redistribution of the population caused by the evacuation of children have increased the danger of the spread of diphtheria. The Ministry of Health aims at immunizing at least five million children before the diphtheria season, which is usually early in the year. At the request of the British Red Cross, the American Red Cross is sending to England by air sufficient material for the preventive inoculation of two hundred thousand children, and sufficient to immunize a further eight hundred thousand is following by sea. The ministry has had such an enthusiastic response to its offer of free immunization that supplies of material are running short. We have eleven and a half million children under the age of 15 years.

Rockefeller Grant to the Royal College of Surgeons

The Royal College of Surgeons has been damaged by the explosion of a bomb outside. Because it did not receive a direct hit, the damage is slight, mainly to ceilings. As a precaution the more valuable books and specimens had previously been removed to a place of greater safety. The Rockefeller Foundation has made a gift of \$7,500 for the expenses of evacuating the library and research laboratories.

The Treatment of British Prisoners of War

A satisfactory report on British prisoners of war has been received through the International Red Cross in Geneva. It has been made by two Swiss physicians, Drs. Marcel Jound and Martel. They have been allowed to visit hospitals in German occupied France and Belgium. It is particularly satisfactory that British army surgeons who are prisoners take part in the care of their wounded countrymen.

Marriages

HUBERT DINWIDDIE CROW, Buckingham, Va., to Miss Pattie Gregg Featherstun of Richmond, Nov. 18, 1940.

EARLE SINCLAIR MCKEY JR., Valdosta, Ga., to Miss Alys Katherine Keiley of Atlanta, Nov. 6, 1940.

BURTON EUGENE FIELD, Fayetteville, Ark., to Miss Georgina Corson in Curdsville, Va., Nov. 30, 1940.

FRANK D. ROYCE, Danville, Ky., to Mrs. Margaret Whitlock Lewis of Lebanon, Nov. 27, 1940.

WILLIAM P. HIGGINS JR. to Miss Ruth Connor, both of Fort Worth, Texas, Nov. 21, 1940.

EGBERT VERNON ANDERSON to Miss Rela Brown Randall, both of Atlanta, Ga., Nov. 21, 1940.

PAUL H. HARWOOD JR., Southport, Conn., to Miss Sibyl Young Hine of New York, Nov. 16, 1940.

THEODORE LOUIS TAKACY, Slater, S. C., to Miss Grace Jameson in Greenville, Nov. 16, 1940.

JOHN HUBERT CLARK, Knoxville, Tenn., to Miss Lois Helene Nabrit of Nashville, Nov. 28, 1940.

WALTER JOHN BALZER to Miss Elizabeth Compton, both of Davenport, Iowa, Nov. 30, 1940.

ABNER BURESH to Miss Jane Elizabeth Cray, both of Limc Springs, Iowa, Nov. 28, 1940.

JOEL FLEET, Live Oak, Fla., to Miss Margaret Fishler of Fernandina, Nov. 10, 1940.

MORRIS M. GANDIN to Miss Lucille Slotnikow, both of Los Angeles, Nov. 3, 1940.

GERALD KENT RIDGE, Ventura, Calif., to Miss Priscilla Ferne Beverly, Nov. 8, 1940.

MARTIN CROW to Miss Kathryn Sue Martin, both of Warren, Ark., Nov. 27, 1940.

Deaths

William Clarence Braisted * Surgeon General, Rear Admiral, United States Navy, retired, died, January 18, at his home in West Chester, Pa., aged 76. Admiral Braisted was born in Toledo, Ohio, Oct. 9, 1864. He was graduated from the University of Michigan, Ann Arbor, in 1883 and from the College of Physicians and Surgeons, medical department of Columbia College, New York, in 1886. He served his internship at Bellevue Hospital, New York, from 1886 to 1888, and from 1888 to 1890 he practiced medicine in Detroit. He entered the navy as an assistant surgeon in 1890 and served on many naval vessels. Admiral Braisted was an instructor of surgery at the Naval Medical School, Washington, D. C., on two different occasions. In 1904 he fitted out and equipped the hospital ship *Relief*. He represented the medical department in Japan during the Russo-Japanese war. From 1906 to 1912 he was assistant chief of the Bureau of Medicine and Surgery and assisted in its reorganization. In 1906-1907, during the administration of Theodore Roosevelt, Admiral Braisted was an attending physician at the White House. He was the fleet surgeon of the Atlantic Fleet from 1912 to 1914 and for nearly seven years was surgeon general and chief of the Bureau of Medicine and Surgery, with rank of rear admiral. He retired from the navy in 1920. Admiral Braisted was President of the American Medical Association, 1920-1921; in 1913 president of the Association of Military Surgeons of the United States; president of the National Board of Medical Examiners from 1915 to 1921; fellow of the American College of Surgeons. He served as president of the board of directors of the Columbia Hospital for Women and was on the board of visitors of St. Elizabeths Hospital in Washington. He was president of the Philadelphia College of Pharmacy and Science, 1920 to 1926. Until his retirement from the navy, Admiral Braisted held executive posts with the American Red Cross. He received the Distinguished Service Medal for service during the World War, the Order of Bolivar from Venezuela and a decoration from the Emperor of Japan. He was a fellow of the Royal College of Surgeons of Edinburgh and was awarded honorary degrees by Columbia University, New York; Jefferson Medical College of Philadelphia, and Northwestern University, Chicago.

WILLIAM CLARENCE BRAISTED
1864-1941

Francis Marion Shook * Passed Assistant Surgeon Lieutenant, United States Navy, retired, Oakland, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; entered the navy in 1905; received his commission as passed assistant surgeon March 15, 1908; retired Nov. 8, 1912 for incapacity resulting from an incident of the service; served during the World War; received the Theodore Roosevelt Medal and letter of commendation from Secretary of the Navy for "Service in San Francisco Fire and Earthquake"; member of the Pacific Coast Oto-Ophthalmological Society; aged 60; died, Dec. 27, 1940, in Orinda of pulmonary embolus and cholecystitis with stone.

Fred Ellsworth Clow * Wolfeboro, N. H.; Harvard Medical School, Boston, 1904; formerly secretary of the New Hampshire Board of Registration in Medicine; past president of the New England Association for the Study of Neoplastic Diseases; fellow of the American College of Physicians; past president of the Carroll County Medical Society; served during the World War; member of the executive committee and visiting physician on the staff of the Huggins Hospital; aged 59; died, January 4, of arteriosclerotic heart disease with coronary occlusion.

John Howard Crosby, Fultonville, N. Y.; Long Island College Hospital, Brooklyn, 1895; member of the Medical Society of the State of New York; county coroner; physician of the county jail in Fonda; served as school physician and at one time as member of the school board; health officer of the consolidated health district of Glen, Fultonville and the town of Rout since 1936; on the staffs of the Nathan Littauer Hospital, Gloversville, Amsterdam (N. Y.) City Hospital and St. Mary's Hospital, Amsterdam; aged 66; died, Dec. 9, 1940, of coronary occlusion.

N. Stone Scott, Cleveland; Western Reserve University Medical Department, Cleveland, 1889; fellow of the American College of Surgeons; formerly professor of surgery and at one time dean of the Cleveland College of Physicians and Surgeons, medical department of Ohio Wesleyan University, later amalgamated with Western Reserve; at various times on the staffs of the Cleveland General, Lutheran, St. Luke's and St. Vincent's Charity hospitals; aged 77; died, Dec. 24, 1940, in St. Petersburg, Fla., of heart disease.

Henry S. Crouse, Littlestown, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1905; member of the Medical Society of the State of Pennsylvania; past president of the Adams County Medical Society; for many years member of the school board; on the staff of the Annie M. Warner Hospital, Gettysburg; aged 62; died, Dec. 17, 1940, of coronary embolism.

Arthur Bowles Fleming * Tamaqua, Pa.; Medico-Chirurgical College of Philadelphia, 1902; formerly vice president of the Medical Society of the State of Pennsylvania; past president and secretary of the Schuylkill County Medical Society; served during the World War; aged 65; died, Dec. 21, 1940, in the Temple University Hospital, Philadelphia, of coronary occlusion.

Thomas Bedford Richardson, Toronto, Ont., Canada; Trinity Medical College, Toronto, 1890; Victoria University Medical Department, Coburg, Ont., 1890; F.R.C.S., Edinburgh, 1894; served with the Canadian Army during the World War; member of the Pensions Commission from 1917 to 1929; on the staff of the Christie Street Hospital; aged 72; died, Dec. 1, 1940.

Timothy M. Ryan, Torrington, Conn.; Baltimore Medical College, 1902; member of the Connecticut State Medical Society; past president of the Litchfield County Medical Society; formerly police and fire department surgeon; on the staff of the Charlotte Hungerford Hospital; aged 67; died, Dec. 16, 1940, in St. Mary's Hospital, Waterbury, of bronchopneumonia and nephritis.

John Joseph Decker * Sioux City, Iowa; University of Wisconsin Medical School, Madison, 1931; police surgeon; at one time assistant superintendent of the Lakeville State Sanatorium, Middleboro, Mass.; aged 36; died, Dec. 18, 1940, in St. Joseph's Mercy Hospital of cerebral hemorrhage following an automobile accident in November.

Arthur H. Bursleson, Olivet, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1896; member of the Michigan State Medical Society; past president and secretary of the Eaton County Medical Society; on the staff of the Hayes-Green Memorial Hospital, Charlotte; aged 79; died, Dec. 17, 1940, of heart disease.

Clark E. Congdon, Fort Plain, N. Y.; Long Island College Hospital, Brooklyn, 1890; member of the Medical Society of the State of New York; past president of the Montgomery County Medical Society; on the staff of the Amsterdam (N. Y.) City Hospital; county coroner; aged 72; died, Nov. 25, 1940, of carcinoma of the rectum.

Charles Oliver DeLaney * Winston-Salem, N. C.; Jefferson Medical College of Philadelphia, 1919; member of the American Urological Association; fellow of the American College of Surgeons; on the staff of the City Memorial Hospital; aged 45; died, Dec. 15, 1940, of coronary occlusion.

Harvey Sprague Chapman, Pontiac, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1885; president of the board of education; formerly mayor, health officer, county physician and bank president; aged 79; was killed, Dec. 31, 1940, in an automobile accident.

William Abraham McBride, Indianapolis; Indiana University School of Medicine, 1909; member of the Indiana State Medical Association; served during the World War; aged 64; formerly on the staff of St. Vincent's Hospital, where he died, Dec. 14, 1940, of coronary thrombosis.

Immanuel Pyle, Jersey City, N. J.; Columbia University College of Physicians and Surgeons, New York, 1898; medical supervisor of the city public school system; on the staff of the Medical Center of Jersey City; aged 65; died, Dec. 30, 1940, of a skull fracture received in a fall.

Thomas Joseph Smith, Cranston, R. I.; College of Physicians and Surgeons, Baltimore, 1884; member of the Rhode Island Medical Society; on the staff of the Homeopathic Hospital, Providence; aged 82; died, Nov. 19, 1940, of arteriosclerosis, diabetes mellitus and gangrene.

Samuel Davis Robinson, Clarksdale, Miss.; University of Tennessee College of Medicine, Memphis, 1914; member of the Mississippi State Medical Association; aged 62; on the staff of the Clarksdale Hospital, where he died, Dec. 26, 1940, of coronary occlusion.

Clyde Benson Conger, San Jose, Calif.; Stanford University School of Medicine, San Francisco, 1935; member of the California Medical Association; aged 30; died, Dec. 18, 1940, in a hospital at San Francisco of uremia, amyloid disease and chronic ulcerative colitis.

Furman Leaming Pyke @ La Fayette, Ind.; Indiana University School of Medicine, Indianapolis, 1913; served during the World War; aged 52; on the staffs of St. Elizabeth Hospital and the Home Hospital, where he died, Dec. 24, 1940, of poliomyelitis.

Edmund Buckner Sweeney, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1904; on the staffs of the Stetson Hospital and St. Mary's Hospital; aged 58; died, Dec. 25, 1940, in the Jefferson Hospital of pneumonia.

Ira Clifford Duncan, Beaver Falls, Pa.; University of Pittsburgh School of Medicine, 1912; member of the Medical Society of the State of Pennsylvania; aged 59; died, Dec. 30, 1940, in the Rochester (Pa.) General Hospital of metastatic carcinoma.

Samuel Ashton Bonnafton @ Wilmington, Del.; Jefferson Medical College of Philadelphia, 1887; University of Pennsylvania Department of Medicine, Philadelphia, 1888; aged 73; died, Dec. 28, 1940, in the Delaware Hospital of carcinoma of the cecum.

Linn Van der Heyden Reed, New York; Cornell University Medical College, New York, 1917; served during the World War; aged 50; died, Dec. 22, 1940, in the New York Hospital, Westchester Division, White Plains, N. Y., of coronary thrombosis.

Robert Brodie, Owensboro, Ky.; Medico-Chirurgical College of Philadelphia, 1899; aged 66; died, Dec. 27, 1940, in the Norton Memorial Infirmary, Louisville, of pneumonia following an operation for removal of an oyster shell from his esophagus.

Henry Franklin Schamel, Baltimore; University of Maryland School of Medicine, Baltimore, 1897; aged 68; died, Dec. 29, 1940, in the University of Maryland Hospital of carcinoma of the esophagus and arteriosclerotic cardiovascular disease.

Frank Wilburn Dudley, Manila, Philippine Islands; University of California Medical Department, San Francisco, 1895; fellow of the American College of Surgeons; visiting surgeon, St. Joseph's Hospital; aged 72; died in December 1940.

Erastus Lafayette Walker @ Magee, Miss.; University of Nashville (Tenn.) Medical Department, 1900; past president of the Central Medical Society; aged 67; on the staff of the Magee General Hospital, where he died, Dec. 18, 1940.

William Robert Abbott @ Chicago; Northwestern University Medical School, Chicago, 1911; fellow of the American College of Surgeons; on the staff of the Englewood Hospital; aged 55; died, Dec. 21, 1940, of coronary occlusion.

Samuel Hutchings Price, Montvale, Va.; Bellevue Hospital Medical College, New York, 1876; member of the Medical Society of Virginia; for many years bank president; aged 88; died, Dec. 14, 1940, of uremia and myocarditis.

Joseph Merle Cowen, Glenwood, Iowa; University of Nebraska College of Medicine, Omaha, 1933; member of the Iowa State Medical Society; aged 35; died, Dec. 9, 1940, of injuries received in an automobile accident.

Robert Erle Evans, Ada, Okla.; University of Oklahoma School of Medicine, Oklahoma City, 1934; member of the Oklahoma State Medical Association; aged 31; was killed, Dec. 31, 1940, in an automobile accident.

Alfred Dannhauser @ New York; Eberhard-Karls-Universität Medizinische Fakultät, Tübingen, Württemberg, Germany, 1920; on the staff of the Mount Sinai Hospital; aged 46; died, Dec. 16, 1940, of heart disease.

George Oliver Evans, Miami Beach, Fla.; University of Pennsylvania Department of Medicine, Philadelphia, 1899; formerly on the staff of the Uniontown (Pa.) Hospital; aged 66; died, Dec. 24, 1940, of heart disease.

Charles Wesley Le Fever @ Philadelphia; Jefferson Medical College of Philadelphia, 1897; aged 71; on the staff of the Jefferson Hospital, where he died, Dec. 17, 1940, of carcinoma of the esophagus with metastasis.

Thomas Jefferson Henry @ Detroit; Trinity Medical College, Toronto, Ont., Canada, 1899; aged 79; on the staff of the Grace Hospital, where he died, Dec. 24, 1940, of hypostatic pneumonia and acute bronchitis.

Arthur Burr Coleburn @ Norwalk, Conn.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1890; aged 77; died, Nov. 5, 1940, of myocarditis and arteriosclerosis.

Vittorio Risicato, New York; Regia Università degli Studi di Catania, Facoltà di Medicina e Chirurgia, Italy, 1905; aged 57; was found dead, Dec. 17, 1940, of an overdose of morphine, self administered.

Mary Law Burgess-Barrow King, Chattanooga, Tenn.; Woman's Medical College of Baltimore, 1890; for many years a medical missionary in China; aged 71; died, Sept. 14, 1940, in California of tuberculosis.

Albert D. Wehinger, Kingman, Kan.; Fort Worth School of Medicine, Medical Department of Texas Christian University, 1913; aged 62; died, Nov. 10, 1940, of a malignant growth with metastases to the lung.

Edwin J. Kuh @ Chicago; Universität Heidelberg Medizinische Fakultät, Baden, Germany, 1882; an Affiliate Fellow of the American Medical Association; aged 82; died, Dec. 31, 1940, of heart disease.

Malcolm Benton Boone, Mount Victory, Ohio; Rush Medical College, Chicago, 1890; formerly member of the board of education and county board of health; aged 73; died, Dec. 22, 1940, of heart disease.

Vincent John Hawkins @ St. Paul; Rush Medical College, Chicago, 1881; an Affiliate Fellow of the American Medical Association; aged 85; died, Dec. 11, 1940, of valvular heart disease.

William R. Ross, Mount Vernon, Ill.; College of Physicians and Surgeons, Baltimore, 1880; member of the Illinois State Medical Society; aged 86; died, Dec. 19, 1940, of heart disease.

Ralph E. Cummings @ Bentleyville, Pa.; University of Pittsburgh School of Medicine, 1908; aged 55; died, Dec. 28, 1940, in the Mercy Hospital, Pittsburgh, of roentgen ray burns.

William F. Cathcart, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906; aged 68; died in December 1940 of arteriosclerosis.

Albert F. Houek, Chilesburg, Va.; College of Physicians and Surgeons, Baltimore, 1884; member of the Medical Society of the State of North Carolina; aged 83; died, Dec. 4, 1940.

Alfred R. Cobbs @ Damascus, Ohio; Miami Medical College, Cincinnati, 1893; aged 75; died, Dec. 26, 1940, in the Central Clinic and Hospital, Salem, of perforated duodenal ulcer.

Uel Keith, Fort Worth, Texas (licensed in Texas by years of practice); at one time health officer of Erath County; aged 72; died, Dec. 18, 1940, in Midland of coronary thrombosis.

John Serbert Johnson, White Salmon, Wash.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1880; aged 84; died, Dec. 5, 1940, of bronchopneumonia.

Rebel J. Brown, Gatesville, Texas; Memphis (Tenn.) Hospital Medical College, 1896; aged 70; died, Dec. 20, 1940, of cerebral hemorrhage.

Claude Melnotte Wade, Chicago; Louisville (Ky.) National Medical College, 1891; aged 77; died, Dec. 26, 1940, of cerebral hemorrhage.

Albert Eliphalt Cotes, Springfield, Ohio; Ohio Medical University, Columbus, 1900; aged 66; died in December 1940.

Morris Richman, Philadelphia; Medico-Chirurgical College of Philadelphia, 1908; aged 64; died, Dec. 22, 1940, of pneumonia.

Edwin Dorsey Abraham, Los Angeles; Rush Medical College, Chicago, 1918; aged 49; died, Dec. 17, 1940, of uremia.

Joe Brown Acree @ Paducah, Ky.; Kentucky School of Medicine, Louisville, 1905; aged 63; died, Dec. 27, 1940.

Janette Baldwin @ Brooklyn; Cornell University Medical College, New York, 1901; aged 68; died, Dec. 17, 1940.

Joseph J. Pittman, Charles Town, W. Va.; Baltimore Medical College, 1891; aged 81; died, Dec. 19, 1940.

Walter R. Reed, Jesup, Ga.; Atlanta College of Physicians and Surgeons, 1899; aged 63; died in November 1940.

Oscar K. Hukill, Egypt, Ark.; Barnes Medical College, St. Louis, 1903; aged 67; died, Dec. 14, 1940.

William T. Spears, Rutledge, Ga.; Atlanta Medical College, 1884; aged 86; died, Dec. 7, 1940.

Correspondence

ACETYSALICYLIC ACID DEATHS

To the Editor:—I note in THE JOURNAL of January 11, page 145, the article about deaths from acetylsalicylic acid. In the village of Vandalia, Mich., 5 miles from Cassopolis, is a man who has been a chronic invalid suffering from arthritis deformans for more than twenty years. For seventeen years he has been confined to the use of a wheel chair. The records indicate, and the facts are supported by members of his family, that he has been taking 125 grains (8 Gm.) of aspirin daily for seventeen years without any apparent harmful effects. His family say that they have been unable to reduce the amount.

E. M. CUNNINGHAM, M.D., Cassopolis, Mich.

SEMANTICS OR THE TYRANNY OF WORDS

To the Editor:—I note in the January 18 issue of THE JOURNAL Dr. Ramsay Spillman's comments on the use of initials in his own specialty and further his distaste for the use of EKG, though as he states "out of his own field." To him it suggests a Teutonic flavor.

I was one of the earlier students of the electrocardiograph in this country and the first to establish a modern cardiac laboratory in the state of New Jersey. It never occurred to me, however, that there was a Teutonic flavor to the initials EKG, for as a matter of fact the K might as well be Dutch. My knowledge of this language is practically nil, but I depend on the fact that while temporarily acting as ship's surgeon on a Dutch liner the sign on my office door read "Dokter."

We all have our antipathies, and I mention here one among several. It is the misuse of the word "clinic." To the medical man it suggests instruction at the sick bed, and rightly so for it is derived from the Greek word *kline*, meaning bed. However, today one reads of cooking clinics, real estate clinics, clinics for living, automobile clinics and so on "ad infinitum" and, for the medical man, "ad nauseam."

HENRY WALLACE, M.D., New York.

ROENTGEN EXAMINATION OF GASTRO-INTESTINAL TRACT

To the Editor:—In the communication by Dr. Ramsay Spillman in THE JOURNAL, January 18, referring to the first two paragraphs concerning "A complete g-i examination," I am prompted to ask Why an incomplete g-i examination? Failure to follow a barium sulfate meal through the entire gastrointestinal tract has always seemed a deplorable waste of valuable clinical material. A complete study may prevent mistakes or reveal coincidental disease. In cases of suspected disease of the lower portion of the bowel mistakes will be reduced if both barium meal and enema are observed.

The gastrointestinal tract is, and should be considered as, a physiologic unit. Failure to detect a pathologic condition in this tract (with history and symptoms justifying a gastrointestinal roentgen examination) calls for a cholecystogram.

Complete gastrointestinal roentgen examinations will be less frequently misinterpreted if test meal and stool examinations are routine preliminaries.

These remarks do not pertain to "Diction and Terminology" but are related to the subject of roentgen examinations of the gastrointestinal tract and their correct interpretation.

GREGORY CONNELL, M.D., Oshkosh, Wis.

Medical Examinations and Licensure

COMING EXAMINATIONS

BOARDS OF MEDICAL EXAMINERS

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, February 15, page 647.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, June 23-25. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: Oral. Part II, Cleveland, May 31-June 1. Final date for filing application is April 1. Sec., Dr. Pant M. Wood, 745 Fifth Ave., New York.

AMERICAN BOARD OF INTERNAL MEDICINE: Oral. April, in advance of the meeting of the American College of Physicians and June, in advance of the meeting of the American Medical Association. Written. Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: Oral. Philadelphia, June 6-7. Sec., Dr. R. Glen Spurling, 404 Brown Bldg., Louisville, Ky.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: Part II, Groups A and B, Cleveland, May 28-June 1. Final date for filing application is March 15. Sec., Dr. Paul Tilus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: Oral. Cleveland, May or June. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF OTOLARYNGOLOGY: Oral and Written. Cleveland, May 31-June 2. Final date for filing application is March 1. Sec., Dr. W. P. Wherry, 1500 Medical Arts Building, Omaha.

AMERICAN BOARD OF PATHOLOGY: Oral and Written. Cleveland, June 2-3. Final date for filing application is May 1. Sec., Dr. F. W. Hartman, Henry Ford Hospital, Detroit.

AMERICAN BOARD OF PEDIATRICS: Chicago, May 18, following the Region III meeting of the American Academy of Pediatrics. Boston, Oct. 12, immediately following the annual meeting of the American Academy of Pediatrics. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

AMERICAN BOARD OF RADIOLOGY: Oral. Cleveland, May 30-June 1. Final date for filing application is April 15. Sec., Dr. Byrl R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: Written. Part I. Various centers, April 2. Sec., Dr. J. Stewart Rodman, 225 South Fifteenth St., Philadelphia.

Georgia October Report

Mr. R. C. Coleman, joint secretary, Georgia State Board of Medical Examiners, reports the written examination for medical licensure held at Atlanta, Oct. 8-9, 1940. The examination covered 10 subjects and included 100 questions. An average of 80 per cent was required to pass. Five candidates were examined, all of whom passed. Eleven physicians were licensed to practice medicine by reciprocity and 1 physician was so licensed by endorsement. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Emory University School of Medicine.....	(1938)		86.2
Rush Medical College.....	(1940)		86.5
Tulane University of Louisiana School of Medicine.....	(1940)		83.7
Univ. of Rochester School of Medicine and Dentistry.....	(1940)		83.6
University of Toronto Faculty of Medicine.....	(1938)		87.3

School	LICENSED BY RECIPROCITY	Year Grad.	Reciprocity with
Indiana University School of Medicine.....	(1924), (1936)		Indiana
State University of Iowa College of Medicine.....	(1939)		Iowa
Tulane University of Louisiana School of Medicine.....	(1932)		Tennessee
(1937), (1938) Louisiana			
Johns Hopkins University School of Medicine.....	(1932)		Maryland
Tufts College Medical School.....	(1914)		Maine
University of Tennessee College of Medicine.....	(1939)		Tennessee
University of Texas Faculty of Medicine.....	(1939, 2)		Texas

School	LICENSED BY ENDORSEMENT	Year Grad.	Endorsement of
Rush Medical College.....	(1929)		N. B. M. Ex.

Montana October Report

Dr. S. A. Cooney, secretary, Montana State Board of Medical Examiners, reports the written examination for medical licensure held at Helena, Oct. 1-2, 1940. The examination covered 10 subjects. An average of 75 per cent was required to pass. Four candidates were examined, all of whom passed. Seventeen physicians were licensed to practice medicine by reciprocity and 1 physician so licensed by endorsement. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
University of Southern California School of Medicine ..	(1940)		82.8
University of Illinois College of Medicine ..	(1935) & 1, (1939)		84.6
Temple University School of Medicine ..	(1940)		82.4

School	LICENSED BY RECIPROCITY	Year Grad.	Reciprocity with
College of Medical Evangelists.....	(1939)		California
Loyola University School of Medicine.....	(1938)		Minnesota
Northwestern University Medical School.....	(1938)		Ohio
Rush Medical College.....	(1939)		Oregon
State University of Iowa College of Medicine.....	(1938), (1939)		Iowa
University of Kansas School of Medicine.....	(1923)		Kansas
University of Michigan Medical School.....	(1936)		Michigan
University of Minnesota Medical School.....	(1939), (1940)		Minnesota
St. Louis University School of Medicine.....	(1913)		Arizona

MEDICOLEGAL ABSTRACTS

Malpractice—Alleged Concealment of Sponge as Toll to Running of Statute of Limitations.—The defendant physician, in December 1934, performed an operation on one of the plaintiff's arms. In the course of the operation he unknowingly failed to remove a gauze sponge which had been inserted, and he sewed up the operative wound with the sponge still retained therein. He ceased treating the plaintiff in March 1935 and never examined him thereafter except once in June 1937. In October 1937, another operation was performed on the plaintiff's arm by other physicians and the sponge was then discovered. In October 1938, the plaintiff brought suit against the defendant for malpractice. From a judgment for the plaintiff the defendant appealed to the United States circuit court of appeals, fourth circuit.

The only question which the court was called on to decide was whether or not the plaintiff's action for malpractice was barred by the West Virginia statute of limitations, which requires that such actions be commenced within one year after the right to bring the same shall have accrued. The plaintiff contended that the statute does not run in favor of a party who has, by some act of his own, concealed the cause of action from the knowledge of the injured party. He argued that when the defendant sewed up the wound with the sponge inside he so concealed it that the plaintiff was unable to discover its presence until the subsequent operation in October 1937 and that therefore the statute of limitations would not commence to run until the latter date. The circuit court of appeals held that a right of action accrues when the wrong is committed and, in the absence of some act of intentional concealment by the wrong doer, the mere ignorance of the injured party of the actionable wrong will not suspend the statute. The court admitted that the action of the defendant in sewing up the incision in the plaintiff's arm did conceal the sponge and prevent the plaintiff from discovering that it had been left in the wound, but it held that such conduct was in no sense an act designed or intended to conceal liability or prevent or delay suit. Since there was no evidence of a fraudulent concealment, therefore, the court held that the action should have been commenced within one year of the defendant's last treatment, which the plaintiff had failed to do. Accordingly, the judgment for the plaintiff was reversed.—*Pickett v. Aglinsky, 110 F. (2d) 628 (1940).*

Osteopathy: Right of Osteopath in California to Be Granted a "Health and Development Certificate."—Prior to 1922 the statutes of California provided for the issuance, by the California state board of education, the defendant in this case, of health and development credentials to any one holding a certificate to practice medicine and surgery issued by the California state board of medical examiners. These credentials qualified the holder to perform certain health services connected with the public school system. At that time the state board of medical examiners was the sole licensing agency for practitioners of all schools of healing, including osteopaths.

Accordingly the state board of education, without question, issued certificates of health and development to any osteopath who had been properly licensed by the state board of medical examiners. On Dec. 21, 1922, however, the state of California passed an initiative measure which set up a separate and exclusive licensing board for practitioners of osteopathy known as the state board of osteopathic examiners. After that date the state board of education refused to issue credentials of health and development to any osteopath who held a license granted by the state board of osteopathic examiners. Consequently, in 1930 the state board of education refused to issue such credentials to the plaintiff osteopath, who had been licensed by the state board of osteopathic examiners, because he did not present a certificate to practice medicine and surgery issued by the state board of medical examiners. The plaintiff, therefore, filed a petition for a writ of mandamus to compel the defendant board to issue him a "health and development credential." From a judgment for the plaintiff, the defendant appealed to the district court of appeal, third district, California.

The defendant board admitted that the initiative resulted in no change so far as the requirements and qualifications of an osteopath were concerned but contended that it was justified in refusing to issue the requested certificate since the education law had not been changed but still required a certificate of licensure from the state board of medical examiners. The court held, however, that the legislative intent indicated that the plaintiff should not be deprived of his right to the certificate here sought simply because a board other than the state board of medical examiners was authorized to license osteopaths. Prior to the initiative act of 1922 there was no legislative discrimination between the graduates of medical and osteopathic schools. The only effect of the 1922 act, continued the court, was to change the name of the licensing body. It was not the intent of the legislature, in separating the power to issue osteopathic licenses, to destroy the power of the state board of education to issue credentials to osteopaths licensed by the state board of osteopathic examiners. The court concluded, therefore, that the plaintiff osteopath was entitled to the credentials which he sought. Accordingly the judgment of the lower court, ordering the defendant board to issue these credentials to the plaintiff, was affirmed.—*Jordt v. California State Board of Education, 96 P. (2d) 809 (Calif., 1939).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Treatment of Carcinoma of Breast.—According to Peck and his associates, a review of the case records of all patients with mammary cancer admitted to the University Hospital from 1931 to 1938 emphasizes the importance of providing care to patients with advanced (inoperable) or recurrent carcinomas. Of 920 consecutive admissions suitable for study 514 patients had received no prior treatment, and of these 163 (31.7 per cent) were inoperable. Of 162 patients who had been treated prior to admission by some method other than radical surgery 86 were no longer operable. The cancers of 244 patients had been removed by radical mastectomy at some time prior to their admission, and of these 63 showed no demonstrable recurrence or distant metastases while 181 had local recurrences and distant metastases and were inoperable. Therefore at the time of admission among 920 patients there were 430, or 46.6 per cent, for whom nothing more than palliative treatment could be offered. Also a number of patients classified as "operable" when first examined returned at a later date with recurrences or metastases following initial treatment at the hospital. On the basis of this, more than one half (56.1 per cent) of all patients with mammary carcinoma were considered inoperable. As time goes on further recurrences may be expected. Fixation of the tumor to the thoracic wall, metastases, widespread cutaneous involvement, high degree of malignancy, extensive ulceration with infection and associated pregnancy contraindicate radical surgical intervention. The immediate treatment of such cases is irradiation. Surgery has little to offer for the inflammatory type of carcinoma or "cancerous mastitis" in which the entire breast becomes uniformly enlarged and firm with considerable cutaneous edema. In the management of such a case the best chance for relief is intensive external irradiation, and more than the usual amount of apparently normal skin should be irradiated because of invisible lymphatic extensions. Irradiation of complicating ulcerations by the divided dose method is usually followed by a definite and rapid decrease of the tumor and also a similar decrease in the infection. Some patients have received as much as 3,000 roentgens (fractionated) to areas greater than 100 sq. cm. Surgical removal of the residual local carcinoma and ulcer may be considered from six to eight weeks after radiation therapy is

completed. There were 10 patients among the 920 who were considered as having two breast primaries; the incidence of more than one primary cancer of any type was 3.3 per cent. Local recurrences after mastectomy have already occurred among 54 of 351 patients. Often multiple small subcutaneous nodules of carcinoma arise almost simultaneously in and about the scar, soon followed by similar small nodules throughout the wall of the chest. It is not practical to excise or to irradiate these individual lesions. As a palliative measure, large portals extending well beyond the evident lesions are used and single doses of from 600 to 900 roentgens are applied to each portal (half-value layer = 5 mm. of aluminum and a focal skin distance of 50 cm.). Such doses may be repeated in from two to three months if necessary. For the recurrence that tends to remain localized in the scar, continuously increasing in size until large, hard, nodular masses are formed and ulceration occurs and does not exceed 2 cm. in diameter, from 1,000 to 1,500 roentgens (half-value layer of 5 mm. of aluminum and portals not to exceed 10 sq. cm.) may be applied on three consecutive occasions or a topical application of radium may be used. This treatment usually destroys the local carcinoma and may be effective if the growth is not present in the rest of the scar. Such treatment should not be repeated to the same area. When these lesions are more extensive, the same dose may be delivered to areas up to 50 sq. cm. These doses may be repeated in a few months. Another type of local recurrence resembles the inflammatory form of primary mammary cancer, in which many foci of carcinoma rapidly appear about the scar or other residual focus and soon spread by lymphatic extension in all directions across the wall of the chest. The prognosis in these recurrences is poor, as the carcinoma is usually extending at a similar rate in other parts of the body. Irradiation of the chest may retard the local lesion, but it does not seem to alter the final result. For local recurrence in an unoperated breast previously treated with intensive irradiation the roentgen dose must be reduced because the surrounding normal tissues will not always recover from a second application of heavy radiation. It seems wise to remove the breast whenever possible after the first irradiation and not delay until local recurrence is evident.

- Problem of Diabetic Retinitis. H. Elwyn, New York.—p. 139.

Anoxia in Production of Episcleritis and Scleritis.—Duggan states that the early changes in episcleritis and scleritis are basically similar to those of acute retrobulbar neuritis, acute exudative choroiditis, acute iritis, iridocyclitis, cyclitis and acute closure of the central retinal artery or one of its branches. The early pathologic picture can be ascribed to increased capillary permeability and arteriolar spasm, with resulting tissue anoxia. The early pathologic change consists of localized edema and

round cell infiltration. In severe cases in which the localized anoxia is of sufficient intensity and duration, focal necroses occur. The focal nature of these lesions must be due to a hypersensitivity of one or more arteriolar-capillary units, which accounts for the sharply localized lesions. Substances which act on the capillaries and/or on the arterioles are possible etiologic agents. Capillary permeability is increased beyond physiologic limits by lack of available oxygen in the circulating blood, by lack of ascorbic acid, by histamine, by certain drugs and by spasm of the arterioles supplying the involved capillaries. Also thiamine, nicotinic acid and riboflavin seem to be concerned with oxidative processes in the body. In cases in which the condition is ascribed to menstruation it is said to be due to an excess or deficiency of certain hormones in the blood. Other factors may be temporary alkalosis, allergy, tuberculosis, and so on. All such conditions can be interpreted as manifestations of acute localized tissue anoxia due to varying degrees of arteriolar spasm and increased capillary permeability accompanied by capillary and venular dilatation. Many of the etiologic factors are of endogenous origin and become operative because of temporary failure of homeostatic mechanisms within the body. Multiple etiologic factors are probably operative in most cases. As vasodilator therapy has been of value in the treatment of other lesions of vascular dysfunction, the author used 0.1 Gm. of sodium nitrite intravenously and 15 or 30 mg. of erythryl tetranitrate orally for 5 cases of episcleritis and scleritis. Treatment effected a rapid amelioration of signs and symptoms in from three to eight days. The treatment is based on a consideration of the pathologic physiology which caused the lesions. Patients may not all be helped, but the therapy is indicated for conditions formerly attributed to allergy, focal infection, exposure to cold or tuberculosis. Vasodilator therapy increases the supply of oxygen-containing blood to the anoxic capillaries and tissues. Tissue anoxia is relieved, capillary permeability is decreased, absorption of exudate occurs and anatomic and functional states return to normal, if the tissue anoxia has not lasted too long.

Pernicious Anemia Following Total Gastrectomy.—Meyer and his co-workers report a case of pernicious anemia five years after total gastrectomy. The case, besides illustrating the usual points stressed in the literature, emphasizes the insidious onset, the necessity of indefinite observation and the specificity of liver therapy. The authors followed the case, though intermittently, from the time of resection until the pernicious anemia appeared. The bone marrow was studied before and after liver therapy. The patient's cure was of short duration, as four months after his discharge from the hospital he was readmitted because of having drunk saponated solution of cresol and died within forty-eight hours. Necropsy revealed gangrenous esophagitis and enterocolitis, edema and cloudy swelling of the viscera, acute glomerulonephritis and an anatomically adequate esophagojejunal stoma with considerable dilatation of the jejunum. Also there was marked redness and hypertrophy of the bone marrow, which microscopically showed extreme hyperplasia. The erythrocyte development had reverted to megaloblastic maturation. The bone marrow, studied before and after liver therapy, showed, respectively, the classic changes of untreated and treated pernicious anemia. The first specimen showed extreme hyper-

plasia with marked preponderance of erythroid elements, a "left shift," a megaloblastic type of erythrocyte maturation, granulocyte maturation, and many primitive cells and mitotic figures. Sixteen days after the beginning of liver therapy it was still hyperplastic, but the erythroid elements showed a relatively decreased hyperplasia. Both erythroid and granulocytic maturation had reverted to normal, and the excess of primitive cells and mitotic figures had disappeared.

Mortality in Acute Appendicitis.—Rumbold analyzes the factors contributing to the lowered mortality in 2,013 consecutive cases of proved acute appendicitis observed at the Genesee Hospital between 1925 and 1938. The mortality, as reported by various workers, from acute appendicitis is between 2.16 and 8.5 per cent. Since 1930, when there were 133 proved cases of acute appendicitis at the hospital with a mortality rate of 6.01 per cent, the number of cases has increased 25 per cent and the mortality rate has decreased yearly until 1938, during which year there were 199 cases with a death rate of 0.5 per cent. Study of the factors that have contributed to the reduced rate shows that attention to the following principles may further reduce the mortality: 1. Continued education of the public against delay in calling a physician in the presence of abdominal upsets. 2. Continued education of physicians and surgeons so as to keep them appendicitis conscious, insuring early diagnosis and operation in the first twelve hours. This is particularly necessary in patients less than 10 and more than 40 years of age. The policy of "watchful waiting" has proved disastrous in these cases. 3. Preoperative preparation of the patient who is acutely ill. 4. A well conceived preoperative plan of treatment, which includes evaluation of the stage of appendicitis which will bear on the decision between immediate operation and delay, and on the choice of an anesthetic, the proper incision and the limitations of surgical intervention. 5. Postoperatively, further involvement should be anticipated and those procedures which will aid in combating it should be used. These are attention to fluid balance, use of the duodenal tube to combat nausea, vomiting and distention, and avoidance of fluid or food by mouth or of futile enemas before intestinal tone is restored. Morphine in sufficient amounts to produce its physiologic action is to be given and the patient's condition gaged by daily leukocyte counts and frequent blood pressure readings. Transfusion is essential in the presence of a marked drop. Sex, age, anesthesia, history of catharsis, delay in reaching the surgeon's care still contribute to the mortality. The factors credited for the reduced mortality rate are (1) better postoperative care, (2) use of the McBurney incision and (3) closure of all wounds except those with well walled off abscesses. The delayed or Ochsner treatment has its place in a few cases.

General Abdominal Lymphadenopathy.—Mesenteric adenitis is fairly common and may simulate numerous acute surgical conditions. It may seem to be limited to the lymph nodes with no primary preceding demonstrable lesion. Wilensky points out that general abdominal lymphadenopathies are similar to lymphadenopathies in other areas. In the abdomen many of them are parts of a distinct symptom complex, such as typhoid or dysentery. Others are related to the "rheumatic" group of diseases, and still others to various conditions associated with generalized cutaneous manifestations. A large group seem to be related to a preceding "catarrhal" or "throat" infection, and this seems to have some relation to forms of glandular fever, infectious mononucleosis and abdominal grip. A type of lymphadenopathy which cannot be clinically associated with any demonstrable preceding or accompanying lesion is referred to as nonspecific mesenteric adenitis. The causative agent is not always demonstrable. In only a minority of the cases can bacteria, some strain of streptococcus, be demonstrated in the nodes. No relation with venereal lymphogranuloma can be demonstrated by the Frei test. A causal relation cannot be established between parasites and nonspecific mesenteric adenitis. The port of entry for the causative agent for nonspecific mesenteric adenitis is rarely the appendix. More commonly entrance seems to be related to "catarrhal" or "throat" infections, and infrequently the condition is a manifestation of a hematogenous mechanism or of an agent swallowed from the oropharynx and passed along to the terminal portion of the ileum, from which local absorp-

tion occurs. Most often nonspecific mesenteric adenitis is a local effect of absorption from some local nondemonstrable lesion in the ileal segment. This includes various forms of transient enteritis, surface infections, various gross and microscopic injuries and physical and chemical trauma. Its similarity to cervical adenitis is absolute. In either case local injuries and infections permit the passage of the causative agent to the appropriate lymph nodes. As in many cases abdominal lymphadenopathy is part and parcel of some larger definite clinical entity, treatment must be along the lines for the original disease. In the presence of nonspecific mesenteric adenitis and the absence of suppuration or other complication, abdominal explorations are more or less frequently necessary to establish the true nature of the intra-abdominal condition.

Chemotherapy of Staphylococcal Infections.—Osgood subjected 13 patients with serious staphylococcal infection to treatment with neosarsphenamine or sulfathiazole alone, to neosarsphenamine and sulfathiazole or to neosarsphenamine and sulfamethylthiazole. Twelve of the patients recovered. His limited experience leads him to believe that it is important to start therapy at the earliest possible moment, to maintain blood levels continuously, to drain localized accumulations of pus, to introduce sulfathiazole in suspension locally, as suggested by Spink and Hansen, and to continue treatment for at least one week after evidence of infection has disappeared. The optimal concentration of sulfathiazole is from 5 to 10 mg. per hundred cubic centimeters. In some experiments with cultures of living marrow neosarsphenamine was superior to sulfathiazole, in others the reverse was true. The combination of the two drugs was often more effective than either alone, but always more effective than the less effective of the two used. Neither drug led to complete sterility of the cultures in as many cases as did sulfanilamide against the beta hemolytic streptococcus when similarly tested. The larger the inoculation of organisms, the less effective were the drugs. The available data suggest that each drug will have a place in the therapy of staphylococcal infections and that their combination may prove more effective than either alone in the most serious infections.

Renal Glycosuria.—Babson presents data on renal glycosuria found in three generations of the same family. The youngest (4 years of age) member who has the disorder was especially studied. The oldest living member is the mother and grandmother respectively of the other 2 patients. She is now 52 years of age and has had almost constant glycosuria for twenty-one years. Her oldest brother was known to have sugar in his urine. The mother's oldest son, now 32 years of age, has had glycosuria for nine years and his 4 year old son is also affected, whereas his other 2½ year old son has so far sugar-free urine. The affected boy exhibited ketonuria, mild acidosis and a renal threshold for sugar below 50 mg. per hundred cubic centimeters. His diet was restricted in carbohydrates. Diabetes mellitus with a normal renal threshold has developed in the oldest member. A rise in renal thresholds for sugar to within normal limits has been observed in the other 2 cases. No special form of treatment is usually necessary. The diet should not be restricted. On the contrary, it should contain sufficient additional carbohydrate to offset the loss of sugar in the urine. This will prevent ketosis and maintain an adequate glycogen reserve. The renal glycosuria was transmitted directly as a dominant character.

Ticks and Relapsing Fever in the United States.—Davis states that the first cases of relapsing fever of proved endemic origin were reported from Bear Creek Canyon, Jefferson County, Colo. Since then reports indicative of new endemic areas have been published from ten other states: Arizona, Kansas, Washington, Utah, Nevada, Idaho, New Mexico, Oklahoma, Texas and California and possibly Montana. Ticks have been reported from Florida, Minnesota, New York, Wisconsin and Wyoming. One or more of the six species of *Ornithodoros* that have been reported from each of the seventeen states are *Ornithodoros turicata*, *hermsi*, *parkeri*, *talaje*, *coriaceus* and *coprophilus*. The presence of *talaje* in Northern states is without doubt due to importation in shipments of materials. However, infestation of ten Northern houses has been reported.

Spondylolisthesis.—Blewett presents 2 cases of spondylolisthesis and a discussion of its pathologic anatomy. He believes that examples of the condition in a minor form still occur which have not been generally appreciated. The 2 case histories are of interest because they have some bearing on the production of symptoms and because their type has not been described heretofore. When the recumbent posture is assumed during examination the cases are in no way different from many others. Their interest lies in the fact that the deformity could be demonstrated only in the erect posture and would have passed unnoticed if such examination had been omitted. The need for investigation in this position before an olisthesis is excluded is therefore indicated. The displacement was present only while the patients were erect and slipped back when they resumed the recumbent position. They experienced pain only when they were erect and they were comfortable only when recumbent. The pain of the first patient was typically of a referred sciatic type, and other signs of neural involvement were lacking. The second complained of sciatic pain and a lumbar ache amounting almost to a feeling of dissolution. Lateral roentgenograms in the erect position demonstrated a forward displacement and it is seen that to some extent collapse of the intervertebral disk accounts for the deformity. This mechanism does not operate alone, as a small degree of forward displacement is present. Whatever the possible explanation of the pain may be, the cases suggest that the actual movement of one vertebra on another can be the direct source of a severe form of sciatica.

Hemolytic Streptococci in Cardiac Lesions in Rheumatism.—Thomson and Innes present data on a study of the cardiac valves in 10 cases of acute rheumatism in which necropsy was performed as soon as possible after death. In some of the cases as much as twenty hours had elapsed. Hemolytic streptococci were recovered from the hearts of 5. Ten similar control necropsies were carried out, but from none was a hemolytic streptococcus isolated; however from a heart valve in 3 cases an α type streptococcus was obtained which was not isolated from the blood. Successful cultures were obtained from eleven of twenty-six valves showing acute rheumatic lesions. The condition of many rheumatic patients examined after death is such that negative results are likely to be obtained, as many will have survived the early acute phase. Of the technical

difficulties encountered the most important is the presence of other bacteria, especially coliform bacilli, which gain access to the blood either soon after death or in the agonal stage. These bacteria rapidly overgrow the hemolytic streptococcus. Therefore the isolation of the causative agent cannot be expected in every case, and the authors are not surprised that they were unable to isolate the hemolytic streptococcus from the heart in more than 50 per cent of the cases. They suggest that hemolytic streptococci are the cause of rheumatic fever, being responsible for the valvulitis, and that some other process leads to pathologic valvular changes which allow organisms of various types, including hemolytic streptococci, to lodge there. Clinical and bacteriologic evidence that infection of the upper respiratory tract by hemolytic streptococci precedes and accompanies the syndrome of rheumatic fever favors the first hypothesis. The fact that hemolytic streptococci can be isolated from the damaged heart valves of patients dying from rheumatic fever but not from the undamaged valves or from the healthy valves in control cases supports the hypothesis. The absence of hemolytic streptococci in the blood and their presence in the damaged valve appears to enhance the view. The second hypothesis is favored by the fact that the pathologic reactions in the valves and myocardium are not those generally accepted as typical of streptococcal infections. This difficulty has been overcome by the suggestion that the patient suffering from rheumatic fever reacts in an abnormal way to streptococcal infection. Another argument favoring the second hypothesis is that other types of streptococci were isolated from heart valves and tissues of patients with rheumatic fever and controls when the blood yielded no such organism; a streptococcus was isolated from six damaged valves and from two undamaged valves, a γ streptococcus from seven damaged valves, an α streptococcus from three valves of the control series, type IV pneumococcus from a damaged valve and an α streptococcus from the spleen of 1 of the patients of the rheumatic series. However, the hemolytic streptococcus was isolated only from damaged valves and therefore the authors are inclined to support the view that the cardiac lesions are due to infection with hemolytic streptococci.

Hyperventilation and Effort Syndrome.—Guttman and Jones observed 52 cases of effort syndrome with no demonstrable organic disease. For practical purposes the cases are divided into psychogenic, postinfective and constitutional groups. The authors use the term "effort syndrome" to describe cases which show an excessive physiologic response (breathlessness, fatigue, precordial pain and palpitation) to some forms of exercise or excitement. As soon as the routine examination was carried out on admission the patients were given a hyperventilation test, only the total ventilation being measured as a check of the patient's cooperation. The ventilation in 34 of the 52 cases was measured and the ventilation of 9 was less than 10 liters. In the remaining cases the reading varied between 10 and 18 liters. The patients were instructed to keep on overbreathing for ten minutes, and 18 did so; 5 breathed more than nine minutes and the others gave up after from two to eight minutes, as they thought the symptoms too disagreeable. The authors were satisfied that the purpose of the test—the reproduction of symptoms—was fulfilled when the patients gave up, or that they had hyperventilated sufficiently to justify the conclusion that they were not abnormally sensitive to overbreathing. The patients were asked to describe what they felt. The symptoms described were those commonly associated with tetany—e. g., paresthesias and disturbances of consciousness—rather than those characteristic of effort syndrome. In view of their observations the authors state that they cannot support the contention that hyperventilation has an important place in the etiology of effort syndrome. Only 4 patients complained of more or less characteristic thoracic pain, which is a symptom complained of by 66 per cent of patients with effort syndrome. Palpitation did not occur. It would appear that hyperventilation can be of importance only in a proportion of cases of effort syndrome. The few patients who showed no symptoms as a result of the test overbreathed to an extent far beyond the effort which otherwise produced their symptoms. All the others ventilated sufficiently to reproduce their symptoms or to show tetanic symptoms. Since the latter patients showed tetanic symptoms

for the first time when they hyperventilated, it is reasonable to assume that their original symptoms were not related to over-breathing. There appear to be two ways in which hyperventilation may operate in producing the syndrome; anxiety plus exertion may bring about hyperventilation and subsequently tetanic and kindred symptoms and habitual overventilation. These two possibilities are not mutually exclusive, but it is certain that hyperventilation is an etiologic factor in only some cases.

Sulfonamide Therapy in Lupus Erythematosus.—In view of the probable streptococcic origin of lupus erythematosus, Glyn-Hughes and Spence tried the sulfonamides for its treatment. Sulfapyridine was used for most of the 12 patients treated. Every patient experienced a definite response to the therapy, a point which strongly supports the theory of a streptococcic origin of the disease. Six patients are completely healed and remain so. Even patients who were not benefited, some of them chronic sufferers, were loath to abandon the treatment owing to the hopes to which the initial improvement had given rise. The existence of some latent and resistant focus of infection is probably the cause for the failures. This is illustrated by a patient who relapsed twice, but after a previously overlooked cervical erosion was eradicated she was completely cured. The successes were among those patients who had not suffered from the disease for more than a year. Roughly 25 Gm. of the sulfonamides administered over a period of about four weeks were successful in clearing up what is regarded an intractable disease. The effect of the drug appears specific and suggests that the prognosis in early cases may be favorable.

Composition of Diphtheria Toxin and the Severity of Diphtheria.—According to O'Meara, the hypertoxic type of diphtheria, that is with toxemia caused by the grave type of organism, as it occurs in the human being may be reproduced

in the guinea pig by a combination of Park-Williams number 8 toxin and bacteria-free preparations of grave strains. However, either alone failed to reproduce it. It is deduced that diphtheria toxin has two components provisionally called substance A and substance B. The Park-Williams toxin appears to contain a high proportion of substance A, and the toxin produced by gravis strains was found to contain a high proportion of substance B, in relation to the other substance. Ehrlich's phenomenon, avidity, the Danyasz phenomenon and the failure of toxin-antitoxin titrations to follow a law of multiple proportions can all be readily explained on the hypothesis that exotoxins are composed of two antigenically distinct substances giving rise to two distinct antibodies which together endow an immune serum with its antitoxic properties. Immunity to diphtheria would be not so much a question of the amount of antitoxin in the body as of its quality, in part explaining the occasional failure of artificial immunization. Organisms which produce toxin containing excess of substance B will be able to cause diphtheria in those who are apparently immune as judged by the presence of antitoxin in their blood. This result may not be achieved in the guinea pig owing to its high natural resistance to substance B, but it is not infrequent in the human being. Belief in the efficacy of the Schick test as a means of detecting immunity to diphtheria has recently been severely shaken. It is not difficult to imagine persons with a sufficient quantity of antibody to one of the constituents of diphtheria toxin (presumably substance B) in their blood to render them immune who would nonetheless be frankly Schick-positive, and others with antibody to the other constituent who would be Schick-negative but would not possess sufficient immunity to substance B to protect them from a natural infection.

Congenital Pulmonary Gas Cysts and Obstructive Emphysema in Children.—Two criteria are stressed by Debré and his associates for the differential diagnosis of congenital lung cysts and obstructive emphysema in children. The one concerns the evolution of the disease, the other the actual discovery of the cause of bronchial obstruction. The observation of a gaseous pocket in an area previously observed to be normal indicates obstructive emphysema. The most significant evidence consists in the disappearance of structural outline in the film. Where vesicular emphysema is suspected, stratigraphic verification needs to be made. However, the argument from disappearance may not always be so conclusive because the exact conditions of the disease and the delay involved, for both interlobular and vesicular emphysema, can be fixed only with difficulty. On the other hand, atelectasis (antecedent, associated or subsequent) is evidence of total and valvular obstruction and indicates an acquired lesion. The determination of a foreign body, a tumor growth or an acute pulmonary disorder obviously clinches the diagnosis of obstructive emphysema. Clinical observations, the roentgen rays, the use of a radiopaque medium and bronchoscopic examinations are cooperatively valid aids. Anatomic diagnosis presents similar diagnostic difficulties. In some cases the presence of cartilage, smooth fibers or stratified, ciliated epithelium reveals the congenital character of the lesion. The anatomic diagnostic difficulties may be further enhanced by the presence of vesicles of a secondary emphysema in congenital cysts. In many cases diagnosis may be long delayed because no roentgenograms were made before pathologic signs manifested themselves, because of the impossibility of proving a cause of bronchial obstruction and because of the persistence of the image in the roentgenogram.

 *Cicatrical Endometrioses. H. H. Wespi and M. Kletzhändler.—p. 169.
 Treatment of Cancer of Vulva. E. Held.—p. 195.

Cicatrical Endometrioses.—According to Wespi and Kletzhändler, 73 women with endometriosis in a laparotomy scar had to undergo operation for this condition at one Zurich clinic in the course of sixteen years. The number is enormous when it is considered that world literature reports only 390 similar cases. In 5 of the 73, cesarean section had preceded the development of the cicatrical endometriosis and in the other 68 cases it followed abdominal interruption of pregnancy. The interval between the causal operation and the first pains resulting from endometriosis was on the average one and six-tenths years. In most of the cases, symptoms developed in the course of the first two years after the operation but rarely immediately after. The authors regard implantation of parts of endometrium into the laparotomy wound as the only possible explanation for the high incidence of cicatrical endometriosis as well as for its localization in the angles of the wound. The thought that implantation of parts of endometrium during an operation might be the cause of cicatrical endometriosis has been expressed by other observers. Another proof of surgical implantation is furnished by the fact that cicatrical endometriosis can be prevented by a surgical technic which carefully avoids transplantation of uterine mucosa into the laparotomy wound. The authors describe such a technic which has reduced the incidence of cicatrical endometriosis to about one fourth.

- *Renal Sarcoma in a Seven Month Fetus. K. Muto.—p. 102.
 *The Changes in the Liver of the Rat Caused by 4-Dimethylaminobenzene-1-Azo-1-Naphthalene, and Related Compounds. R. Kinoshita.—p. 165.

Renal Sarcoma in a Seven Month Fetus.—A case of congenital leiomyoma arising in the right kidney in a seven month fetus delivered by artificial induction of labor in a 23 year old woman is reported by Muto. Except for distention of the abdomen, which was moderately pronounced, the external appearance of the fetus was normal, the body length being 34 cm. and the weight 1,010 Gm. When the abdominal cavity was opened, a tumor about the size of a hen's egg originating from the right kidney and covered with the peritoneal membrane was noted. Microscopic examination revealed that the tumor was composed of elongated or spindle-shaped cells scant in cytoplasm; the nuclear chromatin was moderate in amount and presented a uniformly granular arrangement, with only occasionally visible nucleoli. Mitotic figures were frequent. Although some of the cells contained occasional vacuoles, no excess glycogen was demonstrated (formaldehyde fixation). There was a moderate amount of connective tissue fibers between the tumor cells. This type of intra-uterine tumor is relatively rare, since the literature reveals only two similar cases—one described by Kästner (1921), also occurring in a seven month fetus, and another in a newborn infant, as reported by Lubarsch (1925).

Changes in Rat Liver Due to 4-Dimethylaminobenzene and Related Compounds.—Since the discovery by Kinoshita of the carcinogenic effect of 4-dimethylaminobenzene on the liver of the rat, whether fed by mouth or injected subcutaneously, further investigations have been carried out as to the possibilities of production of either cancerous or precancerous changes in this organ by other related compounds. The object of these researches was primarily to ascertain the radical essential to the carcinogenic properties of these organic compounds. The results of observations are summarized in this report. 1. Hydro-azo compound. 4-Dimethylaminobenzene in the animal organism can be reduced into 4-dimethylaminohydroazobenzene, which in turn will be decomposed into dimethyl-p-phenyldiamine and aniline. The latter products of reduction have already been shown to be noncarcinogenic to the rat. The intermediary product, the hydroazo compound prepared synthetically, was given to rats in daily doses of 4 mg. dissolved in olive oil and a little chloroform, for two hundred days with entirely negative results. 2. Sulfodimethylamino compound. A synthetic preparation of 4-sulfodimethylaminobenzene failed to produce any significant changes in the liver of the rat. 3. Naphthalene compound. 2-Methylbenzene-1-azo-1:2-oxy-naphthalene likewise was found ineffective in carcinogenesis, but 4-dimethylaminobenzene-1-azo-1-naphthalene was capable of inducing an atypical bile duct adenoma with considerable fibrous proliferation. With 4-dimethylbenzene-1-2-naphthalene, however, the resulting changes consisted mostly of degeneration of the liver cells and some adenomatous hyperplasia in the gastric glands, with evidence of invasion into the muscularis. 4. Aldehyde and nitroso compounds. A one hundred and eighty day feeding experiment was undertaken, using p-dimethylaminobenzaldehyde, which gave evidence of producing cirrhotic changes in the liver; but in no case were carcinomatous changes observed. Likewise, p-nitrosodimethylaniline led only to degenerative changes in the liver. 2:4-dinitrophenol, fed in daily doses of 5 mg. per kilogram of body weight, produced loss in weight and death in a few weeks. The pituitary glands of these animals showed a considerable decrease in eosinophil cells; the thyroid glands became atrophic, many nuclei of the follicular epithelium were pyknotic, and the colloid either stained weakly or partially disappeared. The animals which survived showed similar changes in the thyroids, but the pituitary eosinophils were increased. The adipose tissue became abundant. No significant changes were noted in the liver. 5. Nonsaponifiable liver fraction. Suggested by the experiments of Schabad, a nonsaponifiable liver fraction was prepared from the organ of a patient who died of carcinoma of the stomach. In one case, daily subcutaneous injections in mice resulted in the development of spindle-shaped sarcoma at the site of injection.

The Health of College Students and National Defense

RUTH E. BOYNTON, M.D.

Director, University of Minnesota Students' Health Service

MINNEAPOLIS

At the time of our last annual meeting one year ago few if any of us had the vision to see the far-reaching effects which the European war would have on our American way of life. During these past twelve months we have witnessed in our country the passage of the first selective service law in peace time. The young men in the country have had their draft numbers assigned to them, and one group has already been called to military service.

The first hurdle to be passed by these young men called for army service is the physical examination. In 1917 and 1918 the United States Army rejected as physically unfit approximately 30 per cent of the young men who were drafted for military service. The question which is being asked today is: Are the young men who will be drafted now any healthier than those were twenty-two years ago? The answer to this question is one which will be of particular interest to all who have been engaged in student health work and other fields of health education during the past twenty-five years.

The high percentage of young men found unfit for military service in 1917 and 1918 gave great impetus to preventive medical work in this country. The development of college health work was greatly stimulated by these findings. Since the majority of physical defects found on the men excluded from army service were preventable in nature, it seemed obvious that, with some provision for the early detection of such physical defects and for their correction, it would be possible to prevent such a large proportion of our young people from acquiring these physical handicaps.

However uneasy we may be about the world situation and however earnestly we may wish to keep the peace in our country, the physical examination of several million young men offers an unprecedented opportunity to gauge the progress which has been made in health

conservation. Incomplete and scattered data for volunteers in the present national crisis indicate that the percentage rejected for physical defects is approximately the same as in 1917 and 1918. The Metropolitan Life Insurance Company thinks, however, that far fewer serious impairments will be found among the young men of 1940 than among those of 1917. Whether or not this is true will be determined only when the results of the physical examinations of large numbers of the drafted men are made available. The progress which has been made in the control of tuberculosis, syphilis, rheumatic heart disease and certain of the communicable diseases which leave disabling sequelae should be reflected in the physical fitness of the present generation of young people.

Although the college group does not represent a true cross section of the young men of draft age, still a college population in a state university can no longer be said to be highly selective. Unemployment among youth today and scholarships and federal aid have put into the college many youths who formerly had no opportunities for higher education. It seemed of interest, therefore, to take a sampling of young men entering a state university and to compare the results on physical examination with the physical standards of the selective service act.

According to the physical standards under the selective service act, the examinees will be classified into three categories:

Class 1-A: Those physically qualified for general active military service.

Class 1-B: Those who are physically unfit for general active military service but fit for special and limited military service.

Class 4: Those physically unfit for any military service.

At the present time only men assigned to class 1-A will be inducted into the army. In brief the regulations say:

The registrant must be able to see well; have comparatively good hearing; have a heart able to withstand

Presidential address, read before the twenty-first annual meeting of the American Student Health Association, Ann Arbor, Mich., Dec. 27, 1940.

the stress of physical exertion; be intelligent enough to understand and execute military maneuvers, obey commands, and protect himself; and be able to transport himself by walking as the exigencies of military life may demand. Examining physicians will accordingly so construe these standards that the objective stated above may be realized.

An unselected sample of one thousand physical examination records of young men entering the University of Minnesota in the fall of 1939-1940 was studied. Of the group of one thousand, ninety-two, or 9.2 per cent, would be assigned to class 4, those physically unfit for any military service, while ninety-four, or 9.4 per cent, would be assigned to class 1-B, those who are physically unfit for general active military service but fit for special and limited military service. Thus a total of 18.6 per cent of these university students would be rejected for active military service at the present time. The reasons for the disabilities in this group bear out the prediction of the Metropolitan Life Insurance Company that the majority rejected are due to minor physical disabilities. Of the ninety-two students whose physical examinations revealed them to be unfit for any military service, fifty were so classed because of underweight according to the selective service standards. It is possible that a number of these young men would be accepted for military service, as the examining boards have been given a good deal of discretion in matters of height and weight. If, in the opinion of the board, proper food and training will make a man capable of giving service, he may be inducted into the service. It is probable also that this number rejected for underweight is higher than would actually occur in university men of draft age, as the majority of the group were under 21 years of age. Diehl's studies showed that college men increased in weight with age and the percentage of underweight students decreased as the age of the students rose.

The next most common physical defect found in this group was a rapid heart rate. According to the physical standards for selective service, a heart rate of 100 or over per minute, when this is proved to be persistent in the recumbent posture and on observation and reexamination over a sufficient period of time, disqualifies a man for any military service. In the thousand university students examined there were twenty-eight who had pulse rates of 100 or over on repeated examinations. In none of these could any organic cause for the tachycardia be found. It is of interest also that in this sampling there were no students with organic disease of the heart.

Three of the thousand students had visual defects of such severity that they would be excluded from military service. There were two with active pulmonary tuberculosis and

two with diabetes, both of which are causes for rejection. One student with duodenal ulcer and one with syphilis are also included in this group. There were only five of the thousand with flat feet which were disabling and which would therefore put them in the group unfit for any military service. One member of the group was disqualified for any military service because of a severe scoliosis.

In a recent issue of *THE JOURNAL* there was a report¹ on the physical examinations of a group of volunteers in New York. Of those who were rejected for military service, 23 per cent were rejected because of dental defects. It is significant that in this group of entering university students there was not one whose teeth were in such condition that he would be put in class 4, and only one student who would be classified as 1-B. The mouths of all the rest were in such condition that they would have been classified as 1-A.

Those students whose physical examinations on entrance to the university were such that, according to the physical standards for selective service, they would fall into class 1-B, as fit for special and limited military service, numbered ninety-four of the thousand. The largest percentage of this group was so classified because of nose and throat defects. There were forty-four who were classed as 1-B, according to the selective service standard, because of nose and throat defects. Seventeen of these had a deviated septum with obstruction to breathing, fifteen had severe hay fever and twelve a chronic sinusitis. Next in importance were defects of hearing. Fourteen of the group had a hearing loss of 50 or more decibels in both ears when tested with the audiometer. The selective service standards do not require the use of the audiometer to determine hearing loss, but rather the spoken voice at 20 feet. Since there have been no standards by which one might translate audiometer readings to compare with the method of testing with the spoken voice, the hearing loss of 50 decibels in both ears has been arbitrarily selected. Using this, however, there were fourteen with a hearing loss sufficient to classify them for limited service.

There were eleven who were classified for limited service because of asthma and eight because of hernia. Twelve of the group were put into class 1-B because of stuttering. There was only one student who was classed for limited service because of a visual defect. It is obvious that in this group of university students the majority who would be excluded or limited, as far as military service is concerned, would be so classified because of relatively minor physical defects.

1. Leone, G. E.: Causes of Rejection for Entrance into the Regular Army Due to Physical Defects, *J.A.M.A.* 115:1283 (Oct. 12) 1940.

Whether these university students are in better physical condition than a true sampling of the general population is not known. The observations in this comparatively small group would indicate that such is the case. While students in a large state university such as the University of Minnesota probably represent a fairly good cross section of the economic and social groups in the area, there is some selection on the basis of intelligence. One would expect this factor of intelligence to have an effect on the health habits and health practices of this group of college students. Not until the results of the examinations of thousands of young men from all sections of the country and from all social, economic, occupational and intellectual levels are available can many questions which come to mind be answered.

Never before have those working in the field of health education and preventive medicine had such an opportunity as the selective service act offers to evaluate the results of public health measures of the past twenty years. Some disappointments may be in store for us, but such scanty preliminary evidence as I have presented indicates that some progress has been made. Likewise such information presents a challenge to all engaged in health work from the elementary school through the college. It seems reasonable to assume that the results of the physical examinations of young men drafted in 1940 will, as in 1918, cause a renewed interest in preventive medicine and health education and give us valuable information which will guide in the development of the public health program of the future.

Digests and Reviews

POOR BUT PERTINENT

Editorial published in the Journal of the Oklahoma State Medical Association, January 1941.

In this hazardous period of social, economic and political instability, which is threatening the accepted foundations of life, including the time-honored principles of medical practice, it is well for us to continue voluntary care of the poor. This can be accomplished either through individual or organized effort. Accumulated experience indicates that individual care is not wholly without material reward.

Dr. Daniel Drake, one of the great in the history of medicine, once said to Dr. Lunsford P. Yandall of Louisville, Kentucky: "I have never seen a great and permanent practice, the foundations of which were not laid in the hearts of the poor. Therefore cultivate the poor. If you need another, though sordid reason, the poor of today are the rich of tomorrow in this country. The poor will be the most grateful of all your patients. Lend a willing ear to all their calls."

In Abraham Flexner's autobiography, *I Remember*, there is a statement suggesting that Dr. Yandall may have passed this advice on to his illustrious sons. Dr. Flexner says that when he was a boy one of them treated him for a severe and obscure illness and that "his remuneration was a weekly loaf of mother's bread, which I regularly used to carry to his home."

Early in his career Benjamin Rush said the poor were his best patients because "God is their paymaster." At the age of 68, on his deathbed, he said to his son: "Be indulgent to the poor." Though a century has passed,

we find the following in the Life of Chevalier Jackson. Dr. W. W. Keen is quoted as having said "Chevalier Jackson's skill was acquired by a lifetime of work with the poor." No man could wish for a greater reward than Dr. Jackson's skill and the realization of what it has meant to humanity.

Returning to the sordid side, it may be pointed out that in the eighteenth century Fothergill, whose annual income was \$125,000, said "I climbed into the pockets of the rich over the backs of the poor."

The author recalls that one of his professors, a brilliant teacher and busy practitioner, attributed his high professional rating among the well-to-do on Fourth Street to the influence of his washerwomen and nursemaid patients in poverty row on the water front.

In his remarkable work on surgery, Henry of Moudeville made the following statement: "If you have operated conscientiously on the rich for a proper fee, and on the poor for charity, you need not play the monk, nor make pilgrimages for your soul."

Let us pray for the preservation of personal freedom in the choice of a physician. It is this that keeps every good doctor's door open to the poor. The doctor needs the chastening influence of their presence, and they need the sense of security and independence which a free choice helps to preserve. In time of trouble there is something intensely vital about this intimate relationship. No doubt this is due to the fact that the true physician is genuinely interested in his patient and does what he can to mend broken bodies without regard to religious faith, moral, social or financial position.

THE SCIENCE AND THE ART OF MEDICAL PRACTICE

A talk before the cardiac clinics by Dr. Frederick A. Willius, Rochester, Minn. Slightly condensed from Proceedings of the Staff Meetings of the Mayo Clinic, Oct. 9, 1910.

The practice of medicine contains two important ingredients, the science and the art of medicine, which must be so subtly blended that a mixture is created that does not predominate in one constituent at the expense of the other.

THE SCIENTIFIC ASPECT

The physician begins his long period of training chiefly under the influence of the science of medicine, including the acquisition of the basic sciences such as anatomy, physiology, chemistry; later the clinical branches of medicine are undertaken, with the result that he is literally stuffed with facts which require time for their proper digestion. Throughout this period little time remains for teaching that equally important ingredient the art of medicine. Frequently no attempt is made to teach this important subject, the assumption prevailing that this finesse will be acquired with experience. This omission is further fostered by the fact that, in a great measure, undergraduate teaching is carried out in charity hospitals and dispensaries where the sick person frequently is a case rather than a patient. The result may be the brilliantly trained scientist who has not acquired the methods to utilize his knowledge to the best advantage, or the scientist with such an encyclopedic knowledge of uncorrelated facts that he is perpetually bewildered by the enormous extent of his knowledge.

THE ART OF MEDICINE

One would not decry the importance of the science of medicine, for obviously this forms the basis of the sage physician, and without a fundamental knowledge of the many branches of medical science he would not be a safe physician. However, the physician must know how to apply his scientific knowledge if it is to be an asset to him and it is at this point that we envision the portals of the art of medicine. The art of medicine comprises many considerations. The physician inevitably acquires a manner which on the one hand may inspire confidence, be pleasing to the patient and at all times exhibit courtesousness and sincerity of purpose or, on the other hand, by virtue of gruffness, obvious insincerity or impatience may create an unremedial impasse between the patient and himself.

The average patient has but little difficulty in appraising the sincerity of purpose of the physician. The physician must be dignified but

it is no longer necessary to assume a painful artificial guise. There was a stage in medical history when the silk hat and the bewhiskered face of so-called maturity were believed to be requisites of the well trained physician, but today no such parade enables us to hide our deficiencies.

THE INDIVIDUAL PATIENT

Every patient is a problem unto himself not only from the scientific aspects of diagnosis and treatment but likewise in the application of the art of management. Individuals differ from one another when they are well and these differences become greatly amplified when they are ill. Probably one of the most difficult feats for the young medico to master, and some never learn this important lesson, is the knowledge that the psychologic reactions of the sick person are apt to be disturbed; notably is this the case with individuals nervously afflicted. Thus, apparent stubbornness and what may appear to be unreasonable attitudes must not be countered with a stubborn, adamant attitude until cautious tact and diplomacy have been exhausted.

NATURE OF "INTUITION"

The physician must train himself to be a practical psychologist so that he may quickly fathom the unspoken reactions of the patient, which are frequently more outspoken than uttered words but which may entirely escape the unwary. It is important that this appraisal be instantly accomplished, for the ensuing procedure may be dictated by a fleeting impression. The ability to delve into the psychic reactions of the patient and often to anticipate unexpressed reactions is frequently referred to as intuition. It comprises no mystic powers but only the alert interpretation of subtle expressions, both uttered and unuttered. As the physician is usually the interrogator, he should always attempt to command this advantage. The approach to each patient necessitates a variation in technic and it is frequently important to engage the individual in general conversation before bluntly plunging into the presenting problem. Many times the alert physician obtains invaluable clues regarding the patient before a word of the individual's physical complaint has been stated.

The physician's knowledge of human nature must be profound. He must recognize the intellectual, critical individual; the emotional, erratic type; the stolid, reluctant personality; the mentally inadequate as well as the ignorant. These are but a sampling of the human problems that constantly confront the physician, who must be prepared to meet these innumerable problems with correspondingly innumerable variations in method.

APPLICATION OF KNOWLEDGE

The scientific physician who does not interest himself in or acquire the subtleties of the art invariably fails in the full availment of his skill and talents to the patient. The purely scientific approach to a medical problem may suffice in many instances but it is just as likely to be thwarted unless applied in a practical, humane and understanding manner, modified if necessary to meet the requirements of the individual. One sees too many frustrations resulting from the inflexible routine of strictly scientific endeavor. There is the physician so trained in a given specialty that he remains aware only of his limited sphere and finds the ant hill instead of the mountain which glaringly rises before him. We all know that profound scientist who possesses all the answers to the store of medical questions, who has passed brilliant examinations and yet who fails miserably as a physician because his knowledge is at loose ends and cannot be correlated when prompt correlation is imperative. When we require the services of a physician for our families we would not choose this type of ultrascientist but rather the inspiring level-headed practitioner, whose experience has endowed him not only with the science, but amply with the art of medicine.

It is regrettable that the student is too often under the influence of the ultrascientist who remains cloistered in an environment that recognizes little of the art of medicine. The passing generation of teachers possessed the art of medicine to a generous degree. The individual, rather than his disease, must be correlated with the individual, the patient must be regarded as a human being and not as a nondescript case, and the human side of the problem must be stressed. Until this concept is more universally adopted, our medical schools will turn out technicians rather than well equipped physicians. This hazard has never been greater than it is today, owing to the modern trend of medical mechanization. This is one reason why the young physician yearns for metropolitan practice so that he may live and work in the shadows of a laboratory, which he has been led to believe is indispensable. It is true that the laboratory is important, but when these methods are stressed beyond their practical application and supersede the physician's first line of defense, namely physical diagnosis, then I am certain that we have lost the primary objective of a truly noble profession.

There is no reason why the assets of the various methods of medical appraisal and practice cannot be practically combined so that the science and the art of medicine can walk side by side. There is little doubt that in the routine practice of medicine more triumphs result from the well blended science and art of medicine than from science alone.

WHY I WANT TO BE A DOCTOR

At the beginning of the school year 1939-1940 Dr. Waller S. Leathers, the dean, requested the members of the first year class at Vanderbilt University School of Medicine, Nashville, to prepare an essay on the subject "Why I Want to Be a Doctor." In response to this request fifty-two essays were turned in and analyzed from the point of view as to how or in what way the following factors influenced each individual in choosing medicine as a profession:

1. Family, including members who are or were doctors.
2. Environment or natural bent.
3. Profession other than family.
4. Subjective.
5. Miscellaneous.

Under the heading of objective reasons twenty-seven students were influenced by the example of professional relatives, twelve by nonprofessional influence, mother, father and others. Eighteen students reached their decision independent of any stated personal example or influence. Two made the decision in spite of discouragement from their parents.

The subjective components were broken down into eight main headings:

1. Early inherent desire; thirteen mentioned this factor.
2. Interest in science courses; this affected twenty-two decisions. Concrete examples mentioned were "love of physics" and interest in psychology and anthropology.
3. Desire for happiness, cited by ten.
4. Desire for economic security, expressed by thirteen.
5. Desire for esteem of others; fourteen gave this reason. Parents and members of medical profession are given as examples.
6. Curiosity, a factor in three decisions.
7. Desire for knowledge influenced fifteen. "Spirit of adventure," "challenge of the difficult" and "field of research" are given as specific motives.
8. Desire to serve humanity, a prevalent factor, influenced thirty-six decisions. Five mentioned an interest in preventive medicine and public health. One named Christian service as a motive.

The striking feature noted in these discourses is the unanimity in those factors considered as of major importance both by students and by the analyst, Dr. Beverly Douglas. The desire to serve humanity was expressed by thirty-six members as a factor strongly influencing their decision. Each of the number discusses this reason at some length, and in the discussions the choice of words and syntactical methods reveal an underlying similarity of basic motive which is astonishing. The decisive influence of family, especially professional family, is also clearly brought out. It would be of interest to be able to compare this analysis of the present group with that of a similar group in other medical schools in various parts of the country.

THE TUTORIAL SYSTEM IN HARVARD MEDICAL SCHOOL

Abstract of an article by Dr. Walter Bauer, published in the Journal of the Association of American Medical Colleges, March 1940.

Twenty years ago Dr. David L. Edsall introduced to Harvard Medical School an innovation in methods of teaching which was a modified form of the Oxford tutorial system. He observed that in our efforts to improve mediocrity we wasted some the finest material in each class and contended that we should allow for the fullest development of the exceptional student as well as the mediocre one. That some medical students do not think was considered the result of the faculty's tendency to tell students what to do and what to think. Many of the products of this system of education are intelligent, but they lack the boldness necessary for departure from the routine. Thus the average student soon tends to believe only what he reads. Edsall thought that the tutorial system might remedy these defects in education.

The system as originally outlined was to allow four tutors, one each in physiology, pathology, medicine and surgery. The students chosen show evidence of superior capacity. No one tutor attempts to direct the work of each man in his group but places each student in intimate contact with the particular member of the faculty best fitted for his needs. The purpose of the tutorial system is to send into medicine men with scientifically trained minds. The majority of men exposed to this system practice medicine. There are rarely more than fifteen men in any one class assigned to tutorial work.

The system has demonstrated that, if given a suitable problem, achievement can be made by a determined student in the time available in his second and third years. Organized series of lectures or conferences or any other form of group instruction are avoided, as the regular curriculum affords an excess of this sort of intellectual exercise. Each student is given a problem to investigate. The tutorial students are required to take the routine medical curriculum throughout the first three years. In the fourth year they are allowed a period of from four to five months for this special work with a member of the faculty.

Some of the men do continuous research along a specific line throughout their four years in medical school. In most instances the students electing tutorial work anticipate most of the prescribed regular work by taking two or three months of summer work. It is impressed on the student that the laboratory is not a sanctuary for the worship of authorities but a free dwelling for students conscious of the faults and the virtues of those who surround them.

Sufficient time has not elapsed to determine the fate of all students subjected to this type

of teaching. It seems fair to examine the records of sixty-two men from the classes of 1925 to 1929. Three have died, thirty-four graduated with honors, fourteen are in full-time work; the remaining twenty men are engaged in practice. Of the twenty-five men who graduated with a grade of C, seven are in full-time work, eighteen are practicing medicine. The results seem to suggest (1) that medical students can engage in special extracurricular work along one line without jeopardizing their regular work and (2) that a large percentage of men exposed to this type of training contribute to the advancement of medicine. Some have stated that the most important decision made in medical school was that they should do what they had always thought wrong; i. e., depart from the schedule and take free elective work in their fourth year.

Men who practice medicine may advance medical science as effectively as does the laboratory monk. The development of such traits in the practitioner of medicine should in no way interfere with his practice of the art of medicine.

THE CLINICAL PATHOLOGIST

Abstract of presidential address by L. W. Larson before the American Society of Clinical Pathologists and published in the American Journal of Clinical Pathology, July 1940.

Ten years ago there was already a tendency to differentiate between the pathologist and the clinical pathologist. This development of a specialty within a specialty is not peculiar to our branch of the practice of medicine; some internists have become cardiologists and some surgeons have become orthopedic surgeons. Clinical pathologists began as individual units. Today the clinical pathologists who depend primarily on a so-called private or commercial laboratory for a livelihood are few. The increasing knowledge of the laboratory sciences on the part of clinicians, the development of hospital laboratories which have encouraged clinicians to send them work, and the ever increasing scope of tax supported laboratories in city, county, state and nation have driven practically all our members to the shelter of a hospital laboratory. This has created serious problems, for too many hospital managements have attempted to derive a handsome profit from the clinical laboratory at the expense of the pathologist. Even the many varieties of hospital insurance plans have created a grave situation for the clinical pathologist in that he has been faced with the problem of contributing a professional service for an institution which is not authorized by law to practice medicine. In most instances he has not been remunerated for extra burdens thrust on him as a result of these insurance plans.

One of the gravest problems confronting the clinical pathologist is that of the supertrained technologist. We are the creators of this situation, because we pioneered the movement to standardize schools for medical technologists and raised the requirements to such a level that only those with adequate college training in the fundamental sciences and thorough training in a clinical laboratory under the direct supervision of a competent clinical pathologist can even qualify for the examination given by our board of registry. As a result there are about 6,000 medical technologists registered today, each one of whom is presumably competent to perform all laboratory tests. Are we justified in criticizing the well trained clinician who maintains his own laboratory, hires a registered technologist to do the work and interprets the results himself? We may question the ability of most clinicians to do these things, but it is useless to doubt their right to think that they can do them. It will be better for us to look for new horizons or to concentrate on those which we have had with us daily but have rarely taken the time to observe.

The younger men and women have been well instructed in this field, especially those who have spent from three to five years preparing themselves for the practice of a specialty. Except in the large hospitals or clinics, only one part of laboratory diagnosis remains which demands special training and experience, and that is the field of pathologic anatomy. Our society has realized this fact by fostering a yearly seminar in tumor diagnosis. These seminars have impressed our clinical brethren to see in them an effort to standardize classification

of tumors and other pathologic changes and to render to him and his patient a competent opinion. The field is not restricted to surgical pathology but includes postmortem pathology, whereby the ravages of disease are viewed in the light of clinical symptoms and observations.

Hematology also seems to be a field remaining for the clinical pathologist, although more and more clinical hematologists are being trained. The majority of clinicians know little of the abnormal blood cells seen in many blood films. Few technologists are so well trained that they can accurately diagnose the leukemias, to say nothing of the difficulties encountered in leukemoid reactions, bone marrow depression or dysfunction due to drugs. Our society should continue to sponsor the excellent hematology seminars it has conducted in various parts of the country during recent years, for hematology still remains a pillar on which the clinical pathologist can lean for his economic security.

In addition to being well versed in the usual laboratory procedures and to being a specialist in pathologic anatomy and hematology, I believe that the clinical pathologist must learn more about, and be more interested in, the clinical patient. If he is able to take a good clinical history and perform a routine physical examination, he will soon be the most popular consultant on the staff, because his knowledge of pathology will often enable him to interpret clinical signs and symptoms when his clinical brother cannot. He will then be a "consulting physician" in clinical pathology. I urge all of you to develop into true physicians, so that you will no longer be called by such omens as "the laboratory man."

Correspondence

DR. GEORGE GOODFELLOW OF TOMBSTONE

Jan. 28, 1941.

To the Editor:—In the Student Section, January 25, page 352, is a paragraph about Dr. George Goodfellow of Tombstone, Ariz. I would like to add to that.

In 1889-1891, while he was practicing at Tombstone, I was a contract surgeon at Bisbee, 28 miles away. During that time we not infrequently operated together, and I went to Tombstone a number of times to assist him in operations. I can testify to the fact that he was a rapid and a skilful surgeon, many times

doing major operations alone. I am certain that he did the first operation for the removal of a prostate, which operation was done in Tucson, and my recollection was confirmed last fall in a conversation I had with Dr. Jeremiah Metzger of Tucson. I remember one case of his in which he removed a spleen because of a gunshot wound, which operation he did entirely alone; undoubtedly the patient would have lived had he been able to see the patient a little sooner but the patient had to ride 8 miles and was white from loss of blood. I feel that one cannot say too much for him as a great surgeon.

THOMAS DARLINGTON, M.D., New York.

DO YOU KNOW WHAT PHYSICIAN—

1. Attended George Washington in his last illness?

2. Was one of the original signers of the Declaration of Independence?

3. Performed the first mastoidectomy in the United States?

4. Wrote the first work in America on skin diseases?

The answers are on page 796

Medical College News

Medical schools, hospitals and individuals will confer a favor by sending to these headquarters original contributions, reviews and news items for consideration for publication in the Student Section.

Interns' Case Report Contest

The Allegheny County Medical Society in Pittsburgh is conducting its annual case report contest for interns of the hospitals of Allegheny County. The rules of the contest specify that manuscripts shall be mailed to the secretary, Allegheny County Medical Society, Jenkins Arcade, Pittsburgh, prior to April 1. Other details were given in the announcements sent to each intern. This contest, which has been carried on for many years, is for the best case report submitted and it is intended to be an incentive for interns completing their medical training, giving them experience in the correlation of clinic material and in medical composition and writing.

Postgraduate Students at Columbia

During the year ending June 30, 1940, Columbia University College of Physicians and Surgeons, New York, offered 249 postgraduate courses in thirteen hospitals, which were attended by 1,061 physicians from forty-three states, Alaska, Hawaii, Philippine Islands, Puerto Rico and twenty-three foreign countries. The dean, Dr. Willard C. Rappleye, in his annual report says that in keeping with the trend to eliminate from general practice major surgical and other highly technical procedures, it is interesting to note that the majority of physicians taking a postgraduate course elected studies in the field of internal medicine.

Iowa

The following sophomores at the University of Iowa School of Medicine, Iowa City, were elected to Phi Beta Kappa, Dec. 16, 1940: John R. Beebe and Delbert M. and Elwood Buchman of Ottumwa; George F. Fieselman, of Garden Grove; John A. Hutch, of Cedar Rapids, and Gabriel T. Westly of Manly.

At the second student-faculty meeting of the year on January 14, Dr. H. R. Jenkinson, Iowa City, gave a talk illustrated with kodachrome slides on the subject "Wild Flowers of Iowa," including comments on the medicinal uses of some of these flowers. At the student-faculty meeting last November 12, Dr. Robert T. Tidrick, who spent a year as an intern in Cairo, Egypt, spoke on "A Comparison of Egyptian and American Patients."

Creighton Students Assigned to Summer Dispensary

In the summer of 1939 the students at Creighton University School of Medicine, Omaha, were required for the first time to put in six weeks in the summer dispensary, the senior class being divided into groups which rotate during the season. The number of patients visiting the dispensary during the year 1939 was 39,464. Recently the university erected a two story building, the first floor of which provides an addition to the medical dispensary, making room for special clinics, each completely equipped.

Indiana

Dr. Robert C. Badertscher, Indiana '40, who is now interning at Indiana University Medical Center, Indianapolis, has received an appointment for a three year residence in internal medicine at the Mayo Clinic, Rochester, Minn., and will take up his new work in July. Dr. Badertscher is the son of J. A. Badertscher, Ph.D., of the faculty of Indiana University School of Medicine.

Long Island's Freshman Class

The 100 freshmen at Long Island College of Medicine, Brooklyn, brings the total enrolment at the school at present to 371 students, the maximum number allowed under the present policy of the board of trustees being not more than 375. The freshman class comprises students from Connecticut, Maine, Massachusetts, New Jersey, New York, Tennessee and Vermont, and one foreign student, Abu T. Mehra, of Teheran, Iran. The officers of the freshman class, who will serve through the four year term, are George L. Breen, Pompton Plains, N. J., president; Alexander Garcia, Forest Hills, L. I., vice president; Margaret H. Doyle, Brooklyn, secretary, and Michael J. Hyland, Harrison, N. J., treasurer. The two student council members in the freshman class are Charles W. Kelly of Brooklyn and Mr. Mehra.

General Assemblies at Illinois

Each Wednesday at 1 p. m. the students and faculty at the University of Illinois College of Medicine, Chicago, conduct general assemblies. At the Dec. 4, 1940 assembly, Lt. Col. Charles G. Hutter, M.C., U. S. Army, discussed "Military Medicine"; Capt. Harold C. Lueth, "Medical Problems in Air Warfare," and Dr. R. G. Leland, director of the Bureau of Medical Economics of the American Medical Association, "Mobilization of Medical Forces." The program for the January 1 assembly was on the "Aspects of Medicine and Public Health in South America."

Oklahoma—Seniors Assist Draft Board

Members of the senior class of the University of Oklahoma School of Medicine, Oklahoma City, have been assisting the local draft board in that community by doing some of the laboratory work on the draftees. Six senior students, rotating daily, assist in this laboratory work.

Dr. Ernest Sachs, professor of clinical neurosurgery, Washington University School of Medicine, St. Louis, gave the annual LeRoy Long Memorial Lecture in the Auditorium of the University of Oklahoma School of Medicine, February 7, on "Surgery of Brain Tumors Today and Ten Years Ago." This lecture is sponsored by the local chapter of Phi Beta Pi and was founded in memory of Dr. LeRoy Long Sr., former dean of the medical school.

Scholarships for Papers on History of Endocrinology

The Association of Medical Students has announced a competition among medical students in the United States and Canada for the purpose of fostering interest in the subject of endocrinology and to encourage and aid able and gifted medical students. For this purpose the Schering Corporation will award one full year's and one half year's tuition in any medical school in these countries for the best papers on some aspect of the history of endocrinology. If the author of the winning paper is a senior, he will receive the cash equivalent of his tuition. The judges will be a committee of leading endocrinologists, and the award will be made at the next annual meeting of the Association of Medical Students in Chicago in December 1941. All students interested in this competition should communicate at once with the Committee on the Schering Award, c/o The Journal of the Association of Medical Students, 25 Madison Square, N., New York City.

Professor Dam Lectures at Western Reserve

Students, physicians and members of allied professions were invited to the Institute of Pathology at Western Reserve University, Cleveland, February 11, to hear a lecture by Prof. Henrik Dam, Biochemical Institute, University of Copenhagen, on vitamin K, which he discovered. Professor Dam has lectured in various cities in England, Sweden, Norway, Denmark, Holland and Germany; his lectures in the United States are under the auspices of the American-Scandinavian Foundation.

The DeWitt Sherman Hall at Buffalo

The late DeWitt Halsey Sherman, for many years professor of pediatrics at the University of Buffalo, bequeathed to the university a sum of money for the erection of a new medical building, and his widow, Jessica Anthony Sherman, has added to the sum sufficient to make the total about a half a million dollars. The will provides that if a building has been constructed by the time the funds become available, the money shall be placed in trust for the endowment of teaching. Dr. Sherman, a graduate of the University of Buffalo, died in February 1940.

Illinois Seniors Request Degrees in June

The entire senior class of the University of Illinois College of Medicine, Chicago, has petitioned the deans of the school requesting that the M.D. degree be awarded in June. Their action was prompted by the belief that the M.D. degree would qualify them to do medical work in case they were conscripted, and would give those who desire an opportunity to join the medical reserve corps. The *Illini Scope* points out that of all the medical schools in the country, only eleven still withhold the degree until the end of the fifth year. The reason for doing so was to assure that graduates would serve an internship. That function now has been taken over largely by the state licensing boards. Of more than 5,000 medical school graduates in 1940, it is said that only one man went directly from medical school into medical practice.

Women in Medicine

Since 1917 there have been fifty-five women graduates of Long Island College of Medicine and there are twenty-five women students at present at the school, ten of whom are in the freshman class. At the request of the faculty, the chairman of the Committee on Admissions sent a questionnaire to the thirty-four women who graduated during the years 1920-1935. Of the thirteen who replied, all took internships and are now in active practice. All are members of their county medical societies. Four are in general practice, two in obstetrics and gynecology, one in obstetrics and pediatrics, one in psychiatry and one in public health.

Annual "Follies" Provide Library Fund

The twelfth annual Medical Follies, presented Dec. 6, 1940 by seventy members of the junior class of Baylor University College of Medicine, Dallas, Texas, before an audience of 3,000 people, showed a net profit of more than \$4,000, most of which was turned over to the permanent library fund which, together with the contributions of the Baylor Alumni Association, amounts to about \$70,000. Construction of the new library has begun and it is expected to be completed in the spring of this year. The growth of the annual Follies of the junior class has been rapid. The first production was given in a small auditorium seating a few hundred, and the show was written for the entertainment of the student body and alumni. Since then

they have had to change to a larger auditorium three times to accommodate the patrons, and six years ago Dr. William W. Looney, of the department of anatomy and sponsor of the Follies, suggested the idea of establishing a permanent library fund with the profits as a nucleus. The success of the Follies is due in part to the cooperation of the alumni and, as our correspondent says, to the ever present curiosity of the average layman who wishes to know more about the private life of a physician, his problems, and the like. To satisfy curiosity, this group has written and presented "The Life of a Medical Student" and "The Problems of the Medical Profession." The medical students have not only written the dialogue but have acted and directed the plays. Student Charles L. Bloss, 3612 Worth Street, Dallas, Texas, will furnish additional information to any group of medical students who desire to undertake similar ventures.

Duke University

At the beginning of the winter quarter there were 239 medical students at Duke University School of Medicine, Durham, N. C., and 140 student nurses were enrolled. Laurence H. Snyder of Ohio State University College of Medicine, Columbus, is giving a series of lectures during January, February and March at Duke on medical genetics. At a meeting of the Duke Medical Society, January 14, Dr. Tinsley R. Harrison, professor of medicine at Bowman Gray Medical School of Wake Forest College, discussed hypertension.

National Board Questions in Obstetrics

Following are the questions used by the National Board of Medical Examiners in obstetrics and gynecology in part II of the examination held February 12-14, 1940. (Part II of the examination is given immediately after graduation from medical school.)

Answer any five questions: 1. Describe in detail the management of labor in a frank breech presentation. 2. Give the characteristic findings of intrauterine fetal death in the seventh month of pregnancy. 3. Is puerperal sepsis preventable? If so, indicate the preventable factors. 4. Name four laboratory procedures you would institute in the study of a case of sterile mating. 5. Describe the clinical manifestation of carcinoma of the cervix and give in detail the treatment and prognosis. 6. Give diagnosis, treatment and management of leiomyomata uteri in a young unmarried woman. 7. Give the treatment of uterine retro-flexio-version in (a) a nulliparous woman, (b) a multiparous woman.

Wisconsin State Board Questions

The following questions were given by the Wisconsin State Board of Examiners at the examination in Milwaukee, June 26, 1940:

MATERIA MEDICA

1. Name four common vitamins and give indications for use of same.
 2. Give indications for use of sulfapyridine—State precautions to be observed and give dose.
 3. Name principal alkaloid of belladonna—Give dose of same and at least three indications for its use.
 4. Give adult dose and therapeutic use of following drugs—
 - (a) Silver nitrate
 - (b) Codeine sulfate
 - (c) Ferrous chloride
 - (d) Nitroglycerin
 - (e) Tartar emelle
 5. (a) Name two respiratory stimulants—also dose of same. (b) Name two vasomotor depressants—also dose of same.
 6. Name three diuretics and give dose of each.
 7. Name five antiseptics and give their proper dilutions for surgical purposes.
 8. Give briefly the therapeutic use of—
 - (a) Sulfur preparations
 - (b) Mercury preparations
 - (c) Bismuth preparations
- Mention at least three forms of each with proper dose.

TOXICOLOGY

1. Give symptoms and treatment of nuphne poisoning.
2. Describe symptoms of hydrargyrium.
3. State symptoms and treatment of carbon monoxide poisoning.

Hospital Insurance for Students' Dependents at Georgia

A recent development at the University of Georgia School of Medicine is the inauguration of a plan of hospitalization insurance for the wives and children of medical students. Last year the administration of the medical college sponsored a hospitalization plan for the students, each student having paid \$2.50 for protection during the nine month term. The plan worked so well that the dean, Dr. G. Lombard Kelly, suggested extending it to the dependents of students. It is estimated that at least 15 per cent of the students are married, some of them having several children. The plan was presented to the student body and received unanimous approval. Now each married student is permitted to insure each of his dependents for a premium of \$2.50 for nine months. Obstetric cases are not included in the coverage.

The Hamman Society at Western Reserve

A group of twenty junior and senior students at Western Reserve University School of Medicine, Cleveland, are members of the Hamman Society, which was named in honor of the late Dr. Carl A. Hamman, formerly dean and professor of clinical surgery. At their meetings, the members present original papers and discuss diagnostic problems, with honorary faculty members acting as referees. The society held an open meeting during the last school year which was addressed by Dr. Paul W. Harrison, a medical missionary stationed in Arabia. The Hamman Society also gives a banquet annually to which all members of the faculty are invited.

Western Reserve Grows Its Own Digitalis

All the digitalis used in the hospitals affiliated with Western Reserve University School of Medicine, Cleveland (Cleveland City Hospital, St. Vincent's Charity Hospitals and University Hospitals), is grown on a farm given to the university by the late Andrew Squire. After the fox glove plants are harvested the leaves are assayed in the School of Pharmacy, which also makes the tablets and tincture of digitalis for use in the hospitals.

New A. O. A. Members at Texas

The following ten members of the senior class, who comprise the top sixth of the class with regard to grades, have been elected members of Alpha Omega Alpha honorary medical fraternity: Hugh F. Arnold, Ernest S. Cunningham Jr., Harold J. Tausend, Robert E. Hurn, James T. Downs III, Jack M. Lynn, John E. Alexander Jr., Ronald M. Burnside, George S. Woodfin and Samuel A. Hoerster Jr.

New A. O. A. Members at Cornell

The following students at Cornell University Medical College, New York, have been elected members of Alpha Omega Alpha: Elizabeth N. Conover '41, Oscar E. Goldstein '41, Henry H. Graham '41, Charles E. Holzer Jr. '41, Richard R. McCormack '41, John J. Thorpe '41, George A. Wolf Jr. '41, Preston S. Weadon '41, John T. Flynn '42, John B. Pfeiffer '42 and Franklin Robinson '42.

Ohio State University

Members of the senior class recently elected to Alpha Omega Alpha at Ohio State University College of Medicine, Columbus, are the following: Saul C. Sigelman, Harold I. Farber, Harold K. Treese and Marion T. Moreland. Those of the class initiated into the local chapter as juniors are F. Miles Flickinger, Abigail Cohen Englander and Robert E. Reiheld.

Jefferson Medical College of Philadelphia

Prof. Henrik Dam of the Biochemical Institute of the University of Copenhagen, addressed a large audience of students and physicians, January 10, at Jefferson Medical College of Philadelphia on "Vitamin K—Its Role in Human Pathology and Its Application to Therapeutics."

At the recent election, the junior class at Jefferson elected E. W. Connelly, president; Edmund T. Hackman '41, vice president; Robert H. McCarter II '42, secretary, and Joseph J. Rupp '42, treasurer.

The William Harvey Society

The William Harvey Society at Tufts College Medical School, Boston, is one of the activities of the Student Activity Plan and its purpose is to bring prominent members of the profession to the school occasionally to address the students. The president of this group this year is David M. Curtis '42. In the last two months this group has been addressed by Dr. Elliott P. Joslin, clinical professor of medicine, Harvard Medical School, Boston, and Dr. Maxwell M. Wintrobe of Baltimore.

The Louis Pasteur Club at Tufts also has become more active recently in student activities, having been addressed by Drs. Frederick L. Good and Frederick W. O'Brien, both members of the Tufts faculty.

Oklahoma

Mr. William H. Reiff, '41, of the University of Oklahoma School of Medicine, Oklahoma City, was elected to Toga honorary fraternity, the members of which are outstanding students of the professional schools of the university.

"DO YOU KNOW WHAT PHYSICIAN"

Following are answers to the questions appearing on page 793.

1. Dr. James Craik, who was a long-time friend of Washington and was surgeon in the Virginia Provincial Regiment in 1754, of which Washington was the commander. After the Revolutionary War he made his home at Alexandria, Va., in order to be near Washington, who lived at Mount Vernon. Dr. Craik died Feb. 6, 1814, about fifteen years after Washington passed away.

2. Dr. Benjamin Rush who graduated from Princeton in 1760 and from the University of Edinburgh in 1768. He was the chief founder in 1786 of the Philadelphia Dispensary. He was treasurer of the United States Mint from 1799 to 1813. Dr. Rush offered a motion before a group appointed by a mass meeting of citizens June 23, 1775 to draft an address in favor of American independence. He was delegated to prepare a report, which was adopted the following day and submitted to the Continental Congress. Much of the phraseology of this report is said to have been included in the Declaration of Independence.

3. Dr. Lawrence Turnbull (1821-1900), who lived most of his life in Philadelphia, although he was born in Scotland. At one time he was vice president of the Pennsylvania State Medical Society.

4. Dr. Noah Worcester, a native of Thornton, N. H. a graduate of Harvard University in 1832 and of Dartmouth Medical College in 1838. He pursued further studies in Paris in 1841, in 1843 he became professor of general pathology, physical diagnosis and diseases of the skin in the medical department of Western Reserve College in Cleveland. His book on diseases of the skin was published in 1845, having been written while he suffered from active tuberculosis, of which he died in 1847.

illustrations are of common apparatus and are considered superfluous. Certain of the structural formulas may be questioned by meticulous organic chemists, but most discrepancies are due to inaccuracies in the literature rather than to the author. A few revisions have been made and the translator has added two pertinent chapters—one on "Oxine" and one on "Neocupferron." The ready availability of such a collection of analytic procedures will be of great value to laboratories in which determinations of inorganic radicals are carried out.

Functional Diseases of the Intestines. By Gustav Slinger, M.D. Cloth. Price, \$2.50. Pp. 80, with 27 illustrations. New York & London: Oxford University Press, 1939.

This monograph consists of an expansion of a lecture before the Hunterian Society in 1938. It is chiefly a review of experimental work of the European school and of the author. In an attempt to explain the etiologic basis of the common functional intestinal disorders, it presents to the reader a summary of the pathologic physiology concerned, emphasizing chiefly neurogenic factors. The anatomic and physiologic discussion of the autonomic nervous system, together with the description of motor and secretory physiology, is hardly more than one would find in any good textbook on physiology. Topics are divided into dyspepsia, disorders of motility, diarrhea, constipation, ileus, diverticula, autointoxication and autoinfection, allergy and "neuroses." Aids to diagnosis, differential diagnosis, diet and environmental influences are also discussed. Foreign terminology and sentence structure make for some difficulty in reading. The book has a definite value for those not well acquainted with the subject.

Bacillary and Rickettsial Infections, Acute and Chronic: A Textbook. Black Death to White Plague. By William H. Holmes, Professor of Medicine, Northwestern University Medical School, Chicago. Cloth. Price, \$6. Pp. 676. New York: Macmillan Company, 1940.

The recent death of Dr. Holmes focuses attention on this fundamental contribution to medical science. The book has charm and literary quality possessed by few other works in the medical field. Among the conditions concerned are plague, tularemia, typhus, undulant fever, Rocky Mountain spotted fever, cholera, typhoid, the dysenteries, diphtheria, leprosy, tuberculosis and a number of bacillary infections. The method of presentation, the arrangement of headings and subheadings, the historical articles and the extensive bibliography combine to offer something distinctive in the field of medical writing. The work indicates great scholarship and insight into the educational problems of students which bespeak its wide use in medical education. Here is a textbook which may be read with the kind of ease and pleasure associated with a classic like Osler's textbook on the Practice of Medicine. To the publisher much credit is due for the quality of the presentation of this unusual material.

Physical Diagnosis. By Ralph H. Major, M.D., Professor of Medicine in the University of Kansas, Kansas City. Second edition. Cloth. Price, \$5. Pp. 464, with 437 illustrations. Philadelphia & London: W. B. Saunders Company, 1940.

The author has been a teacher of physical diagnosis for many years. His book reflects the point of view of the physician who relies largely on his well trained five senses for the diagnosis of disease. He tries to emphasize that physical signs are produced by physical causes, which must be understood before the physical signs can be properly appreciated. He has a yen for the classic descriptions made by pioneers in certain fields of medical investigation at a time when they had to rely on their senses instead of on mechanical procedures which are much in use today. His book is well illustrated with recent pictures and yet some of the illustrations are those used by the pioneers; for example, Traube's original curve of pulsus alternans, which, the author says, is of more interest than any of the many curves of this condition which have been made since. Osler once said "when you can, read the original descriptions of the masters who, with crude methods of study, saw so clearly." Probably this suggestion caused the author to quote from many of the descriptions of the old masters. But the book is modern and, with the second edition following the first in three years, it undoubtedly has served to help those who are practicing physical diagnosis without the aid of expensive and sometimes unnecessary mechanical equipment.

Your Mental Health or Between Mental Health and Mental Disease for Intelligent Laymen and Physicians. By B. Liber, M.D., Dr.P.H. Cloth. Price, \$3. Pp. 408. New York: Mellor Books, 1940.

Here is an attempt at popularization of mental hygiene, prefaced by the publisher with a number of testimonials which would seem to serve as a warning as much as an endorsement. Actually the book is a record of the author's practice concerned with questions in the field of mental disturbances, written in journalistic style, almost like a day-to-day diary. Here is an example:

Any physician in private and general practice may be called in an emergency to diagnose some form of true or false psychosis and should know how to distinguish it from intoxication or from more or less normal emotional states.

One doctor was taken by the alarmed policeman on the beat to see a young girl, who, arriving at two o'clock in the morning with her boyfriend in an automobile, had climbed into her parents' stoop apartment through the window. The officer, in the face of the young woman's opposition to be removed to the police station, had diagnosed insanity and, to prove it to her parents, wanted the nearby doctor's corroboration. The physician, however, hurriedly reaching the scene in his night-robe, found the offender just drunk—and that settled the question.

Altogether, the book gives the impression of hasty preparation and confusion. Its value for the prevention and treatment of mental disease is certainly questionable.

The Malarial Therapy of General Paralysis and Other Conditions. By William H. Kupper, M.D. Cloth. Price, \$2.25. Pp. 155, with 8 illustrations. Ann Arbor: Edwards Brothers, Inc., 1939.

This monograph is an excellent reference manual for any physician treating neurosyphilis, especially dementia paralytica. It is essentially a review of the literature. It contains many important and practical points regarding the life cycles of the tertian, quartan and estivo-autumnal parasites. There is considerable pertinent discussion regarding the anopheline mosquito. The history of malarial therapy for dementia paralytica is also given. The author reviews the various causes of cure in the malarial therapy of dementia paralytica. The latter is compared with other treatments such as relapsing fever, sodoku, typhoid vaccine, saprovitin, sulfur, artificial hyperpyrexia, tryparsamide and artificial fever plus tryparsamide. The author's attempt to enhance the value of malarial therapy by citing instances of treatment for nonsyphilitic diseases with malaria is not necessary. There is a detailed bibliography.

Getting More Out of Life. By Joseph Jastrow, Ph.D., LL.D. New edition. Cloth. Price, \$2. Pp. 312. New York: Emerson Books, Inc., 1940.

This book presents a strangely reminiscent picture. While no statement is made on the jacket or on the volume itself that the book has previously been published, the material is identical with, or much resembles, similar material published elsewhere by the same writer. Dr. Jastrow is one of the older psychologists and is the teacher of many prominent nonmedical teachers in this field. He has been a prolific writer, both scientifically and, in recent years, popularly, and his ideas are sound and conservative. The present volume deals with a number of psychologic observations, some beliefs are exploded and some interesting angles of the science are explained. The general point of view is to help people better to employ their own mental faculties and to explain mild abnormalities of the mind. It is not particularly inspirational, but it is interesting and, from the point of view of the lay psychologist, scientifically sound. It has the good point of not professing to aid the patient in any self treatment.

A Handbook of Radiography. By John A. Ross, M.A., M.R.C.S., L.R.C.P., Radiologist, Warrington Infirmary, Warrington. Cloth. Price, 7s. 6d. Pp. 126, with 67 illustrations. London: H. K. Lewis & Co., Ltd., 1940.

This interesting, concise book on radiographic technic is attractively presented in a small volume. Interleaved are a number of blank pages for notations. The book is essentially a handbook on the technical and practical radiographic methods for technicians and students. The various technical maneuvers are explained, and an effort is made to make clear the purpose of each stage of technic. There is no discussion of physics included. Such a book will be valuable in the hands of most technicians. Many physicians who do occasional radiographic work should find it useful.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

AMINOPHYLLINE FOR CORONARY THROMBOSIS

To the Editor:—In a case of coronary thrombosis, how long is it advisable to give aminophylline? Can this drug do harm if given for months?

M.D., New York.

ANSWER.—Aminophylline may be continued for weeks or months after an attack of coronary thrombosis without harm as far as is known, provided there is no disagreeable reaction from its use. In small doses, such as are commonly given, $1\frac{1}{2}$ grains (0.1 Gm.) three times a day, there is probably but little benefit. In the larger dosage of 3 grains (0.2 Gm.) or more, three or four times a day, there is indication experimentally and in some instances clinically that it may be helpful provided these larger doses do not upset the stomach. However, there is justified skepticism about the value of the drug as a routine measure in the healing process of coronary thrombosis. Many patients have done extremely well without it. Other patients have done poorly with it. A few patients have discomfort while taking it. It is more indicated in the presence of persistent symptoms of angina pectoris or disturbed breathing than in other conditions. Some patients have taken it daily for years in small doses without any evidence of harm but also without much proof of benefit. It is probably sensible to try its effect in the presence of such symptoms as mentioned for a week or two but not to continue indefinitely if there seems to be no favorable result. Intravenously, in an emergency, it is much more effective, particularly for Cheyne-Stokes respiration.

DISTURBED VISION AND FORMALDEHYDE EXPOSURE

To the Editor:—On May 21 a man aged 60 consulted me about his vision. He had been working for the past five and one-half months in a plant for making plastics. He said his eyesight had been failing rapidly for the past few days. His employer found fault with his color mixtures and it was difficult for him to do his work. His work consisted of mixing formaldehyde, urea and sulfuric acid together in certain proportions, cooking it and drying it and grinding it. He carried on this work in a basement room measuring about 15 by 25 feet. This room was poorly ventilated. Examination showed his vision to be 10/200 in each eye with the best refraction I could give him. The vessels of the fundus were dilated and tortuous with pigmented areas around the macula of the left eye. The patient has a history of a high blood pressure varying from 160 to over 200. This might account for some of the disturbance. Many plants making plastics use these some ingredients. Have others been affected as this man has been? Do you think it was the formaldehyde fumes that caused the trouble? Would good ventilation and rigid cleanliness be sufficient preventives?

H. H. Leavitt, M.D., Minneapolis.

ANSWER.—The key to this situation possibly may reside in the fact that most commercial formaldehyde contains wood alcohol as an impurity. Given in sufficient amounts, this is quite capable of inducing the impaired vision mentioned. In similar situations there have been found contracted visual fields, scintillating scotomas, dilated, immobile pupils, retinitis, atrophic nerve heads, damage to extra-ocular muscles and ptosis. Suitable inquiry should be made as to a possible methyl alcohol content in the solution of formaldehyde utilized in the preparation of the urea formaldehyde resin. Heat, as mentioned in the query, naturally increases the quantity of formaldehyde gas introduced into the atmosphere. However, formaldehyde gas chiefly acts locally, producing conjunctivitis, coryza, bronchitis and skin injury. Unless some or all of these disturbances have arisen, it is somewhat unlikely that the ocular damage described may be associated with the formaldehyde. Since formaldehyde is one of the most irritating gases of industry, suitable exhaust equipment should obviate any concentrations higher than 20 parts per million of air as breathed by workmen. Some opportunities exist in the manufacture of this type of resin to use completely enclosed systems, involving no escape of gas into the atmosphere. It is desirable that no direct contact be permitted between the skin and the materials of this synthetic resin. Finished resin occasionally induces a dermatitis among those exposed, since some persons respond to minute traces of the resin dust.

PAIN AND ESCHAR AFTER INTRAGLUTEAL INJECTION

To the Editor:—A man aged 50 received on October 8 his ninth injection of 2 cc. of iodobismutol given intragluteally. On the introduction of the needle he complained, slightly more than was his custom, of pain. He is not a hypersensitive nervous patient. As is my method, the barrel of the syringe was drawn up to be sure the point of the needle was not in a blood vessel. At once after receiving the injection the patient showed some shock, weak pulse, pallor and clammy sweating. Remaining in the office for a time he seemed to get approximately 75 per cent relief from pain and shock. Soon, however, I was called to his home, and the man was complaining of much pain in the gluteal region and some along the distribution of the sciatic nerve. Numerous visits were made to the home, and besides narcotics for pain local treatment, e. g. injections of physiologic solution of sodium chloride into the site of the pain and injections of procaine hydrochloride, was given. There was no loss of power or of sensation, but terrific pain continued, some relief beginning after about only one week. At a considerable distance from the site of injection there gradually developed what seemed to be an ecchymosis as from an outpouring of blood into the subcutaneous tissues. He has recovered from the pain and has returned to work after losing about two weeks. At present over the region of the great trochanter is a dry eschar about 3 by 4 inches. To all appearances this represents dead tissue. The results from present appearance will probably be formation of fibrous tissue beneath this eschar, the eschar being gradually cast off. What happened in this case? I feel that I did not get into the blood vessel with the point of the needle. Did I injure the nerves around a blood vessel, causing the severe pain which results from sudden lack of a good blood supply to any part, as from the ischemia of the heart muscle in angina pectoris or that of intermittent claudication? I have been using iodobismutol for many years, and this is the first trouble; it was severe. Did the patient have some vascular spasm resulting in thrombosis, which in turn gave rise to the pain and to the death of tissue resulting in the black eschar? This is to all appearances gangrene of the skin and immediately underlying tissues.

John A. Bradley, M.D., Sfeubenville, Ohio.

ANSWER.—Possibilities that come to mind are (1) that the injection of the drug involved a nerve and blood vessel, (2) that some solution other than iodobismutol was injected.

Reports in the literature (Gammel, John A.: Arterial Embolism: An Unusual Complication Following the Intramuscular Administration of Bismuth, *THE JOURNAL*, March 26, 1927, p. 998) indicate that an occlusion of the blood vessel may follow an intramuscular injection and result in what appears to be at first an infection at the site of the injection but eventually results in a slough. This reaction is not accompanied by immediate severe pain and does not appear for twenty-four or more hours after the injection.

The immediate pain and apparent shock after the injection would suggest that something other than iodobismutol was injected, possibly an escharotic because of the resulting eschar. Phenol or mercuric iodide is capable of producing such a reaction.

IRIDECTOMY

To the Editor:—A patient aged 75 had a preliminary iridectomy done a month ago. Within the past week I have noticed that the anterior chamber has become shallow, probably because of swelling of the lens; however, there was no break in the anterior capsule at the time of the iridectomy and he made an uneventful postoperative recovery. The tension with the Schiötz tonometer was 19. The cataract appeared to be mature at the time of the iridectomy. Can you give me an opinion as to the probable cause of the shallowness of the anterior chamber and its probable duration? I realize the section could be enlarged by using scissors.

M.D., Ill.

ANSWER.—In all probability the shallowness of the anterior chamber was due to swelling of the lens, which at the time of the iridectomy was not completely mature. The absorption of water by the fibers of the lens increases the volume of the lens, and the resultant expansion is always anterior, because of incompressibility of the vitreous humor. As the last lens fibers become more opaque, they lose their aqueous content and the antero-posterior diameter of the lens decreases, causing the anterior chamber to become deeper. But this process is slow and may take many months.

Operation on a swollen lens with a shallow anterior chamber involves certain risks that can be avoided by waiting for the chamber to deepen. In the first place, the incision is apt to be difficult, because of the endeavor to avoid the iris or irregular injury to the capsule. Consequently, the incision may lie too near the cornea; it is frequently too small. Improper length must not be counted as a great mistake, for the incision can always be lengthened with scissors. The resultant wound, however, is not as smooth as though the entire incision were made with a Graefe knife. In the second place, if the lens is to be removed within its capsule it is difficult to grasp the anterior capsule with any forceps, and the purpose of the operation is likely to be defeated. Therefore extracapsular or suction extraction is the method of choice with a swollen lens. But, in the hands of the experienced operator, neither produces as good results as does a smooth intracapsular extraction.

QUERIES AND MINOR NOTES

EPHEDRINE DERIVATIVES, BARBITURATES AND DIPLOPIA

To the Editor:—A patient aged 51 complains of diplopia for three weeks and bronchial asthma for twelve years. During the past twelve years he has taken many remedies for relief of his asthma. For the past year he has taken propadrine hydrochloride (Sharpe and Dohme), six to eight 34 grain (0.04 Gm.) capsules daily; also an occasional inhalation of epinephrine spray. The previous year he took large quantities of ephedrine and amytal capsules. Are there any reports of propadrine hydrochloride or ephedrine causing diplopia? His eyes when checked by a good eye specialist were found to have normal vision and normal fields. There is some damage to the third and sixth cranial nerves. There are no other neurologic abnormalities, and the blood Wassermann reaction is negative.

Frederick A. Shore, M.D., Ventura, Calif.

ANSWER.—There are no reports in the literature pointing to diplopia being caused by propadrine hydrochloride, ephedrine or their derivatives. This does not preclude the possibility that ephedrine-like compounds may produce disturbances in vision through their well known effects on the central nervous system. The use of barbituric acid and its derivatives has caused complications too numerous to mention. In the French literature there is a report in which a case of acute barbiturism simulating encephalitis lethargica with diplopia is described. In the American writings Lundy and Osterberg commented on the occurrence of dilated pupils and nystagmus and included the report of Lyons, who in 1907 reported a case in which diplopia occurred within two hours after the patient took a barbituric acid derivative.

TREATMENT OF ICHTHYOSIS

To the Editor:—Is there a new or different treatment for ichthyosis?
George E. Gardner, M.D., Lancaster, Ohio.

ANSWER.—There is no accepted new treatment of ichthyosis. There are only a few reports of success in treating one or more cases, and these lack substantiation by others. Niizawa reports (Ueber drei interessante Fälle von Ichthyosis vulgaris und die neue Behandlungsmethode, *J. Orient. Med.* 27:29 [Sept.] 1937) three cases in one family, brothers aged 4, 6 and 8 years. They were given intracutaneous injections of blood serum which had been exposed in a quartz container for thirty minutes to ultraviolet radiation. From twenty-one to twenty-four doses were given, 0.3 cc. each time. After this series there was remarkable improvement in all the children. P. S. Robinson (Congenital Ichthyosis, *Southwest. Med.* 21: 41 [Feb.] 1937) describes a severe congenital ichthyosis which he treated with thyroid extract one-tenth grain (0.0065 Gm.) daily up to 6 months of age, and after that one-half grain (0.03 Gm.) daily. The skin improved and the ectropion disappeared. Some thickening of the skin and branny scaling persisted. Kylin (Ein Fall von Ichthyosis mit erfolgreicher Behandlung durch Hypophysentransplantation, *Svenska läk.-tidning* 35:1123 [July 8] 1938, reviewed in German in *Zentralbl. f. Haut- u. Geschlechtskr.* 60:665, 1938) reports a cure of ichthyosis by transplantation of the hypophysis cerebri of a calf. After only fourteen days the skin had become normal in appearance.

TREATMENT AND PROGNOSIS IN CARCINOMA OF BREAST

To the Editor:—What is the preferred treatment of a patient 67 years old in apparently good health who has a breast tumor as big as a walnut with a dimpling of and attachment to the breast with no palpable glandular involvement? Clinically it is a carcinoma. What is the percentage of five year cures in similar cases by (1) radical operation and roentgen therapy and (2) mastectomy and roentgen therapy?

ANSWER.—Radical mastectomy is the treatment of choice for operable mammary cancer. This procedure should be preceded by biopsy and frozen section only when the clinical diagnosis is in doubt. When the axillary glands are proved to be free of cancer by microscopic examination the cures by radical mastectomy amount to approximately 70 per cent. There is a difference of opinion on the value of prophylactic postoperative irradiation. One school of thought considers that prophylactic postoperative irradiation after radical mastectomy for a strictly operable lesion in which the lymph nodes are not involved is not indicated. Others believe that the radical operation should be followed by prophylactic roentgen therapy in all cases. The

Somuel Chernauek, M.D., Dickinson, N. D.

comparative statistics of radical mastectomy alone and radical mastectomy followed by postoperative irradiation vary markedly as reported by different authors. No comprehensive statistics in the literature stating the five year cures by simple mastectomy combined with postoperative irradiation have been found.

EXTENSOR REFLEX OF BIG TOE FROM YAWNING SUBSEQUENT TO HEMIPLEGIA

To the Editor:—Am I right in assuming that I have observed a new Babinski reflex sign, as I could not find this sign mentioned in the literature accessible to me? A man suffered a cerebral hemorrhage of the facial hemiplegia alternans (Millard-Gubler syndrome) type on July 10, 1940. After four weeks it evolved into the usual chronic type with paralysis of the whole right side of the face and contralateral paralysis of the left arm and leg, suggesting pontile lesion. I have observed that when he yawns the paralyzed left foot and hand show the typical Babinski phenomenon d'éventail accompanied by dorsal flexion of the first toe and response finger. The same patient exhibits the coughing sign in a pronounced way even while standing. I would greatly appreciate your opinion whether this sign was ever recorded in the medical literature.

Hilary Layzer, M.D., Cleveland.

ANSWER.—No mention of the Babinski sign, as such, as produced by yawning has been found. However, stretching and extensor movements which probably include extension of the big toe are described as being produced in persons with hemiplegia by yawning. Samuel Brock (The Basis of Clinical Neurology, Baltimore, William Wood & Co., 1937, p. 314) says that "it would seem that extrapyramidal pathways carry these posture-changing impulses to the anterior horn cells, since stretching movements occur in the hemiplegic limbs of patients, in which the usual signs of defect of the pyramidal tract are easily demonstrated." James Purves-Stewart (The Diagnosis of Nervous Diseases, ed. 5, London, E. Arnold & Co., 1920, p. 87) states that automatic extension movements "are often well seen in the paralyzed limbs in a case of severe hemiplegia when the patient yawns or is tickled."

EUCUPIN NOT SUITED TO PARAVERTEBRAL INJECTION

To the Editor:—A white man aged 47 complains of pain in the lower portion of the lumbar region radiating to the entire left lower extremity especially toward the lateral aspect approximately three and one-half months following a left paravertebral infiltration with what he understands to have been eucupin (contains eucupin base 0.1 per cent, ethyl aminobenzoate 3 per cent and benzyl alcohol 5 per cent in oil of sweet almond. Eucupin is isoamylhydrocupreine). This treatment was administered for a sprained back. Examination reveals no sensory or motor disturbance. There was no evidence of spasticity, deformity or abscess formation in the region which was infiltrated. Please comment on any undesirable reaction from the use of eucupin in oil or nerve injury from this procedure.

M.D., Michigan.

ANSWER.—Eucupin has been carefully studied in various laboratories and according to a recent but unpublished report it tends to cause fibrosis in the tissues. Proctologists like its prolonged anesthetic effect but say that great care must be taken to avoid necrosis. The discoverer of eucupin, Morgenroth (1912), emphasized its antiseptic as well as prolonged anesthetic action. It was the subject of a special article by de Takats, published in *Surgery, Gynecology and Obstetrics* (43:100 [July] 1926). It is easy to understand that it is not suitable for paravertebral injection, as the resulting fibrosis may compress and irritate the nerve.

WELTMANN SERUM COAGULATION REACTION

To the Editor:—In reference to the question regarding the coagulation reaction (January 11, p. 176): After extensive study of the test, I agree that it has not fulfilled the original expectations in differentiating between introhepatic and extrahepatic jaundice. It is of little value in diagnosing parenchymatous or cirrhotic processes in the liver. The test is, like the sedimentation rate and the leukocyte count, a nonspecific indicator of disease. I also agree that the test can in no way replace a careful history and physical examination, as the publications of others and in unpublished data of my own, the test has been found a more reliable indicator of the presence of an inflammatory process than the sedimentation rate. False positives (increased speed of sedimentation in absence of disease) are common for the sedimentation rate. False shortening (coagulation bond of less than 4) rarely occurs with the Weltmann test. If a coagulation bond of 4 or less is found and no other laboratory, roentgenologic or physical finding explains the patient's symptoms, it is best not to make a diagnosis of a functional disturbance but to recheck and make additional tests until some organic process is found. In certain carcinomas of the digestive tract the coagulation bond (K. B.) is shortened. Penetrating posterior wall gastric or duodenal ulcer should be suspected with a positive history, despite negative roentgen ray evidence, if the coagulation bond is shortened. In pneumonia the coagulation bond is shortened before physical signs become definite, and lengthening of the bond is evidence of improvement even if physical signs persist. Further investigation is required to establish the true value of this test. I believe it will prove as useful as leukocyte counts and may replace the sedimentation test.

TOXOPLASMIC ENCEPHALITIS IN CHILDREN

ALBERT B. SABIN, M.D.
CINCINNATI

It has been abundantly demonstrated in recent years that acute nonsuppurative encephalitis is a syndrome of multiple etiology. My purpose in the present communication is (1) to present evidence that organisms of the genus *Toxoplasma* can be the cause of such encephalitis in children, (2) to describe the clinical and pathologic appearances and (3) to indicate the steps which can be taken to establish the diagnosis.

PRESENT STATUS OF TOXOPLASMA

Toxoplasma is a genus of protozoan parasites which were first observed in the gondi (North African rodent) in 1908 by Nicolle and Manceaux,¹ who differentiated it from *Leishmania*, and independently in the same year in the rabbit (Brazil) by Splendore.² They are highly organized parasites consisting of distinct cytoplasm and nuclear chromatin and are crescentic, pyriform, oval or round, measuring 6 to 7 microns in length and 2 to 4 microns in width, depending on the stage of development, as seen in fresh cover-slip preparations or in stained films. In fixed tissue sections they are not only smaller but also appear different because of the shrinkage of the cytoplasm and nucleus. The chief taxonomic characteristic of the group, however, is the capacity to multiply and produce disease in a wide range of hosts, including mammals and birds. Since 1908 there have been reports of the natural occurrence of the organisms in a large number of animal species (gondi, rabbit, guinea pig, mouse, rat, squirrel, dog, monkey, pigeon and other birds) from almost all parts of the world, but in the majority of instances the diagnosis was based entirely on morphology. The existence of *Toxoplasma* in any host cannot, however, be accepted as proved without demonstrating the chief characteristic of pathogenicity for many different types of animals. Sabin and Olitsky³ first proved the existence of *Toxoplasma* in North America when they isolated and maintained for study a highly pathogenic strain from a guinea pig. They demonstrated that (1) this strain was pathogenic for guinea pigs, mice,

rabbits, rhesus monkeys, chicks and chickens, (2) multiplication was possible only within living cells, which included not only monocytes and endothelial cells but practically every type of parenchymal cell (liver, adrenals, lung, brain), (3) infection could be effected experimentally by the intracutaneous, subcutaneous, intracerebral, intravenous, intranasal and oral routes and contact infection, studied in mice, occurred only when small numbers of starved animals were allowed to feed on others recently dead of the experimental disease, and (4) neutralizing antibodies, which could be used not only as an index of infection but also as a means for identifying *Toxoplasma*, developed during the course of the disease in some animals (rhesus monkeys) but not in others (rabbits).

Toxoplasma has been reported on a number of occasions as causing disease in man, but, with one exception, on inadequate and inconclusive criteria. Castellani⁴ described bodies which he believed to be *Toxoplasma* in smears of the blood and spleen of a 14 year old boy from Ceylon who died of a disease characterized by severe anemia, prolonged fever and splenomegaly. Fedorovitch⁵ found bodies similar to those reported by Castellani in blood smears of a 10 year old boy from the Black Sea district who also had prolonged fever, anemia and splenomegaly. Chalmers and Kamar⁶ also reported bodies similar to those of Castellani in a film of the spleen of a soldier in the Sudan, who along with many others suffered chiefly from chronic fever, headache, cough and diarrhea. While even the morphologic resemblance to *Toxoplasma* has been questioned in these cases (Wenyon⁷), they cannot be accepted as examples of human toxoplasmosis chiefly because definite identification is impossible without transmission to animals of various species. In this connection it should be pointed out that isolation of *Toxoplasma* from a single animal inoculated with suspected human material also constitutes inadequate evidence unless the same parasites are directly demonstrable in the suspected tissue, or at least several animals, of a stock proved not to be spontaneously infected, succumb within a similar period after inoculation; as an example may be cited Bland's⁸ isolation of *Toxoplasma* from a rabbit inoculated with the blood from a patient with glandular fever (infectious mononucleosis).

Toxoplasma has also been considered as the probable etiologic agent in still another type of human disease.

Read before the twelfth annual meeting of the Society for Pediatric Research at Skytop, Pa., May 1, 1940.

Jankú⁹ reported the presence of parasitic cysts in the retinal lesion of the right eye of an infant who had left microphthalmus and increasing hydrocephalus from birth, and although he referred to them merely as Sporozoa, Levaditi¹⁰ suggested that they may be Toxoplasma. Torres¹¹ found parasites in sections of the brain, heart, skeletal muscle and subcutaneous tissue of an infant who died with convulsions at 2 days of age and named them *Encephalitozoon chagasi*, although in this case also Levaditi was inclined to regard the parasites as *Toxoplasma*. "Parasitic" forms in the spinal fluid of a 17 year old boy (Corsica) who died

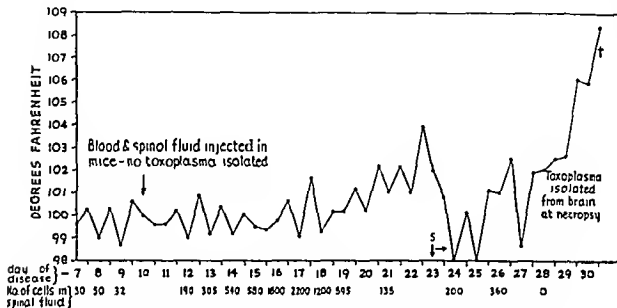

Fig. 1 (case 1).—Temperature in a case of toxoplasmic encephalitis.

of meningitis after an illness of three days were described by Coulon,¹² who called them *Encephalitozoon brumpti* because they were larger than those described by Torres. In 1937 Wolf and Cowen¹³ gave a complete description of the clinical and pathologic observations in a case of congenital granulomatous encephalomyelitis in an infant who died at 29 days of age; because the parasites which they found with ease in the sections of the nervous system were smaller in size than that recorded for *Toxoplasma* organisms in fresh preparations or stained smears, they called them *Encephalitozoon hominis*. The familiarity with *Toxoplasma*, gained from two years of study of a guinea pig strain, led me to suggest to Wolf and Cowen that there was nothing in the appearance of the parasites and the associated pathologic changes found in their case which was inconsistent with their identification as *Toxoplasma*, but that an absolute diagnosis was possible only after suitable transmission to animals. After a study of this guinea pig strain in histologic sections, Wolf and Cowen¹⁴ noted the similarity to the parasites in their human case and reported finding similar parasites and lesions in still another case of congenital encephalitis which was described by Richter¹⁵ and reinvestigated by themselves. However, it was not until the following

year, 1939, that definite evidence was supplied by Wolf, Cowen and Paige¹⁶ that the parasites found in association with the granulomatous lesions in a 31 day old infant dead of "congenital" encephalitis were actually *Toxoplasma*; this was accomplished by transmission to a large number of animals, and comparative biologic and immunologic studies which those authors¹⁶ and I¹⁷ made established the identity between *Toxoplasma* of human origin and the guinea pig strain. There is therefore definite evidence of toxoplasmic infection in only one human being, an infant with "congenital" encephalitis; that the four other cases of congenital encephalitis associated with morphologically similar parasites are also examples of the same infection can be considered only as probable. The recent report of Pinkerton and Weinman¹⁸ contains most striking morphologic evidence of the occurrence of lesions and *Toxoplasma*-like parasites in the central nervous system, myocardium, liver, spleen, skin, lymph nodes, bone marrow, adrenals and kidneys of a 22 year old Peruvian. It may be of interest to note also that, through the courtesy of Dr. J. H. Bauer and L. T. Coggeshall of the International Health Division of the Rockefeller Foundation, I have had the opportunity to observe lesions (focal necrosis) and *Toxoplasma*-like structures in sections of liver obtained in the routine yellow fever viscerotome studies in South America.

REPORT OF PRESENT CASES

CASE 1.—*Encephalitis in a 6 year old boy, fatal one month after onset. Lesions and parasites in nervous system. Toxoplasma isolated from many mice inoculated with nervous tissue, and neutralizing antibodies for Toxoplasma demonstrated in blood obtained from patient post mortem.*

Clinical History.—R. H., a white boy aged 6 years, who was born and raised in Cincinnati, was admitted to the Contagious Division of the Cincinnati General Hospital on Oct. 31, 1939, complaining chiefly of weakness of the legs and headache. There was nothing of significance for the present illness either in the family or the past history.

The history of the present illness begins with an incident on Oct. 22, 1939, when the boy received a blow on the head with a baseball bat. He was not knocked down, however, and the blow was so slight that he laughed about it. Two days later (October 24) he had severe headache which was relieved by acetylsalicylic acid. On October 25, while going to school, he staggered and had much difficulty in walking. He was sent home from school and was put to bed complaining of weakness of the right leg and severe frontal headache. On the same day (October 25) he had a generalized convulsion, and the local physician who examined him could find "nothing specifically wrong." He vomited once on October 27, and on October 30 the headache reappeared and weakness of both arms was noted. He had another convulsion on October 31 and vomited "forcefully" just before admission. There was no history of fever or of respiratory or gastro-enteric disturbance prior to admission.

Physical Examination.—On admission to the hospital, which was seven days after the first onset of headache, the boy appeared well developed but somewhat poorly nourished, was oriented, mentally alert and cooperative, and did not appear very ill. The rectal temperature was 99.6 F. and there was no evidence of injury to the head or even of localized tenderness. The positive physical signs outside of the nervous system consisted of (1) a generalized lymphadenopathy involving especially the anterior and posterior cervical nodes and to a lesser extent the axillary and inguinal nodes and (2) a palpable spleen. The affected lymph nodes were firm, discrete and not tender. The neurologic examination was remarkable for the negative rather

than the positive results. There was no nuchal rigidity, and the Kernig and Brudzinski signs were negative. There was no photophobia, and examination of the fundi revealed neither papilledema nor any exudate or hemorrhage in the retina. There were no signs of involvement of any of the cranial nerves. He could move all his extremities and there were no tremors, atrophy or definite weakness in any of them. Sensation was normal. The knee jerks were equal and active, while the ankle jerks, the abdominals and the reflexes of the upper extremities were obtained irregularly. The Babinski, Hoffman, Chvostek and Trousseau signs were negative.

Course.—On October 31, about four hours after admission, he became very restless and semidelirious and had a convulsive seizure, which began with slight twitching of the face and right arm, followed by a turning of the head and eyes to the right, and continued with twitching of both sides of the face and tongue, violent clonic movements of the right arm, slight clonus of the right leg and tonic spasm of the left arm and leg. The seizure lasted about six minutes and was followed by relaxation and stupor. The next day he was apathetic, comatose, confused and irrational, and jerky movements of the right hand and arm were noted. He became more apathetic and, although he still responded to noise and light, he did not speak. Jerking movements of the right upper extremity continued, and by the eleventh day of the disease there was twitching of the arms, face and tongue occurring with a certain rhythmicity. Between the eleventh and twenty-third days of the disease his condition was more or less the same with occasional convulsive seizures and periods of muscle twitching. Parkinsonian-like movements were noted on the twenty-third day and he continued to get worse with rapid and labored respiration, weak and irregular pulse, profuse perspiration and almost persistent muscle twitching, sometimes approaching convulsive severity. He died on the thirtieth day of the disease coincidentally with a rise in temperature to 108.4 F.

The temperature (fig. 1) ranged between 99 and about 101 F. until the twentieth day, when it rose to 102.2 and remained at a higher level thereafter except for about two days after the beginning of sulfanilamide¹⁹ therapy on the twenty-third day of the disease. Except during the last few days, the pulse and respiratory rates were more or less proportional to the temperature.

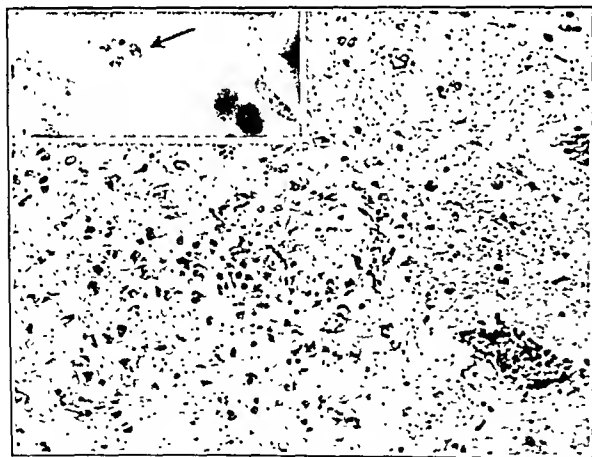

Fig. 2.—Pathologic focus in human cortex; (X 148) reduced from a photomicrograph with a magnification of 240 diameters. Inset shows group of four organisms of the genus *Toxoplasma*; (X 857) reduced from a photomicrograph with a magnification of 1,400 diameters.

Treatment was symptomatic and consisted of sedatives, transfusions, intravenous injection of fluid, gavage (because there

were periods of dysphagia) and during the last week of the disease sulfanilamide.

Laboratory Data.—**Spinal Fluid:** The number of cells per cubic millimeter rose from 30 on the seventh day to 2,200 on the seventeenth day and then dropped again to a point where no cells were seen on the twenty-eighth day of the disease; the cells were predominantly mononuclear throughout; the

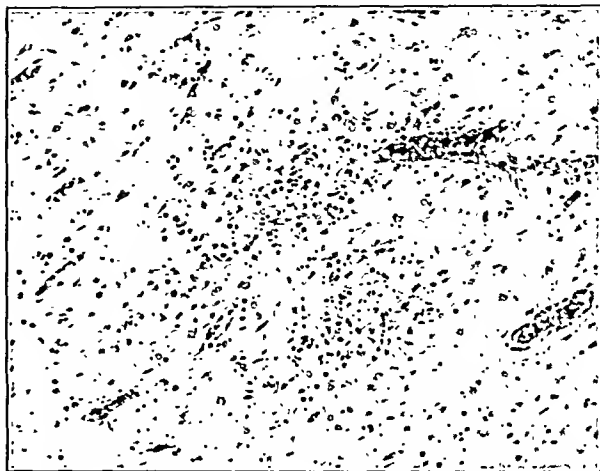

Fig. 3.—Pathologic focus in human cortex; (X 148) reduced from a photomicrograph with a magnification of 240 diameters.

results of repeated chemical examinations yielded values of 15-38 mg. per hundred cubic centimeters for protein and 45-76 mg. per hundred cubic centimeters for sugar; cultures and Wassermann reaction were negative.

Blood: Cultures and the Wassermann reaction were negative. The amount of sugar was 128 mg. and of calcium 10.2 mg. per hundred cubic centimeters. The Widal test, *Brucella abortus* and *Pasteurella tularensis* agglutination were normal on the twenty-first day of disease. A typical blood count on the fifteenth day of the disease showed 5,020,000 erythrocytes and 10,000 leukocytes, with 70 per cent neutrophils, 25 per cent lymphocytes, 5 per cent monocytes and less than 1 per cent of eosinophils and basophils.

The throat culture was negative for diphtheria bacilli. The urine was normal on repeated tests. The tuberculin reaction was negative. Roentgenograms of the skull showed no evidence of fracture; the cervical spine and long bones were normal, and examination of the chest on the eighth and eighteenth days of the disease revealed no abnormalities.

Pathologic Examination.—The autopsy was performed within one hour after death. Unfortunately, permission was limited to examination of the brain and spinal cord. With the probable exception of congestion and slight edema there was no gross pathologic change. Even after fixation in solution of formaldehyde, section of the entire brain in 3 to 5 mm. slices failed to reveal any gross lesions. The paucity of microscopic abnormalities was equally surprising. In the first examination of sections from about twenty different levels of the brain and cord only one pathologic focus was found. Examination of more than 100 additional sections from as many different levels of the central nervous system, including the olfactory bulbs, the neopallial and rhinencephalic cortex and the corpus striatum, diencephalon, mesencephalon, pons, medulla, spinal cord and intervertebral ganglions revealed only twelve pathologic foci of the type illustrated in figures 2, 3 and 4. The pathologic focus was apparent even under low magnification as a "moth-eaten," necrotic and honeycombed area which was infiltrated with a varying number of cells which had irregular, pyknotic nuclei. An adjacent vessel occasionally showed cuffing with a single row of round cells (fig. 2) but that was infrequent. Figure 3 shows clearly the relationship that these necrotic foci bore to the cerebral vessels. Careful examination of each focus under high magnification failed to reveal forms which one could identify as *Toxoplasma* with certainty, although in at least one instance a group of four *Toxoplasma*-like structures (inset in figure 2) was found in the immediate vicinity of the area shown

19. Recent chemotherapeutic studies with the strain of *Toxoplasma* isolated from this patient have shown that, while sulfathiazole and sulfapyridine can exert a curative effect on toxoplasmic infection in mice, sulfanilamide only delays death but cannot prevent it. Twenty other compounds of known therapeutic effectiveness against various protozoan infections had no effect on the course of toxoplasmic infection in mice (Sabin, A. B., and Warren, J., Therapeutic Effect of the Sulfonamides on an Intracellular Protozoan [*Toxoplasma*] Infection, abstr. J. Bact. [Jan.] 1941).

in figure 2. These pathologic foci were scattered diffusely throughout the nervous system and were noted in the cortex (figs. 2 and 3), right side of the thalamus (fig. 4), the corpus striatum, the nuclei of the pons and the cervical cord. While some of the foci contained isolated forms which might be suspected of being *Toxoplasma*, no cystlike aggregates or other collections of morphologically similar structures were found anywhere in the nervous system, even though I am fully familiar

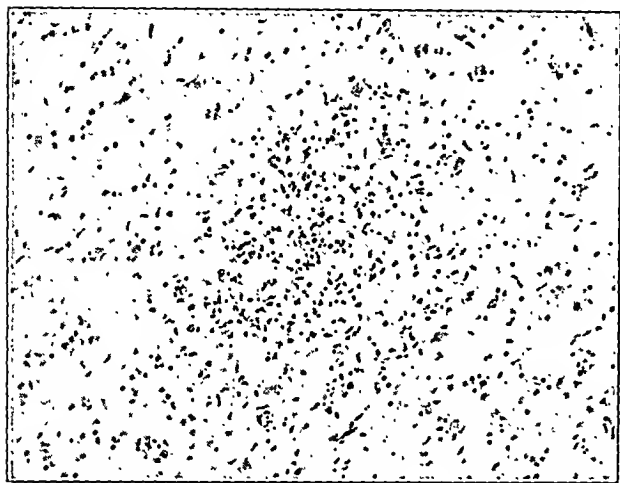

Fig. 4.—Pathologic focus in human thalamus; ($\times 110$) reduced from a photomicrograph with a magnification of 160 diameters.

with the difference in appearance of *Toxoplasma* in sections of fixed tissue and in films. In addition to these necrotic foci the meninges were thickened and hyperplastic in isolated areas and sparsely infiltrated with mononuclear and polymorphonuclear cells. An occasional vessel in a cortical fissure was infiltrated with round cells (fig. 5) but that was uncommon. Most of the nerve cells and especially those of the spinal cord showed diffuse chromatolysis but were otherwise well preserved. The choroid plexus showed no pathologic change. It should be noted here that, while the character and distribution of lesions is not dissimilar to those found in mice and rabbits after infection by a peripheral route, the diagnosis of toxoplasmic encephalitis could not have been made in this case without transmission to animals. It is also remarkable how the observations in this case differ from the extensive, gross and microscopic pathologic changes which have been observed in the one proved case of "congenital" encephalitis due to *toxoplasma*.¹⁰

Transmission to Animals.—When the nervous tissue in this case was injected into mice, the possibility of toxoplasmic infection was not considered and one step was used, i. e. the preliminary light centrifugation of the tissue suspension, which is known to diminish the chances of isolating *Toxoplasma* from the supernatant liquid. Because of their large size, the organisms are easily sedimented by ordinary horizontal centrifugation. Nevertheless, 5 of the 8 mice which were inoculated intracerebrally (0.03 cc.) and intra-abdominally (1 cc.) with the lightly centrifuged 10 per cent suspension of the human brain in broth developed typical experimental toxoplasmosis. Culture of the human brain suspension on ordinary bacteriologic mediums was sterile (the brain was removed with aseptic precautions). On the thirteenth day after inoculation, one of the mice exhibited a swollen abdomen and puncture yielded a large amount of peritoneal exudate in which *Toxoplasma* organisms were found extracellularly and intracellularly both in fresh cover-slip preparations and in films stained with Wright's stain. Intracerebral injection of this exudate into 6 mice produced a fatal toxoplasmic encephalitis in all of them. Similar abdominal distention with *Toxoplasma* in the peritoneal exudate was found in 3 other mice (one on the fourteenth and two on the seventeenth day) which received the human brain suspension. Of these mice 1 died on the seventeenth day, 1 on the nineteenth, 1 on the twentieth and 1 survived. The most striking gross finding was a cherry-red gelatinous pneumonitis. The largest number of organisms were seen in films of the lungs, while in

those of the liver and spleen only an occasional organism was found after long searching; a few pseudocysts were found in films of the brain (fig. 6). While none of the other 4 mice developed abdominal distention and the small amount of peritoneal fluid which could be obtained from them did not show *Toxoplasma*, 1 died on the twenty-first day and showed the same type of pneumonitis with large numbers of organisms in the films from the lungs. The remaining 3 mice were killed on the twenty-sixth day; films from the brain and viscera did not reveal *Toxoplasma*, and subinoculation of the tissues of each mouse into at least 4 others was negative. Subinoculation of the tissues from the mice which showed *Toxoplasma* produced a fatal toxoplasmic infection in each instance.

It should be noted here that at the same time that the fresh human brain (motor cortex and medulla) suspension was inoculated into mice, the olfactory bulbs and whole blood obtained by cardiac puncture postmortem were also inoculated, each into 5 mice. *Toxoplasma* was not found in any of these animals; they were killed on the twenty-sixth day and after examination for *Toxoplasma* the brain and viscera from each of these mice were subinoculated into 4 others with negative results. Furthermore, the tissues of 3 mice which died of trauma within twenty-four hours after inoculation with the human material were subinoculated into 12 others with negative results; these were in turn killed on the twenty-sixth day and their tissues inoculated into 12 new mice with negative results. Although previous attempts to demonstrate spontaneous toxoplasmic infection in another stock of laboratory mice have been unsuccessful, such an attempt was repeated on at least 200 mice of the stock used in the present study and also without success. These experiments are mentioned to point out that the stock of mice we used was not spontaneously infected with *Toxoplasma* and that the development of experimental toxoplasmosis in 5 of the 8 mice inoculated with the centrifuged human brain suspension points to the origin of these *Toxoplasma* organisms in the human brain. It is also apparent that *Toxoplasma* was not present in the human blood after death or in the olfactory bulbs. It should also be noted that on the tenth day of the human disease the patient's heparinized blood and spinal fluid were inoculated intracerebrally and intra-abdominally, each into 6 mice. None of these mice developed toxoplasmic infection, and passage of the brain and viscera from half their number

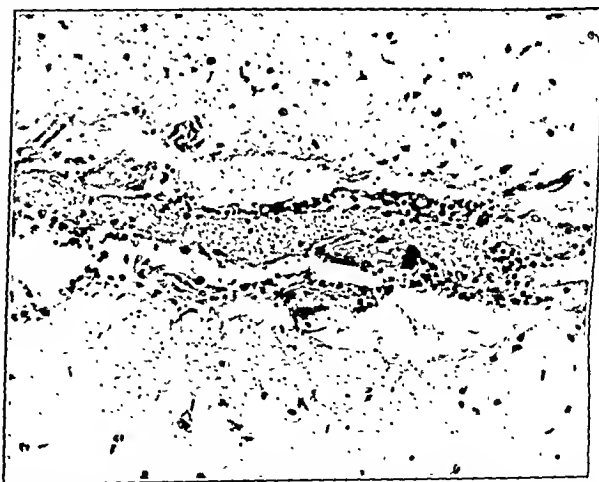

Fig. 5.—Cellular infiltration along a vessel in a cortical fissure; ($\times 110$) reduced from a photomicrograph with a magnification of 160 diameters.

at the end of five weeks into other mice was also negative; the remaining mice were found not to be immune when they were tested ten weeks after the original inoculation.

Some of the human brain which was preserved in 50 per cent buffered glycerin and kept in the refrigerator for thirteen days was inoculated into 6 mice but *Toxoplasma* was not isolated either directly or by passage. This observation is in agreement with the fact that these organisms do not survive in glycerinated tissue.

PROPERTIES OF THE R. H. STRAIN OF HUMAN TOXOPLASMA

Mause Passage.—The interval between inoculation and death was rapidly shortened on passage from seventeen to twenty-one days in the first (partly because of the small number of *Toxoplasma* organisms in the centrifuged human brain suspension) and from seven to eight days in the second to from three to five days in the third passage and thereafter. This strain has now undergone over forty passages in mice and is being maintained in this species for future reference and further studies.

Pathogenicity for Other Species.—Guinea pigs inoculated intracerebrally and intra-abdominally or only intracerebrally succumb with a toxoplasmic encephalitis between the fourth and sixth days. Rabbits inoculated intracutaneously with 10 per cent mouse brain suspension regularly develop necrotic skin lesions and fever on about the fourth day and succumb to a generalized toxoplasmic infection usually between the eighth and tenth days. At necropsy the liver shows innumerable white, pinpoint, necrotic foci, and the spleen is enlarged often to more than three times the normal size. Microscopically, lesions and *Toxoplasma* organisms are also found in the brain and adrenals. Four *Macacus rhesus* monkeys were inoculated with 10 per cent mouse brain suspension intracutaneously (0.2 cc. in two areas on the abdominal skin) and intra-abdominally (10 cc.); 2 of the 4 monkeys were also inoculated intracerebrally (2 cc.). All monkeys developed papular skin lesions (from 1 to 2 cm. in diameter) and fever on about the fourth day. In the monkeys inoculated only intracutaneously and intra-abdominally the temperature returned to normal after several days, the skin lesions disappeared, and neutralizing antibodies against *Toxoplasma* appeared in the blood. Both monkeys which received the intracerebral inoculations died—one on the seventh day after two days of almost continuous convulsions and the other on the fourteenth day after several days of severe lethargy and weakness. Two 3 day old chicks, inoculated intracerebrally with 0.06 cc. of 10 per cent mouse brain suspension developed paralysis in five days; 1 died on the tenth day and the other was killed on the seventh day when he was prostrate, and a suspension of its brain which showed many *Toxoplasma* organisms was inoculated intracerebrally into 2 other 4 day old chicks. One of these died twelve days after inoculation, and while the other remained well for a month, *Toxoplasma* organisms were shown to be present in its brain by subinoculation of mice. Two 3 day old chicks which were inoculated intramuscularly with 1 cc. of 10 per cent mouse brain suspension developed a generalized weakness on the twelfth day; 1 died on the thirteenth day and the other on the nineteenth day. By subinoculation in mice, *Toxoplasma* organisms were shown to be present in the brain as well as in the viscera. The etiologic relationship between *Toxoplasma* and the fatal experimental diseases induced in the guinea pigs, rabbits, *rhesus* monkeys and chicks was established in each case by demonstrating *Toxoplasma* in films of affected tissues and in histologic sections, by positive passage back again into mice, and by the absence of other infectious agents.

CASE 2.—*Atypical encephalitis of nine days' duration followed by complete recovery in an 8 year old boy. Toxoplasma isolated from guinea pigs inoculated with patient's spinal fluid.*

Clinical History.—W. B. D., a white boy aged 8 years who was born and raised in West Virginia, was well until Oct. 12, 1939, when he first complained of headache and "lights in front of his eyes." He went to school that day but was brought home by the teacher, who said that the boy had "fainted, his eyes rolled and he vomited." He was kept in bed for about a day and then was up and about without further complaint or signs of disease (he was observed by his father, who is a physician) until Oct. 16, 1939, when headache reappeared. The headache was worse on October 17, and he vomited several times on

October 18. The headache was localized over the frontal region and was so severe that he was brought to the Children's Hospital in Cincinnati on October 19 because of it.

Physical Examination.—On admission the boy appeared well developed and well nourished and he did not appear acutely ill but was pressing his hands against his forehead obviously suffering from severe headache. With the exception of a temperature of 101 F. (fig. 7), noticeable enlargement of the anterior and posterior cervical lymph nodes and slight enlargement of the inguinal nodes, the systemic examination was negative. The neurologic examination also was entirely negative. Especially noteworthy were the absence of nuchal rigidity, a definite Kernig's sign or abnormal reflexes. The fundi were normal.

Laboratory Data.—Lumbar puncture on October 19 yielded a clear fluid under an initial pressure of 170-200 mm. of water and a final pressure of 130 (after removal of 12 cc.). The fluid contained 200 white cells (mostly lymphocytes), 45 mg. of protein, 59 mg. of sugar and 685 mg. of chlorides. Culture was sterile. The blood count revealed 4.7 million red cells (13.3 Gm. of hemoglobin) and 20,800 white cells with 90 per cent polymorphonuclear neutrophils, 4 per cent lymphocytes and 6 per cent monocytes. The erythrocytes showed no stippling. The urine, tuberculin test and roentgenograms of the skull and bones of the hands and wrists and blood culture were all negative.

Course.—On October 20 at 5 a. m. the patient had a slight generalized convulsion with his eyes rolled up to the left and nystagmus to the left; the pupils were small and did not react

Fig. 6.—*Toxoplasma* as seen (a) free in stained films of peritoneal exudate or tissues, (b) intracellularly, (c) "pseudocyst" in film of brain. Wright's stain (X 800) reduced from a photomicrograph with a magnification of 1,000 diameters.

to light. This seizure lasted about two minutes. Several minutes later another seizure began during which he became cyanotic and had twitching of the right eyelid and forehead, and jerking of the left arm and hand, left foot and jaws. Twitching of the arm and face continued until about 6:30 a. m., after which he remained stuporous. He was irrational, confused and restless during the day and night, sleeping and crying or screaming at intervals.

On October 21 after a very disturbed night he rested quietly and showed much improvement, expressing the wish to read a newspaper that evening. Another lumbar puncture on this day yielded a clear, colorless fluid at a pressure of 200, with 300 lymphocytes, 35 mg. of protein, 62 mg. of sugar and 680 mg. of chlorides. A portion of this spinal fluid was used for animal inoculation.

Beginning with October 22 the boy seemed entirely well; he was bright, oriented, played, ate well and rested. He has remained well and no sequelae have been noted in subsequent months.

Animal Inoculations.—The patient's spinal fluid was injected intracerebrally and intra-abdominally into each of 2 guinea pigs and 6 mice. Because toxoplasmic infection was not suspected at the time, the mice were discarded when they remained well for five weeks. Between the fifth and sixth weeks both guinea pigs died within a day of each other and *Toxoplasma* was isolated by passage to other guinea pigs. The peritoneal exudate and viscera from 1 of the second passage guinea pigs dying on the tenth day contained large numbers of the organisms and were injected intracerebrally and intra-abdominally into

2 guinea pigs and 6 mice and intracutaneously into 2 rabbits. Although the 6 mice remained well for four weeks, passage of their brain and viscera to 5 other mice produced a fatal toxoplasmic infection in all of them in from four to seven days. In subsequent intracerebral passages the mice died regularly on the fourth and fifth days. One of the 2 guinea pigs died on the twenty-first day of a generalized toxoplasmic infection while the other one, still being well at the end of four weeks, was

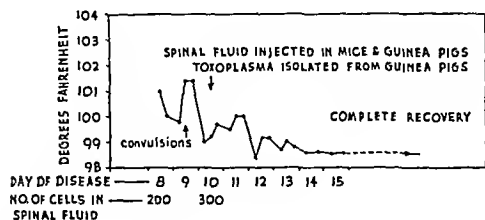

Fig. 7 (case 2).—Temperature in a case of probable toxoplasmic encephalitis.

killed and its brain was passed to 6 mice and 2 guinea pigs. The mice remained well while the 2 guinea pigs died of generalized toxoplasmosis, one on the twelfth day and the other on the twenty-fourth day. Both rabbits developed the typical necrotic skin lesions and fever,¹⁰ but only 1 of them died of the toxoplasmic infection while the other one recovered and was subsequently immune to reinoculation with the more virulent and regularly fatal R. H. strain (from case 1).

It is thus apparent that the W. B. D. strain (from case 2) was originally practically nonvirulent for mice and of considerably lesser virulence for guinea pigs and rabbits than the R. H. strain. In view of the fact that guinea pigs are known to be occasionally spontaneously infected with *Toxoplasma*, it is justifiable to question whether the W. B. D. strain was derived from the patient's spinal fluid. While the almost simultaneous death of both guinea pigs inoculated with this patient's spinal fluid and the failure to isolate *Toxoplasma* from at least 40 other guinea pigs which either were uninoculated or had received human spinal fluid or blood may favor the possibility that the W. B. D. strain is of human origin, the evidence cannot be regarded as absolutely conclusive.

Pathogenicity of the W. B. D. Strain for Other Species.—Using the virulent mouse-adapted W. B. D. toxoplasma, the same results were obtained in rhesus monkeys and chicks as with the R. H. strain.

Immunologic Identity.—The R. H. and W. B. D. strains were found to be immunologically identical not only with each other but also with *Toxoplasma* of animal origin. The methods used were the same as those which established the immunologic identity of the first human strain of *Toxoplasma* isolated from a case of congenital encephalitis with those of animal origin, i. e. cross neutralization of the skin lesions in rabbits with convalescent monkey serum and the resistance of rabbits recovering from infection with one strain to reinoculation with another.¹⁷

NEUTRALIZATION TESTS WITH HUMAN SERUM

Previous studies have shown that rhesus monkeys recovering from toxoplasmic infection as a rule developed neutralizing antibodies against the parasite, while rabbits usually became immune without such antibodies.³ The results obtained with the serum from patient 1 (fig. 8) suggest that neutralizing antibodies against *Toxoplasma* developed early in the disease and were present at death. While the antibody titer is rather low, it is nevertheless of the same order of magnitude that is developed by most convalescent monkeys. This amount of neutralization was never obtained with any convalescent rabbit serum, and no neutralization of any kind has been observed with at least fifteen human serums of various sorts. The serum obtained from patient 2 (W. B. D.) ten weeks after the onset of his illness had neutralizing antibodies neither against the

R. H. strain (fig. 8) nor against the W. B. D. strain. It should be noted here, however, that it has been observed that convalescent monkeys may lose their antibodies as early as six weeks after infection.²⁰ These results suggest that in future studies on human toxoplasmosis it would be advisable to test for neutralizing antibodies during the first three to four weeks after onset of the disease. While the presence of such antibodies would be strong evidence in favor of toxoplasmic infection, their absence would not be evidence against it.

The same serums from patients 1 and 2 were also tested for neutralizing antibodies against minimal doses of the viruses of St. Louis encephalitis, Eastern and Western equine encephalomyelitis, and lymphocytic choriomeningitis but none were found.

EPIDEMIOLOGIC CONSIDERATIONS

Although there can now be no doubt that *Toxoplasma* can infect human beings, there is as yet no indication how frequent such infection is. The probability is that it is a relatively rare disease which is transmitted to man from a reservoir of infection in lower animals. It should be noted, therefore, that in case 1 the family related that they had a half-grown cat in the house which became sick and had frequent convulsive seizures about the time their boy became ill. The boy was neither bitten nor perceptibly scratched by the cat. Unfortunately, the family disposed of the cat by abandoning it on an open road far from home. There was also a dog in the house but to the best of their knowledge no mice or rats. They lived in a house on the outskirts of the city and, while they were troubled to some extent by mosquitoes, they had not observed any ticks. The mother was certain that the only meat the boy had eaten was beef or pork and not rabbit or fowl. Three other children and both parents remained in good health

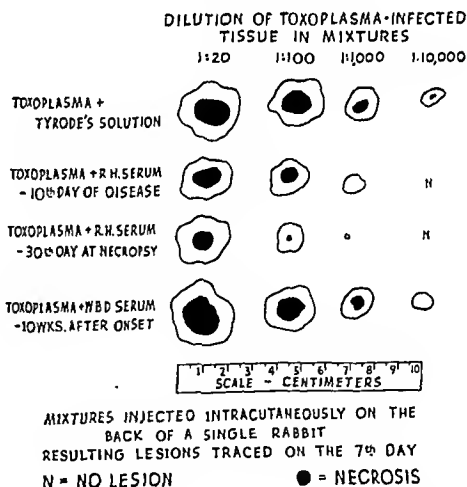

Fig. 8.—Neutralization test with R. H. strain and patient's serums.

during the entire period. In case 2 there was no history of exposure to animals or of eating any meat other than beef, pork or chicken.

There is also reason to believe that toxoplasmic infection may exist as a disease with only systemic manifestations, suggesting that one's alertness in detecting this type of infection should not be limited to patients with signs pointing to involvement of the nervous system.

DIAGNOSIS OF TOXOPLASMIC INFECTION

It is apparent from the two cases described in the present report that the diagnosis of toxoplasmic infection is made in the laboratory either after death of the patient or long after recovery. Work at present in progress on a complement-fixation test may overcome this difficulty, but until that is achieved it may be advisable to pursue the following procedure in a suspected case. While direct microscopic examination of the spinal fluid is obviously indicated in every case, it is doubtful whether *Toxoplasma* will thus be found except in rare cases in which the disease is especially destructive to the nervous system, as in infants during the first days or weeks of life.¹⁶ The spinal fluid or heparinized blood or both should be inoculated separately into mice and guinea pigs by the intracerebral and intra-abdominal routes. Six or more mice and two or more guinea pigs should be used. Abdominal distention in the animals should be watched for and, when it occurs, the presence or absence of peritoneal exudate should be ascertained by puncture and the fluid examined for *Toxoplasma*. If the mice remain well for a month, about half their number should be killed, Wright-stained films of the lungs and brain examined for *Toxoplasma*, and the brain, lungs, liver and spleen ground in Tyrode's solution, without the use of an abrasive, and injected into 6 other mice, which are in turn observed for evidence of toxoplasmic infection. The temperature of the original guinea pigs is recorded daily, and if they do not die by the end of the sixth week they should be killed and their brain and viscera passaged to other guinea pigs. Isolation of *Toxoplasma*, particularly on passage, from a single guinea pig cannot be regarded as evidence that they originated from the human material; if both the original guinea pigs succumb almost simultaneously, the probability of the human origin of the *Toxoplasma* organisms can be considered as being greater, particularly if an examination of the stock does not reveal spontaneous infection. If the guinea pigs succumb and the mice do not, a diligent study of the mice may reveal a strain of low original pathogenicity for mice. The simultaneous isolation of *Toxoplasma* from a number of different animals inoculated with human material must be regarded as strong evidence for their human origin. Biopsy and inoculation of animals with an enlarged lymph node may occasionally be advisable. When a protozoan resembling *Toxoplasma* is isolated, it should be identified either by its pathogenicity for a wide range of hosts or by immunologic tests or both.

In addition to attempts at direct isolation of *Toxoplasma*, the patient's blood should be tested for neutralizing antibodies from three to four weeks after the onset of illness, and whenever possible comparison should be made with a specimen obtained earlier or later in the disease.

SUMMARY

Two cases of clinically atypical encephalitis occurring in boys 6 and 8 years of age during October 1939 were investigated and definite evidence of the etiologic relationship of the protozoan parasite *Toxoplasma* was obtained in one and suggestive evidence in the other. The outstanding clinical features in both patients were generalized convulsions, disorientation, fever, pleocytosis without such signs of meningeal irritation as nuchal rigidity or Kernig's sign, and the absence of signs pointing to involvement of the cranial nerves. One died thirty days after onset and the other recovered completely on the tenth day.

The chief pathologic change, found in the nervous system only after many sections from various regions had been searched, consisted of microscopic necrotic and granulomatous foci, in the vicinity of which it was occasionally possible to find structures morphologically similar to *Toxoplasma*. Intracerebral and intra-abdominal inoculation of fresh brain suspension produced toxoplasmic infection in 5 of 8 mice which came from a stock that was proved to be free of spontaneous infection. Inoculation of mice with the spinal fluid and blood obtained on the tenth day of the disease, and with the blood and olfactory bulbs obtained post mortem, did not yield *Toxoplasma*. The strain of *Toxoplasma* isolated from patient 1 was found to be highly pathogenic for mice, guinea pigs, rabbits, chicks and rhesus monkeys. Neutralizing antibodies for *Toxoplasma* were shown to have developed in the patient's blood.

Spinal fluid from the second patient was inoculated into 6 mice and 2 guinea pigs. *Toxoplasma* was isolated from the guinea pigs, which died within a day of each other during the sixth week after inoculation. This strain (W. B. D.) of *Toxoplasma* was originally and even after several passages in guinea pigs practically nonvirulent for mice but became highly virulent after several mouse passages. The mouse-adapted W. B. D. strain was as pathogenic for the other species as the R. H. strain and they were found to be immunologically identical with each other and with *Toxoplasma* of animal origin.

ADULT TOXOPLASMOSIS

A PREVIOUSLY UNRECOGNIZED DISEASE ENTITY
SIMULATING THE TYPHIUS-SPOTTED
FEVER GROUP

HENRY PINKERTON, M.D.

AND

RICHARD G. HENDERSON, M.D.

ST. LOUIS

Although *Toxoplasma* has been recognized as pathogenic for lower animals since 1900, our knowledge of human infection with this protozoan is in its infancy. The organism has only recently been established as the etiologic agent in a peculiar type of meningo-encephalitis in newborn infants, under circumstances which suggest prenatal infection and consequently imply latent or subclinical infection in the mothers of these infants. Six instances of this infantile disease entity have been reported to date.¹

The first proved case of adult toxoplasmosis was recently reported by one of us with Weinman.² In this case the clinical features were obscured by a concomitant infection with *Bartonella bacilliformis*. In the report the literature has been reviewed, and the criteria for the identification and differential diagnosis of the organism have been discussed. The probability that the infection might not be excessively rare was also pointed out at this time.

The present study is based on the occurrence, in St. Louis, of two fatal cases of an acute febrile, exanthematic disease in adults. Intracellular *Toxoplasma* organisms

Read in part before the St. Louis Pathological Society, Nov. 29, 1940.

were found in the tissues in both of these cases in such numbers as to leave no doubt concerning their etiologic significance. The clinical picture of the disease had almost nothing in common with that of the previously reported cases in infants. The similarity of the clinical and pathologic pictures in these two cases, together with the apparently identical epidemiologic features, justify the assumption that we are dealing with a previously unrecognized disease entity which closely simulates Rocky Mountain spotted fever and endemic typhus and has many features in common with certain of the recently described atypical pneumonias. The frequency of this infection can be determined only by further observation and study. As an aid in such

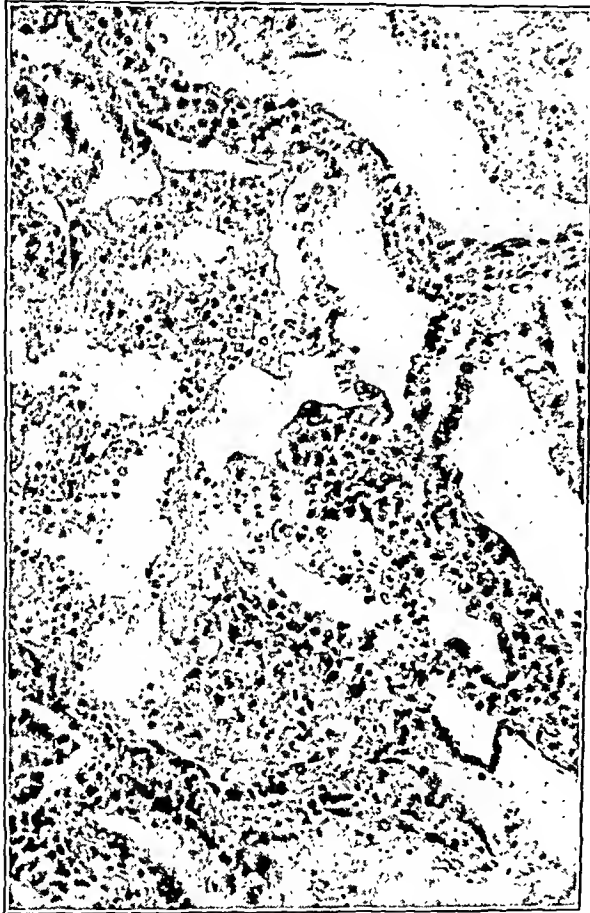

Fig. 1 (case 2).—Section of lung showing cuboidal metaplasia of alveolar lining cells and gelatinous exudate with hyaline membrane in alveolar sacs. Hematoxylin-eosin stain; $\times 225$.

studies, the differential diagnosis of the disease, and possible methods for its recognition during life and after death, will be discussed in the light of evidence brought out by this study.

REPORT OF CASES

CASE 1.—History.—A white man aged 50 entered the St. Mary's Hospital in St. Louis on June 11, 1940, complaining of fever, cutaneous rash and diarrhea. The diarrhea was of seven days' duration but had almost entirely ceased on admission. The fever and cutaneous rash were noted simultaneously twenty-four hours prior to admission but the patient had complained of weakness and malaise for a period of several days before the onset of these symptoms.

The patient had visited a Boy Scout camp near Ironton, Mo., for several week ends prior to the onset of the illness and was known to have removed an engorged tick from his abdomen on or about June 1. A clinical diagnosis of portal cirrhosis of

the liver had been made several months previously. During the past year, increasing dyspnea had been noted and occasional attacks of mild pain in the left chest had occurred. A non-productive cough had been present for several weeks.

Physical Examination.—The facial expression was dull and masklike. Voice sounds were distant over the base of the left lung, and dulness to percussion was found posteriorly over both lung bases. Coarse rales were heard in the same areas. There was enlargement of the cardiac area of dulness to the right and left. Blood pressure was 120 systolic and 64 diastolic; the pulse rate was 118 per minute; temperature was 106 F. rectally; the respiratory rate was 36 per minute.

There was a maculopapular eruption covering the entire body except for the scalp, the palms of the hands and the soles of the feet. The lesions varied from bright red to pale pink, and some of them appeared to blanch on pressure. Over the abdomen and lower part of the chest there was some coalescence of the lesions. No vesicles or pustules were observed. Except for their distribution, the cutaneous lesions were entirely consistent with those of Rocky Mountain spotted fever.

On admission, the white blood cells numbered 5,300 with 1 per cent juvenile forms, 12 per cent stab forms, 39 per cent segmented neutrophils, 17 per cent monocytes and 31 per cent lymphocytes. The erythrocyte count and hemoglobin were within normal limits. All blood chemistry was within the normal range except the blood cholesterol, which was 261 mg. per hundred cubic centimeters. Blood cultures were repeatedly negative. No malarial parasites were found in blood smears. Urine examination showed 2 plus albumin and 3 plus sugar. On microscopic examination of the sediment there were many cellular and hyaline casts, with numerous red and white blood cells. The stools were brown, and semisolid. Cultures were negative for organisms of the typhoid-dysentery group. Staphylococcus aureus and type IX pneumococcus were cultured from the sputum. Agglutination tests were negative with *B. proteus* X2, but positive with X19 in a dilution of 1:160. Electrocardiographic study revealed sinus tachycardia, respiratory sinus arrhythmia, left axis deviation, myocardial disease and transitory paroxysmal nodal rhythm. Biopsy of the skin of the chest was done on June 17, in an attempt to establish a diagnosis of spotted fever. Although the histologic picture in the skin was not inconsistent with this disease, no rickettsiae were found in the vascular lesions after long search.

Roentgen examination of the chest showed moderately heavy hilus shadows and lung markings throughout both lung fields, accentuated in the lung bases bilaterally and with irregular areas of increased density in the lower half of both lung fields. The cardiac shadow was enlarged to the left and downward.

The rectal temperature on admission was 106 F. and throughout the illness maintained an average 103-104 F., with morning remissions of 1 or 2 degrees. The pulse varied between 110 and 120 per minute with no relation to the rise or fall of the temperature. During the fourth day in the hospital the patient gradually became irrational and markedly cyanotic, refusing symptomatic treatment. Nasal oxygen was given, but in spite of all treatment the patient lapsed into coma and died on June 16. There was a terminal oliguria with a rise in the nonprotein nitrogen.

Postmortem Examination.—The eruption described during life was present on the skin, particularly on the face, shoulders and flexor surfaces of the arms. The liver and spleen showed the changes characteristic of moderately advanced portal cirrhosis, which will not be described, as they seem unrelated to the acute illness. The lungs were markedly congested, and a hemorrhagic, frothy fluid exuded from the cut surfaces. Uniformly distributed through all lobes of both lungs were firm, shotlike areas of induration, ranging from 1 to 3 or 4 mm. in diameter. The mesenteric lymph nodes were moderately enlarged. No other gross changes of importance were noted. The brain was not examined.

Microscopic Examination.—The lungs showed an interstitial pneumonitis, with rounding up of the alveolar lining cells, and areas of organization by connective tissue corresponding to the shotty nodules described grossly. In some areas there was also a fibrinopurulent exudate in the bronchioles and alveoli, but the

connective tissue proliferation was in the alveolar walls rather than in the alveoli. The heart showed prominent fusiform accumulations of mononuclear cells between apparently undamaged muscle fibers. The liver and spleen, in addition to the characteristic changes of portal cirrhosis, showed scattered small areas of focal necrosis consistent with those described in previously reported cases of toxoplasmosis.

The most important microscopic feature was the presence in the tissues of intracellular protozoa having the morphologic characteristics of *Toxoplasma*. Parasitized cells were fairly numerous in the spleen (particularly in the focal lesions mentioned) and were occasionally found in the lung. In the latter organ the cells containing the organisms were principally alveolar lining cells and alveolar macrophages, while in the spleen the invaded cells were those of the reticuloendothelial system. A single parasitized cardiac muscle fiber containing a group of 18 organisms was found after long search. Sections of skin representing the papules showed focal collections of inflammatory cells around blood vessels, both in the corium and in the subcutaneous fatty tissue. No protozoa were found in these lesions.

CASE 2.—History.—A white woman aged 43 entered the St. Mary's Hospital on Sept. 16, 1940, complaining of fever, cutaneous rash and increasing weakness. On September 1 the patient noted a feeling of weakness and malaise which continued for ten days. On September 10, six days before admission to the hospital, she experienced a chill followed by a sudden rise in temperature and a severe headache. The temperature remained elevated and on admission was 102.6 F. On September 13, three days before admission, a course of sulfanilamide (40 grains, or 2.6 Gm., daily) was begun. On the day of admission the patient developed marked cyanosis with nausea and blurring of vision. Sulfanilamide treatment was discontinued at this time and was not resumed.

The last week in August 1940 the patient spent at a country home near Warrenton, Mo. During her stay there she frequently removed ticks from dogs. Her husband stated that she removed two ticks from her leg at some time during this week but he could not recall the exact time.

Physical Examination.—The patient was well developed and well nourished. Her facial expression was dull and apathetic. The tongue was furred and the pharynx dry but not reddened. The respiratory rate was 24 per minute. The lung fields were resonant, and no rales were heard. A dry, unproductive cough was noted at the time of the examination. There was some tenderness in the left lower abdominal quadrant. The abdominal viscera were not palpable. Vaginal, rectal and neurologic examinations were negative.

The skin was warm and moist. The patient was perspiring freely at the time of examination. There was an erythematous maculopapular rash covering most of the body but sparing the palms of the hands, the soles of the feet and the scalp. The lesions were pale rose in color and did not fade on pressure. They were from 2 to 6 mm. in diameter and in some areas appeared to coalesce. The possibility was considered that the cutaneous rash might have been caused by the sulfanilamide. This point will be considered later.

On admission, the white blood cells numbered 10,050, with 2 per cent juvenile forms, 14 per cent stab forms, 60 per cent segmented neutrophils, 4 per cent monocytes and 20 per cent lymphocytes. The erythrocyte count, hemoglobin and platelet count were within normal limits, as were also the nonprotein nitrogen, blood sugar, blood chlorides and carbon dioxide combining power. No malarial parasites were found in the blood smears. The Kline test was negative. The urine was normal. Blood cultures up to the day of death were negative. The examination of the feces was negative for pus, ova and motile parasites, and cultures were negative for organisms of the typhoid-dysentery group.

Agglutination tests for typhoid, paratyphoid, dysentery and tularemia were negative. Positive agglutination with *B. abortus* in a dilution of 1:1,280 was found, but when repeated with a new antigen only partial agglutination in a dilution of 1:80 was obtained. On September 24, four days before death, agglutination tests with *B. proteus* X2 and X19 were negative at all dilutions higher than 1:20.

The clinical condition remained the same during the first five days in the hospital except that the cutaneous rash faded slightly during this period. On September 21, however, the patient suddenly developed cyanosis and marked dyspnea, the respiratory rate reaching 56 per minute. Rales were heard at both lung bases posteriorly. Examination of the chest with a portable x-ray apparatus showed a pronounced accentuation of the hilus shadows and lung markings of the lower lobes, suggesting pulmonary congestion. The cardiac shadow appeared normal. There was marked abdominal distention. Nasal oxygen was given with immediate improvement of symptoms.

On September 24, eight days after admission, the patient became irrational. Because of the respiratory difficulty, nasal oxygen was continued. At this time all normal reflexes of the lower extremities and abdomen were absent, and a positive

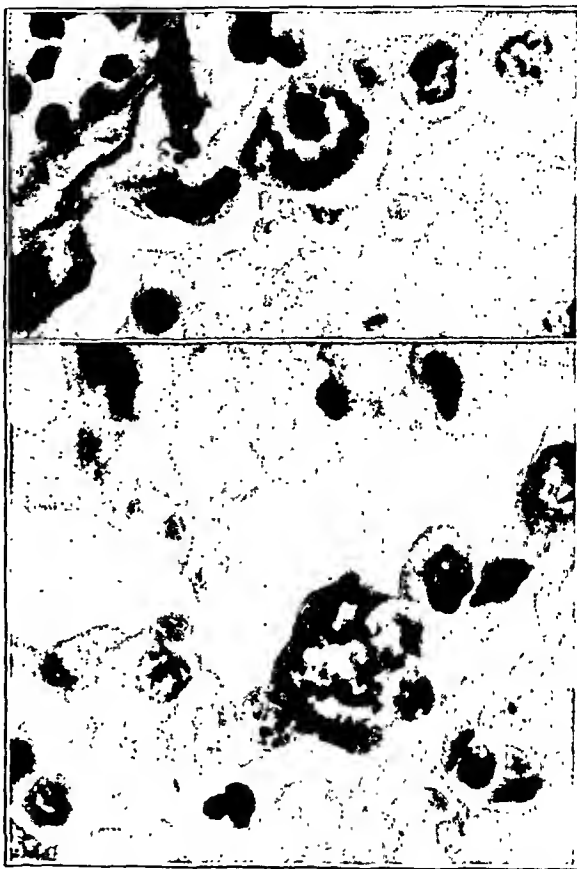

Fig. 2 (case 2).—Section of lung showing two alveolar lining cells loaded with *Toxoplasma*. Note the rounding up of the alveolar lining cells and the character of the alveolar exudate. (Parts of two separate alveoli are shown in this illustration.) Hematoxylin-eosin stain; $\times 1,000$.

Oppenheim reflex was elicited. There was no neck rigidity. Rocky Mountain spotted fever was considered as a possible diagnosis.

The temperature remained high, averaging 103-104 F. throughout the course of the illness. There were transitory remissions at irregular intervals, but rarely did the temperature approach normal. Terminally, the patient's hearing became very poor. Symptomatic treatment included small blood transfusions, and nasal oxygen was administered throughout the course of the illness. The patient died on September 28, twelve days after admission.

Postmortem Examination.—Petechial hemorrhages were noted on the parietal pleura. All lobes of both lungs were edematous and consolidated, the right lung weighing 750 Gm. and the left 680 Gm. The cut surfaces of the lungs were grayish white and, when scraped with the knife, yielded a frothy, grayish white, semifluid material. The spleen was normal in size. The mesenteric lymph nodes were moderately enlarged. The brain

showed marked congestion. No other gross changes of importance were noted. The provisional gross diagnosis was atypical pneumonia of possible virus origin.

Microscopic Examination.—The lungs showed a remarkable picture of interstitial pneumonitis, with interstitial organization in many areas (fig. 1). Practically every alveolus appeared to be lined with cuboidal epithelium. The alveoli contained a gelatinous appearing exudate in which very few inflammatory cells were present, and the alveolar walls were often lined with a thick, hyaline membrane similar to that seen in influenzal pneumonia (fig. 1). The heart showed rare necrotic muscle fibers with relatively little cellular reaction. The liver and spleen showed occasional areas of focal necrosis like those seen in

Fig. 3 (case 2).—Cardiac muscle fiber in longitudinal section, containing a large fusiform collection of *Toxoplasma*. Hematoxylin-eosin stain; $\times 1,000$.

case 1. *Toxoplasma* was not numerous in any of the tissues. Occasional alveolar lining cells, as well as macrophages lying free in the alveoli and bronchioles, were distended with these organisms (fig. 2), and a few myocardial fibers, otherwise normal in appearance, contained large colonies of organisms (fig. 3). These parasitized muscle fibers were so few in number that it was impossible to find them in many of the sections of the myocardium. *Toxoplasma* was also found in the hepatic and splenic lesions.

The brain showed occasional focal lesions (fig. 4) apparently centering around small capillaries and consisting of accumulations of small and large round cells with rare neutrophils. A few definite groups of *Toxoplasma* were found in these lesions after long search. The meninges were edematous and the sub-arachnoid space contained from 20 to 30 inflammatory cells per high power field. These inflammatory cells were chiefly macrophages and lymphocytes, with a few neutrophils. No organisms were found in the meninges.

TRANSMISSION OF THE INFECTION TO GUINEA PIGS AND MICE

On September 26, two days before the death of the patient, two male guinea pigs were inoculated, supposedly intraperitoneally, with 5 cc. each of citrated blood from patient 2. One of these animals died on the eleventh and the other became moribund and was killed on the thirteenth day after inoculation. The autopsy revealed practically identical observations in the two animals: caseation necrosis in the abdominal wall at the site of injection, enlargement of the liver and spleen, hemorrhagic lung consolidation, and softening and injection of the brain. In one animal the liver was studded grossly with minute yellowish foci of necrosis. Protozoa having all the characteristics of *Toxoplasma* were found in Giemsa-stained impression films of nearly all organs from these animals. The appearance of the organisms in films is shown in figure 5. They are crescentic or pyriform, with pale blue staining cytoplasm and large purple nuclei occupying the entire width of the cytoplasm and situated nearer the more pointed end. Their true shape is rarely seen in sections. Their approximate size in comparison to red blood cells may be seen in figure 5. Organisms were also numerous in the necrotic lesions at the sites of injection in the abdominal walls of the animals.

The infection has been transmitted serially in guinea pigs for seven generations by the intraperitoneal injection of emulsions of liver, spleen and brain. Animals injected in this way have shown no lesions at the sites of inoculation, but a mucinous peritonitis, with caseation necrosis of the omentum, has been added to the picture described in the animals injected with patient's blood. Animals injected subcutaneously have, however, shown necrotic foci in the abdominal wall, suggesting that the original injection with human blood may have been largely subcutaneous. The mortality in injected guinea pigs has been practically 100 per. cent, death occurring between the seventh and twelfth days.

Microscopic examination of guinea pig tissues has shown an accurate reproduction of the lesions of the patients, including the focal brain lesions and the myocardial involvement. In sections of eyes, granulomatous lesions have been seen under the conjunctiva. Retinal lesions have not been noted. Numerous specimens of *Toxoplasma* have been found in the lesions in paraffin sections of nearly all organs. In particular, the myocardial invasion seen in the patients (fig. 3) has been frequently duplicated.

On June 17, two male guinea pigs were injected intraperitoneally with 5 cc. each of blood from patient 1. The temperatures of these animals remained normal until the ninth day after injection, when one of them was found to have a temperature of 105.8 F. On the following day the temperature was 105.2 F., and this animal was killed. About 5 cc. of clear, mucinous exudate was present in the peritoneal cavity. Since this picture was inconsistent with spotted fever, and since toxoplasmosis was not considered as a possibility at that time, the peritonitis was assumed to be "secondary infection" and further investigation was not made. The other guinea pig was reported by the caretaker to have died a few days later. In the light of our present knowledge, it seems probable that these guinea pigs died of *Toxoplasma* infection, although the evidence is only presumptive.

The evidence given for the transmission of *Toxoplasma* infection to guinea pigs by inoculation with blood from patient 2 seems fairly conclusive. Both injected animals died of the infection, and organisms were numerous at the actual sites of inoculation. The possibility of bringing to light a latent spontaneous *Toxoplasma* infection in guinea pigs by the trauma of injection has, however, been pointed out in a previous publication.² In order to rule out this possibility as far as possible in the present instance, two procedures were carried out. In the first place, three guinea pigs from the same source as those used for the inoculation in case 2 were killed, and emulsions of brain, spleen and liver were pooled and injected intraperitoneally into three other guinea pigs of this same group. The tem-

peratures of these animals remained normal and the animals remained in apparently good health over an observation period of forty days. At this time they were killed, and no gross or microscopic lesions were found at autopsy. Secondly, the tissues of 10 guinea pigs from this same source which had been used for the routine diagnosis of tuberculosis (with negative results) were minutely examined, but no protozoa or lesions suggestive of *Toxoplasma* infection were found. These guinea pigs had been killed six to eight weeks after injection and were all negative to gross inspection at autopsy.

On October 6, brain and liver tissue removed post mortem from patient 2 and kept in glycerin in the ice box at 40 F. for eight days was emulsified and injected intracranially into twenty young Swiss mice. At this time the diagnosis had not been made, but a frozen section of the lung had supported the provisional gross diagnosis of atypical "virus" pneumonia. Consequently, 10 mice were injected with the unfiltered material and 10 with the material after passage through a Seitz filter.

The 10 mice injected with the filtered material showed no symptoms during an observation period of sixty days. Seven of the 10 mice injected with the unfiltered material died between the fifth and the tenth day after inoculation. The tissues of 3 of these mice were examined microscopically, and numerous intracellular *Toxoplasma* organisms were found in the brain, spleen and liver of 2 of these. At this time a paratyphoid infection (*B. typhi murium*) had been discovered in this strain of mice, and occasional normal mice were dying of this infection. The three experimental mice showed, in addition to the *Toxoplasma* infection, evidence of the paratyphoid infection in the form of extracellular and intracellular gram-negative bacilli in the tissues. Tissues of 10 mice dying spontaneously of the paratyphoid infection alone were minutely examined and *Toxoplasma* was not found.

Because of the paratyphoid infection, the *Toxoplasma* strain in mice could not be transmitted serially. The foregoing facts, however, strongly suggest that the

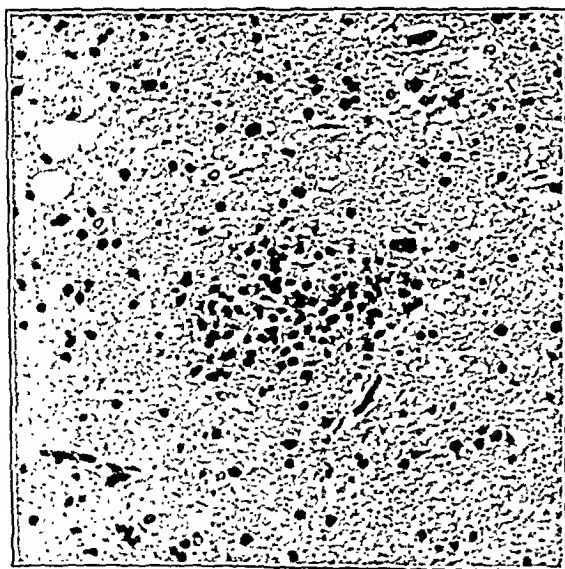

Fig. 4 (case 2).—Focal brain lesion. Note the resemblance of this lesion to the lesions seen in typhus and spotted fever. Hematoxylin-eosin stain; $\times 225$.

Toxoplasma organisms seen in the mice were of human origin and did not represent a latent infection in the mice. When added to the evidence of the transmission of the infection to guinea pigs, it seems clear, beyond a reasonable doubt, that the *Toxoplasma* infection was transmitted from patient 2 to both of these experimental animals.

Wolf and his co-workers³ undoubtedly transmitted human *Toxoplasma* infection to rabbits, infant mice, chicks and guinea pigs by intracerebral injections of brain tissue from one of their infantile cases. The observations reported here represent the first apparently successful transmission of *Toxoplasma* infection to animals by the injection of human blood. They suggest

Fig. 5.—*Toxoplasma* in Giemsa-stained film preparation from the omentum of guinea pig. Second passage of the infection in guinea pigs after isolation from blood of patient 2; $\times 1,000$.

that this procedure may be valuable as a method for making an accurate diagnosis.

CLINICAL FEATURES

It would be obviously unsafe to assume that the clinical descriptions of the 2 reported cases form a complete picture of the disease. Their almost complete identity, however, suggests that they may be taken as a tentative working basis. Prodromal symptoms consisting of malaise and weakness were present for several days before the onset of acute illness in each case. The onset of the acute illness was sudden, with chills and fever, and a variable but sustained elevation in temperature was present throughout the course of the disease. The duration of the fever was apparently six days in case 1 and eighteen days in case 2, but the presence or absence of slight fever during the prodromal stage is an unknown factor in each case. The pulse was rapid with some variations, not following the temperature fluctuations with any regularity.

A maculopapular eruption, involving the entire body but sparing the palms of the hands, soles of the feet and scalp, seems to be an important feature in the diagnosis from a purely clinical point of view. The significance of the cutaneous eruption in case 2 is somewhat doubtful, since it may conceivably have been caused by the administration of sulfanilamide. Long, Bliss and Feinstone⁴ report that only 1.6 per cent of 307 adults receiving large doses of this drug developed dermatitis and that this symptom was not seen before the fifth day of therapy. It seems unlikely that it could have occurred in the case reported here on the third day of therapy, particularly since the dosage used was small. It should also be pointed out that cutaneous lesions containing *Toxoplasma* were noted at autopsy in the single previously reported case of adult toxoplasmosis² and that cutaneous lesions were present in case 1 (reported here) in which chemotherapy was not used.

3. Wolf, Almer; Cowen, David, and Paige, Beryl: Human *Toxoplasmosis*: Occurrence in Infants as an Encephalomyelitis: Verification by Transmissions to Animals, *Science* 89: 226 (March 10) 1939.

4. Long, P. H.; Bliss, Eleanor A., and Feinstone, W. H.: Mode of Action, Clinical Use and Toxic Manifestations of Sulfanilamide, *J. A. M. A.* 112: 115 (Jan. 14) 1939.

Pulmonary involvement occurred in both cases and death appeared to be due primarily to interference with respiratory function. In case 2 the pneumonitis was recognized clinically and roentgenologically eleven days after the onset of fever and six days before death. At autopsy in this case the pulmonary lesions seemed to be in a relatively acute stage. In case 1 the pneumonitis was recognized on the day following the apparent onset of fever and five days before death. The postmortem observations in this case showed a somewhat older lesion, accompanied by focal areas of complete organization. It is therefore probable that in this case the pulmonary involvement began during the prodromal period.

A positive Oppenheim reflex was elicited in case 1 but, on the whole, evidence of meningeal or cerebral involvement was not striking. Although the cases were seen by clinicians of wide experience, indications for spinal fluid examination were not thought to be present.

It will be noted that the picture described, which may be accepted as essentially that of acute *Toxoplasma* infection in adults, has little in common with the clinical picture of the six previously reported instances of neonatal infection. In the infantile form retinitis, hydrocephalus and signs of meningo-encephalitis have been the outstanding features and, although 2 of the patients were said to have had "terminal pneumonia," respiratory signs and symptoms have not been stressed. Cutaneous eruption has not been mentioned in the infantile cases. In one case, however,⁵ focal lesions and *Toxoplasma* were found in the fatty subcutaneous tissue at autopsy. On the whole, there would seem to be little reason for connecting the adult form with the infantile form of the disease on the basis of the clinical observations.

Perhaps the most striking feature of the clinical picture is its resemblance to that of the rickettsial diseases, and because of the history of tick bite, more particularly to that of Rocky Mountain (or Eastern) spotted fever. For an account of the clinical features of the rickettsial disease, reference may be made to a recent discussion by Gordon.⁶ Evidence will be given for believing that even with complete postmortem examination toxoplasmosis could easily be mistaken for spotted fever or typhus unless *Toxoplasma* organisms are specifically and conscientiously looked for in tissues by one familiar with their appearance. It would therefore appear that, until the frequency of toxoplasmosis in different parts of the world is determined and methods for its accurate diagnosis are devised, local epidemics of exanthematic disease with a history of insect bite must be studied with great care. Previously reported atypical cases of spotted fever not confirmed by animal inoculation should also be restudied in the light of this new diagnostic possibility.

In typical spotted fever, the rash involves the palms of the hand, soles of the feet and scalp, a distribution not seen in typhus. It will be noted that the rash did not involve these regions in either of the two reported cases. Further observations must be made before it can be decided whether or not this feature has differential diagnostic value.

From the clinical point of view, interest centers about the pulmonary manifestations as of possible importance in the differential diagnosis. Pneumonia is a rather rare complication of spotted fever,⁷ while both of our patients had evidence of lung involvement, one on the first and the other on the fifth day after entering the hospital. At autopsy the involvement was of sufficient extent in each case to be regarded as the probable cause of death. Pulmonary involvement in typhus and spotted fever is secondary and terminal, while in the cases reported here the picture was that of a primary pneumonia, resembling that of the recently described "atypical pneumonia."⁸ The roentgen picture of the lungs may prove to be somewhat characteristic of the condition.

Spinal fluid examination may prove of diagnostic value, although data on this point are not available in our cases. Spotted fever has a negative spinal fluid, while typhus fever is said to show a slight increase in mononuclear cells and the fluid is not markedly turbid. In view of the definite meningeal involvement seen in sections in case 2, it seems probable that the spinal fluid would have shown an increased cell count and perhaps turbidity or other diagnostic features. One of the previously reported infantile cases of toxoplasmosis showed a spinal fluid cell count ranging up to 1,500 white blood cells per cubic millimeter, and in another case 800 red cells and 30 white blood cells per cubic millimeter were present.

THE PATHOLOGIC PICTURE

Without going into detail concerning the pathologic picture, which will be reported elsewhere, it may be stated that the gross and microscopic appearances are remarkably similar to those of typhus and spotted fever. The absence of splenic enlargement (case 2) and the pulmonary lesions (in both cases) are the only gross features of possible differential value. Histologically the focal brain lesions (in case 2) and the myocarditis (in both cases) are, as far as we are aware, indistinguishable from the lesions in both typhus and spotted fever.⁹ The pulmonary lesions are unusual and possibly pathognomonic. Aside from this, the diagnosis depends on finding the intracellular protozoa in the tissues.

The pulmonary lesion bears a rather striking resemblance to that described in cases of atypical pneumonia of unknown etiology.¹⁰ Clinically also there are many similarities between our cases and certain of the reported cases of atypical pneumonia. Previous to the discovery of the intracellular protozoa, this was believed to be the most probable diagnosis in case 2.

The massive invasion of myocardial fibers found in case 2 (fig. 3) could scarcely be overlooked in a careful examination, although invaded fibers were not numerous and were unaccompanied by cellular infiltration. They were not present in all sections of the myocardium, however, and in case 1 only one invaded heart muscle fiber was found after a prolonged search. Parasitized cells were by no means numerous in the lung in either case and were definitely rare in the brain. Tissues must be examined with great care to exclude the diag-

nosis of toxoplasmosis in autopsy material showing lesions of the type described. The demonstration of the rickettsiae of typhus and of spotted fever in tissues is likewise attended with great difficulties. In case 1, although tissues were studied for many hours in an unsuccessful attempt to demonstrate the rickettsiae of spotted fever, it was not until the slides were carefully restudied in the light of the observations in case 2 that *Toxoplasma* was found and the diagnosis was made.

The staining of the organisms in the cytoplasm of cells requires further study. In many apparently well stained sections the organisms appeared as homogeneous spherical eosinophilic bodies which could easily have been mistaken for colloid droplets or other structures of a nonspecific nature, while in other sections from the same paraffin block, stained somewhat differently, their structural detail was clearly visible.

EPIDEMIOLOGIC CONSIDERATIONS

Up to the present time nothing has been learned about the epidemiology of toxoplasmosis, although the mere fact of its occurrence in lower animals would suggest the possibility of an arthropod vector. In the reported infantile cases the presence of retinal lesions at birth presupposes subclinical infection of the mothers, but the mode of infection in the mothers and the exact method of transmission to infants remain obscure.

The occurrence of the two adult cases reported here in the late summer months and the definite antecedent history of the removal of engorged ticks a few days before the onset of the illness in each case forces one to consider the possibility that the disease may be tick borne. Attempts were made, as soon as the nature of the disease was recognized, to obtain ticks from the country home visited by the second patient. Frost had already occurred, however, and it was necessary to defer this part of the study until spring.

It must be borne in mind that, although spotted fever is probably exclusively tick transmitted, a definite history of tick bite is not always obtained. Contamination of the skin with tick viscera as a result of crushing ticks while removing them from dogs undoubtedly accounts for many cases, and ticks may become attached and drop off without the knowledge of the victim. The possibility that toxoplasmosis may be transmitted by ticks is being investigated experimentally in this laboratory. The fact that *Toxoplasma*, like *Plasmodium malariae*, belongs to the Sporozoa, suggests that the experiments should include mosquitoes.

The direct transmission of the disease from person to person by droplet infection is also suggested as a possibility by the finding of *Toxoplasma*-laden macrophages in the alveoli and bronchioles. Experiments are in progress to determine whether lower animals may be infected by the respiratory route.

LABORATORY DIAGNOSIS

In discussing the diagnostic problems raised by the observations reported here, it may be well to review the methods for the identification and differential diagnosis of the rickettsial diseases. A detailed discussion of these methods has been given by one of us¹¹ and those

methods which are of possible practical use in the present problem will be considered here.

White Blood Cell Count.—The low leukocyte count in the reported cases, in the presence of pulmonary consolidation, may be of diagnostic importance. In this respect the cases resemble those of atypical pneumonia reported by various workers.¹²

Weil-Felix Reaction.—This reaction is of considerable diagnostic value, but too much reliance should not be placed on it. In typhus, agglutination in high titer with *Proteus* OX19 and in relatively low titer with OX12 is the characteristic finding, while, in spotted fever, agglutination is usually obtained in relatively low titer with both OX2 and OX19. In one of the cases reported here (case 2) the Weil-Felix reaction was negative, while in the other (case 1) it was positive with OX19 in a dilution of 1:160. Recent observations here (unpublished) indicate that a positive reaction in this dilution may often be found in a variety of conditions and that it can therefore have little significance. The Weil-Felix reaction in animals experimentally infected with *Toxoplasma* is under investigation.

Skin Biopsy.—In spotted fever a definite diagnosis can frequently be made by demonstrating rickettsiae in the endothelial cells and smooth muscle cells of arteriolar walls. In typhus fever, rickettsiae are found with greater difficulty and may be recognized by the fact that they are found only in endothelial cells. This method is of value, however, only in the hands of an experienced observer. In case 2, no definite *Toxoplasma* organisms were seen either in the cutaneous lesions excised during life or in those excised post mortem. It should be pointed out, however, that *Toxoplasma* was easily seen and recognized in cutaneous lesions excised post mortem in the first adult case reported by one of us with Weinman.²

We are not able at present to state that the cutaneous lesions of toxoplasmosis, typhus and spotted fever can be distinguished from one another by purely histologic examination, although suppurative involvement of the subcutaneous fatty tissue seems to be more characteristic of toxoplasmosis. Biopsy should be done in doubtful cases, however, since it is probable that *Toxoplasma* may be found in some cases, while the demonstration of rickettsiae will exclude toxoplasmosis in other cases.

Animal Inoculation.—It has long been realized that transmission to guinea pigs by inoculation with patient's blood is the sine qua non for accurate diagnosis of the rickettsial diseases. The procedure is a simple one, and its general adoption would be of great value in solving the problems raised by the observations presented here. Typhus and spotted fever are readily transmissible to guinea pigs by this method and easily differentiated from each other by cross immunity tests with known strains. It would appear from our observation that toxoplasmosis is transmissible to guinea pigs by the same method and that the diagnosis can be easily established by finding the organisms in smears and sections of the animal tissue. Precautions to be observed in excluding the possibility of spontaneous infection in the animals used for the test should include the inoculation of control animals with normal human

blood, as well as the use of stock animals proved, as far as possible, to be free from the infection.

Neutralization Tests.—By mixing immune serum from a patient with the viruses of typhus and spotted fever and then injecting the mixtures into guinea pigs, it is possible to establish or exclude the diagnosis of these diseases with a fair degree of accuracy. This test should be used more frequently to make the diagnosis in cases in which recovery occurs and in which guinea pig inoculation has not been done or has given negative results. In cases in which recovery occurs which are negative for both typhus and spotted fever by this method, the test described in the following paragraph might give significant results:

Sabin and Olitsky¹³ and Sabin,¹⁴ working with Toxoplasma infection in lower animals, have developed a rabbit cutaneous protection test based on the protective action of immune monkey serum against the inoculation of virulent strains of Toxoplasma. It seems probable that this method could be used for the diagnosis of toxoplasmosis in man, although it is doubtful whether it would be of value in the early stages of the disease.

Spinal Fluid Examination.—The potentialities of spinal fluid examination as a diagnostic method have already been mentioned. Although the cerebral lesions in the cases reported here are less conspicuous than those in the reported infantile cases, the microscopic appearance of the meninges in case 2 suggests that important spinal fluid changes may have been present. Incidentally, in one of the infantile cases, Toxoplasma was found in considerable numbers in the sediment of the spinal fluid¹⁵ and it is possible that a diagnosis could be made in this way in adult cases.

Examination of the Blood for Toxoplasma.—Toxoplasma infection was transmitted to each of two guinea pigs by the intraperitoneal injection of 5 cc. of blood from patient 2. Careful examination of a blood smear from patient 2 gave negative results, and the organisms are probably so rare in the peripheral blood that this method may have little diagnostic value. We have, however, found occasional organisms after long search in blood smears from infected guinea pigs.

Examination of Sputum for Toxoplasma.—It has been brought out in the pathologic descriptions that the alveoli and in one case the bronchioles contained macrophages distended with protozoa. Since toxoplasma organisms are easily recognized morphologically in smear preparations (fig. 5), it seems probable that sputum examination may prove to be a simple and accurate method of diagnosis. Guinea pig inoculation with sputum, preferably subcutaneously to avoid causing bacterial peritonitis, also suggests itself as a procedure of possible value.

Culture Methods.—Toxoplasma has been grown on the developing egg embryo and would probably grow in Maitland medium. The possibility of using these methods for growing the organism directly from circulating blood should not be overlooked. If this proves to be possible, it will probably be a more rapid method than animal inoculation and will have the added advantage of excluding more definitely the hazard of spontaneous infection in the test animals.

SUMMARY AND CONCLUSIONS

Two fatal cases of Toxoplasma infection in adults were observed. The clinical features of the disease have almost nothing in common with those of the previously described cases of neonatal infection with this protozoon, the picture being essentially that of an acute febrile exanthematic disease with atypical pulmonary involvement and, in fatal cases, death from respiratory embarrassment.

Pathologically also the picture differs widely from that of the infantile type, the outstanding feature being a peculiar type of interstitial pneumonitis, with rounding up of the alveolar lining cells and interstitial organization by connective tissue. Meningoencephalitis, though present, is not conspicuous. The pathologic features common to the infantile and the adult type are focal brain lesions, myocarditis and the presence of Toxoplasma in the lesions.

Both clinically and pathologically the disease is remarkably similar to Rocky Mountain spotted fever and may easily be mistaken for the latter disease, even with a complete and careful postmortem examination, unless the organisms are conscientiously searched for in tissues by one familiar with their appearance. The cases reported have also many clinical and pathologic features in common with certain recently reported cases of atypical pneumonia of unknown etiology. The assumption that toxoplasmosis is a rare disease is therefore not justified.

The disease was transmitted readily to guinea pigs by inoculation of blood taken from at least one of the patients during life and to mice by the intracranial inoculation of autopsy material from the same patient. This statement is made with the reservation that the inoculation may conceivably have brought to light a previously existing spontaneous Toxoplasma infection in the guinea pigs and mice employed, a possibility which, for reasons given, is believed to be remote. Toxoplasma infection has not previously been transmitted to laboratory animals by inoculation with human blood.

The observations presented in this paper introduce a new factor of uncertainty in the differential diagnosis of the acute exanthematic diseases, particularly those of the typhus-spotted fever group. At present the most practical method for accurate diagnosis is the transmission of the infection to experimental animals. Animal inoculation should therefore be done more frequently in isolated cases and small local outbreaks of diseases of this group, in an attempt to determine the frequency and importance of toxoplasmosis in various sections of the country.

In cases of obscure acute febrile illness with (or without) a rash resembling that of typhus or spotted fever, clinical and roentgen evidence of diffuse atypical pneumonitis may suggest the diagnosis. The presence of Toxoplasma-laden macrophages in alveoli and bronchioles indicates that the diagnosis might be made from Giemsa-stained films of the sputum, a diagnostic procedure which has, as far as we are aware, never been employed. The possible importance of spinal fluid examination as a diagnostic measure should also be considered in view of the meningeal involvement noted in one of the reported cases.

Purely circumstantial evidence suggests that the disease may be transmitted by ticks. The presence of organisms in bronchioles also indicates that direct droplet transmission from person to person may take place. These possibilities are being investigated.

CONSECUTIVE ATTACKS OF PNEU-
MOCOCCIC PNEUMONIAREPORT OF A CASE EXHIBITING FOUR RELAPSES
DUE TO FOUR PNEUMOCOCCUS TYPES

EDWARD BIGG, M.D.

AND

ROGER A. HARVEY, M.D.

CHICAGO

Recurrence occurs more commonly in pneumonia than in any other acute infectious disease. The incidence of one or more previous attacks has been noted by various writers as from 13.6¹ to 41 per cent.² Repeated attacks in the same case are not unusual. Cases in which there were from ten³ to twenty-eight⁴ attacks have been reported. Of the cases cited by Cole,⁴ thirty gave a history of more than one previous attack of pneumonia. In eighteen of these there were two previous attacks, in nine there were three, in two there were four and in one there were eighteen. The interval between

occurrence of a fresh invasion of the same or different lobe appears several days after the subsidence of an original attack. As Finland⁵ points out, relapse may be due to (a) reinfection by the pneumococci which produced the original infection, (b) pneumococci of a different type or (c) some other organism, usually hemolytic streptococcus or staphylococcus. The importance of this observation has been stressed by Bullowa,⁷ Cole,⁸ Cecil⁹ and Lord and Heffron¹⁰ in discussing the failure of specific therapeutic agents. A survey of the literature reveals little detailed study on the incidence of consecutive pneumococcic infections. Although Norris¹¹ reported that 0.06 per cent of a series of 5,966 patients suffered relapse, no bacteriologic data were presented. Finland, Spring and Lowell¹² noted three cases in 1,037 in which relapse was produced by pneumococci of types other than those causing the original infection. We were unable to find any case in which more than one such consecutive infection was recorded. Thus our purpose in this communication is to present the complete study of a case in which four types of pneumococci were definitely shown to be etio-

Fig. 1.—Appearance of chest on admission, showing dense consolidation of the left upper lobe (portable film). Type II pneumococci in blood and sputum.

Fig. 2.—Appearance on fifteenth hospital day. The area of consolidation in the left lower lobe can be clearly seen. There is some residual infiltration in the left upper lobe, although marked clearing has occurred. Types XXIV, II and VI pneumococci recovered from sputum.

Fig. 3.—Appearance on twenty-sixth day of hospitalization. The left lung field is clear. A new area of consolidation is noted in the right lower lobe. Sputum contains pneumococci type XX.

recurrences is significant. In Cole's series 107 patients had only one previous attack and in only nine of these it had occurred within one year. In thirty-eight the initial attack had occurred from one to five years before, in nineteen from five to ten years earlier, in twenty-five from ten to twenty years previously and in sixteen more than twenty years before. In a carefully studied series of fifty-seven cases reported by Finland and Winkler⁵ the shortest interval between infections was four weeks and the longest nearly twelve years.

In striking contrast to the frequency of recurrence in pneumococcic pneumonias is the fact that relapse is a rare phenomenon. Although the distinction between relapse and recurrence may be arbitrary, we would limit the term relapse to those instances in which the

logic agents in the production of four consecutive pulmonary lesions, all of which occurred within a period of fifty days.

PROTOCOL

History.—P. C., a white man aged 25, entered the University of Chicago Clinics Jan. 6, 1940, complaining of pleural pain, chills, fever and cough productive of bloody sputum. These symptoms had appeared suddenly three days before admission and were increasing in severity. The past history was non-contributory.

Physical Examination.—The temperature (rectal) was 103.8 F., pulse rate 110, respiratory rate 28. The blood pressure

was 90 systolic, 50 diastolic. The patient was well developed and well nourished. He appeared acutely ill. The face was flushed and the skin was hot and dry. Cyanosis was absent. The pharynx was injected and granular. There was definite limitation of movement of the left chest. A friction rub was palpable in the left axilla. Over the upper half of the anterior and posterior left lung field, dullness to percussion, increased vocal and tactile fremitus, bronchial breathing and moist rales could be demonstrated. A coarse friction rub was heard in the left axilla. The remainder of the physical examination was not remarkable.

Laboratory Examination.—The leukocyte count was 11,200 with 76 per cent polymorphonuclears; the hemoglobin content was 12 Gm. (Sahli) and the red cell count 3,700,000. The urine contained a trace of albumin and occasional red and white blood cells. The sputum contained many pneumococci found to be type II by direct Neufeld reaction and mouse inoculation. A blood culture taken on admission contained type II pneumococci. All subsequent blood cultures were negative. X-ray examination of the chest showed consolidation of the left upper lobe (fig. 1). The Francis test¹³ with type II specific soluble substance was negative. Ophthalmic and intradermal tests with rabbit serum were negative.

Hospital Course.—Immediately following identification of type II pneumococci in the sputum, 200,000 units of type II antipneumococcus rabbit serum was administered intravenously.

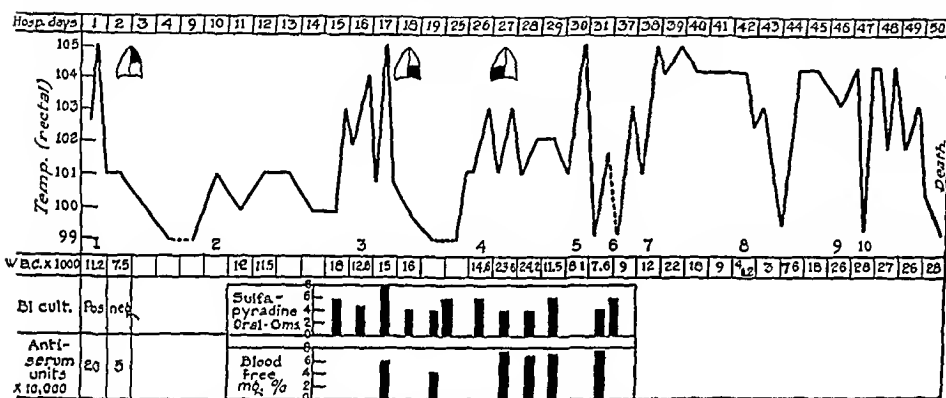

Fig. 4.—Hospital course: 1. Type II pneumonia, left upper lobe. 2. Rabbit serum sickness. 3. Type II, VI and XXIV pneumonia, left lower lobe. 4. Type XX pneumonia, right lower lobe. 5. Transfusion reaction. 6. Icterus noted; hemolytic anemia. 7. Thrombophlebitis. 8. Granulocytopenia. 9. Lung abscess, right lower lobe. 10. Cellulitis, right thigh.

An additional 50,000 units was given the following morning when the admission blood culture was found to be positive and the temperature still elevated. There was striking improvement following this therapy and the patient felt well until the tenth hospital day, when he developed serum sickness. The polyarticular pains, urticarial rash, leukocytosis and fever responded to the usual symptomatic measures. X-ray examination showed almost complete clearing of the previously involved left upper lobe.

On the morning of the fifteenth hospital day the patient complained of sudden sharp pain in the left lower chest and began raising moderate amounts of "rusty" sputum. The temperature rose to 103 F. A friction rub was present in the left axilla and signs of consolidation could be demonstrated in the left lower chest. X-ray examination showed pneumonic involvement of the left lower lobe (fig. 2). Bacteriologic studies of the sputum revealed pneumococci types II, VI and XXIV, the predominant type both on direct examination and following mouse inoculation being XXIV.

In view of a possible concurrent mixed pneumococcal infection, recent presence of serum sickness and a strongly positive intradermal and ophthalmic reaction to rabbit serum, it was decided to use sulfapyridine as our therapeutic agent. The drug was administered as suggested by Evans and Gaisford¹⁴

and within seventy-two hours clinical and subjective improvement occurred. After four days of normal temperature, sulfapyridine was discontinued. At no time was there any indication of drug intolerance. Chest roentgenograms showed clearing.

On the twenty-sixth day of hospitalization, six days after cessation of sulfapyridine, the patient noticed pain in the right lower chest and once more a cough productive of rusty sputum appeared. The temperature rose to 103 F. with a corresponding leukocytosis. Examination of the chest revealed signs of consolidation at the right lung base. X-ray examination showed a new area of pneumonia, this time in the right lower lobe (fig. 3). Examination of the sputum revealed pneumococci in large numbers which appeared to consist entirely of type XX. Sulfapyridine therapy was reinstituted, the same program of dosage being used as previously. There was little improvement; the temperature, pulse and white blood cell count remained elevated. The patient grew much weaker and continued to bring up blood streaked sputum. A microcytic anemia of 3.0 million red blood cells and 9 Gm. (Sahli) of hemoglobin developed. The following day 700 cc. of citrated blood was given with no untoward effects. Clinical jaundice was observed eight days after the resumption of sulfapyridine. Sulfapyridine was immediately discontinued, 32 Gm. having been given during this course, making a total drug intake of 65 Gm. over a period of nineteen days.

The patient continued to raise moderate amounts of sputum, containing frank blood which gradually changed to small dark clots. A pulmonary infarct was suspected although the source of an embolus could not be demonstrated. Electrocardiographic examination and the blood nonprotein nitrogen were normal. The temperature fell slowly after cessation of sulfapyridine administration but on the thirty-seventh hospital day thrombophlebitis of the right femoral and popliteal veins developed, with severe edema and pain of the entire right leg. This was accompanied by a sharp rise in temperature and leukocytes.

Within four days the patient had grown much worse, the temperature ranged around 104 F. and the pulse rate was 140 per minute. Jaundice became more intense and bile appeared in the urine. The blood bilirubin was 1.4 mg. per hundred cubic centimeters. The blood nonprotein nitrogen remained normal. He now complained of soreness of the throat, and the pharynx was found to be injected and edematous; a small yellowish gray membrane was observed in the right tonsillar fossa. Smears and cultures of this area failed to show fusospirochetes or Klebs-Loeffler bacilli. Within twenty-four hours the white blood cell count had dropped from 18,000 to 9,000 and the polymorphonuclears from 76 per cent to 64 per cent. The pharynx appeared much worse, and the membrane now covered both tonsillar fossae and several small areas of ulceration and necrosis appeared on the posterior pharyngeal wall. On the following day there was further extension of the pharyngeal ulceration and necrosis. At 8 a. m. the white blood count was 4,000; three hours later it had dropped to 1,200 with 6 per cent polymorphonuclears. Oozing of blood from the gums was noted. Prothrombin was 29 per cent of normal. A transfusion of 300 cc. of citrated blood was given with resulting rise in the white blood cells to 2,000 with 10 per cent polymorphonuclears. Repeated transfusions of 700 cc. and 800 cc. were given on successive days. Gingival bleeding ceased, the pharynx showed rapid improvement and the white blood cell count rose to 28,000 with 86 per cent polymorphonuclears. Prothrombin determinations returned to normal.

The patient then began raising progressively increasing amounts of sanguinopurulent sputum and the possibility of a

lung abscess was considered. X-ray examination corroborated this impression, showing evidence of excavation in the previously described area of consolidation in the right lower lobe. The temperature became septic in type, cellulitis developed in the right upper leg, and the jaundice increased. Despite postural drainage and intensive supportive measures, respirations ceased on the fiftieth hospital day.

Postmortem Examination.—Both pleural cavities were obliterated by delicate fibrous adhesions. A small encapsulated empyema cavity was present over the posterior right lower lung. The right lung contained an abscess in the lower lobe and resolving lobar pneumonia of the middle and upper lobe. An organized thrombus could be seen in the branch of the pulmonary artery leading to the right lower lobe. The left lung showed resolving lobar pneumonia in the upper lobe and beginning pneumonic consolidation of the lower lobe. The liver was enlarged and demonstrated cloudy swelling and passive congestion. There was moderately far advanced cloudy swelling of the kidneys with beginning tubular degeneration. The right femoral vein contained a large organized thrombus and was surrounded by a large area of induration. Culture of the left lower lobe revealed type VI pneumococci. Agglutinins for types II, VI, XX and XXIV were demonstrated in the blood serum.

COMMENT

Evaluating the results of the bacteriologic studies, one must conclude that this case demonstrates an unusual instance of superinfection with four pneumococcus types. Although the third pulmonary infection was probably preceded by an embolus, the infarcted area was invaded by type XX pneumococcus. The clinical significance of these consecutive infections has been discussed at length in the literature dealing with specific serum therapy, but we stress again the importance of repeated bacteriologic examinations in cases of pneumococcal infections in which there is "relapse."

The toxic effects of sulfapyridine are well known and have been described by many workers.¹⁵ However, it is of interest to note the occurrence of both acute hemolytic anemia and granulocytopenia as complications of drug therapy in this case and the appearance of the latter eight days after the cessation of sulfapyridine. Barnett¹⁶ and Dolgopol¹⁷ point out that damage to the bone marrow may manifest itself only after discontinuance of sulfapyridine, and included in the reports noted are occasional examples corroborating this observation. In one case of Thompson's¹⁸ hemolytic anemia appeared three weeks subsequent to sulfapyridine administration. It would be of value, therefore, to examine the blood of all treated patients one month after cessation of the drug.

The total drug intake of 65 Gm. is of interest. Evans and Gaisford¹⁴ state that in their experience the highest total dosage administered to adults producing no damage to the hematopoietic system was 49.5 and 51 Gm. They suggested limiting sulfapyridine dosage to 25 Gm.

Although more recent studies include patients receiving larger amounts, it is felt by Dolgopol and Hobart¹⁷ that most hematologic changes appear in those cases in which a large total of the drug is administered. The occurrence of individual sensitivity to small quantities of sulfapyridine has been reported but it probably plays a minor role in the production of blood changes. When possible, therefore, as a measure of safety the intake of the drug should be kept within a limit of 25 Gm.

POSTOPERATIVE PERITONEAL GRANULOMATOUS INFLAMMATION

CAUSED BY MAGNESIUM SILICATE

EDWARD J. McCORMICK, M.D.

AND

THOMAS L. RAMSEY, M.D.

TOLEDO, OHIO

We have been interested for some time in the reactions caused by lycopodium powder and magnesium silicate in the tissues. Reactions initiated by foreign body substances are responsible for surgical complications which are frequently unrecognized. They are of great importance to the surgeon because of the subsequent mortality and morbidity.

Lambert¹ in 1912 called attention to the formation of giant cells in lymphocytic cultures when lycopodium was used as an irritant. Papers on the subject of foreign body irritants were written by Harrison, Lambert, Haynes, Burroughs and others and summarized and published in 1913.² Erb³ reported six cases of lycopodium granuloma in 1935. Grieco⁴ reported the results of experiments with the use of lycopodium and talc in 1936. Fienberg⁵ reported two cases of granuloma caused by talc in 1937. Antopol and Robbins⁶ discussed granuloma caused by lycopodium following the use of rectal suppositories in 1937. Ramsey and Douglass⁷ discussed these reactions and reported five cases in a paper in 1940.

Lycopodium powder is produced from the spores of club moss, which belongs to the fern family. It is a fine yellowish substance used as a desiccant and absorbent with which all surgeons are familiar. This powder has also been used on pills and as a dusting powder on suppositories.

Talcum, or talc, is a native hydrous magnesium silicate. It is a white dusting powder. At times lycopodium is used in combination with talc to make a desirable powder which is easily sterilized and is used on the hands and gloves preceding operative procedures.

LESIONS PRODUCED

Lycopodium or talc or both are introduced into the tissue from the gloves of the surgeon or of his assistants. Inflammatory reaction of the granulomatous type

is produced. Granulomas vary in appearance. They may be nodular and show lymphocytic infiltration, fibroblasts and giant cells of foreign body types. In one of our cases we thought we were dealing with tuberculous peritonitis. Pathologically some of the lesions resemble

Fig. 1 (case 1).—Serosal thickening, fibroblastic proliferation, granulomatous inflammatory infiltrate and giant cells ($\times 70$).

tubercles and may show central caseation and necrosis. When tissues from this type of inflammatory reaction are examined microscopically, lycopodium spores and magnesium silicate crystals are found. Magnesium silicate was clearly demonstrable in the two cases that we report. The crystals are usually found within the large multinuclear giant cells, and that they are undoubtedly the etiologic factors seems beyond dispute. The importance of this condition can be realized from the synopsis of the following two cases:

Fig. 2 (case 1).—Typical type of granulomatous inflammation; one giant cell shows an arrangement of nuclei in the form of a crescent. The resemblance to tuberculosis is seen in this area ($\times 70$).

REPORT OF CASES

CASE 1.—A white woman aged 38, single, admitted to St. Vincent's Hospital Dec. 20, 1939, complained of abdominal cramps and pain which she attributed to spastic colon, a diagnosis previously made elsewhere. She had submitted to surgery in 1927, the gallbladder and appendix having been removed at

that time. For some time following the cholecystectomy and appendectomy she had abdominal distress which was diagnosed as spasticity of the colon. These attacks had ceased about three years before, although she had since had ribbon-shaped stools containing mucus on occasion.

For a week prior to admission the patient had cramps and pain in the abdomen accompanied by watery stools. Enemas in the meantime gave poor results. The cramps continued. There was no nausea or vomiting. The temperature was 101 F. the day prior to admission. She improved during the few days that she was in the hospital and was discharged December 24 with some abdominal tenderness but no diarrhea and no fever. The diagnosis on discharge was chronic pelvic inflammatory disease and grip.

The patient was readmitted to the hospital Jan. 5, 1940, with pain in the lower part of the abdomen and a palpable mass in the left tubo-ovarian region. There was a very definite cervicitis, and a preoperative diagnosis of cervicitis and left salpingo-oophoritis was made. Operative procedure was undertaken January 9. The cervix was dilated and tissue was obtained for biopsy. The cervix was cauterized. The abdomen was opened and the left tube was found greatly swollen and edematous, injected and bound down with the ovary to the posterior surface of the broad ligament. It was noted that the right

Fig. 3 (case 1).—Nodular serosal thickening, a giant cell showing an intracellular crystal at its lower margin ($\times 70$).

tube was somewhat injected but apparently normal and patent. There was a small cyst on the right ovary. There were adhesions in the upper part of the abdomen from the previous cholecystectomy and appendectomy.

The left tube and ovary were removed. The small cyst was resected from the right ovary. The round ligaments were plicated and the abdomen was closed in layers without drainage. The pathologic diagnosis was "chronic cervicitis with chronic erosion, partial healing and scar tissue formation; chronic active suppurative salpingitis; congestion, edema and cystic degeneration of the ovary with atretic follicle cysts, one showing intra-cystic hemorrhage."

January 22 the patient was up in a chair and feeling well. Discharge from the hospital was discussed with the patient at this time.

On January 26 the patient complained of pain in the lower part of the abdomen. The complaint of pain was accompanied by an elevation of temperature, which on January 27 reached 101.4 F. An irregular temperature curve was charted until January 31, when the temperature returned to normal and remained there. The patient was discharged from the hospital on February 12. At this time it was felt that she probably had salpingitis on the right side. Bimanual examination revealed some evidence of thickening and involvement of the right tube. She was discharged from the hospital and instructed to take douches and rest at home. It was felt that the inflammatory

condition in the right side might subside. Her course at home was not satisfactory and she was readmitted to St. Vincent's Hospital on February 20. At this time she was afebrile. She complained, however, of pain in the lower part of the abdomen, distention and persistent obstipation. Good results were not obtained with enemas.

Flat plates of the abdomen did not reveal evidence of small bowel obstruction. Examination of the abdomen showed definite tenderness in the right lower quadrant and bimanual examination revealed considerable thickening and the suggestion of a mass in the region of the right tube and ovary. Because of the colicky pain, nausea and distention of the lower part of the abdomen, a diagnosis of partial obstruction was made despite the negative flat plates and likewise a diagnosis of right salpingo-oophoritis. Transfusions and infusions of saline solution were given and everything was done to enhance the patient's general condition.

The abdomen was reopened on February 27. The tissues of the abdominal wall appeared edematous. The omentum was densely adherent to the peritoneal surface of the abdominal wall in the region of the previous incision. The uterus could be palpated on the left side of the pelvis. There was a large mass in the region of the right tube and ovary which appeared to be an inflammatory condition of the tube with cystic degen-

It at once becomes apparent that magnesium silicate as the offending agent caused this patient to have a secondary laparotomy, to lose the remaining tube and ovary and to become quite ill because of the extensive inflammation and partial intestinal obstruction. This

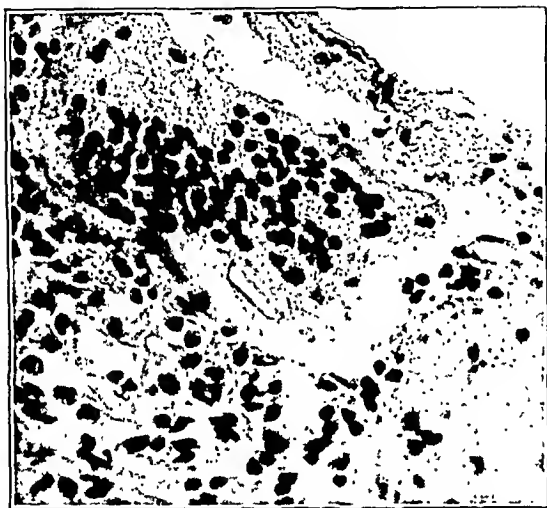

Fig. 4 (case 1).—Same as figure 3 but with a higher magnification ($\times 400$).

eration of the ovary. The small bowel was densely adherent to all surrounding structures and there seemed to be little question from the appearance of the bowel that we were dealing with a tuberculous peritonitis. Tubercle-like structures were seen all over the small bowel in this locality.

The right tube and ovary were freed and removed and many adhesions of the small bowel, which were apparently causing partial obstruction, were freed by sharp dissection. Some of the tubercle-like bodies were removed for examination. After freeing the bowel and closing the peritoneum, merthiolated solution of amniotic fluid of cows (amfetin) was introduced through a catheter in the hope of preventing further adhesions. The abdomen was closed without drainage. The department of pathology was requested to go over the previous specimen again as we felt that tuberculosis might have been the causative factor in the condition which necessitated the first laparotomy.

The tube and ovary, when grossly examined, showed many small clear vesicles on the serosal surface and there was definite cystic change in the ovary. Subsequent pathologic study of the tissues resulted in the following diagnosis: "Subacute salpingitis with hyperemia and edema and many nodules of foreign body granuloma from magnesium silicate. Hyperemia and edema of the ovary with granulomatous nodules on the serosal surface also caused by magnesium silicate. A few atretic follicle cysts are also present."

Fig. 5 (case 2).—Nodular serosal thickening with inflammatory infiltrate, hyperemic vessels and necrosis in the granulomatous area ($\times 70$).

condition would not have occurred had not magnesium silicate been introduced into the patient's peritoneal cavity. Fortunately, she has made a good recovery following the second operation and will soon return to her nursing duties.

CASE 2.—A white woman aged 21, admitted to St. Vincent's Hospital Dec. 15, 1939, complained of severe, lancinating, generalized abdominal pain. There were fever, anorexia and general malaise.

Fig. 6 (case 2).—Granulomatous nodules undergoing fibrosis, one area showing hyperemic vessel and a marginal giant cell ($\times 70$).

The patient had sharp pains in the abdomen radiating upward in the midline during the first day of her last menstrual period, December 10. Pain continued during the period and became more severe on December 14, at which time the pain was generalized. Vomiting had occurred at home. The patient described the pain in the lower part of the abdomen as similar to labor pains. She stated that her abdomen had been sore

to the touch and distended. Fever and profuse diaphoresis were noted before admission.

There was rigidity in the lower part of the abdomen and tenderness over the pelvic organs. Rebound tenderness was present. Vaginal examination revealed marked tenderness in the adnexal regions. Movement of the cervix caused her excruciating pain. No definite mass could be made out in the region of either tube or ovary. There was a purulent vaginal discharge, quite profuse. The white blood count ranged from 17,950 to 12,250 during the first two days in the hospital. Conservative treatment was employed with a fall in temperature and a disappearance of tenderness and improvement in the patient's general condition. She was discharged without operation on December 24 and sent home for continuation of treatment under the direction of the family physician. She was advised that operation might be necessary in the future.

The patient was readmitted to St. Vincent's Hospital Jan. 2, 1940, with a mass in the right side. There was no temperature and there were no contraindications to laparotomy. It was felt that further conservative treatment would be of no avail.

She was operated on January 3. The uterus, tubes and ovaries were found bound down in the pelvis by many adhesions. There were some adhesions of the small bowel.

Fig. 7 (case 2).—Typical granulomatous area with multiple multinuclear giant cells; several small magnesium silicate crystals are present but are indistinct in this photomicrograph ($\times 70$).

It was apparent that the right tube could not be saved. The right ovary appeared normal. The right tube, therefore, was removed and the right ovary was preserved. The adhesions about the left tube were freed and the tube was found to be patent in its entire length. The patient's age and her desire to bear children were taken into consideration and every effort was made to preserve tubal and ovarian tissue to the end that she might become a mother. The appendix was retrocecal and buried in its entire length. A routine appendectomy was done and the incision was closed without drainage. The cervical canal was dilated and treated with the actual cautery. The pathologic diagnosis was "subacute suppurative salpingitis; chronic interstitial inflammation with subacute activity in the appendix."

The patient was left, therefore, with the left tube and both ovaries. The postoperative course was uneventful and the patient was discharged on January 16 in good condition.

The patient was readmitted to the hospital on February 28. At this time she complained of pain in the left lower quadrant present for about four weeks. She stated that the menstrual flow had been profuse and vaginal bleeding seemed to be a prominent manifestation after discharge from the hospital. Tenderness and pain made their appearance in the lower part of the abdomen, particularly marked on the left side. Bimanual examination revealed a mass in the left tubo-ovarian region, and a tentative diagnosis of recurrent salpingitis and oophoritis was made.

The patient had fallen at home and had injured the left breast, and there was considerable bleeding from this wound. The loss of blood from the wound in the region of the breast and the loss of blood from the uterus combined to cause a secondary anemia. The patient's general condition was not exceptionally good.

The abdomen was reopened on March 1. The old median incision was rescoted and it was at once apparent that there had been considerable inflammation in the pelvis following the first operation. The left tube and ovary were bound down and there was adherent a section of the small intestine in this region. The right ovary appeared cystic. The adhesions in the area were freed and the left tube and ovary were freed and a supravaginal hysterectomy was done.

Subsequent pathologic examination of the uterus, right ovary, left tube and left ovary was reported as follows: "The section from the uterus shows fibrosclerosis, the blood vessels appear hyperemic, the mucosa shows small gland crypts and a rather dense cellular stroma. Two sections were taken from the tube and both areas show active inflammation, the tubal folds are almost completely destroyed, and the inflammatory infiltrate consists mostly of plasma cells and lymphocytes with a few eosinophils and polymorphonuclear leukocytes. Scattered through the tubal wall are areas of inflammatory cell infiltrate, many of these in and just beneath the serosa; these areas are particularly dense around the blood vessels. The serosa is roughened and several definite areas of granulomatous formation are present, some containing giant cells and crystals of magnesium silicate. Sections from the right ovary show a moderate degree of edema and hyperemia, a few atretic follicle cortical cysts were present and one retrogressing corpus luteum body. A section from the adherent and inflammatory omental tissue shows many granulomatous areas and fibrosclerosis. The granulomata show foreign body type giant cells many containing magnesium silicate crystals."

We feel that we are justified in the statement that magnesium silicate crystals were responsible for a serious postoperative complication in this case necessitating a second operation and loss of the generative organs of a young woman in the child bearing period. She has made an uncomplicated recovery and is now symptom free.

COMMENT

It should be remembered that magnesium silicate or talc is used extensively in operating rooms, in dressing rooms and also in the laboratory if rubber gloves are used dry. These crystals, therefore, may contaminate solutions, instruments and glassware and also dressings, so that they may be found on almost anything if examined microscopically. This is important in consideration of pathologic lesions as seen under the microscope, for crystals may be found while tissues are being examined under the microscope which have no part in the pathologic condition.

In order to connect these crystals with the pathologic condition they must be found in granulomatous areas and some will be found in the typical foreign body type giant cells that are always present in some parts of the lesions. We have found that slides prepared with albumin fixative and allowed to dry in the open air in the laboratory are particularly prone to have dust particles and often magnesium silicate crystals settle on and adhere to their surfaces; also, while areas are being selected for embedding and sectioning, the handling of the tissues with rubber gloves on which powdered talc is present may contaminate the tissue and be found in and on the sections. These words of warning are herein expressed so that no misleading observations will be reported and to avoid incriminating a few crystals in or on sections as an etiologic factor.

If rubber gloves are used in surgery, an excess of powder must be avoided; thorough washing of the

gloved hands will remove most of the powdered talc. The atmosphere of the operating room must be kept as free as possible of this powder so that possible foreign body lesions will not be produced by contamination of the operative area.

Often the finding of these crystals in the lesions is not easy, but careful examination with dim lighting will reveal these irregular shaped refractile bodies. Their presence in the giant cells is conclusive evidence that they are the offending factor.

SUMMARY

It is evident that in each of the two cases of granulomatous inflammation here reported the unsatisfactory postoperative condition was caused by magnesium silicate crystals and second laparotomies were made necessary. The thought must come to mind, as one considers these cases, that it is probable that many postoperative complications caused by magnesium silicate or lyco-podium have gone undiagnosed. This may be especially true of postoperative intestinal obstruction.

The excessive and indiscriminate use of powder on the gloves and hands of the surgeon should receive serious consideration, as there is little doubt that these substances can and do cause serious complications. It should likewise be borne in mind that the use of rectal and vaginal suppositories covered with powder are not without danger, as nonhealing granulomatous lesions may occur following their use in the vagina and in the rectum.

CONGENITAL SHORT ESOPHAGUS WITH THORACIC STOMACH AND ESOPH- AGEAL HIATUS HERNIAS

REPORT OF FORTY-SEVEN CASES

HOWARD F. POLLEY, M.D.

ROCHESTER, MINN.

Herniation of the stomach into the thorax by way of the esophageal hiatus is encountered with increasing frequency as efforts to diagnose or suspect it clinically are intensified by more relevant information regarding the condition. Various authors have attempted to define typical symptoms or symptom complexes since Bailey¹ in 1919 wrote of the thoracic stomach which was associated with a congenital short esophagus. We are now familiar with another similar but more common entity in which the esophagus is of normal length, best referred to as esophageal hiatus hernia. The present report presents a survey of forty-seven cases taken from the St. Luke's Hospital records in an attempt to analyze further clinically the symptom relationship. There were fourteen in which there was a congenital short esophagus with partial or complete thoracic stomach; thirty-three presented an esophageal hiatus hernia with varying degrees of stomach herniation. All presented positive roentgenographic, esophagoscopy or surgical confirmation of the diagnosis.

In the literature various classifications are proposed for esophageal hiatus hernias, among them embryology, etiology, trauma and nontrauma. Åkerlund² divides them into three types: (1) congenital short esophagus with partial or complete thoracic stomach, (2) esoph-

ageal hiatus hernia with an esophagus of normal length which does not form a part of the hernia (i.e. para-esophageal hernia) and (3) esophageal hiatus hernia in which the esophagus is shortened and the distal portion forms a part of the hernial contents. The important differentiation from the therapeutic point of view will be mentioned later. The term "para-esophageal hernia" used by Eppinger³ also defines an esophagus of normal length fixed below the diaphragm with the cardia of the stomach passing upward closely adjacent to it. "Partial thoracic stomach" describes the stomach in association with a congenital short esophagus. Often it is difficult to distinguish accurately one type of hernia from another, even with the aid of laboratory procedures.⁴

ETIOLOGY

Anatomically the types differ. A congenital short esophagus with thoracic stomach is regarded as the result of incomplete embryologic development in which the stomach never has been below the diaphragm, usually has no enclosing hernial sac and is not a true herniation of a once normally placed organ. In esophageal hiatus hernias the herniated stomach constitutes a true hernia with a serous sac and the esophagus also extends below the diaphragm and may or may not extend back into the hiatus. Moersch⁴ considers even this type of congenital origin, as are inguinal hernias, relaxation of the potentially weak rings induced by factors which increase intra-abdominal pressure, such as severe physical strain or exertion, pregnancy or vomiting. The two produce similar symptoms and diagnostic problems. Perhaps the main reason for differentiating the types concerns surgical therapy, because the congenital short esophagus type is not so amenable to the usual surgical methods of replacing the stomach into the abdominal cavity as the esophageal hiatus hernia in which the esophagus is of normal length.

The esophageal hiatus hernia, seen from childhood⁵ to senility,⁶ is more frequent in older persons. Age, therefore, is suggested as a contributing factor to its presence, because increasing age causes degenerative tissue changes with lack of muscular control of all muscle structures of the body. Other factors set forth by Åkerlund² include (1) stretching of the hiatus due to the insufficiency of surrounding muscle fibers, (2) decrease in the amount of fat tissue in the esophageal ring, (3) decrease in elasticity of the elastic fibrous tissue about the hiatus, (4) loosening of connective tissue between the esophagus and peritoneum and (5) the already mentioned increase in intra-abdominal tension.

These hernias occur equally in the two sexes and more frequently in patients past the fourth decade of life. The ages in this report range from 28 to 80 years, the average being 58.8 years. Twenty-five patients were women, twenty-two were men. The average age of the women was 59.7 years and of the men 58.8 years. More than half of the patients were between 51 and 70 years of age and nearly 90 per cent were more than 40 years (table 1).

Obesity, thought to be another definite factor in the etiology of hiatal hernias, is mentioned by only a few authors.⁷ In this series, excess weight was a prominent factor. Of thirty-nine patients whose weight records were obtainable eleven, or 28.2 per cent, were 20 pounds (9 Kg.) or more overweight as determined by age, height and weight actuarial statistics whenever applicable, or by estimation based on the height and weight of the patients as determined by physical examination. Six patients, or 15.3 per cent, were 15 pounds (6.8 Kg.) overweight; nine, or 23 per cent, were moderately so (10 pounds, or 4.5 Kg.), and thirteen, or 33.3 per cent, were not significantly beyond the usual limits of normal or were classed as underweight (table 2).

The influence of obesity is said to be affected by (1) increasing intra-abdominal pressure which forces the cardia of the stomach through the nearby point of weakness, the esophageal hiatus⁸ and (2) changes in the cell structure due to fat deposit in the tissues adjacent to the hiatus.⁹ Obese patients may be much relieved of their symptoms on a weight reduction regimen. This often obviates the need of surgical treatments.

COINCIDENCE OF COLON DIVERTICULA

An interesting observation not previously noted in the literature on hiatus hernias concerns the incidence of diverticula elsewhere in the body of patients who

have hernias through the esophageal hiatus. Thirty-three patients had a complete roentgenologic examination of the gastrointestinal tract. Of these sixteen, or 48.4 per cent, had diverticula of the colon, usually of the sigmoid region, and eighteen, or 54.5 per cent, had diverticula of the colon or other sections of the gastrointestinal tract. Of six with diverticula in more than one region of the gastrointestinal tract, three were in the duodenum and colon. Rankin,¹⁰ who summarized the numerous reports of the literature on this subject, estimated the incidence of diverticula of the colon among patients more than 40 years of age at approximately 5 per cent. The incidence increases with age. The records of 422 consecutive routine complete gastrointestinal roentgenologic examinations in 1939 in patients over 40 years of age who were examined because of various symptoms of the entire gastrointestinal tract revealed an average age of 54.09 years. Only those over 40 years of age were included in the control group so as to correspond more closely to the age of the great majority of patients with hiatal hernias; their average age in this series was 58.8 years. The incidence of diverticula of the large bowel in this control group was 32.9 per cent. The 48.4 per cent

incidence of colon diverticula in patients with esophageal hiatus hernias is almost a 50 per cent increase over that of the control group.

SYMPTOMS

The symptomatology of hiatus hernia varies, depending on factors such as the progress of the disease when the patient is examined, the duration and rapidity of onset of symptoms⁶ and the degree of stomach incar-

ceration and associated spasm of the diaphragm and esophagus.⁴ Most patients who present themselves for diagnosis or treatment of this condition have had symptoms a long time. The average duration of symptoms in the cases of this series was seven and three-fourths years (table 3).

For purposes of analysis, the symptoms may be classified into several groups after the plans of Cowan¹¹ and others:

Group 1, upper gastrointestinal symptoms, thirty patients.

11. Cowan, I. I.: Diaphragmatic Hiatus Hernia, *Am. J. Roentgenol.* 37:333 (March) 1937.

7. Marks,⁹ Moersch.⁴
8. Harrington, S. W., and Kirklin, B. R.: The Clinical and Roentgenologic Manifestations and Surgical Treatment of Diaphragmatic Hernia, with a Review of 131 Cases, *Radiology* 30: 147-156 (Feb.) 1938.
9. Marks, J. H.: Diaphragmatic Hernia and Associated Conditions, *Am. J. Roentgenol.* 37: 613 (May) 1937.
10. Rankin, F. W.; Bagen, J. A., and Buie, L. A.: The Colon, Rectum and Anus, Philadelphia, W. B. Saunders Company, 1934, pp. 138-140.

Group 2, symptoms simulating cardiorespiratory abnormalities, one patient.

Group 3, mixed symptom group, which includes the epiphrenal or von Bergmann syndrome, a gastrocardiac symptom complex due to irritation of the nerve endings in the esophageal hiatus with reflex manifestations of precordial pain through the sympathetic nervous system,¹² thirteen patients. This characteristic variation in the symptoms of hiatal hernia is discussed also by the Jacksons¹³ and by Cowan.¹¹

Group 4, asymptomatic group, three patients. A few in the first three groups may seem to some readers to belong to the group presenting no symptoms actually attributable to the herniation. This cannot be settled definitely at the present time. In Cowan's series, 7 per cent were asymptomatic; in the group collected at the Mayo Clinic, 7.7 per cent.⁴ The three cases in the present report constitute a 6.3 per cent incidence.

Different authors seem to have a predominance of one or the other symptom groups in their series and future analyses of all reports will be needed to evaluate accurately these smaller group studies in the light of the total.

GROUP 1.—The most persistent complaint of all patients (table 4) with hiatal hernias is pain or distress during or soon after eating¹⁴ and usually is localized in the epigastrium or substernal areas but occasionally in the right upper quadrant of the abdomen. There is often projection through to the back or to the left shoulder. The pain varies from a feeling of discomfort and fullness to a gnawing or burning, or to severe, sharp, colic-like pain, probably depending on the degree of stomach incarceration⁴ and the action of the acid contents on the esophageal mucosa.¹⁵ The distress or pain is associated with belching, heartburn and bloating. The pain may occur at night or when the patient lies in the supine position, a characteristic symptom when present. The aggravation of symptoms by lifting heavy objects, stooping or a sudden shift in body position rarely was encountered. These symptoms, when present, help make the presence of an esophageal hiatus hernia recognizable.

Nausea with or without vomiting, and regurgitation, especially following large meals, are common complaints. Regurgitation usually occurs immediately after meals or at night and often results in symptomatic relief, as does belching and emesis, at times self induced.

Several patients used alkalis and milk with varying degrees of relief, probably dependent on the extent of mucosal ulceration in the esophagus or herniated stomach. The use of alkalis, however, may cause the symptoms to be misinterpreted for those of peptic ulcer.⁴

Dysphagia, especially for solid foods, occurs in from 15 to 20 per cent of the cases.¹⁶ It is thought to be more common in cases presenting congenital short esophagus with thoracic stomach but does occur in the other types of hiatal hernias and when there is constriction of the hiatal ring.¹¹ Dysphagia may be overcome by belching or emesis⁴ or by the prone position.⁵

Gastric hemorrhage was present in four cases. Except for these, anemia rarely was encountered.

GROUP 3.—The age range of patients having esophageal hiatus hernias and other coincidental pathologic changes render it difficult at times to interpret accurately the symptoms in mixed symptom groups. Of the thirteen patients in this group, ten presented a combination of cardiorespiratory and gastrointestinal symptoms; eight had dyspnea of varying degrees as the main complaint, associated with palpitation in five cases; eight had precordial pain or fullness and two had constricting sensations with the chest pain. One had pain which radiated into the neck and down the left arm; another had radiation down the right arm to the finger tips, so that in many of this type a presumptive diagnosis of angina pectoris or organic heart disease is made. The analogy of complaints with the symptoms of angina pectoris is noted and discussed by Truesdale,¹⁷ who states that the differentiation from actual anginal attacks of coronary disease may be aided by the atypical radiation of pain to the back, its occurrence without relation to effort, and the limited degree of heart disease. Two patients had radiation of chest pain to the left shoulder; in one of these it was at times related to food intake.

Nonproductive cough was more than an incidental finding in four instances. The cough precipitated the

epigastric symptoms in one case. Another patient had a "stomach cough" with heartburn after meals, as well as a chest cough.

In this group, all had epigastric pain, frequently accompanied by nausea and vomiting and regurgitation, though most patients presented themselves primarily because of cardiorespiratory symptoms.

One patient (group 2) had only cardiorespiratory symptoms characteristic of angina pectoris and associated with occasional belching. Vague symptoms of dyspnea, palpitation and fatigue with electrocardiographic evidence of a 4:1 heart block and auricular flutter known to be present for two years were present in another case better placed in the asymptomatic group 4. Two other cases are placed in this group. Less emphasis is being placed on the symptom-free group, though some authors have stated that "a clinical diagnosis or even a surmise of a diaphragmatic hernia is scarcely to be expected."¹⁸ This opinion has been shared also by Hedblom,¹⁹ Morrison and his co-workers²⁰ and Ritvo.²¹

21. Ritvo, Max: Hernia of the Stomach Through the Esophageal Orifice of the Diaphragm, J. A. M. A. 94: 15-21 (Jan. 4) 1933.

No relationship between the severity of symptoms and the length of the esophagus or size of the hernia could be demonstrated. Often the severity of the symptoms exceeds the degree of herniation¹⁷ and seemingly depends on the degree of mucosal ulceration. Bloch²² suggests that symptoms of long duration indicate the presence of a congenital short esophagus with the thoracic type of stomach.

DIAGNOSIS

Accurate diagnosis of hiatus hernia is important because of complications which may arise (1) by confusion with other organic diseases of the abdomen and thorax and (2) by permitting the herniation to progress without treatment. Coexisting pathologic conditions often make evaluation of the symptoms difficult. Gallbladder disease, peptic ulcer, heart disease, malignant conditions of the cardia or esophageal and intestinal

obstructions may present symptoms not unlike those of hiatus hernia. Unnecessary surgical intervention because hiatus hernia was not ruled out in the differential diagnosis is reported.⁶

Since a symptom complex cannot be definitely established for the diagnosis of hiatus hernia, it is important that this entity be searched for constantly and kept in mind whenever the differential diagnosis of thoracic, cardiac or abdominal conditions, especially those of more serious portent, presents itself.

In every case, clinical suspicion of this entity must be confirmed by laboratory procedures, especially the roentgenologic study. Briefly, the technic of the x-ray search for hiatus hernias consists in routine fluoroscopy, and the examination of all patients in either the horizontal or the Trendelenburg position or both, with ingestion of the opaque meal while in these positions. In many instances, especially with small hernias and no adhesions, the lesion may be demonstrable only by

this procedure when a portion of the full stomach protrudes through the esophageal hiatus when the opaque meal is being swallowed or during inspiration. The x-ray diagnosis of the congenital short esophagus is made as follows: (1) A portion of the cardia, as evidenced by longitudinal rugae markings, must be shown to stay above the level of the diaphragm and (2) the esophagus must be shown to be too short to reach as low as the level of the diaphragm, with no change by postural variations. Often there is a narrowing at the esophagogastric junction, and the cardia above the diaphragm may fill only after the rest of the stomach has been filled or when the patient is in the right oblique or prone position, which places the hiatus higher than the upper end of the esophagus.²³

The use of esophagoscopy in the diagnosis of these entities is advocated as a routine procedure in all suspected cases, especially when surgery is contemplated.²⁴ Esophagoscopy is of value in studying the conditions of the esophagus, especially ulceration, in determining the presence of pathologic changes in the lower end of the esophagus, in measuring the length accurately and in obtaining mucosal biopsy of suspected gastric tissue when indicated. In a congenitally short esophagus a narrowing at the esophagogastric junction is found with the dilated portion below this level lined with gastric mucosa and no evidence of a normal diaphragmatic hiatus. The esophagus in the esophageal hiatus hernia is usually more redundant with less pronounced narrowing at the esophagogastric junction.⁴

Roentgenologic examination being simpler and less objectionable to the patient than esophagoscopy, it would seem that the latter could be restricted to persons presenting inconclusive x-ray evidence.

TREATMENT

The treatment of hiatus hernia varies with the type of hernia, the age of the patient, the presence of complications and the severity of symptoms. Esophageal bouginage is beneficial in the treatment of the narrowing at the esophagogastric junction in the congenital short esophagus with partial thoracic stomach, especially in children. If no relief is obtained, Harrington⁶ advises surgical exploration, as it is sometimes possible even in these cases to replace the stomach in the abdominal cavity with subsequent relief of symptoms. The reader is referred to the articles by Harrington on the technic of the surgical treatments of hiatus hernias.

Before surgery is recommended, it is advisable that most patients with hiatal hernias be given a period of conservative management. This is especially true of obese patients who present themselves for surgery, but many of whom need no radical surgical procedures after medical management.

Besides the reduction of excess weight, the essentials of medical treatment include a diet schedule of smaller meals at more frequent intervals, so that the patient eats four, perhaps five, meals a day. The diet should be nonirritating and exclude foods with a tendency to gas formation causing greater stomach distention. The largest meal should be at noon, with a light, rather dry diet in the evening to decrease the tendency for pain at night and for regurgitation. Thorough mastication of the food is important. Smaller meals do not

24. Clerf and Manges.² Findlay and Kelly.² Glatt.¹³ Harrington.⁶ Moersch.⁴

distend the stomach so greatly and presumably permit peristalsis below the diaphragm without restriction or compression, whereas peristaltic activity in a distended stomach may act to force the constriction of a portion of the cardia through the enlarged or weakened hiatal ring. Decrease in bulk facilitates the relief of other symptoms of the upper gastrointestinal tract and allows the previously injured mucosa to repair itself.

The patient is instructed not to lie down for several hours after a meal; this also aids in overcoming the regurgitation. A restriction of exercise sometimes is indicated. Wood chopping, horseback riding, golf and other activities requiring frequent stooping or bending of the trunk of the body so as to increase intra-abdominal tension are harmful.

Patients with symptoms of ulceration of the esophageal mucosa or herniated gastric mucosa are usually adequately managed with peptic ulcer therapy, alkalis and antispasmodics. Calcium carbonate in from 10 to 20 grain (0.65 to 1.3 Gm.) doses is preferred to sodium bicarbonate because its lesser solubility may cause less rapid formation of gas in the stomach with less resultant distention.

Advanced age and the presence of serious coincidental pathologic changes are frequent contraindications to surgical repair of hiatus hernias. These patients may benefit from a planned medical regimen. When no symptoms are referable to the hernia and the hernia is not large enough to interfere with vital body functions, treatment is not necessary.

SUMMARY

1. In a series of forty-seven patients with nontraumatic esophageal hiatus hernia, congenital short esophagus with partial or complete thoracic stomach was present in fourteen. The average age was 58.8 years, almost 90 per cent of the patients being more than 40. Predominance of one sex over the other was not noted.

2. All the cases were considered as actually or essentially congenital. Age and obesity are thought to be contributing factors in the presence of a congenital potentiality for herniation through the esophageal hiatus.

3. There was a high incidence, 48.4 per cent of this series, of coexisting diverticula of the large bowel; this is a previously unreported observation.

4. The most common symptom was epigastric pain or distress after eating (83 per cent), associated with bloating and belching (44.7 per cent), and heartburn (31.9 per cent). Nausea and vomiting (47 per cent) and regurgitation (30 per cent) are frequent complaints. Other characteristics, less often encountered, included night pain (23.4 per cent), dysphagia (17 per cent), dyspnea (12.7 per cent), chest pain (14.9 per cent), gastric hemorrhage (8.5 per cent), anginal pain and cough.

5. No relationship between the severity of symptoms and the type or size of hiatus hernia could be demonstrated.

6. It is exceedingly important that hiatus hernia be ruled out in all suspicious or atypical cases because of the greater seriousness of other diseases of the thorax, heart and upper part of the abdomen.

7. The clinical evidence should be substantiated by roentgenoscopy and by esophagoscopy if x-ray evidence is inconclusive or if surgery is contemplated.

8. The essentials of medical treatment include weight reduction, dietary regulation, use of antispasmodics and peptic ulcer management when indicated, and selective restriction of physical activity.

ISOIMMUNIZATION IN PREGNANCY

ITS POSSIBLE BEARING ON THE ETIOLOGY OF ERYTHROBLASTOSIS FOETALIS

PHILIP LEVINE, M.D.

EUGENE M. KATZIN, M.D.

NEWARK, N. J.

AND

LYMAN BURNHAM, M.D.

ENGLEWOOD, N. J.

A number of transfusion accidents in pregnancy have been reported in the literature, even though the donor, frequently the husband, was in the same blood group as the patient.¹ In one instance analyzed by Levine and Stetson² it was assumed that the accident could be attributed to an agglutinin resulting from immunization of the mother by factors in the fetus inherited from the father.

Analysis of a series of 12 cases in which atypical agglutinins could be demonstrated revealed the significant fact that these patients presented obstetric histories characterized by a number of complications such as toxemia, macerated fetus, repeated abortions, miscarriages or stillbirths.³

Recently 5 additional patients with atypical agglutinins were observed, 3 of whom gave birth to infants suffering from erythroblastosis foetalis. The obstetric histories of these cases are so striking as to merit brief mention.

One patient, J. L. (decigravida, sextipara), now pregnant and under observation, had three spontaneous abortions and six full term pregnancies with living babies, five of whom survived only one to three days. In at least three of these five babies there is clinical or pathologic evidence to support a diagnosis of erythroblastosis foetalis. The blood of this patient was studied for agglutinins because of the remarkable history of repeated abortions and neonatal deaths.^{5a}

Another patient, R. C. (group O), had three pregnancies, the first and third of which resulted in neonatal deaths with postmortem evidence of erythroblastosis. The third infant showed pronounced anemia, and blood smears revealed a large number of peripheral normoblasts. During the second pregnancy the fetus died in utero at eight and one-half months. This patient was called to our attention because of anuria following a transfusion of her husband's blood, which was also in group O. It is of interest that atypical agglutinins in

Aided by a grant from the Blood Transfusion Betterment Association of New York City.

From the Division of Laboratories, Newark Beth Israel Hospital, Newark, N. J., and the Englewood Hospital, Englewood, N. J.

Drs. Ralph L. Barrett, Ralph A. Hurd, John N. Pannullo, Donald Z. Rhoads and Greta Stohr cooperated in supplying histories and specimens in several cases. Drs. William Antopol and Lester Goldman were consulted with regard to pathologic and hematologic aspects.

1. Levine, Philip, and Polayes, S. H.: *Ann. Int. Med.*, to be published. Wiener, A. S., and Peters, H. R., *ibid.* 13: 230, 1949. Levine and Stetson.²

2. Levine, Philip, and Stetson, R. E.: Unusual Case of Intra-Group Agglutination. *J. A. M. A.* 113: 126 (July 8) 1939.

3. Levine, Philip, and Katzin, E. M.: *Proc. Soc. Exper. Biol. & Med.* 45: 343, 1940.

5a. This patient has since delivered, and the infant exhibited classic symptoms of erythroblastosis foetalis.

this case could not be demonstrated in the specimen drawn the day after the transfusion. This was to be expected, since the donor's blood, still present in the patient's circulation,⁴ had specifically absorbed the atypical agglutinin, which reappeared in the serum several days later.

The blood of a third patient, E. F. W. (group O), was sent to us because the infant suffered from erythroblastosis foetalis as evidenced by the clinical condition and the characteristic blood picture. The blood of the mother, drawn two days after a transfusion with her husband's blood (group O), did not contain any atypical agglutinins because in this instance also it could be shown that the blood of the donor (her husband) was still present in her circulation. The serum of this specimen was distinctly icteric. However, a specimen drawn six days after the transfusion contained atypical agglutinins active on the cells of her husband and other donors of group O. That the patient did suffer from a transfusion reaction was evidenced by jaundice, oliguria and nitrogen retention.

The past obstetric history of this patient (E. F. W.) reveals one spontaneous abortion followed by birth of a normal living infant. During this pregnancy the patient was distinctly toxic, as evidenced by rise in blood pressure, albuminuria and edema.

Of the remaining two patients in whom atypical agglutinins were found, one patient (L. L., primipara,

and A. This patient died of transfusion anuria on the ninth day.

Patient J. B. (primipara, secundigravida) had a full term hydrocephalic macerated fetus in her first pregnancy. In the second pregnancy, the fetus died in the sixth month. A decidedly edematous fetus dead about six days was delivered spontaneously; the placenta was edematous and two to three times the normal size. Sections of the liver showed striking evidence of extramedullary hemopoiesis. The patient was given a transfusion the day before delivery with presumably compatible blood. The blood of this patient was examined only on the fourth day after the transfusion and five days prior to her death. No agglutinins could be demonstrated, probably because of specific absorption by the donor's blood, as indicated.

Serologic tests for syphilis in these cases were negative.

It is probable that there is a connection between the occurrence of these complications and the presence of immune agglutinins in the mother. This relationship lends itself readily to form a theoretical basis for the etiology of at least some cases of erythroblastosis foetalis. "This condition occurs late in uterine life, although its manifestation may not appear until shortly after birth. A striking familial incidence is found in many cases."⁵ The hypothesis of isoimmunization can readily explain the familial incidence of this condition.

The blood picture characteristic of erythroblastosis foetalis, i. e. destruction of red cells and compensatory reaction of the bone marrow, can also be explained in terms of the isoimmunization theory. One may assume that the agglutinins in the mother's circulation under certain conditions are capable of penetrating the placental barrier so that these antibodies, by their continual action on the blood cells and perhaps tissue cells of the fetus, induce erythroblastosis foetalis and its several manifestations. In the presence of a sufficient concentration of agglutinins the fetus may die in utero.

A similar explanation may also hold for some stillbirths, miscarriages and abortions—at least as far as the cases presented are concerned.

The question of the specificity of the agglutinins involved will be discussed in further publications, but there is sufficient evidence to indicate that most of these serums contain an agglutinin which parallels the anti-Rh agglutinin of Landsteiner and Wiener.⁶ Rh is an antigen present in the red blood cells of *Macacus rhesus* monkeys and in about 85 per cent of human beings.

SELECTION OF COMPATIBLE DONORS IN THE CASES DESCRIBED

Obviously, blood grouping tests with potent anti-A and anti-B serums followed by a cross matching must be performed with great care. It is safer to look for compatible donors among the patient's blood relatives than to use the husband. Preferably, transfusions should not be performed if the patient is under an anesthetic. In view of the fact that the blood of many of the patients studied does not contain the Rh antigen, a list of Rh negative donors should be available. It is hoped that methods will soon be found for the preparation of potent immune anti-Rh serums in rabbits or other animals.

Outcome of Thirty-Six Pregnancies in Seven Patients

Normal babies	10	
Babies with erythroblastosis.....	6	
Neonatal deaths	3	
Stillbirths	5	
Abortions or miscarriages.....	10	(at least 6 spontaneous)
No data available.....	2	

quadrigravida) had two miscarriages and a premature baby who survived only four days. The presence of atypical agglutinins in this case, observed after the fourth pregnancy, was not associated with any complications in either mother or baby.

The fifth patient (F. Z., octipara, undecigravida) had two miscarriages. Unfortunately the details of the past obstetric histories are not available. The eleventh pregnancy was characterized by placenta praevia, for which condition a cesarean section was performed and a macerated male fetus was delivered. The patient was given a transfusion the day of the operation but developed jaundice and anuria, which terminated fatally twelve days later. Atypical agglutinins were demonstrated in a blood specimen obtained just before death.

Two other cases of erythroblastosis foetalis can be recorded, in only one of which were atypical agglutinins demonstrated. This patient (G. B., quadrigravida, primipara) mentioned in our previous publication,³ had two spontaneous abortions and one normal full term infant. In the fourth pregnancy the baby, which died during labor, was delivered by cesarean section. A clinical diagnosis of fetal hydrops was made, but a necropsy was not performed. The blood of this patient (group A) was examined on the fourth postpartum day, four days after a transfusion with her husband's blood (group A). Atypical agglutinins could be demonstrated which acted on numerous bloods of groups O

4. The red cells of the donor (type MN) was demonstrated in the patient's blood (type M) by the method described by Landsteiner, Levine and Janes (Proc. Soc. Exper. Biol. & Med. 25: 672, 1928).

5. Diamond, L. K., in Symposium on the Blood and Blood-Forming Organs, Madison, Wis., University of Wisconsin Press, 1939, p. 66.

6. Landsteiner, K., and Wiener, A. S.: Proc. Soc. Exper. Biol. & Med. 43: 223, 1940.

ADDENDUM

Since the manuscript was submitted, anti-Rh agglutinins were demonstrated in the blood of 3 additional patients who delivered infants suffering from erythroblastosis foetalis. In 3 other cases, however, atypical agglutinins could not be found although the tests were made soon after delivery. In two of the latter and in an additional case the mother's blood contained the Rh factor, indicating that other blood factors may be involved or that an alternative explanation of the etiology exists for some cases.

The bloods of five other mothers of infants with erythroblastosis foetalis were examined at three months to three years after the delivery. In each case the mother's blood was negative for Rh while the husband's blood was positive in 4 cases tested. The blood of six infants in whom the diagnosis of erythroblastosis foetalis was made was found to contain the Rh factor.

The concept of an antigen-antibody reaction as a basis for the etiology of erythroblastosis foetalis has been previously mentioned by Ottenberg⁷ and Darrow.⁸

Clinical Notes, Suggestions and New Instruments

GAS BACILLUS GANGRENE OF LUNG

LELAND F. GLASER, M.D.;
ROBERT GLYNN, M.D.,
AND
ERNEST B. HANAN, M.D.,
SPRINGFIELD, Mo.

Gangrene of the lung is a rare condition when compared to the frequency of the pneumonias, pulmonary abscesses and infarctions. It is usually secondary to other lung infections but may develop without a definite precursor. Severe debility is almost invariably associated with the diffuse form of pulmonary gangrene such as follows diabetes mellitus, protracted fevers, carcinoma or tuberculosis. Lung abscesses or bronchiectatic cavities secondary to pressure rarely become gangrenous. Large septic infarcts may quickly develop into gangrene. Likewise, pneumonic areas secondary to aspiration of infected material from the upper respiratory tract, such as occurs after anesthesia, may be the forerunner of gangrene.

Bacteria associated with pulmonary gangrene are usually of multiple types. Among the more commonly found organisms are *Streptococcus pyogenes*, *staphylococci*, *pneumococci*, fusiform bacilli and the *Spirochete* of Vincent. The association of pulmonary gangrene with extensive gas bacillus infection of the lungs is mentioned but little in the literature. Autopsy reports and textbooks on pathology imply that anaerobic bacteria are frequently found along with other organisms in the necrotic lung tissue but give the impression that they were not of great importance in causing destruction of tissue. In the case to be presented here gas bacillus organisms played the leading part in the gangrene of the lung, as shown by the conditions found on radiographic examination and at autopsy.

REPORT OF CASE

D. B., a farmer aged 41, 5 feet 8 inches (173 cm.) tall, entered Burge Hospital April 3, 1940, in the service of Dr. Robert Glynn, complaining of shortness of breath and injuries from a fist fight a week before. His past history was essentially negative except that he had worked for six years in a lead and zinc mine; he quit the mine and took up farming because of bad health. The family history was essentially negative.

7. Ottenberg, Reuben: The Etiology of Eclampsia. *J. A. M. A.* **81**: 295 (July 28) 1923.

8. Darrow, R. R.: Icterus Gravis Neonatorum. *Arch. Path.* **25**: 378 (March) 1938.

He had been married sixteen years and his wife had had no pregnancies. The patient was in a fist fight one week before entrance to the hospital. After the fight the patient lay unconscious for two or three hours. He was weak from loss of blood and from having some of his teeth knocked out. He continued to get weaker and more dyspneic. The day before entrance to the hospital the patient complained of a knifelike pain in the right lower part of the chest. He had been spitting up blood more or less continuously since onset of the present illness.

Physical examination revealed that the patient was poorly developed, poorly nourished and dyspneic, with many ecchymotic areas over the face. There was no evidence of a skull injury. The scleras were discolored from an old conjunctival hemorrhage. The pupils were equal and reacted promptly to light and to distance. Ocular movements were normal. The ears, nose and throat were normal. The breath had a foul odor and the tongue was heavily coated. Examination of the lower jaw revealed sockets of recently removed teeth filled with foul smelling clotted material. The remainder of the teeth were carious and the gum lines were retracted. The submaxillary gland on each side was palpable. The neck was freely movable. The thyroid was not enlarged. The chest was emaciated with an increase of the anteroposterior diameter. The respiratory rate was 26; movements were shallow and restricted on the right side. Breathing was noisy with asthmatic wheezing. Percussion showed hyperresonance on both sides of the chest except for dullness over the right lower portion. Blowing breath sounds were heard over the anterior right lower part of the chest, while posteriorly dry crackling rales were heard. The sputum was thick and foul smelling. The heart was of average size and in the normal location, and cardiac sounds were essentially negative. The cardiac rate was from 80 to 90 and regular, and the blood pressure was 130 systolic, 100 diastolic. The abdomen and genitalia were normal and reflexes were normal.

Examination of the sputum revealed 3 dust cells per high power field and a large number of pus cells. No tubercle bacilli were found.

A blood count showed red cells 4,350,000, white cells 9,750, hemoglobin content 80 per cent, with a color index of 0.9; the differential count was eosinophils 1 per cent, stab cells 18 per cent, segmented cells 51 per cent, lymphocytes 25 per cent and monocytes 5 per cent. The Kahn test gave a negative reaction. The urine was amber, clear and acid, specific gravity was 1.025, tests for albumin and sugar were negative and there was an occasional pus cell.

X-ray examination of the chest showed that the apexes were clear. An area of fibrosis extended from the right hilus toward the right base with questionable cavity formation. Punctate fibrosis was noted along each bronchial marking throughout the lung fields. The right lower lobe was retracted toward the heart and adherent to the diaphragm. Many air containing sacs were noted in the right lower lobe. The lower left lobe was also adherent to the diaphragm. An x-ray diagnosis of first stage silicosis, bronchiectasis and possible lung abscess was considered.

Clinically the patient had a typical attack of asthma at the time of admission to the hospital. A lung abscess was seriously considered in spite of the questionable x-ray studies. Bronchiectasis was thought to be the basis of the dilated air sacs in the right lower lobe. The oral sepsis no doubt added insult to injury.

During the first two days in the hospital the patient was quite comfortable. His temperature was of the septic type and his pulse varied between 80 to 100 a minute. On the third hospital day the patient became much worse; his temperature rose to 103.2 F. and his pulse to 140 and his color became cyanotic. He was placed in an oxygen tent and given intravenous dextrose and cardiac stimulants. He rapidly became moribund, the temperature went up to 105.2 F. and the pulse became so weak and rapid that it could not be counted. The patient died at 3:20 a. m., April 7. Dr. E. B. Hanan did the autopsy.

AUTOPSY

Gross Examination.—Two incisors were absent in the upper jaw and the right canine was loose. In the lower jaw one incisor was missing and one was out of line from its fractured socket,

as evidenced by the sensation of grating when an attempt was made to straighten the tooth. A bloodlike fluid exuded from the mouth.

The abdomen was tense; the intestine was distended with gas; there was no evidence of a ruptured viscus. The liver, gallbladder, stomach, spleen, pancreas and intestine did not grossly show any essential abnormality. The kidneys, bladder and prostate were essentially normal.

When the thoracic cavity was opened it was seen that an emphysematous border of the right lung had pushed the anterior mediastinum to the left.

The lower lobe of the right lung was a dirty gray, mottled with black pigment. The upper lobe was a darker red with the same pigment markings. The base of the lower lobe adhered to the diaphragm, forming a pocket containing about 250 cc. of a dark, foul smelling fluid. This cavity lay within the visceral pleura and involved the lung tissue. The bronchi and blood vessels extended across the sides of the opacity; the lung tissue was black and fragile. In the upper part of the cavity in the region of the main inferior bronchus was a thinly encapsulated mass, fairly firm in consistency. On section this mass appeared to be caseous. The lateral and medial portions of the lower lobe were gray on section and had the consistency of liver tissue. Pleural adhesions extended along the mediastinal border of the right base to the hilus. The apex of the upper lobe

Appearance of the lower right half of the chest. Note the possible cavity of lung abscess close to the right hilus. The right lower lobe is retracted toward the mediastinum and is adherent to the right side of the diaphragm. Numerous dilated air sacs are shown in the right lower lobe.

adhered firmly to the body wall and lighter adhesions extended along the lateral border of the lung to the base. When the lung was removed from the chest cavity crepitation was absent in the lower lobe, but on section a foul smelling gas escaped from the necrotic lung tissue and on pressure a dark red, foul smelling fluid escaped. The hilar lymph nodes were matted together in large calcified masses, one mass being lobulated and about the size of a small tangerine. The bronchi were filled with a dirty gray

exudate and the terminal bronchi in the region of the inferior main bronchus were involved in the necrotic process at the right base.

The left thoracic cavity contained about 150 cc. of a clear brown fluid. The apex of the left lung was firmly adherent, the adhesions extending down the posterior surface of the lung to the diaphragm. Adhesions were also present along the mediastinal border from the apex to the hilus. The lung surface was dark. The lung tissue was definitely emphysematous with many large distended blebs at the base. The hilar glands were enlarged, many showing calcification but not to the marked extent previously described in the right hilus. On section the lower lobe was bright red and a dark foamy fluid escaped on pressure. On section the cut surface of the upper lobe was mottled, varying from a dark red to a light gray, and did not crepitate on pressure. The bronchi contained a dirty gray exudate. A dark gray foamy fluid escaped on pressure.

The heart was small. When the pericardium was opened about 50 cc. of a brown fluid was present in the pericardial space. The visceral pericardium showed a grayish mottling and the coronary vessels were congested. The right side of the heart was empty; tricuspid and pulmonary semilunar valves were normal. The left side of the heart contained fluid blood; mitral and aortic semilunar valves were normal. The coronary orifices and arteries were normal. The aorta was normal except

for atheromatous plaques in the intima of the ascending portion. The posterior mediastinal nodes were enlarged, many showing calcification which was apparently a continuation of the process as previously noted in the hilar nodes.

The cranium was intact with no evidence of fracture of the bones of the skull. The meninges were normal in appearance. The cortical surface of the brain was obviously edematous and congested, but no gross hemorrhage was demonstrable. On section of the brain no gross abnormality was found except a diffuse edema.

Microscopic Examination.—Sections from various regions of the lung showed various stages of acute inflammatory processes; in many areas the alveoli were filled with a fibrinous exudate; the walls of the alveoli in many places were necrotic. Histologic sections of the thinly encapsulated mass previously described in the right lung proved to be an area of organized pneumonia. There was considerable replacement of fibrosis tissue. Terminal bronchi in many places were obliterated; in some areas they had disintegrated. Near the center of this reaction there was diffuse hyaline degeneration. In the periphery of this mass there was localized abscess formation. In the lung tissue adjacent to this mass there was an acute inflammatory reaction resulting in diffuse necrosis of lung tissue with its resulting hemorrhage and thrombosis of vessels.

The pulmonary lymph nodes showed much congestion and necrosis. The afferent vessels of the lymph nodes were filled with organizing thrombi.

The outstanding picture of the spleen was one of hemorrhagic necrosis. Many of the splenic lymph follicles had disappeared. Splenic vacuoles were increased in number while some of the follicles were completely destroyed by necrotic processes.

The liver showed necrosis of the central vein. The liver cells of the periphery of these necrotic areas contained bile and blood pigment.

The pancreas showed no abnormality.

The kidneys showed extensive congestion of the tufts of the glomeruli. The principal pathologic condition was distributed to the tubular areas; the epithelium of the tubules showed fatty degeneration. In the larger collecting tubules the epithelium was necrotic; in many other areas the epithelium was desquamated. Others showed interstitial hemorrhage. Many of the tubules were filled with pink hyaline casts.

Bacteriologic Examination.—Stained smears obtained from the foul smelling fluid showed the presence of a large number of various types of bacteria; morphologically there were many streptococci, staphylococci, many gram-negative bacilli and many gram-positive bacilli. Because of the morphology and the foul smelling character of the material, gas bacilli were thought to be present. Some of the material was injected intraperitoneally into a guinea pig. The guinea pig was then killed and placed in an incubator. Within twelve hours the guinea pig was considerably distended from the formation of gas.

Diagnosis.—The anatomic diagnosis was trauma on the chin and interstitial hemorrhage in both infra-orbital regions of the face, congestion and edema of the brain, healed tuberculosis, bronchiectasis, unresolved pneumonia with abscess formation, acute pneumonia with abscess formation and gangrene of the lung, degeneration of the heart, liver and spleen, and nephrosis.

CONCLUSION

An analysis and summary of all the observations in this case led us to the conclusion that the patient had a chronic lung abscess and bronchiectasis of the right lower lobe. The extreme weakness following the loss of blood and coma contributed to decrease the patient's resistance. The trauma was a factor in activating the old lung abscess. Also no doubt the patient aspirated large quantities of infected blood from the mouth.

All these conditions contributed an ideal culture medium for the growth of all the bacteria, particularly the gas bacillus, which produced the extensive gangrene of the right lung and generalized pneumonia.

PARATYPHOID SEPTICEMIA IN MAN DUE TO
SALMONELLA SUIPESTIFER

A. E. HARDISON, M.D., M.P.H.,

Field Epidemiologist

AND

A. B. SHIPLEY, M.D., M.P.H.,

Director, Carter-Unicci-Johnson Health District
NASHVILLE, TENN.

So far as is known, no case of septicemia due to *Salmonella* suipestifer has been reported previously in Tennessee. In 1927 Stewart and Litterer¹ reported a milk-borne epidemic of gastroenteritis at Dyersburg, Tenn., caused by this organism. It would appear that "food poisoning" cases of *S. suipestifer* are more frequent than other manifestations due to this organism. However, during the past few years several cases of continued fever caused by this organism have been reported in the United States. In 1932, Kuttner and Zepp² of the Johns Hopkins Hospital reported a series of 7 cases of *S. suipestifer* septicemia in children at Baltimore varying in age from 7 months to 6 years. Again in 1933 these authors³ described 4 similar cases in persons from 5 weeks to 28 years of age, one of whom died. Several authors in this country and abroad have reported isolated cases of *S. suipestifer* infections, some of them fatal.

S. suipestifer, or paratyphoid C organisms, were isolated from hogs by Salmon and Smith in 1885⁴ and afterward designated *Salmonella cholerae suis*. Hirschfeld first observed the typhoid-like infections due to this bacillus in the Serbian army; later, isolated cases were discovered in other parts of eastern Europe, India, Africa and the United States. In no case has any direct connection between hogs and the infection in man been shown.

REPORT OF CASE⁵

History.—G. L., a white man aged 66, a cotton mill superintendent, had lived in Elizabethton most of his life. He was 5 feet 11 inches (180.3 cm.) tall and weighed 215 pounds (97 Kg.). For the past thirty years or longer he had complained of a "missed beat" in his pulse. About ten years before admission he allegedly had chills and fever for five or six weeks and his illness was diagnosed as influenza. For several years he had complained of his right shoulder becoming cold. During the fall of 1938 he began to complain of fatigue and dyspnea, which appeared to become progressively worse for several months. Throughout the winter months he complained of "rheumatism" in his right shoulder and arm. During the week of April 23, 1939, symptoms of general malaise were noticed. On Sunday morning, April 20, while at church, he experienced chilly sensations which lasted about two hours. In the afternoon he consulted a physician relative to his condition. His temperature at this time was 102 F. At 8 p. m. while walking in the house he fell, became temporarily unconscious and vomited. About two hours later, after an apparently normal sleep, he awoke suddenly and had a severe chill followed by vomiting and profuse sweating. His physician found his axillary temperature to be 105.2 F. during the chill. The following day the patient appeared much better, and his temperature was normal. However, the next day there was another severe chill, with the axillary temperature reaching 106 F. Chills continued at irregular intervals but were less severe in character until May 17, when an unusually severe one occurred and the patient became cyanotic. During the next week his temperature ranged from normal to 102 F., with two or three mild chills occurring. On May 26 the patient died of respiratory failure.

3. Kuttner, A. G., and Zepp, H. D.: *Salmonella* suipestifer Infection in Man. *J. A. M. A.* 101: 269 (July 22) 1933.

4. Havens, L. C.: The Bacteriology of Typhoid, *Salmonella*, and Dysentery Infections and Carrier States. New York, Commonwealth Fund, Division of Publications, 1935.

5. Dr. W. G. Frost, of Elizabethton, Tenn., the attending physician in the case, provided the history of the patient, and Miss Margaret Morrison, director of the Johnson City Branch State Laboratory, worked on the identification of the organism.

During the twenty-seven days of illness the patient had about twenty chills, all of which were followed by vomiting and profuse sweating. The only pain noted was headache on April 30 and an occasional pain extending from the right side of the throat to the right side of the chest. Dyspnea was severe during the last week, with the respiratory rate about 40 per minute. The patient's pulse rate ranged from 90 to 110 a minute. Diarrhea was not observed at any time. Complete loss of appetite prompted the forcing of fluids. Loss of weight was noticeable after the first week. Occasional fleeting, fine, crepitant rales were detected over the bases of the lungs posteriorly, which aroused suspicion of pneumonia. Roentgen examination on May 15 showed the lungs to be normal. A slight irregularity of cardiac action was found during the last week. No enlargement of the liver or spleen could be detected, but obesity prevented accurate palpation.

Treatment consisted mainly of irregular administration of sulfapyridine and sulfanilamide. During the last week three blood transfusions and several intravenous injections of dextrose were given.

Laboratory Examination.—At the onset, urinalysis revealed the presence of numerous leukocytes and an albumin content of 1 plus. During the second and third weeks of illness the urine was essentially normal, but during the last week albumin was present to the extent of 2 plus. Culture of a voided specimen of urine on May 19 yielded nonhemolytic streptococci; examination was negative for the typhoid bacillus and related organisms. Examination of feces on the same day gave negative results. White blood cell counts varied from 13,000 to 18,000 per cubic millimeter, with polymorphonuclear cells averaging about 84 per cent. Diligent search on numerous occasions failed to reveal the presence of malarial parasites in the blood.

Beginning on May 7, blood was sent several times to the branch laboratory of the Tennessee Department of Public Health at Johnson City for agglutination. Blood cultures for the typhoid-paratyphoid group were taken on May 19. On all occasions agglutination was negative for typhoid, paratyphoid A, undulant fever, tularemia, typhus fever and Rocky Mountain spotted fever. The patient's blood serum agglutinated a standard paratyphoid B antigen in dilutions ranging from 1:160 on May 7 to 1:640 on May 19. The organisms isolated from the culture of the patient's blood taken on May 19 were agglutinated by paratyphoid B serum in a dilution of 1:160. Blood serum from the patient completely agglutinated the bacillus obtained from culture of the patient's blood in dilutions up to 1:2,560.

The organism isolated from the culture of the patient's blood belonged morphologically and culturally to the typhoid-paratyphoid subgroup of bacteria. The fermentation reactions were characteristic of paratyphoid B with the exception of a negative reaction with Simmons' citrate agar. This discrepancy, in addition to the fact that the organisms were agglutinated by the paratyphoid B antiserum in a dilution no higher than 1:160 while they were agglutinated by the patient's own serum in dilutions up to 1:2,560, led the laboratory technician to suspect a closely allied strain of bacteria, probably paratyphoid C. Thereupon a transfer of organisms isolated from cultures of the patient's blood was sent to the National Institute of Health for complete identification. The following report was received:

"The culture of the organism . . . appears to belong to the *S. cholerae suis* (*Bacillus suipestifer*) group. It produces acid and gas in dextrose, rhamnose, sorbitol and xylose broth but fails to attack lactose, sucrose, salicin, raffinose, arabinose or trehalose in an incubation period of fourteen days. Milk becomes first acid and then alkaline. Gelatin has not been liquefied in twelve days. . . . The strain is agglutinated strongly by an antiparatyphoid C serum, which indicates that it falls within the *S. cholerae suis* group serologically as well as culturally."

Epidemiology.—No indication of the source of infection could be determined. No reported case of fever of unknown origin or of food poisoning in the county preceded this case. Mr. L. and his wife had lived alone for several years, Mrs. L. doing all the housework including cooking. Mrs. L. stated that she had never had any typhoid-like illness or symptoms of food poisoning. Mr. L. ate all his meals at home and had not been

outside of Carter County during the past six months. The only food consumed by the patient not prepared at home was an occasional barbecue sandwich brought to him from a stand in Johnson City. He drank little milk, and it was obtained from a local dairy distributing raw milk. The house occupied by the patient is on the municipal water and sewage disposal system. He was visited frequently by his grown children, none of whom gave a history of a suspicious illness in the past. There were no pets or other animals associated with the household. No employees of the cotton mill of which Mr. L. was superintendent had experienced any recent typhoid-like illness.

COMMENT

In the case of paratyphoid septicaemia due to *S. suipestifer* here reported the high agglutination titer of the patient's serum against the organisms isolated from the patient through blood cultures suggests that the organism identified was the etiologic agent rather than a terminal or accidental invader, with no suggestion as to the epidemiology. The possibility of a rodent-borne infection cannot be dismissed. This condition is rare, judging from reports in the literature. It may be that if thorough laboratory work was done in all cases of prolonged fever and of gastroenteritis the distribution of *S. suipestifer* in man would be found more widespread.

Special Articles

THE FEDERAL FOOD, DRUG AND COSMETIC ACT

AS IT APPLIES TO DRUGS DISPENSED BY
PHYSICIANS OR ON PHYSICIANS'
PRESCRIPTIONS

THEODORE G. KLUMPP, M.D.
WASHINGTON, D. C.

The new Federal Food, Drug and Cosmetic Act, which became fully effective on July 1, 1940, is an expression of the authority conferred on Congress in the interstate commerce clause of the Constitution. All drugs that move in interstate commerce, including exports and imports, or are manufactured or sold in the District of Columbia or any of the territories, are within the jurisdiction of the act and are subject to its provisions. In many instances drugs dispensed by physicians or on a physician's direction are within the scope of the law. Even though the actual prescription of a drug may be a purely local transaction, the drug prescribed is subject to the federal law when it moves across a state line or is held for sale after such movement or is sold in the District of Columbia or a territory. However, Congress has provided certain exemptions for drugs in this class, both by direct legislative action and by the regulation making authority delegated to the administrator of the law. For a complete statement of the provisions of the law, the reader is referred to the text of the act and regulations issued to date. A copy of these may be obtained on application to the Food and Drug Administration. Likewise, a discussion of features of the act that are of particular interest to the medical profession is contained in an article which appeared in *THE JOURNAL* on Dec. 16, 1939.¹

From the numerous inquiries that have been received, it is evident that the application of the law to drugs dispensed on a physician's prescription or by a physi-

cian himself is not understood by all concerned. It seems desirable, therefore, to present a summary of those provisions of the law which must be met even after full advantage is taken of the exemptions provided by the act and its regulations. The summary to be given applies only when a drug is dispensed by or on the written prescription of a physician, dentist or veterinarian who is licensed by law to prescribe the drug in question. It does not apply to a drug dispensed in the course of the conduct of a business of dispensing drugs pursuant to diagnosis by mail. In this case all the provisions of the act without exception or exemption are applicable. Likewise, all the provisions of the act pertain when the labeling of a drug bears such information as will result in the repurchase and continued use of the drug by lay users without the direction and supervision of the physician who prescribed it or any other physician. Obviously it was the intent of Congress that substantial exemptions from the full labeling requirements of the act should be extended only to drugs which are bona fide prescription items and which are, in fact, available only on the direction of a physician. It is evident, therefore, that labeling or other printed matter which operates to circumvent this purpose shall, by the same token, serve to negate the fundamental condition on which the exemptions are granted.

Having taken full advantage of the exemptions, the following provisions still apply to drugs dispensed by physicians or on physicians' prescriptions:

1. A new drug, as defined in the act, may not be dispensed even on the prescription of a physician unless a new drug application filed with the Administrator of the Federal Security Agency has become effective. This does not mean that a qualified expert may not administer a new drug for investigational purposes after compliance with the regulations of section 505 (i) of the law.

2. The labeling of the drug shall not be false or misleading in any particular [section 502 (a)].

3. The label of the drug dispensed on the written order of a physician shall bear [section 503 (b)]:

(a) The name and place of business of the dispenser.

(b) A serial number identifying the drug dispensed and connecting it with the physician's prescription kept on file by the dispenser or the dispenser's record of the transaction or both.

(c) The date of the prescription.

(d) The name of the physician, dentist or veterinarian who wrote the prescription.

4. Where the physician's prescription is marked as "not refillable" or refilling is prohibited by state or local law, the labeling of the drug dispensed need not bear a statement of the name and quantity or proportion of alpha eucaine, barbituric acid, beta eucaine, bromal, cannabis, carbromal, chloral, coca, cocaine, codeine, heroin, marihuana, morphine, opium, paraldehyde, peyote or sulfonmethane, or any chemical derivative found to be and by regulation designated as habit forming, nor the statement "Warning—May be habit forming." For the present, it is our interpretation that the physician may direct in writing that such a prescription be filled more than once, provided the number of times is precisely stated and it is also clearly marked in writing as not refillable beyond the number of times so stated. The regulations designating

habit-forming derivatives of the substances mentioned are expected to be promulgated shortly. After they are issued, physicians may obtain a list of them by application to the Food and Drug Administration.

5. Regulations under section 502 (f) (1) exempt drugs dispensed by or on the prescriptions of physicians from the necessity of carrying directions for use, under specified conditions, since it may be assumed that the physician prescribing the drug will convey to his patient in detail the specific individually indicated directions for use. Applications for potent new drugs intended to be sold on physicians' prescriptions will not be permitted to become effective when the labeling bears any directions whatever that may serve to encourage unsupervised use.

6. Section 502 (f) (2) provides that the labeling of drugs in general shall bear such adequate warnings against use in pathologic conditions or by children when its use may be dangerous to health, or against unsafe dosage or methods or duration of administration or application, in such manner and form, as are necessary for the protection of users. Here again it may be assumed that the physician will provide his patient with warnings which will be more specific and comprehensive than anything which can be given in a general way on the labeling of drugs. Where such warnings are given and are adequate to protect the user, the purpose of the act will presumably be accomplished in most instances without resort to a statement on the labeling which would be superfluous and repetitious. However, the statute itself provides no exemption from the requirement that adequate warnings appear in the labeling.

As indicated previously, if a drug is dispensed in such form and manner and under such labeling as will enable the user to repurchase the article and continue to use it indefinitely and perhaps recommend it to friends, obviously under such circumstances only such warnings on the labeling will be adequate which will in themselves fully protect the user.

7. The law provides that official drugs shall be packaged and labeled as prescribed in the official compendiums, and in the case of unofficial drugs the administrator is authorized to prescribe by regulations such packaging and such label statements as are necessary for the protection of the public health. These regulations have not yet been issued. For the present, it may be presumed that where such packaging and labeling requirements are essential for the protection of the public health they will apply to drugs dispensed on the written prescription of a physician.

8. A drug coming under the jurisdiction of the act may not be dispensed if it is dangerous to health when used in the dosage or with the frequency or duration prescribed, recommended or suggested in the labeling thereof. Ordinarily it may be assumed that a physician will not prescribe such a dangerous drug. However, instances may arise in which the medical profession as a whole condemns the use of a drug as dangerous and despite this consensus of condemnation an individual, oblivious to such danger, may wish to administer the drug. In such a case the safeguard of the law cannot be withheld. Its effect would be to close the channels of interstate commerce to the drug. An example of this is the drug dinitrophenol, which is not now available in interstate commerce. The same applies to the so-called elixir of sulfanilamide, in which the toxic element was the solvent diethylene glycol and not the sulfanilamide.

GLANDULAR PHYSIOLOGY AND THERAPY

OVARIAN DYSFUNCTIONS AND THEIR TREATMENT

C. FREDERIC FLUHMAN, M.D.

SAN FRANCISCO

This special article is published under the auspices of the Council on Pharmacy and Chemistry. It is one of a series which will be published in book form as the second edition of "Glandular Physiology and Therapy." The opinions expressed in these articles are those of the authors and not the official views of the Council.—Ed.

The ovaries have three essential functions: First, they produce ova, the germ cells. Second, they elaborate or metabolize estrogenic substances, which play a primary role in the development of the female secondary sex characters and in the maintenance of the accessory genital organs. Third, in them is formed corpus luteum, an ovarian structure which appears at cyclic intervals and produces a hormone, progesterone, which is indispensable for reproduction.

Ovarian dysfunctions must be regarded as manifestations of deficiency or hyperactivity of one or more of these phenomena, but with the present knowledge a classification in terms of clinical syndromes is impossible. For this reason it is best to discuss the subject not on the basis of ovarian pathologic conditions but indirectly from evidences of gonadal disturbance obtained from the study of disorders of menstruation. It must be granted that there are disadvantages in doing this, since one must deal with symptoms rather than with disease entities, but it is the method of approach used by an overwhelming majority of clinicians. The only exceptions which may be made are in cases of a few fairly well defined clinical entities, such as precocious development, complete absence of ovarian function and metropathia haemorrhagica.

OVARIAN DYSFUNCTION DURING THE PREPUBERAL AND PUBERAL PERIODS

The first sign of active ovarian function is the development of the secondary sex characters. The earliest evidence appears at about the age of 8 years, when the breasts begin to develop and estrogenic substances become demonstrable in the blood and urine. The most striking manifestation, however, is the onset of the first menstrual period, the menarche. In this country, the average age for this event is between 13½ and 14½ years, and in the majority of instances it occurs between the ages of 10 and 16 years. The appearance of menstruation before the age of 9 is therefore regarded as precocious maturation and after the age of 16 as "delayed onset of the menses" or "primary amenorrhea."

1. *Pubertas Praecox.*—In true precocious menarche all the events of the normal physiologic process are reproduced. The secondary sex characters develop, there is an enhanced rate of body growth and the menses appear and recur at cyclic intervals. Of especial significance is the fact that the menstrual cycles are complete, with ovulation and corpus luteum formation, so that the subjects are able to become pregnant at an early age. In this category belong instances of

gestation in girls from 6 to 12 years of age. The exact etiology of such a disturbance is not known. It must be of endocrine origin, but the only demonstrable abnormality is the appearance of normal physiologic phenomena at an earlier age. Obviously, no therapy is indicated, but a careful investigation of all such patients must be made to make sure that they do not belong to the second subgroup of this division.

2. *Pseudo Pubertas Praecox*.—The majority of instances of so-called precocious menarche in the literature are not true "pubertas praecox" but represent a definite pathologic entity. In such cases the secondary sex characters develop, the pelvic organs enlarge and uterine bleeding occurs. These changes, however, merely represent an estrogenic effect. Ovulation does not take place, there is no formation of corpus luteum and pregnancy is not possible. Following suitable treatment, there is a regression of these changes and uterine bleeding ceases, but if at least one ovary is present they recur later as part of the physiologic menarche.

The cause is found in tumors which produce excessive amounts of estrogen, and, although attention has been directed to lesions of the anterior lobe of the hypophysis, thymus and pineal gland, the only clear instances have been associated with tumors of the ovaries. The treatment consists of surgical removal of the new growths, which have been described as granulosa cell tumors, sarcomas, teratomas and carcinomas.

3. *Delayed Menarche and Primary Amenorrhea*.—These terms are employed synonymously, or an arbitrary distinction is made between them, according to the age of the patient. In the latter case, delayed menarche is applied to girls between the ages of 16 and 18 years and primary amenorrhea to those beyond the eighteenth year. Both terms refer to a delay in the appearance of the first menstruation, which often is accompanied by various disturbances in other changes of the adolescent period. The secondary sex characters are often imperfectly developed or absent. The breasts remain small, and there is no hair, or only a scant amount, over the pubic and axillary regions. There may be but little deposition of fat over the hips, shoulders and thorax. Of importance is the fact that the deficiency of ovarian function leads to an imperfect development of the genital organs, especially noteworthy in the case of the uterus, which persists in an "infantile type." At times alterations in body growth are striking, and the most characteristic finding is that the patients are tall and thin, with long lower extremities and span in proportion to the length of the trunk.

Many causes have been suggested for primary amenorrhea, and attention must be directed particularly to hereditary and constitutional factors, systemic disease, environment and malnutrition. It is likewise probable that primary deficiencies of the endocrine glands, notably the anterior lobe of the hypophysis, the thyroid and the gonads, are frequently responsible.

The treatment of primary amenorrhea has proved very disappointing. In recent years estrogenic and gonadotropic substances have been widely employed in the manner described in the section dealing with secondary amenorrhea. In spite of many favorable reports, the most successful approach probably lies in the employment of suitable dietary and hygienic measures, and, whenever clinical signs and a basal metabolic test so indicate, the use of thyroid substance.

SECONDARY AMENORRHEA

Under the term secondary amenorrhea are included instances of cessation of menstruation in women who possess one or both ovaries and an endometrium capable of normal function. The period of amenorrhea may vary from a few weeks to several years. When it becomes permanent in younger women it may be considered as a "premature menopause."

In many cases the exact mechanism concerned with amenorrhea is not clear, but the focal point of the disturbance is always the ovaries, which fail to undergo a normal cycle. This may be due to some influence exerted on the gonads directly or indirectly through interference with the gonadotropic function of the anterior lobe of the hypophysis.

There are many causes of functional amenorrhea. The occurrence of normal menstruation is dependent on general good health, and failure to menstruate may be the first indication of a systemic disease. It may occur in almost any form of ill health and is found in many instances of malnutrition, intoxications and wasting diseases such as tuberculosis and diabetes mellitus. Although the reproductive organs are primarily under the control of the endocrine glands, the glands themselves are subject to the autonomic nervous system, and various emotional disturbances may lead to amenorrhea. It is well known that shock, fright, fear, worry, sexual disharmony, changes of work, climate or environment, surgical operations and certain mental diseases frequently cause a cessation of menstruation. On the other hand, the majority of amenorrheic patients suffer from a primary endocrine disturbance. A small number of these present a definite condition, such as deficiency of the anterior pituitary lobe due to tumor growth or constitutional defect, hyperthyroidism, adrenal new growth or ovarian deficiency. In many cases the exact ductless gland at fault is not discernible with certainty, as the amenorrhea is not associated with clearcut clinical manifestations; these cases present a very difficult diagnostic problem.

The treatment of secondary amenorrhea primarily demands the employment of general measures and the eradication of any organic lesion which may be responsible for it. It is a symptom which calls for extensive investigation, and attention must be directed to the existence of systemic disease, endocrine disorder, psychic disturbance, malnutrition or an unfavorable living or occupational environment. If such a factor is discovered, it necessarily follows that the cure is altogether dependent on the rectification of the condition at fault.

Among general measures, special attention must be given to personal hygiene. Proper and sufficient food is necessary, and it may be advisable to supplement the diet with vitamins and minerals. When amenorrhea exists with obesity an attempt must be made to reduce the patient's weight. A low basal metabolic rate requires the daily administration of suitable doses of thyroid substance. The patient also should take enough exercise in the open air, and at times an investigation of working hours and living conditions may give a clue to the correct therapeutic approach.

The specific treatment of amenorrhea must be directed toward a restoration of a complete ovario-uterine cyclic activity. Recent advances in knowledge of the mechanism of the menstrual cycle have shown conclusively the uselessness of emmenagogues and procedures which lead merely to an abnormal uterine hemorrhage.

The employment of low dosage irradiation of the ovaries has been championed by a number of authors both in Europe and in this country but has failed of wide clinical application owing to the individual variations in the narrow margin between safe and harmful dosages, and also because of the possibility of damage to the germ plasma which may manifest itself in later generations. Irradiation of the hypophyseal area alone, in the hope of enhancing this gland's gonadotropic function, also has been advocated, but the results are not convincing.

The appearance of active biologic preparations of estrogenic substances was at once hailed as a possible cure for amenorrhea, and many favorable reports regarding their usage have been published. In some instances ridiculously small dosages have been employed, such as 100 to 500 international units taken by mouth. In others, a total of as much as 500,000 to 1,000,000 international units has been administered by intramuscular injections of from 10,000 to 50,000 international units two or three times a week. Many patients bleed cyclically during treatment or following each course of injections, but the infrequency of a permanent restoration of menstruation arouses a doubt as to the validity of many published reports. Some authors justify this therapy on the ground that it may result in the growth of an atrophic uterus (temporary?). It is important to remember that the use of estrogenic substances is purely substitutive therapy. Estrogens have no direct effect on the ovaries, and in the endometrium they merely stimulate growth and do not produce secretory changes, which is a function of the corpus luteum. Nevertheless, estrogens are widely used in the treatment of amenorrhea, and further judgment must remain *sub judice*.

The logical substance for the treatment of functional amenorrhea should be capable of stimulating the ovaries to normal function. For this reason attention is directed particularly to anterior pituitary or equine gonadotropins, but this method of approach is still in an experimental stage.

An international standard for equine gonadotropin has only recently been established, and there is none for hypophyseal gonadotropin. Recent attempts with such substances have been inadequate, but attempts nevertheless are made by giving short courses of high doses of gonadotropin at intervals of a month. It is not possible to give any recommendations regarding dosage at the present time because of the lack of consistency in the available commercial preparations, but each manufacturer makes his suggestions for the use of his specific product.

Of importance is the fact that the employment of chorionic gonadotropin is not indicated. There is no evidence that this substance can lead to a normal development of graafian follicles in women. The only exception to this statement is that it may be used with the hypophyseal follicle-stimulating principle with the object of enhancing the gonadotropic effect of the pituitary factor.

POLYMENORRHEA AND OLIGOMENORRHEA

The menstrual cycles of normal persons are subject to considerable variation in length, but at times there is such a marked shortening or lengthening of consecutive cycles that attention is directed to them as evidence of some disorder.

Polymenorrhea.—This condition is characterized by a shortening of the average length of the menstrual cycle. The usual course of events goes on both in

ovaries and in endometrium, but the cycles last only from fourteen to twenty-five instead of the average thirty days. It is often stated that this abnormality is brought about by a hyperhormonal condition, that is by overactivity of the ovaries. This contention is open to question, and on the basis of Schroeder's studies it is more likely that it results from an ovarian deficiency which manifests itself by a premature disintegration of the corpus luteum, thus leading to a shortening of the postovulatory phase of the cycle.

Although it is the least common type of menstrual irregularity and is found in women who are normal in all other ways, polymenorrhea is an important symptom pointing to a pathologic condition. It is found frequently in the preclimacterium or in ovarian deficiencies associated with hypothyroidism, and it may have a psychogenic origin and result from fear of pregnancy or infection or from one of various sex perversions. Most often it accompanies organic pelvic disease, especially pelvic inflammation, fibromyoma uteri or uterine retrodisplacement. In such cases the shortened cycles must be attributed to vascular disturbances which directly affect the ovaries.

In most instances polymenorrhea does not call for specific therapy, as it results from some systemic or pelvic disorder. Whenever there are no apparent local or general causes, treatment is very discouraging. The endocrine factors concerned are not clearly understood, and hormonal therapy has not proved effective. It is said that cycles may be prolonged by administering large doses of estrogens, such as from 50,000 to 100,000 international units, during the early part of the cycle, but this effect is not permanent.

Since menorrhagia frequently accompanies polymenorrhea, treatment should be directed primarily to this complication. Of importance also is the establishment of a correct diagnosis, since the occurrence of too frequent menses may be confused with the hemorrhage of metropathia haemorrhagica and midinterval (ovulation) bleeding.

Oligomenorrhea.—This condition is a prolongation of the menstrual cycle beyond average limits. It is closely related to amenorrhea, and it is difficult to differentiate between the two. A woman who menstruates at intervals of three or four months may be regarded as having either oligomenorrhea or recurring periods of amenorrhea.

Treatment of oligomenorrhea is not always justified, since this symptom may be compatible with normal good health. In certain instances, for example when it is associated with sterility, it may be desirable to institute therapy, and in this case the problem should be approached exactly along the lines given for secondary amenorrhea.

HYPOMENORRHEA AND HYPERMENORRHEA

Although there is a marked variation in the length of successive menstrual cycles in women, there is a much greater constancy in the duration of the menses and the amount of loss of blood in each case. For this reason, any increase or decrease in the amount of blood lost during menstruation is of importance as indicative of a pathologic condition, but the exact role of the ovaries in such disturbances is not definitely understood.

Hypomenorrhea.—This term refers to a diminution of the amount of flow or a lessening of the duration of the menses. It is not a very frequent finding in cycles of average length. The cause, or causes, are difficult to determine, but generally it is attributed to

endocrine disorders which lead to a functional ovarian deficiency. At times, also, it occurs from an endometrial deficiency, such as follows a subtotal hysterectomy with a resultant diminution of the total area of the uterine mucosa, or a partial destruction of the endometrium by injudicious curettage, chemical treatments or extensive infections.

This symptom often accompanies oligomenorrhea, and the most important indication for treatment is its occurrence in association with sterility. Endocrine therapy is directed, as in amenorrhea, toward either (1) stimulating the endometrium with estrogenic substances or (2) attempting to influence the ovaries with gonadotropic preparations. In either case the results have not been promising.

Hypermenorrhea, or Menorrhagia.—These terms are applied to the occurrence of a succession of unduly profuse or prolonged menstrual periods following complete ovulatory cycles. A flow of more than seven days' duration should be considered abnormal. Menorrhagia may be found with cycles of average length and is a frequent accompaniment of polymenorrhea. It is an important complication, as it may bring about serious consequences, even to the point of endangering the life of the patient.

It is probable that endocrine disorders may be etiologic factors, but it is difficult to determine the exact mechanism by which profuse menses are produced. Theoretically, an excessive activity of normal ovarian function resulting in overgrowth of the endometrium prior to menstruation may result in excessive bleeding. This state of affairs is seen in some instances of hypothyroidism. As a matter of fact, menorrhagia in the vast majority of instances is observed in women with an organic pelvic disease, for example, chronic salpingitis, fibromyoma uteri, adenomyoma, subinvolution of the uterus, endometritis or a systemic condition, such as one of the various blood dyscrasias.

In all such cases, the treatment must depend on first combating the effect of the recurring hemorrhages by blood transfusions, the administration of liver extract and iron and a suitable dietary regimen. Whenever a systemic or local disturbance is noted it must be met with suitable therapeutic measures. In the total absence of apparent causative factors, local or general, various endocrine preparations may be employed, but the results are not as hopeful as they are in metropathia haemorrhagica. The use of the chorionic gonadotropin or of progesterone (as for metropathia haemorrhagica) has been widely advocated, but the results are favorable only in a limited number of instances. In many cases thyroid substance has proved of value, even in women with normal basal metabolic rates. Many other procedures have been advocated, with varying degrees of success, such as administration of solution of parathyroid, of moccasin snake venom or of insulin and irradiation of the spleen. Irradiation with roentgen rays or radium finds its greatest value in the treatment of women nearing the menopausal age, and for younger women the final resort is hysterectomy. In young or old, the possible existence of a carcinoma demands careful diagnostic precision, but a malignant condition of the uterus is not often found in instances of regular cyclic uterine hemorrhage.

ANOVULATORY MENSTRUATION

At certain times "menstruation" occurs without preceding ovulation, corpus luteum formation and secretory changes in the endometrium. It should be regarded

as a type of ovarian deficiency, since it results from failure of ovulation to take place. Clinically, the patient has periods of bleeding indistinguishable from ovulatory menstruation, so that the diagnosis must be made from an examination of the endometrium.

The frequency and clinical significance of anovulatory menstruation in women are not determined, but they are possibly factors in some cases of sterility. If treatment seems desirable, the logical approach is to stimulate follicle growth with either anterior pituitary or equine gonadotropin. The gonadotropin should be given early in the cycle, a few days after the cessation of the menses.

METROPATHIA HAEMORRHAGICA

The term metropathia haemorrhagica is applied by Schroeder to a definite endocrine entity characterized by specific changes in the ovaries and endometrium and clinically of importance because it leads to profuse uterine bleeding.

The disease is found at all ages but is especially prone to occur shortly after the menarche and in the preclimacterium. The uterine hemorrhage may manifest itself in several ways. It may be periodic in occurrence and hence simulate menorrhagia. Frequently the bleeding occurs irregularly, or it may become continuous, appearing daily for weeks or months. In a considerable number of instances it sets in after a period of amenorrhea, in which case it may be confused with threatened or incomplete abortion.

In metropathia haemorrhagica the ovaries may be slightly enlarged and contain from a few to many cysts representing various stages of follicular atresia, the most characteristic feature being an absence of corpora lutea. There is thus a failure of ovulation in these patients, so that the endometrium is constantly stimulated by estrogens in the absence of the progesterone influence. The same result is obtained in the presence of granulosa cell tumor of the ovary.

The uterine mucosa reflects this abnormal stimulation from the ovary. It is usually thickened and edematous, and the surface has irregular prominences. Histologically, the normal cyclic changes are lacking, and it presents the abnormal development known as "hyperplasia of the endometrium."

The treatment of metropathia haemorrhagica consists in the first place of treating the resultant anemia with suitable means, such as the administration of iron and liver extract and the use of blood transfusions. Of the specific procedures to control the bleeding, five of them call for especial consideration: 1. Chorionic gonadotropin may be given in large daily doses, such as from 500 to 1,000 international units, intramuscularly for from six to ten days, beginning with the onset of bleeding. The Council on Pharmacy and Chemistry of the American Medical Association recently held that the efficacy of this therapy is not clearly established, but many observers have reported favorable immediate results in as many as 75 per cent of their cases. It is most effective in younger persons, but, although it may control the bleeding, recurrences are experienced at varying intervals. 2. Injections of progesterone also may be employed, from 1 to 3 international units being given daily until the bleeding is controlled. This substance often controls the bleeding in a dosage insufficient to stimulate definite secretory changes in the endometrium. Since this substance has no direct effect on the ovaries, it is not curative. 3. Although it must be regarded as an experimental procedure, the use of

testosterone propionate is worthy of consideration and has given some encouraging results. It may be given by intramuscular injection in amounts of 25 mg. in oil twice weekly until a total of 250 to 400 mg. has been administered. There is some danger of inducing masculinizing effects when higher doses are employed. 4. The operation of curettage is at times resorted to as an adjunct to endocrine therapy when there is a marked proliferation of the mucosa and polyp formation. It is also a valuable diagnostic procedure to eliminate the possibility of a coexistent carcinoma. 5. Roentgen and radium irradiation are indicated for patients in the climacteric because they do not respond readily to endocrine therapy. Radium is preferable, since a diagnostic curettage can be done at the time of its application. From 1,200 to 1,500 milligram hours in the uterine cavity has been found suitable. 6. Hysterectomy is the last resort in cases of uncontrollable metrorrhagia haemorrhagica in young women, in which it is desired to avoid the castration produced by irradiation.

TOTAL ABSENCE OF OVARIAN FUNCTION

A complete loss of ovarian function follows surgical removal or destruction by irradiation of both gonads and is a sequence of the physiologic menopause. There are many individual variations in the reaction to ovarian deprivation, and in some instances it produces numerous local and systemic disturbances.

The lack of ovarian stimulation immediately results in cessation of menstruation and in atrophy of the accessory genital organs. The breasts likewise undergo involution, and with the removal of the inhibitory influence of the ovaries there is an overproduction of the anterior pituitary gonadotropin, which appears in great amounts in the blood and urine. Estrogenic hormones are still demonstrable in the blood and urine after castration or the menopause, a fact which speaks for an extragonadal origin for these substances.

In most cases the loss of the ovaries produces few or no symptoms requiring therapy, but at times a long train of disturbing elements enter into the picture. The most frequent subjective symptom is "hot flushes," a result of vasomotor instability. Their incidence is usually placed at between 60 and 90 per cent of all cases. There also may be tachycardia, palpitation, dyspnea, choking sensations, insomnia and headaches. A certain number of women at the climacteric have an increase of blood pressure, but many authors attribute this condition to cardiovascular or renal disease, which is especially prevalent in this age group. At times, various psychoses may develop in unstable persons. The libido may undergo no change, although usually it is diminished. Hirsutism is occasionally found, and obesity frequently results.

The first step in the treatment of a patient with symptoms resulting from castration or the menopause is to direct attention to her general health. She should be encouraged to take plenty of exercise, preferably outdoors, and sufficient restful sleep. Hot baths or cold showers may be employed to advantage. A full life with vital interests, diversions and recreation should be encouraged. A suitable vacation or change of climate is often of great benefit. A correct diet is essential, and in the presence of obesity it should be controlled. Of importance is the patient's mental attitude, and the number and the intensity of the nervous and psychic manifestations of the climacteric may be greatly influenced by a helpful talk with a sympathetic physician. Women with intense psychic manifestations may require psy-

chiatric supervision. In many cases mild sedatives, such as bromides or phenobarbital, are of distinct value in controlling nervousness, insomnia and vasomotor symptoms.

The specific measures employed in the treatment of symptoms of the climacteric aim at a direct control of endocrine changes, and the most important is the administration of estrogenic substances. They have been instrumental in bringing relief to a high percentage of patients with vasomotor and nervous symptoms. Many authors advocate the continued employment of small doses, such as from 50 to 200 international units orally two or three times a day, increasing gradually until relief is obtained.¹ In cases of severe symptoms it is better to give short concentrated courses of estrogens by intramuscular injection. For instance, from 5,000 to 50,000 international units in oil may be given every three or four days for periods varying from two to five weeks. By this means relief is readily obtained, but it may be necessary to repeat such courses of treatment at intervals of a few months.

Estrogenic substance performs another valuable service in the treatment of symptoms resulting from atrophy of the accessory genital organs, especially "senile vaginitis." In such cases, the substance is used in the form of vaginal suppositories containing 2,000 international units which can be inserted each evening by the patient herself.

Recently a number of authors have demonstrated that administration of the androgen testosterone is also effective in controlling postcastration and postmenopausal symptoms. This method has as yet been insufficiently studied, and two objections are apparent: First, the available preparations are very expensive and, second, overdosage may lead to undesirable masculinizing effects, such as facial hirsutism, enlargement of the clitoris and a change of the voice.

PREMENSTRUAL TENSION

During the premenstruum many women experience nervousness, irritability, tendency to cry, malaise, cold sensations, nausea or abdominal distention. In some instances these symptoms are markedly accentuated and cause patients to seek relief. Although psychic factors often are in the background, many authors believe that the symptoms result from an endocrine disturbance. Frank gave to this state the appropriate name of "premenstrual tension," and the term is now generally used in medical literature. Although no conclusive evidence in support of this concept had been advanced, he attributed the condition to an excess of estrogen in the blood and advocated the employment of magnesium sulfate in order to eliminate the hormone as speedily as possible.

The wide variety of therapeutic agents advocated for this distressing condition is a warning against premature explanation of its causation. If excess of estrogen is the cause, the administration of estrogenic substances should intensify the symptoms. This is often the case, but at times such a method of treatment brings relief. Some investigators administer progesterone, others testosterone, by intramuscular injection. Of especial interest is the suggestion made recently that premenstrual tension results from the generalized edema which is so often an accompaniment of this stage of the menstrual cycle. In order to offset this effect, it has been suggested that patients be placed on

1. Some authorities favor giving a preliminary course of intramuscular injections. When relief is obtained, the estrogen is administered orally, and the daily dose is diminished until a "maintenance level" is determined.

a salt-free diet and take 0.6 Gm. of ammonium chloride three times daily for two weeks before an expected period.

INTRINSIC DYSMENORRHEA

Pelvic pain occurring just before or at the time of menstruation in the absence of gross lesions has been termed intrinsic, primary, idiopathic, essential or functional dysmenorrhea. It is frequently complained of, but the exact incidence is not known, owing to the difficulty of interpreting the subjective symptom "pain" in different persons. There are many conflicting reports on the subject.

Intrinsic dysmenorrhea is essentially a disease of the third decade, but it may persist throughout menstrual life. It may have its inception at the menarche or after a few years of painless menstrual periods. The most common type of pain is sharp, cramping and intermittent, and is referred to the midline in the lower part of the abdomen, extending at times to the back or thighs. It is often accompanied by headache, backache, general pain, nervousness, irritability, nausea, vomiting, joint pains or gastrointestinal disorders. The time at which the pain begins varies considerably. It may start a few hours before the onset and continue during menstruation, or it may be present in the premenstruum and cease when the menses appear. In still other instances the patient suffers only during the flow. The duration is from a few hours to several days.

This subject is treated in this chapter in order to complete the general discussions included in the book "Glandular Physiology and Therapy," but this must not be interpreted as an admission that intrinsic dysmenorrhea has been proved to be ovarian dysfunction. The immediate factor producing dysmenorrhea is held to be a disordered or spasmodic contractility of the uterine musculature, but the basic cause is unknown, although many theories have been advanced. For instance, it has been suggested that intrinsic dysmenorrhea is the result of a congenital obstruction of the cervical canal, of purely psychogenic factors, of hypoplasia of the uterus, of overactivity of the abdominopelvic sympathetic nerve, of painful separation of a decidua cast or of constriction of the uterine arteries. There is likewise no lack of speculation regarding the role of the endocrine glands. It has been said that dysmenorrhea is caused by a deficiency of estrogens, an excess of estrogens, a lack of progesterone, an excess of progesterone, thyrotoxicosis, hypoglycemia and calcium deficiency.

In keeping with the vast array of theories advanced for the cause of dysmenorrhea are the countless therapeutic measures which have been recommended. It is impossible to record them all in this brief review, but mention may be made of some specific endocrine measures at present under investigation. In each instance favorable results have been reported, but the whole problem must be regarded as still in an experimental stage.

1. Estrogenic hormones are used in the belief that they may serve to overcome uterine hypoplasia and degenerative changes in the cervical ganglions and to produce dilatation of the endometrial blood vessels. Several methods of administration have been described. These substances have been given by mouth in daily doses of 100 to 500 units during the whole menstrual cycle. Some authors give intramuscular injections of 10,000 to 50,000 international units during the premenstruum. Still other investigators recommend the injection of 5,000 to 15,000 international units every three to four days over a period of three months, but

such high dosages may disturb the cycle, lengthening it from one to three weeks.

2. The trial of progesterone is warranted because it has an inhibitory effect on the contractility of the uterine muscle. The minimal effective dose has not been ascertained, but $\frac{1}{4}$ to one or even more international units may be given intramuscularly two or three times a day, beginning a few days before an expected menstrual period. The advent of an orally effective progestin-like substance, pregnenolone, also presents possibilities, but no reports of well controlled studies are available.

3. Of especial interest have been the recent reports on the employment of testosterone propionate. This substance is given by intramuscular injection in doses of 10 or 25 mg. twice or three times a week over a period of one to two months. One wise recommendation limits the total dosage to 200 mg. given during one menstrual cycle and 150 mg. during the second.

4. The employment of chorionic gonadotropin was in vogue for a short time, but it is probably of no value beyond psychotherapeutic effects.

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

OFFICE OF THE SECRETARY.

ADRENAL CORTEX EXTRACT

The cortex of the adrenal gland is essential for life. Adrenalectomized animals die in a few days. During the acute stages of adrenal insufficiency, occurring in disease or as the result of experimental procedures in animals, conditions commonly observed include blood concentration, low blood pressure, gastrointestinal disturbances, asthenia, subnormal temperature and low basal metabolic rate. There also may be found loss of sodium and retention of potassium in most species, loss of carbohydrate reserves with hypoglycemia and retention of nitrogenous products in the blood. Injections of suitable extracts of adrenal cortex which contain little or no epinephrine restore even moribund animals to apparently vigorous health for as long as the injections are continued.

Extracts of the adrenal cortex contain several potent substances which influence to a variable degree electrolyte, water or carbohydrate metabolism; however, no one of these substances and no synthetic substance has yet been shown to possess all of the effects of a potent cortical extract.

Crystalline compounds have been isolated from the cortex which are capable of maintaining the life of adrenalectomized animals and restoring toward normal the metabolic conditions induced by adrenal insufficiency. These compounds are steroids, and the most potent of them are corticosterone and dihydrocorticosterone. Many other steroids have been isolated from this tissue, but most of these have little known physiologic activity.

The chemical structure of the cortical steroids is closely related to that of the sex hormones; in fact, some of the cortical steroids have estrogenic or androgenic properties and, in certain abnormal conditions of the cortex, large amounts of estrogens or androgens may be recovered in the urine. On the other hand, the sex hormone progesterone has life maintaining properties in adrenal insufficiency, while other sex hormones such as estrone and testosterone are capable of inducing electrolyte changes similar to those produced by cortical steroids.

Adrenal cortex extracts have been assayed in many ways. There are advantages to each of the various methods, but it appears that the maintenance of life in the adrenalectomized animal is the most significant measure of activity for such extracts. For purposes of N. N. R. description, the Council has recognized the assay method devised by Pfiffner, Swingle and Vars (*J. Biol. Chem.* 104:701, 1934) or the slight modification used by Cartland and Kuizenga (*Am. J. Physiol.* 117:678,

1936). By these methods the activity of adrenal cortex preparations is expressed in terms of dog units for uniformity of labeled potency. An alternate assay method using adrenalectomized rats according to the procedure of Cartland and Kuizenga (*Am. J. Physiol.* 117:678, 1936) may also be employed and the results transposed in terms of dog units, provided sufficient data are presented that such a comparison of assays is justified. No preparation of adrenal cortex extract will be accepted for inclusion in New and Nonofficial Remedies that does not have a minimum of 40 Gm. of gland concentrated in 1 cc. of extract.

Desoxycorticosterone, one of the components of adrenal cortex but which is prepared synthetically, is capable of maintaining life in adrenalectomized animals. Desoxycorticosterone differs from extracts of the adrenal cortex in being relatively inactive by mouth and in being chiefly concerned with salt and water metabolism. The adrenal cortex has other activities such as a role in the regulation of carbohydrate, fat and protein metabolism. Therapy with desoxycorticosterone is promising but, as yet, only on an experimental basis. The status of this therapy, including the possibility of harmful reactions and contraindications, is discussed in a Council report (*J. A. M. A.* 114:2549, 1940).

ADRENAL CORTEX EXTRACT (UPJOHN).—An extract of adrenal glands, from domesticated animals used as food in man, containing the cortical steroids essential for the maintenance of life in adrenalectomized animals. Only traces of epinephrine are present.

Actions and Uses.—Although the extract is active by mouth, this method of administration for therapeutic purposes is not practical; the usual methods of administration are subcutaneous, intramuscular or intravenous injection. The extract is of value in the treatment of Addison's disease or of adrenal insufficiency of other types, and in surgical procedures involving the adrenal cortex when prophylactic measures are needed to prevent the development of temporary adrenal insufficiency. There is as yet no conclusive proof of the value of the extract in the so-called borderline cases of adrenal insufficiency.

Dosage.—The amount required for therapeutic purposes varies widely according to the degree of cortical insufficiency, the condition of the patient, the presence of infection or other complications, and during a crisis. The clinical response of the patient should govern the dosage. As much as 2,500 to 5,000 dog units within a few hours may be required for a patient in a severe crisis, while from 100 to 500 dog units daily may be sufficient substitution in many cases of Addison's disease. Large amounts of sodium chloride or other sodium salts, as well as a diet which is low in potassium, are of definite value in supplementing adrenal cortex extracts.

Manufactured by The Upjohn Company, Kalamazoo, Mich. U. S. patent 2,053,549 (Sept. 8, 1936; expires 1953); and 2,096,342 (Oct. 19, 1937; expires 1954). No. U. S. trademark.

Sterile Solution Adrenal Cortex Extract, 10 cc. vials: Each cubic centimeter contains not more than 3 mg. of gland extractives and has a potency equivalent to 50 dog units when assayed by the Cartland and Kuizenga method. The vehicle is physiologic solution of sodium chloride containing alcohol 10 per cent as a preservative.

Adrenal cortex extract (Upjohn) is prepared by the method of Cartland and Kuizenga (*J. Biol. Chem.* 116:57, 1936). Frozen beef adrenal glands are extracted with chilled acetone and the gland residue removed by filtration. The acetone extract is concentrated in vacuo below 45 C. and the aqueous fraction so obtained is freed of inactive lipid substances by filtration and extraction with petroleum ether. The aqueous fraction is extracted with ethylene dichloride, which removes the adrenal cortex activity, leaving the epinephrine behind in the aqueous phase. Ethylene dichloride is removed in vacuo, and the residue is dissolved in alcohol and partitioned between 70 per cent alcohol and petroleum ether. The 70 per cent alcohol solution is concentrated in vacuo below 45 C., and sodium chloride is added to the aqueous residue to make 0.9 per cent. An inactive precipitate is removed by filtration. Alcohol is added to make 10 per cent, and the solution is sterilized by Berkefeld filtration.

Adrenal cortex extract (Upjohn) is assayed biologically according to the Cartland and Kuizenga method (*Am. J. Physiol.* 117:678, 1936). Each cubic centimeter is obtained from not less than 40 Gm. of gland and contains not less than 50 dog units (2.5 rat units) when assayed according to the method of Cartland and Kuizenga. This assay method depends on the maintenance of life in adrenalectomized dogs. The epinephrine content of the extract as determined by the U. S. P. dog blood pressure method is less than 1:200,000.

ANTIPNEUMOCOCCIC SERUM, TYPE I (See New and Nonofficial Remedies, 1940, p. 429).

Mulford Biological Laboratories, Sharp & Dohme, Inc., Philadelphia.

Antipneumococcic Serum Type I, Refined and Concentrated-Mulford.—(See New and Nonofficial Remedies, 1940, p. 430—formerly Pneumococcus Antibody Globulin Type I-Mulford). It is marketed in packages of one ampule-vial containing 20,000 units and packages of one ampule-vial containing 50,000 units accompanied by a vial containing a 1:10 dilution of serum for the sensitivity test.

Council on Foods and Nutrition

ACCEPTED FOODS

THE FOLLOWING ADDITIONAL FOODS HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON FOODS OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO ACCEPTED FOODS.

FRANKLIN C. BING, Secretary.

FRUIT JUICES INCLUDING TOMATO JUICE (See Accepted Foods, p. 48).

Frank Farnsworth Fruit Farm, Waterville, Ohio.

FARNSWORTH BRAND APPLE JUICE UNSWEETENED.

Analysis (submitted by manufacturer).—Moisture 88.6%, total solids 11.4%, ash 0.2%, protein ($N \times 6.25$) 0.1%, invert sugar 8.8%, sucrose 2.2%, carbohydrates other than crude fiber (by difference) 11.1%, specific gravity 1.052, titratable acidity expressed as malic acid 0.54%, malic acid content 0.39%. Tests of lead and arsenic show that the product complies with Council requirements for freedom from toxic spray residues.

The firm reports (1940) that the product contains from 0.11 to 0.43 mg. of ascorbic acid per hundred grams of juice.

Calories.—0.44 per gram; 12 per ounce.

GRAIN PRODUCTS (See Accepted Foods, p. 95).

Pillsbury Flour Mills Company, Minneapolis.

PILLSBURY'S FARINA WITH ADDED VITAMIN B₁, heat treated farina enriched with thiamine hydrochloride in such an amount that the product provides 900 international units of vitamin B₁ per pound.

Analysis (submitted by manufacturer).—Moisture from 9 to 12%, total solids from 91 to 88%, ash 0.4%, protein ($N \times 5.7$) from 10.2 to 10.6%, fat (ether extract) from 0.5 to 0.8%, reducing sugars as dextrose¹ from 0.2 to 0.3%, sucrose from 0.9 to 1.3%, total carbohydrate other than crude fiber (by difference) from 78.6 to 77.6%, crude fiber from 0.3 to 0.5%.

The firm reports (1940) that the product contains approximately 1.97 international units of vitamin B per gram, 56 per ounce, 900 per pound.

Calories.—from 3.52 to 3.64 per gram; from 100 to 103 per ounce.

PREPARATIONS USED IN THE FEEDING OF INFANTS (See Accepted Foods, p. 156).

H. J. Heinz Company, Pittsburgh.

HEINZ BRAND CHICKEN FARINA VEGETABLE PORRIDGE WITH MILK, WHEAT GERM AND YEAST, a canned cooked mixture of milk, chicken, farina, wheat germ, dried brewers' yeast, celery, carrots, onions, sodium chloride and parsley.

Analysis (submitted by manufacturer).—Moisture 87.6%, total solids 12.4%, ash 1.3%, fat (ether extract) 0.6%, protein ($N \times 6.25$) 2.9%, crude fiber 0.5%, total carbohydrates other than crude fiber (by difference) 7.1%, sucrose (Munson and Walker Method) 1.0%, calcium (Ca) 0.043%, phosphorus (P) 0.072%, iron (Fe) 0.0023%, copper (Cu) 0.00036%.

According to report of biologic assay (1939) this product contains 125 international units of vitamin A, 38 international units of vitamin B₁ and 42 Sherman-Bourquin units of riboflavin per hundred grams. Report of chemical titration (1939) shows the product contains 34 international units of vitamin C per hundred grams.

Calories.—0.45 per gram; 13 per ounce.

SUGARS AND SYRUPS (See Accepted Foods, p. 324).

A. E. Staley Manufacturing Company, Decatur, Ill.

STALEY'S SWEETOSE BRAND CRYSTAL SYRUP, containing sweetose (a brand of corn syrup) and granulated sugar syrup slightly flavored with vanilla extract.

Sweetose is a registered trade name for a corn syrup prepared according to United States Patent No. 2,201,609, May 21, 1940. In its production a mixture of cornstarch and water is subjected to acid hydrolysis until the dextrose content is about 40 per cent. The mixture then is neutralized, clarified and subjected to the further action of saccharifying enzymes from fungus until the syrup has a reducing sugar content calculated as dextrose of about 62 per cent. At this point the syrup is heated to 170 F. and maintained at this temperature for a sufficient time to inactivate the mold enzymes. The syrup is further refined by repeated filtrations through bone charcoal and concentrated under vacuum to the desired consistency.

The syrup obtained by this dual conversion process contains 64.5 per cent reducing sugar calculated as dextrose and 34.2 per cent dextrins. Ordinary corn syrup contains about 42 per cent reducing sugars calculated as dextrose, and 65.5 per cent dextrins. Because of its composition Sweetose is sweeter than ordinary corn syrup and has a lower viscosity.¹ Its characteristics make it useful as a sweetening ingredient in frozen dairy products.² It is a satisfactory carbohydrate supplement in the feeding of infants.³

Analysis (submitted by manufacturer).—Moisture 25.5%, total solids 74.5%, ash (residue remaining at 500-550 C.) 0.3%, reducing sugars as dextrose 45.0%, sucrose 5.5%, dextrins 23.0%, total carbohydrates 74.2%.

Calories.—3.0 per gram; 85 per ounce.

1. Determined according to the method of Schoorl, N., and Bogen-Regen, A.: *Massanalytische Zuckerbestimmung*, Ztschr. f. anal. Chem. 56: 191, 1917.

2. Improved Sweetening Agent Developed from Corn Syrup, *Food Industries* 12: 62 (Jan.) 1940.

3. Tracy, P. H., and Edman, G.: Tests of Enzyme-Converted Corn Syrup Reveal Desirable Properties, *Food Industries* 12: 43 (Dec.) 1940.

Unpublished data supplied by Dr. Irving J. Wolman, Children's Hospital, Philadelphia.

SATURDAY, MARCH 1, 1941

PARENTERALLY ADMINISTERED NITROGEN

Although the intravenous administration of nutrient dextrose is a method regularly employed in the clinic, this procedure furnishes no other nutritional elements except water. The requirement for electrolyte may be also readily fulfilled by the use of saline solution, and some efforts have been made to meet the nutritional and metabolic needs for fat by the intravenous administration of fine emulsions of fat.¹ The problem of protein requirement is more difficult; moreover, the importance of protein in the diet frequently becomes accentuated in instances in which oral intake of this foodstuff becomes difficult or impossible. Several approaches are available for parenteral administration of protein and some of these have yielded encouraging results. It has been possible² to maintain nitrogen equilibrium by the intravenous administration of plasma. However, the quantity of plasma required daily in order to meet the minimum protein requirements is relatively large. Furthermore, unhydrolyzed proteins, in the form of plasma, although perhaps making immediately available material for the replenishment of the plasma proteins, may not be directly utilizable for other body proteins. These must be synthesized in a specific manner from amino acids, for the problem of meeting the protein requirements of the entire organism is essentially one of supplying an adequate mixture of amino acids in sufficient quantity.

The demonstration that nitrogen metabolism requirements may be met not only by protein but by administration of a mixture of amino acids has greatly facilitated the possibility of meeting the nitrogen needs of the body. The recent investigations of Rose and his colleagues,³ using mixtures of pure amino acids, have shown that by supplying only nine pure amino acids

in the diet of the young rat the requirements for normal growth and nutrition can be met. Similar observations have been made with respect to the maintenance of nitrogen balance in dogs. Recently, Mitchell and his collaborators⁴ have studied the problem of the amino acid requirements for maintenance of nitrogen equilibrium and have shown that the adult rat can be maintained in nitrogen equilibrium on a nitrogen supply containing only seven amino acids. These data immediately suggest a simple procedure for meeting the patient's needs for nitrogen when the parenteral route is indicated. However, the high cost of the individual amino acids makes impractical the intravenous administration of mixtures of these compounds.

An economical approach to the problem of providing amino acids involves the hydrolysis of a relatively pure, cheap and complete protein to its constituent amino acids, removal of the hydrolytic reagents to render the mixture nontoxic, and utilization of the mixture for intravenous injection. Thus, Elman and Weiner⁵ employed an amino acid mixture prepared by the acid hydrolysis of casein. Two amino acids, tryptophan, which is destroyed by acid hydrolysis, and cystine, which is low in casein, were added to the hydrolysate mixture, which was then made up as a 10 per cent solution, passed through a sterile Seitz filter and poured directly into 5 or 10 per cent dextrose solution as ordinarily prepared for routine use. Each liter contained about 20 Gm. of amino acids and 80 Gm. of dextrose. This volume of the solution could be given slowly over two hours, with none of the amino acids appearing in the urine and without objective reactions. Subjectively, some patients reported a sense of warmth; there was evident a slight peripheral vasodilatation. Of some twenty patients given amino acids intravenously, eight received large amounts of amino acids for more than one or two days. Chemical and clinical observations indicated rapid utilization of the injected amino acids, and nitrogen balance was achieved in some instances immediately after the first injection. Regeneration of serum protein with concomitant reduction of the nutritional edema were also evident in some cases.

The observations of Elman and Weiner have been confirmed and expanded by other investigators. Shohl and his collaborators,⁶ working with normal infants, succeeded in establishing positive nitrogen balance by either oral or intravenous administration of hydrolyzed casein prepared by enzymatic digestion. Although native casein was shown to be absent by negative sensitization tests with guinea pigs, febrile reactions were noted in most instances. However, Farr and MacFayden⁷ have reported the clinical use of an enzymatic digest of casein with no untoward reactions and with

good utilization of the administered nitrogen in four children with nephrosis. The analytic data indicate that the nitrogen supplied by the amino acid mixture was utilized for nutritional purposes. More recently, Altshuler, Hensel and Sahyun⁸ have reported the establishment of nitrogen equilibrium in both normal and postoperative patients following the subcutaneous or intravenous injection of a mixture containing all the essential amino acids in the form of a hydrolysate of casein supplemented with tryptophan and cystine.

The chief problem at present appears to be the development of a reproducible method for the preparation of the amino acid mixtures. Enzymatic digestion of a protein like casein, which contains a representative mixture of amino acids, suffers from the difficulty of reproducibility and from the possibility of unpleasant clinical reactions due to larger molecules of the peptone type. Acid hydrolysis of the protein, the simplest of the hydrolytic procedures, destroys the amino acid tryptophan and some cystine. The high cost of the former amino acid is again a problem, since efficient utilization of the parenterally administered amino acid mixture appears possible only in the presence of tryptophan and the other essential amino acids. The problem of a convenient and economical method of preparing a protein hydrolysate suitable for injection does not, however, appear to be insurmountable. Its solution should open the way to further important applications of the methods which have given favorable results in clinical studies of the utilization of parenterally administered nitrogen.

ENCEPHALOMYELITIS IN MICE

The close resemblance between human poliomyelitis and spontaneous encephalomyelitis in mice enhances the value of recent contributions to the epidemiology of this veterinary disease. Seven years ago Theiler¹ found an occasional young mouse with flaccid paralysis of the hind legs among the stock mice purchased by his laboratory. Stock mice similarly affected have subsequently been described by numerous European and Asiatic investigators,² an average of about one purchased mouse in 3,000 exhibiting this disease. Five strains of the specific neurotropic virus responsible for this paralysis have been isolated by Theiler and propagated by brain to brain inoculation.

In mice injected intracerebrally with this isolated virus the first sign of the infection is almost invariably a weakness of one of the fore limbs, which usually develops after an incubation period varying from seven to thirty days. This weakness is progressive, rapidly changing to a flaccid paralysis and almost invariably

ending in paralysis of both hind legs. In a few of the animals the disease may be arrested at this stage. In a slightly larger percentage, severe paralysis with emaciation of the hind legs may persist for many months. In most mice, however, the paralysis ends fatally. A fairly large percentage of the younger mice may even die before showing distinct paralytic symptoms.

Mice which survive the experimental infection are almost invariably carriers of the virus, the infectious agent being recoverable from the spinal cord for at least one year after the date of inoculation. Paralyzed mice are immune to a second intracerebral injection, as are also a number of mice which have not shown signs of paralysis after the first intracerebral injection. Intranasal instillation of massive doses is the only other way of transferring the disease.

The anatomic basis of the paralysis is an acute necrosis of the ganglion cells of the anterior horn of the spinal cord. Ultrafiltration experiments show that the virus is approximately 13 to 19 millimicrons in diameter, about the same size as human poliomyelitis virus. Attempted cross immunizations, however, suggest that there is no antigenic similarity between the two infectious agents.

Interest in encephalomyelitis of mice was heightened by the more recent discovery by Olitsky³ that an infectious agent indistinguishable from Theiler's neurotrophic virus can be isolated from the intestinal contents of normal mice. Almost every one of the normal stock mice from 1 to 2 months of age was found to be a carrier of an intestinal virus which on intracerebral inoculation into normal mice induced the characteristic paralytic symptoms. Theiler and Gard⁴ afterward found that at least two thirds of their normal stock mice approximately 6 months of age passed the neurotrophic virus in the feces. In normal mice which pass this virus the infectious agent has been repeatedly demonstrated in the intestinal walls but has never been found in the central nervous system, thoracic viscera or other abdominal organs, with the sole exception of its occasional presence in the mesenteric lymph glands.

Mice are apparently free from this intestinal virus at birth and presumably acquire the infection shortly after weaning. The intestinal infection may persist for at least six months, at which time it usually ends spontaneously. As a result of this carrier condition the mice may develop a partial immunity. If so, immunity with age might cease to be synonymous with sexual maturity. For some unknown reason this apparently nonpathogenic intestinal virus invades the central nervous system in about one mouse in 3,000, producing paralytic symptoms. Poliomyelitis in mice, therefore, is a rare and accidental event, presumably due to some unknown gastrointestinal disturbance or deficiency in

specific antibody production. There is, of course, no evidence at the present time that these results are applicable to human poliomyelitis.

Current Comment

DANGEROUS DRUGS

The Federal Food, Drug and Cosmetic Act prohibits, among other matters, the introduction or delivery for introduction into interstate or foreign commerce or commerce within the District of Columbia or the territories, or the manufacture within the District of Columbia or one of the territories, of a drug that is misbranded. Section 502 (j) provides that a drug shall be deemed to be misbranded if it is dangerous to health when used in the dosage or with the frequency or duration prescribed, recommended or suggested in its labeling. The Food and Drug Administration has informally declared that there are a number of drugs which are in fact dangerous if consumed other than on expert advice and under constant supervision. There are other drugs, however, which may safely be distributed to the public for consumption in small doses under labels bearing adequate directions for use and adequate warnings against misuse but which become dangerous drugs for self medication when administered in larger doses. With the understanding that it is not possible to list all of the preparations which fall under either of these two categories, the Food and Drug Administration has from time to time informally announced, as a guide to the drug industry and to pharmacists, that the drugs listed in the following statement are dangerous to health and should not be distributed over the counter for indiscriminate lay use but should be sold only on the prescription of a physician, dentist or veterinarian:

1. Drugs containing significant amounts of such ingredients as:

Aconite.
Aminopyrine.
Aspidium (male fern).
Benzedrine sulfate (for internal administration).
Cantharides (for internal use).
Carbon tetrachloride.
Chenopodium oil.
Chrysarobin.
Chrysophanic acid.
Cinchophen and its derivatives, including neocinchophen.
Colchicine.
Colchicum.
Digitalis (in therapeutically effective proportion).
Dinitrophenol.
Emetine.
Goa powder.
Phosphorus or phosphides.
Radium.
Santonin.
Squill (in therapeutically effective proportion).
Strophanthus or other pharmacologically related drugs (in therapeutically effective proportion).
Sulfanilamide.
Sulfapyridine.
Sulfathiazole.
Tetrachlorethylene.
Thiocyanates.
Thymol.
Thyroid.

2. Drugs in certain dosages or concentration:

Bromides if dosage provided involves the consumption of more than 30 grains a day or more than 15 grains during any three hour period.
Acetanilid if dosage provided involves the consumption of more than 5 grains daily or more than 2½ grains during any three hour period.

Bromide-acetanilid combinations if dosage provided involves the consumption of more than a total daily dose of 15 grains of a bromide and 5 grains of acetanilid, or more than 7½ grains of a bromide and 2½ grains of acetanilid during any three hour period.
Acetophenetidin if the daily dosage provided exceeds 15 grains.
Antipyrine if the daily dosage provided exceeds 15 grains.
Epinephrine in a solution of 1 per cent or stronger.
Ipecac if the daily dosage provided exceeds 10 grains.
Strychnine if the daily dosage provided exceeds ½ grain.
Ointments containing more than 0.2 per cent of mercury bichloride or more than 5 per cent of ammoniated mercury.

The Food and Drug Administration has also issued an informal warning to the drug industry and to pharmacists that drugs labeled "Caution: To be used only by or on the prescription of a physician [or a dentist or a veterinarian]" should not be sold otherwise than on prescription.

VITAMIN K AND THE DAMAGED LIVER

The response of patients with hypoprothrombinemia to the administration of the antihemorrhagic vitamin K is commonly incomplete. Brinkhous and Warner¹ studied the effect of vitamin K on animals with experimental liver injury. It will be recalled that an experimental prothrombin deficiency may be produced by injury to the liver or by partial or complete extirpation of that organ as well as by withholding vitamin K from the diet or preventing the absorption of this factor. The effectiveness of vitamin K in raising the prothrombin level of the blood and, consequently, correcting the tendency to hemorrhage in cases in which an existing hypoprothrombinemia is due to a deficiency of vitamin K is well appreciated. In contrast, Brinkhous and Warner have now demonstrated that, when the low level of blood prothrombin is due to injury to the liver, the administration of vitamin K may be wholly ineffective. These investigators used dogs in which liver damage had been produced by chronic chloroform intoxication. In such dogs the administration of vitamin K fails to modify in any way either the fall in prothrombin with chloroform administration or the rise in prothrombin during the recovery period. Somewhat comparable to this observation is that of Andrus, Lord and Moore,² who have reported that the administration of vitamin K does not alter the typical decrease in the plasma prothrombin level that is observed in hepatectomized dogs. Prothrombin deficiency observed in the clinic may often be due to a combination of two factors, liver damage and a deficiency of vitamin K. In these cases the response to the administration of vitamin K may be incomplete; for, as pointed out by Brinkhous and Warner, it may correct the latter condition but an excess of vitamin cannot be expected to compensate for the element of liver injury. Lord, Andrus and Moore³ give accounts of clinical cases that did not respond satisfactorily to vitamin K therapy. In one case a post-mortem examination revealed massive hepatic necrosis and in another the liver was cirrhotic and much reduced in size. There seems to be little doubt that the condition of the liver is important in determining the response of the prothrombin level to vitamin K.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

CONFERENCE ON PROBLEMS OF MEDICAL PREPAREDNESS

Meeting of the Committee on Medical Preparedness,
American Medical Association Building,
Chicago, February 15

Dr. JAMES E. PAULLIN, Atlanta, Ga., Presiding

The following, among other visitors were in attendance:

Dr. Arthur W. Booth, Elmira, N. Y.
Dr. Charles A. Dukes, Oakland, Calif.
Dr. Morris Fishhein, Editor, THE JOURNAL, Chicago.
Dr. Roy W. Fouts, Omaha.
Dr. Stanley H. Osborn, Hartford, Conn.
Dr. John O'Shea, Spokane, Wash.
Dr. Walter G. Phippen, Salem, Mass.
Dr. Fred W. Rankin, Lexington, Ky.
Dr. Harvey B. Stone, Baltimore.
Dr. Sam E. Thompson, Kerrville, Texas.
Dr. Nathan B. Van Etten, New York.
Dr. Olin West, Secretary and General Manager, American Medical Association, Chicago.
Capt. Dallas G. Sutton, Naval Medical Center, Washington, D. C.
Dr. Warren F. Draper, U. S. Public Health Service, Washington, D. C.
Dr. J. A. Crahtree, U. S. Public Health Service, Washington, D. C.
Dr. C. Sidney Burwell, Chairman, Medical Education Committee, Boston.
Lieut.-Col. G. C. Dunham, U. S. Army, Washington, D. C.
Dr. Willard C. Rappleye, New York.
Dr. Harold S. Diehl, Minneapolis.
Dr. John H. Musser, New Orleans.
Lieut.-Col. W. C. Munly, U. S. Army, Washington, D. C.
Dr. E. H. Cushing, National Research Council, Washington, D. C.
Dr. Reginald Fitz, Boston.
Dr. H. G. Weiskotten, Syracuse, N. Y.
Dr. Emmet B. Bay, Chicago.
Dr. Walter Bierring, Des Moines, Iowa.
Dr. John W. Spies, dean, Texas University School of Medicine, Galveston.
Dr. Ray Lyman Wilbur, Council on Medical Education and Hospitals, Stanford University, Calif.
Lieut.-Col. Charles G. Hutter, Chicago.
Dr. Norman M. Scott, Trenton, N. J.
Dr. F. H. Arestad, American Medical Association, Chicago.
Dr. A. R. Bowles, Council on Medical Education and Hospitals, Chicago.
Dr. William D. Cutter, Council on Medical Education and Hospitals, Chicago.
Mr. Harvey T. Sethman, Denver.
Dr. R. G. Leland, American Medical Association, Chicago.
Dr. Charles G. Heyd, New York.

Chairman Paulin introduced members of the Committee on Medical Preparedness, representatives of the Army, the Navy and the United States Public Health Service, members of the Subcommittee on Education of the Health and Medical Committee, and members of the Council on Medical Education and Hospitals of the American Medical Association.

Dr. Olin West presented a confidential communication from the British Medical Association, which was given consideration.

Dr. E. H. Cushing said that it had been arranged in England that all official requests for medical supplies and personnel are to be routed through one Red Cross to another Red Cross. The American Red Cross is using the National Research Council in an advisory capacity.

PLANS FOR PROCUREMENT OF PERSONNEL

Dr. Olin West submitted the communication from the Adjutant General's Office, War Department, covering the assistance of the American Medical Association in the classification and procurement of physicians for military service (see Medical Preparedness, THE JOURNAL, February 22, p. 709).

It was brought out that physicians are not now commissioned above the grade of lieutenant, except for those in the organized units who are to be called into service only in case of war. At present no doctor is commissioned in the Medical Reserve Corps over the age of 35.

The conference discussed the problem of securing for physicians commissions of a rank commensurate with the positions they occupy and the services they render. Consideration was given also to the utilization of the services of physicians whose physical condition may be such as to make them unable to qualify under the regulations but who yet may be capable of giving excellent service as physicians.

Dr. Sam Thompson presented a plan for the procurement of medical personnel, which was referred to the Surgeon General's Office for consideration.

SUPPLY AND DEFERMENT OF MEDICAL STUDENTS

Dr. Olin West presented a communication from Mr. Clarence Dykstra, director of Selective Service. Dr. Sidney Burwell reported the recommendations made by the Subcommittee of the Committee on Health and Medical Education. After extended discussion a special committee was appointed to draw up a communication for transmission to the Selective Service Board (see editorial THE JOURNAL, February 22, p. 706).

Dr. Weiskotten said he did not believe there is a medical school in the country which should increase the size of its student body or that would be in a position to maintain what we consider adequate standards if they should materially increase the size of the student body.

AVAILABLE MEDICAL PERSONNEL

It was brought out that at present there are 13,861 medical reserve officers. Of this number 3,556 were on active duty as of February 14. There are approximately 8,000 vacancies in the Medical Reserve Corps to meet the demands of our present procurement objective of 20,000. On the basis of 6.5 medical officers per thousand men, 9,100 medical officers will be needed yearly for the present training program, which will continue for a five year period. With the rapid expansion of the Air Corps, more than 9,100 may be needed. Of the 9,100 there are 1,230 in the medical corps of the regular army and 1,100 in the National Guard, so that 7,000 to 8,000 medical reserve officers will be needed yearly for five years. It is estimated that of the 5,200 graduates yearly not more than 3,000 will be available for the armed forces, with deferments due to dependence, physical disqualifications and other factors.

Authority has been given for the formation of sixty general hospitals, thirty evacuation hospitals and twenty-three surgical hospitals or sponsored units. Thus far forty-seven general hospitals, eighteen evacuation hospitals and seven surgical hospitals have been organized.

It was brought out that there are on duty in the Navy 886 medical officers, 28 acting assistant surgeons, to which 34 have recently been added, 71 medical officers retired who have been recalled to active duty and 350 medical officers of the Naval Reserve on active duty, making a total of 1,335. All figures are based on a maximum of 500,000 personnel, of which some 400,000 are already on active duty. In the Naval Reserve there are at present 1,763 medical officers, or a shortage of 1,134. There are 300 applications pending.

MISCELLANEOUS

Consideration was given also to the problem of physicians with foreign licenses, selective service boards and difficulties of men already in service.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY

WAR DEPARTMENT

The following additional medical reserve corps officers have been ordered to extended active duty by the War Department, Washington, D. C.:

BANICK, V. William, Captain, Scranton, Pa.
BARKER, Carl DeVaux, 1st Lieut., Paris, Texas.
BIRDSONG, William F., Captain, Texon, Texas.
BROWNTON, Sheldon Seymour, Captain, Clayton, Mo.
CASPERS, Carl Gerald, 1st Lieut., Minneapolis.
DEWIRE, Merrill Brown, Major, Reading, Pa.
DIAMOND, Oscar Kantor, 1st Lieut., Mount Vernon, N. Y.
FLYNN, Vincent Patrick, Captain, Pasadena, Calif.
FRIEDMAN, Eliot Marvin, 1st Lieut., New York.
GARVIN, Paul Drews, 1st Lieut., Boulder, Colo.
GILPIN, Burhl Bobbitt, Jr., 1st Lieut., Medford, Ore.
HERMANN, Robert C., 1st Lieut., Yoakum, Texas.
HILL, Thurman Knight, 1st Lieut., Nashville, Tenn.
JACOBSON, Seymour Shulman, 1st Lieut., Brooklyn.
KALIL, Charles, 1st Lieut., Spartanburg, S. C.
McGLONE, Frank Bartlett, 1st Lieut., Denver.
OSBORNE, Charles Dunlap, Lieut. Col., Sedalia, Mo.
PARNALL, Christopher, Jr., Captain, Rochester, N. Y.
RANDALL, Charles C., 1st Lieut., Iowa City.

ROGERS, Benjamin C., 1st Lieut., Nashville, Tenn.
ROHNER, Ralph George, 1st Lieut., Mitchell, Ind.
ROSENFELD, Julius L., 1st Lieut., New York.
ROSENFELD, Robert Thorman, 1st Lieut., Chicago.
RUSSIN, Lester Allen, 1st Lieut., Iowa City.
TANZ, Stanley Stuart, 1st Lieut., New Rochelle, N. Y.
THORNTON, John Thurston, Jr., 1st Lieut., Wbceling, W. Va.
VAN KINSBERGEN, Maurice, Captain, Washington, D. C.
VOSS, Bernard Jerome, 1st Lieut., Columbia, Utah.
WILSON, Joseph Crawford, 1st Lieut., Hollandale, Miss.

Order Revoked

McCAULEY, Lewis Ross, 1st Lieut., Punxsutawney, Pa.

CORRECTION

Lieutenants Byars.—In THE JOURNAL, Nov. 30, 1940, page 1892, the name Blars, Perry J. C., 1st Lieut., Lampasas, Texas, should have been spelled Byars, and the next name in the list should have been Byars, Stevens, 1st Lieut., Spring Creek, Texas.

FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area. The First Corps Area comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut.

ARCIERO, Michael, Lieut., Providence, R. I., Fort Benning, Ga.
BARNES, Louis D., Major, Lanesboro, Mass., Carlisle Barracks, Pa.
BRADY, Charles E., Lieut., Barret, Vt., Camp Lee, Va.
BRISLIN, William W., Lieut., Alstead, N. H., Camp Lee, Va.
CROSS, Merrill M., Lieut., Clinton, Mass., Army Medical Center, Washington, D. C.
CUTLER, Joseph G., Lieut., Salem, Mass., Camp Lee, Va.
DAMIANI, Clito R., Lieut., Newtonville, Mass., Camp Edwards, Mass.
EBBETT, George H., Lieut., Houlton, Maine, Fort Benning, Ga.
EDSON, Ralph H., Lieut., Shelton, Conn., Fort Benning, Ga.
FLYNN, Timothy P., Lieut., Lancaster, N. H., Fort Benning, Ga.
HUNTRESS, William W., Lieut., Fall River, Mass., Army Medical Center, Washington, D. C.
LA POINTE, Roland E., Lieut., Manchester, N. H., Fort Williams, Maine.
LARSON, Carroll B., Lieut., Brookline, Mass., Fort Benning, Ga.

LO VETERE, Angelo A., Captain, Kensington, Conn., Camp Lee, Va.
MURPHY, Theodore P., Lieut., Montpelier, Vt., Camp Lee, Va.
QUIGLEY, Thomas J., Lieut., Boston, Camp Edwards, Mass.
SULLIVAN, Arthur B., Lieut., West Hartford, Conn., Camp Edwards, Mass.
WARD, John V., Captain, Portland, Maine, Camp Lee, Va.
ZONDERMAN, Bernard, Lieut., Revere, Mass., Fort Banks, Mass.

Orders Revoked

The following medical reserve officers have had their orders revoked:

BEEAKER, Vincent H., Lieut., Lewiston, Maine.
CALCAGNI, Oscar H., Lieut., Morrisville, Vt.
CARROLL, Francis B., Lieut., Great Barrington, Mass.
CRISCUOLO, Joseph A., Lieut., New Haven, Conn.
FULLER, Richard C., Lieut., Saxtons River, Vt.
GORMAN, Richard J., Lieut., Winchendon, Mass.
HADLER, Arthur J., Lieut., Boston.
LARSON, Carroll B., Lieut., Brookline, Mass.
LUCKNER, Wendelin G., Lieut., Stafford Springs, Conn.
NEWTON, AARON W., Lieut., Greenfield, Mass.
WHELAN, Edmund L., Lieut., East Boston, Mass.

THIRD CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Third Corps Area. The Third Corps Area comprises the states of Pennsylvania, Virginia, District of Columbia and Maryland.

BAKER, Harold Frederick, Lieut. Col., Muncy, Pa., Army Medical Center, Washington, D. C.
BAUERSFELD, Emil Herbert, 1st Lieut., Washington, D. C., Fort Belvoir, Va.
BENZ, George Henry, 1st Lieut., Pittsburgh, Fort Eustis, Va.
BLANK, Philip, 1st Lieut., Pittsburgh, Fort Eustis, Va.
BRANDT, Charles Richard, Captain, Mechanicsburg, Pa., Medical Field Service School, Carlisle Barracks, Pa.
BUTLER, Henry Lee, 1st Lieut., Baltimore, Indiantown Gap, Pa.
CAMPBELL, Edgar Thrall, 1st Lieut., Hagerstown, Md., Fort Eustis, Va.
CHAPMAN, William Holmes, Jr., Captain, Suffolk, Va., Fort Eustis, Va.
CLOSE, Henry Fletcher, 1st Lieut., Germantown, Pa., Indiantown Gap, Pa.
COHEN, Hilliard, 1st Lieut., Baltimore, Fort Monroe, Va.
CURD, Howard Harman, 1st Lieut., University, Va., Fort George G. Meade, Md.
DAWE, George Griffith, Captain, Millintown, Pa., Fort Belvoir, Va.
DILCHER, Robert Horn, 1st Lieut., Allentown, Pa., Indiantown Gap, Pa.
DOLLMAN, Clarence Mazarin, Lieut. Col., Washington, D. C., Fitzsimons General Hospital, Denver.
DOUGLAS, Harry Samuel, 1st Lieut., Washington, D. C., Camp Lee, Va.
EGBERT, Ernest Wayne, 1st Lieut., Chester, Pa., Fort George G. Meade, Md.
FAW, Wylie Melvin, Jr., 1st Lieut., Cambridge, Md., Fort Story, Va.
GILARDI, Robert John, 1st Lieut., Pittsburgh, Camp Shelby, Miss.
GOLDBERG, Harold Ernest, 1st Lieut., Philadelphia, Fort McClellan, Ala.
GRANA, Philip Charles, 1st Lieut., Harrisburg, Pa., Indiantown Gap, Pa.
GRAY, Raymond John, Captain, Pittsburgh, Fort Eustis, Va.
HARNISH, Robert Livingstone, 1st Lieut., Denver, Pa., Fort Belvoir, Va.
HARRIS, Harold Byron, 1st Lieut., Bellefonte, Pa., Fort Eustis, Va.

HECKER, Arthur Orr, Captain, Harrisburg, Pa., Indiantown Gap, Pa.
HERR, Paul Sylvester, Captain, Harrisburg, Harrisburg, Pa.
HINDMAN, Thomas Audley Newcomer, 1st Lieut., Burgettstown, Pa., Fort Monroe, Va.
HOCH, Vincent Adolphus, 1st Lieut., Butler, Pa., Fort George G. Meade, Md.
ILYAS, Shakir Thomas, 1st Lieut., Rural Valley, Pa., Fort Eustis, Va.
IRVING, Richard Henson, 1st Lieut., Washington, D. C., Camp Devens, Mass.
JACKSON, Richard Lee, 1st Lieut., Arlington, Va., Fort Meade, Md.
JACOBSON, Robert Morris, 1st Lieut., Punxsutawney, Pa., Fort Belvoir, Va.
JEFFREY, Millard, 1st Lieut., Washington, D. C., Fort George G. Meade, Md.
KAPO, Peter Joseph, Major, Mahanoy City, Pa., Camp Lee, Va.
KILLIUS, William Joseph, 1st Lieut., Johnstown, Pa., Fort Monroe, Va.
KITCHEL, James Roderick, 1st Lieut., Philadelphia, Indiantown Gap, Pa.
KRAUSE, Edward Ab, Major, Washington, D. C., Fort Story, Va.
KREIGER, Alexander Allen, 1st Lieut., Pittsburgh, Indiantown Gap, Pa.
LECHAUSSE, Ralph Maurice, 1st Lieut., Pardee, Va., Fort Eustis, Va.
LIVINGOOD, Clarence Svineheart, 1st Lieut., Philadelphia, Indiantown Gap, Pa.
LUPO, Deonis Matteo, 1st Lieut., Baltimore, Fort Eustis, Va.
MAGNESS, Stephen Lee, 1st Lieut., Catonsville, Md., Fort George G. Meade, Md.
MAHER, Regis Martin, 1st Lieut., Uniontown, Pa., Camp Lee, Va.
MARLEY, Ralph, 1st Lieut., New Castle, Pa., Indiantown Gap, Pa.
MARTIN, George Vincent, Jr., Captain, Washington, D. C., Indiantown Gap, Pa.
McELROY, Walton Dixon, 1st Lieut., McKeesport, Pa., Fort George G. Meade, Md.
MILLER, Kenneth Frederick, Major, West View, Pa., Washington, D. C.
MOYER, Donald Groesch, Major, Wyomissing, Pa., Fort Monroe, Va.
MUSSO, Charles Marion, Jr., 1st Lieut., Washington, D. C., Fort George G. Meade, Md.
OLAH, George William, 1st Lieut., Pittsburgh, Camp Lee, Va.
PEPPER, Dickinson Sergeant, 1st Lieut., Bala-Cynwyd, Pa., Indiantown Gap, Pa.
PHILLIPS, Joseph Thomas, Jr., 1st Lieut., Norfolk, Va., Fort Eustis, Va.

RABOLD, Bernard Louis, 1st Lieut., Baltimore, Fort Eustis, Va.
REHER, Charles August, Jr., Captain, Clinton, Pa., Fort Monroe, Va.
REIZMAN, Ivy Albert, Major, Washington, D. C., Fort Belvoir, Va.
RIESTER, Herman William, 1st Lieut., Erie, Pa., Indiantown Gap, Pa.
ROSENBLOOM, Meyer Abraham, 1st Lieut., Pittsburgh, Fort Monroe, Va.
ROSENFELD, David Herman, 1st Lieut., Richmond, Va., Camp Lee, Va.
SAYLOR, Clyde Llewellyn, 1st Lieut., Meyersdale, Pa., Camp Lee, Va.
SCHAEFER, William Carl, 1st Lieut., Pittsburgh, Camp Lee, Va.
SHAULIS, Frederick Steinrod, 1st Lieut., Indiana, Pa., Fort Eustis, Va.
SCHWAB, Carl Leopold, 1st Lieut., Harrisburg, Pa., Indiantown Gap, Pa.
SCHWARTZMAN, Joel Jay, 1st Lieut., Philadelphia, Camp Lee, Va.
SCOTT, James Vickers, 1st Lieut., Pittsburgh, Fort Belvoir, Va.
SHOVLIN, John Patrick, 1st Lieut., Waymart, Pa., Fort Meade, Md.
SIMPSON, Robert Chester, Captain, Ridgway, Pa., Edgewood Arsenal, Md.
SLOANE, Milton Bennet, 1st Lieut., Pittsburgh, Fort Bragg, N. C.

FOURTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Fourth Corps Area. The Fourth Corps Area comprises the states of Tennessee, North Carolina, South Carolina, Alabama, Georgia, Mississippi, Florida and Louisiana.

BREWER, Frederic W., 1st Lieut., Port Sulphur, La., Camp Lee, Va.
BROWN, Ralph E., 1st Lieut., Barnwell, S. C., Fort McPherson, Ga.
CHRISTIAN, Robert H., 1st Lieut., Baldwin, Miss., Fort Benning, Ga.
COHEN, Emanuel, 1st Lieut., Pace, Miss., Camp Lee, Va.
COLEMAN, James A., Major, Jena, La., Camp Blanding, Fla.
FOGEL, Julius M., 1st Lieut., Fort Benning, Ga., Fort Benning, Ga.
FOX, Edward F., 1st Lieut., Miami, Fla., Camp Forrest, Tenn.
GREEN, Edgar V., 1st Lieut., Youngsville, N. C., Fort Bragg, N. C.
JEANES, Robert P., 1st Lieut., Easley, S. C., Camp Forrest, Tenn.
KING, James M., 1st Lieut., Tullahoma, Tenn., Camp Grant, Ill.

FIFTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Fifth Corps Area. The Fifth Corps Area comprises the states of Ohio, West Virginia, Indiana and Kentucky.

BAKER, Philip H., 1st Lieut., Columbus, Ohio, Fort Knox, Ky.
BRADSHAW, Wilber V., Captain, Stanford, Ky., Fort Knox, Ky.
DANCHIK, Sol A., 1st Lieut., Columbus, Ohio, Fort Knox, Ky.
DREY, James C., 1st Lieut., Louisville, Ky., Fort Knox, Ky.

SEVENTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Seventh Corps Area, which comprises the states of North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Kansas, Missouri, Arkansas and Wyoming.

MOTHERSHEAD, John Lee, 1st Lieut., St. Louis, Jefferson Barracks, Mo.

Orders Revoked

HURLINGAME, David Albert, 1st Lieut., Minneapolis, William Beaumont General Hospital, El Paso, Texas.
DE YOUNG, George Marion, 1st Lieut., George, Iowa, Camp Murray, Wash.
GRIMES, Henry Burton, Major, Madelia, Minn., Fort Ord, Presidio of Monterey, Calif.

EIGHTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Eighth Corps Area, which comprises the states of Colorado, Arizona, New Mexico, Oklahoma and Texas.

AISENSTADT, E. Albert, Lieut. Col., Picher, Okla., Station Hospital, Fort Sill, Okla.
BRADLEY, Frank L., 1st Lieut., Tahleah, Okla., Station Hospital, Fort Sam Houston, Texas.
BRIDGES, James Payne, 1st Lieut., New York, Station Hospital, Fort Sam Houston, Texas.
COOKERLY, Van, Lieut. Col., Dallas, Texas, Station Hospital, Fort Sill, Okla.
DORNAK, Franklin K., Captain, Houston, Texas, 82d Field Artillery, Fort Bliss, Texas.
HODGES, Tom Wiley, 1st Lieut., Boston, Station Hospital, Fort Sam Houston, Texas.
HYDE, Theodore L., Captain, Wichita Falls, Texas, Fort Bliss, Texas.
JERNSTAD, Robert J., 1st Lieut., Fort Worth, Texas, Station Hospital, Fort Sam Houston, Texas.
MOSSBERGER, Joseph I., 1st Lieut., Denver, Station Hospital, Camp Wallace, Texas.

STUTZMAN, Clyde Malverne, Jr., 1st Lieut., South Williamsport, Pa., Camp Lee, Va.
THOMPSON, John Edward, 1st Lieut., Youngsville, Pa., Fort George G. Meade, Md.
VERMILYA, Walter Emerson, 1st Lieut., Clifton Forge, Va., Camp Lee, Va.
VERNOCY, William Charles, 1st Lieut., Coraopolis, Pa., Camp Lee, Va.
WAGNER, Ira Garfield, Captain, Lancaster, Pa., Fort George G. Meade, Md.
WAGNER, Philip Sigmund, 1st Lieut., Baltimore, Fort Belvoir, Va.
WALMER, Charles Richard, 1st Lieut., Wilkinsburg, Pa., Camp Lee, Va.
WATKINS, Evan Lloyd, 1st Lieut., Philadelphia, Camp Shelby, Miss.
WATTS, Thomas Duvall, Captain, Richmond, Va., Fort Meade, Md.
WEAVER, Thomas David Littler, 1st Lieut., Bellevue, Pa., Fort Eustis, Va.

MAYER, Orlando B., Captain, Columbia, S. C., Camp Forrest, Tenn.
MOORHEAD, Robert J., 1st Lieut., Yazoo City, Miss., Camp Lee, Va.
MOULEDOUS, Shelly J., 1st Lieut., Abbeville, La., Camp Lee, Va.
PREJEAN, James L., 1st Lieut., Sunset, La., Camp Lee, Va.
SAPP, James W., 1st Lieut., Havana, Fla., Fort Benning, Ga.
SCOTT, William S., 1st Lieut., Jonesville, S. C., Camp Grant, Ill.
STECHEER, Joseph L., 1st Lieut., Orlando, Fla., Camp Grant, Ill.
WARD, Francis O., 1st Lieut., Macon, Ga., Camp Wheeler, Ga.
WILSON, James S., 1st Lieut., Kenansville, N. C., Fort Bragg, N. C.

Orders Revoked

BRANDON, Robert W., Jr., 1st Lieut., Martin, Tenn.
DUCKWALL, Fred M., 1st Lieut., Kingsport, Tenn.
JORDAN, Henry C., Captain, Robertsdale, Ala.
MILLING, Chapman J., 1st Lieut., Columbia, S. C.
SNELLING, William R., 1st Lieut., Fernandina, Fla.
SYKES, Charlie L., 1st Lieut., Pilot Mountain, N. C.
WHITMAN, Oscar F., 1st Lieut., Statesboro, Ga.

FRYE, Carl M., Captain, Newark, Ohio, Fort Knox, Ky.
MILLER, Alfred O., 1st Lieut., Louisville, Ky., Fort Knox, Ky.
PERRY, Claude S., Major, Columbus, Ohio.
PETRO, George J., 1st Lieut., Louisville, Ky., Fort Knox, Ky.
PHARR, Percy F., 1st Lieut., Charleston, W. Va., Fort Knox, Ky.
PILLERSDORF, Louis, 1st Lieut., Cleveland.
PIRKEY, Everett L., 1st Lieut., Louisville, Ky., Fort Knox, Ky.
ROHRER, James R., Captain, Fort Knox, Ky.
SMITH, Earl E., Captain, Cleveland, Fort Knox, Ky.
SONNE, Irvin H., Major, Louisville, Ky.
WILLETT, Irving, Major, Fort Wayne, Ind.

HAMILTON, Benjamin Charles, Major, Jefferson, Iowa, Camp Murray, Wash.
HAYMOND, Harold Everest, Captain, Perry, Iowa, Fort Meade, S. D.
ROBERTS, John Richard, 1st Lieut., Brentwood, Mo., William Beaumont General Hospital, El Paso, Texas.
ROSENFELD, Abraham Benjamin, Captain, Hibbing, Minn., Army and Navy General Hospital, Hot Springs, Ark.
SAGI, Joseph Herman, 1st Lieut., Minneapolis, Fort Lewis, Wash.

CORRECTION

Lieutenant Hudgel.—First Lieut. Lawrence Eugene Hudgel, of North Platte, Neb., whose name was listed among the orders revoked in THE JOURNAL, February 15, page 600, writes that he had received two different orders and that it was only one of these which was revoked. Lieutenant Hudgel is still in active service and at present is serving at the Medical Replacement Center, Camp Grant, Ill.

OXMAN, Albert C., 1st Lieut., Denver, Station Hospital, Fort Sam Houston, Texas.
PROSSER, Moorman P., 1st Lieut., Norman, Okla., Station Hospital, Fort Sill, Okla.
ROBERTS, Aaron L., Lieut. Col., Fort Worth, Texas, Station Hospital, Fort Sill, Okla.
SECRETST, Pettus G., Jr., 1st Lieut., Boston, Station Hospital, Camp Bowie, Brownwood, Texas.
STRADER, Simon E., Lieut. Col., Oklahoma City, Station Hospital, Fort Sam Houston, Texas.
WADE, David Chapel, 1st Lieut., Galveston, Texas, Station Hospital, Fort Sam Houston, Texas.
WEISS, Joseph H., 1st Lieut., Denver, Station Hospital, Fort Sam Houston, Texas.
WHEELER, Norman O., 1st Lieut., Globe, Ariz., Station Hospital, Camp Barkley, Abilene, Texas.

Orders Revoked

HANNA, William Ray, 1st Lieut., Ladonia, Texas.
HESTAND, Haskell E., 1st Lieut., Odessa, Texas.
McMILLAN, George S., 1st Lieut., Hurley, N. M.
TRIPPET, Horace H., 1st Lieut., Waco, Texas.
WOODS, Haddon Benjamin, Captain, Refugee, Texas.

NINTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Ninth Corps Area, which comprises the states of Washington, Montana, Oregon, Nevada, Utah, California and Idaho.

BELL, Ralph M., 1st Lieut., Santa Maria, Calif., Antiaircraft Firing Center, Riverside, Calif.
BERKE, Samuel D., 1st Lieut., Indio, Calif., Camp Roberts, Nacimient, Calif.
CASH, George C., 1st Lieut., Burns, Ore., Fort Lewis, Wash.
FIELDS, Irving A., 1st Lieut., Los Angeles, Camp San Luis Obispo, Calif.

GEEN, Robert S., Captain, Hollister, Calif., Camp Roberts, Nacimient, Calif.
GLICKMAN, Milton, 1st Lieut., Los Angeles, Camp Haan, Riverside, Calif.
HENNING, Berthel H., Major, San Francisco, Camp Haan, Riverside, Calif.
LARRABEE, James F., 1st Lieut., Santa Clara, Calif., Nacimient, Calif.
MAYTUM, Harry R., 1st Lieut., Merced, Calif., Fort McDowell, Calif.
MORRIS, George W., 1st Lieut., San Diego, Calif., Fort Ord, Calif.
SOLL, Sidney N., 1st Lieut., Los Angeles, Camp Roberts, Nacimient, Calif.

Orders Revoked

HEATH, Richard S., 1st Lieut., Los Angeles.
LANDERS, Clyde H., 1st Lieut., Altadena, Calif.
NASH, Frank P., 1st Lieut., Townsend, Mont.

NAVAL RESERVE OFFICERS ON ACTIVE DUTY

The following medical officers of the U. S. Naval Reserve have reported for active duty since February 5:

ADAMS, Frank A., Lieut. (j. g.), M. C.-V. (G.), Bentleyville, Pa., Fleet Marine Force, San Diego, Calif.
ADAMS, Walter P., Lieut., M. C.-V. (S.), Norfolk, Va., Norfolk Naval Hospital, Portsmouth, Va.
ALLISON, Stanton T., Lieut. Comdr., M. C.-V. (S.), New York, Naval Hospital, Brooklyn.
ALVIS, Harry J., Lieut. (j. g.), M. C.-V. (G.), Chicago, Fleet Marine Force, San Diego, Calif.
BENNETT, Everett E., Lieut. (j. g.), M. C.-V. (G.), Los Angeles, Fleet Marine Force, San Diego, Calif.
BILLION, Thomas J., Jr., Lieut. (j. g.), M. C.-V. (G.), Sioux Falls, S. D., Fleet Marine Force, San Diego, Calif.
BRADFORD, Fred E., Lieut. (j. g.), M. C.-V. (G.), Loma Linda, Calif., Fleet Marine Force, San Diego, Calif.
CHESBRO, Wayne P., Lieut. (j. g.), M. C.-V. (G.), Gilroy, Calif., 2d Marine Brigade, Fleet Marine Force, San Diego, Calif.
GARREY, Walter E., Lieut., M. C.-V. (S.), Boston, Naval Hospital, Chelsea, Mass.
GILMAN, Philip K., Jr., Lieut. (j. g.), M. C.-V. (G.), Watsonville, Calif., 2d Marine Brigade, Fleet Marine Force, San Diego, Calif.
GLEYSTEN, Rodney R., Lieut. (j. g.), M. C.-V. (G.), Alton, Iowa, 2d Marine Brigade, Fleet Marine Force, San Diego, Calif.
GRATZ, Charles M., M. C.-V. (S.), New York, Naval Hospital, Brooklyn.

HAHNE, Leonard J., Lieut. (j. g.), M. C.-V. (G.), Savannah, Ga., Marine Recruiting Station, Savannah, Ga.
HANKINS, Franklyn D., Lieut. M. C.-V. (G.), Loveland, Colo., Fleet Marine Force, San Diego, Calif.
HYNES, Edward A., Lieut., M. C.-V. (S.), South Portland, Maine, Naval Hospital, Chelsea, Mass.
JWERTSEN, Frank J., Lieut. (j. g.), M. C.-V. (G.), Omaha, Fleet Marine Force, San Diego, Calif.
KAHN, Bernard I., Lieut. (j. g.), M. C.-V. (G.), Ardmore, Okla., Aviation Base Group, Fleet Marine Force, San Diego, Calif.
LANE, Charles W., Lieut. Comdr., M. C.-V. (G.), Coronado, Calif., Naval Air Station, San Diego, Calif.
LIDE, Charles M., Lieut. (j. g.), M. C.-V. (G.), Columbia, S. C., Naval Hospital, Parris Island, S. C.
PENDERGRASS, Clayton I., Lieut. (j. g.), M. C.-V. (G.), Clovis, Calif., Fleet Marine Force, San Diego, Calif.
PERSON, Edward C., Lieut. (j. g.), M. C.-V. (G.), Wauneta, Neb., Fleet Marine Force, San Diego, Calif.
POPPEN, Mayo, Jr., Lieut. (j. g.), M. C.-V. (G.), Burr Oak, Kan., Fleet Marine Force, San Diego, Calif.
POWELL, Archie C., Lieut. (j. g.), M. C.-V. (G.), Omaha, Fleet Marine Force, San Diego, Calif.
SERRANO, Ernest E., Lieut. (j. g.), M. C.-V. (G.), Tampa, Fla., Marine Barracks, Quantico, Va.
SIMON, Julius, Lieut. (j. g.), M. C.-V. (G.), Los Angeles, Fleet Marine Force, San Diego, Calif.
STEIN, Ephraim, Lieut. (j. g.), M. C.-V. (G.), Brooklyn, Marine Barracks, Quantico, Va.
WOOD, Dennistoun, Jr., Lieut. (j. g.), M. C.-V. (G.), Palo Alto, Calif., Fleet Marine Force, San Diego, Calif.

NURSES APPOINTED FOR OVERSEAS SERVICE

Thirty-two nurses were named, January 25, by the American Red Cross to form the first contingent of a staff of 65 which will serve with the Harvard University hospital unit now being established in England by Dr. John E. Gordon, professor of preventive medicine and epidemiology at Harvard Medical School, Boston. Miss Mary Beard, national director of the Red Cross nursing service, who made the appointments, said that applications would be received from other nurses under 35 years of age who have graduate certificates and have had experience or training in the care of patients with communicable diseases.

WOMEN'S MEDICAL ASSOCIATION SENDS FUNDS TO ENGLAND

The American Women's Hospitals, which is the medical service committee of the American Medical Women's Association, has for the past eight months sent \$1,000 a month to England for use wherever it is most needed, the New York Times reported January 26. An extra \$1,000 was sent during the holidays through special Christmas donations. Distribution of the funds is handled by the Medical Women's Federation of Great Britain under the direction of Dame Janet Campbell, honorary secretary of the federation. Dr. Esther Clayson Pohl Lovejoy, New York, is director of the medical services and is assisted by the following committee: Drs. Helen I. Walbridge, Harriet F. Coffin and Inez A. Bentley, New York; Mabel M. Akin, Portland, Ore.; Louise Tayler Jones, McLean, Va.; Catherine Macfarlane, Philadelphia; Luvia M. Willard, Jamaica, N. Y.; Elizabeth Mason Hohl, Los Angeles, and Mathilda K. Wallin, Elmsford, N. Y. The committee is continuing its service in Greece, which has been functioning since

1917. Dr. Ruth A. Parmelee, Athens, in charge of the work there, has recently been made the only woman member of the administrative board of the Greek War Relief Committee.

GRADUATES OF FOREIGN MEDICAL SCHOOLS ELIGIBLE FOR COMMISSION IN MEDICAL DEPARTMENT RESERVE

The Adjutant General of the U. S. Army, Major General E. S. Adams, has issued regulations concerning the appointment of graduates of foreign medical schools in the medical department reserve. Graduates of foreign medical schools are considered eligible for appointment in the Medical Corps Reserve provided they meet the following requirements:

(a) Are citizens of the United States and can present satisfactory evidence of premedical education equivalent to the requirements of the Association of American Medical Colleges and the Council on Medical Education of the American Medical Association.

(b) Have completed a medical course of at least four academic years.

(c) Have a license to practice medicine in the country in which their medical school is located.

(d) Have completed not less than one year's internship in a hospital acceptable to the Council on Medical Education and the Committee on Hospitals of the American Medical Association.

(e) Are eligible to take the examination given by the National Board of Medical Examiners.

(f) Have a license to practice medicine in the United States.

All applications for such commissions must be referred to the Surgeon General of the Army for approval.

WEDNESDAY, FEBRUARY 12

TESTIMONY OF WILLIAM FREDERICK PENNIMAN (Resumed)
CROSS EXAMINATION—(RESUMED)

By Mr. Leahy:

Q.—Mr. Penniman, I think yesterday afternoon we had just about finished relative to the conversation that you had with Dr. Neill in his office on that Saturday afternoon. Do you recall?

A.—Yes.

Q.—What was that young lady's name again, Mr. Penniman?

A.—Mary Frances Stuart.

Q.—Was she a member of G. H. A.?

A.—She isn't a member in the sense—she was connected with the G. H. A. as laboratory—in charge of the laboratory.

Q.—You knew, did you not, that the District Medical Society had a provision in the constitution with reference to the approval of contracts which any member of the Association had entered into with any group or industrial organization or what not?

A.—I have been so informed, yes.

Q.—You knew the terms of that, did you not, fairly well?

A.—Well, it had been presented to me I think by the chairman of that C. C. & I. M. Committee.

Q.—Was that Dr. Hooe?

A.—That's right.

Q.—And of course you knew somewhat about the District Medical Society, didn't you?

A.—Oh, yes.

Q.—Had you ever read its constitution and by-laws?

A.—No. I never did.

Q.—The only provision which you knew then in the by-laws was this one with reference to contracts needing approval?

A.—Yes. We had gotten it from various sources of course that these doctors could not be approved by the District Medical Society until they had approved Group Health Association.

Q.—Well, did you not think it was a question of approving the contract under which the doctors were to render services, that required approval?

A.—Well, I think we learned that subsequently, that they wanted to know if there was a definite contract that existed between the doctors and the Group Health Association.

Q.—Well, you knew it was that contract which the doctor who was a member of the Association was to render service under, that was the contract which required approval?

A.—That's right.

Q.—Did you ever submit that contract for approval to the District Medical Society?

A.—I didn't, but I think both Drs. Lee and Scandiffio did.

Q.—When?

A.—At the hearing.

Q.—Was there ever a written contract signed between Dr. Scandiffio and the Association, I mean, the Group Health, or Dr. Lee and the Group Health?

A.—I think there was a contract, sir, that was drawn up, and I think they signed it.

Q.—Are you sure of that?

A.—No, I am not sure. I know it was drawn up all right, and I know it was presented to the District Medical Society that night.

Q.—What night was that?

A.—It was either the first hearing or the second hearing.

Q.—Now, before you had entered into negotiations with Dr. Scandiffio and Dr. Lee, had you submitted the proposed contract to the District Medical Society for approval?

A.—Well, now, I would like to get that clear. I made no contract with either Dr. Lee or Dr. Scandiffio. That was something we left entirely to the Medical Director. He was the one who made the negotiations between these two.

Q.—But the Medical Director had no authority to employ doctors without the approval of the Board of Trustees, did he?

A.—He had authority to investigate their qualifications, and then present the terms to the Board.

Q.—And it was then the Board which employed the doctor, and not the Director?

A.—No. I think he presented the question of the salary that was to be paid to them and the Board, of course, had to consider that within its budget.

Q.—Let me ask you this, Mr. Penniman, did the Medical Director of Group Health Association have authority to employ a doctor without the approval of the Board of Trustees?

A.—He had the authority to employ them as to their qualifications but not as to the salary.

Q.—In other words, no doctor could work for G. H. A. until the Board of Trustees authorized that employment?

A.—The salary, yes.

Q.—Now, what the Medical Director did was make an investigation of the qualifications. Isn't that true?

A.—That's right.

Q.—Is that because you felt that a lay board could not investigate the professional qualifications of a doctor?

A.—I would think that is true, yes. They left that to the Medical Director.

Q.—Isn't that exactly what you and Dr. Neill were discussing that day when Dr. Neill said to you you could take the Supreme Court, all the courts, and the members of Congress, but they couldn't judge a doctor?

A.—I think so.

Q.—Meaning that lay people could not determine the qualifications of a doctor?

A.—That's right. There are a lot of new people coming to Washington that don't know the qualifications of a doctor here. How can they select a doctor, then?

Q.—Doctor, did you know that the Executive Committee of the District Medical Society was in doubt as to how to act in this matter of doctors working for the G. H. A.?

A.—That they were in doubt?

Q.—Yes.

A.—Oh, I think we had ample evidence of that, Mr. Leahy. You see, we had been working on this since January, and we had ample evidence that they were not cooperative.

Q.—What do you mean when you say not cooperative? Will you kindly restrain your answer to the question?

A.—The question you asked me was whether they were doubtful as to the operation.

Q.—No. What their conduct should be with reference to members of the Association whom you were seeking to employ.

A.—Well, I don't know as I could answer that just the way you want me to answer it.

Q.—I want the fact.

A.—I think the first doubt of doctors came to us from Dr. Glen R. Jones, as far back as March. We knew pretty well.

Q.—Let me refresh your recollection.

Mr. Lewin:—Let him finish his answer.

Mr. Leahy:—I think he has finished his answer.

By Mr. Leahy:

Q.—You have read over all those notes of that meeting that were there taken down? (indicating).

A.—I think so, sir.

Q.—Do you recall Dr. Macatee's talk to you at that meeting?

A.—Is this the hearing in the board room?

Q.—Yes. You have read that over, haven't you?

A.—No, I have not. I heard it that night. I meant the hearing at the District Medical Society.

Q.—You presided at the meeting, didn't you?

A.—I did, sir.

Q.—And in opening the meeting you had this to say, didn't you, that your committee was invited to appear before a group of the members of the Medical Society that they might learn more about the aims and objectives of this effort of yours in Group Hospitalization?

A.—Yes.

Q.—Then you said:

"We met with the committee that was selected and a good many questions were asked and a good many answers were given." You said that, didn't you?

A.—Yes.

Q.—

"We hope we gave the answer they wanted. We endeavored to do so. We had nothing to withhold. We put all the cards on the table and endeavored to answer every question that was asked us in which we felt they would receive any benefit."

Did you make that statement?

A.—I think so. That is the transcript of the meeting?

Q.—Yes. Did you put all the cards on the table?

A.—I think we did.

Q.—Put the contract on the table, too, did you, that we discussed yesterday?

A.—Which contract, with the Federal Home Loan Bank Board?

Q.—Yes.

A.—No, we didn't do that.

Q.—You had nothing to withhold but you withheld that contract, didn't you?

THE COURT:—He said he did.

By Mr. Leahy:

Q.—All right. Now, did Dr. Macatee say this, that he should like at the outset to express appreciation of the attendance of Mr. Penniman and the gentlemen of your organization at the Medical Society some time ago; and did he further express his appreciation at the full meeting of your Board of Trustees down there that evening?

A.—Does it say so in that? (indicating).

Q.—Yes.

A.—Yes. I think that is correct.

Q.—Now, on this question about the lack of cooperation which you just mentioned in your previous answer, did Dr. Macatee say this to the entire Board that night, your board meeting:

"I think I may say for the Medical Society that we are in sympathy with the proposition of spreading the costs of illness for individuals over a large group so that the disasters that come to family budgets may be avoided by that group protection. We feel that if some method could be devised by which there could be accomplished economically, and I use the word 'economically' in the sense of not only doing it within the means of people of moderate income but also from the view of keeping the project solvent, that if some such method could be worked out, it would have tremendous social value."

Did he say that?

A.—I think he did.

Q.—Is that right?

A.—I think so. I don't remember his words, but if it is in the transcript, I think that transcript is correct.

Q.—But you don't remember Dr. Macatee saying that the District Medical Society was in sympathy with its aims or objects which you presented as the aim and object of G. H. A.?

A.—I couldn't recall just exactly what he said, Mr. Leahy. He gave a very interesting talk for some thirty minutes. I couldn't remember the details, but I think the transcript there is correctly taken, and if it is in that, I think he said that.

Q.—Just a moment. Didn't you know, then, as early as June when you met the Medical Society's Board, that the Medical Society and you, as to the objectives which you both were seeking, were in harmony and in sympathy?

A.—Well, the objective was there, yes. The method wasn't entirely there.

Q.—Now, what was said, according to your recollection, which was developed at either one or two, or both of those meetings, which the Medical Society of the District of Columbia objected to, according to those who spoke for its Executive Committee, as to the method which you were pursuing?

A.—As I recall, the main objection that had been registered was the fact that these doctors were working on a contract, those that were getting a salary for their services.

That is one of the main objections. I think the proposals, as near as I can recall, were that they were willing to go along with us on some basis whereby we could have membership in an organization and let the doctors take care of the patients.

By Mr. Lewin:

Q.—Let what doctors?

A.—The local doctors, members of the Medical Society; and not have any salaried doctors on the staff at all.

By Mr. Leahy:

Q.—Now, was it the fact the doctors were working on a contract, on a salary, or was it the fact that the District Medical Society wanted to know what sort of a contract you wanted their members to work under?

A.—No, I think it was because they were working under a contract which they had a great deal of contention about, the doctors getting a salary.

Q.—Do you remember Mr. Macatee then saying this, after you opened this meeting in July:

"Now, Mr. Penniman's remarks, however, leave us somewhat in an embarrassing situation, for the reason that we are not yet in a position to know how we may cooperate helpfully to the organization."

Do you remember when he said that?

A.—I think he did.

Q.—Was he referring then to the fact that you had not submitted to him or to the Medical Society or to the Executive Committee any of the information which Dr. McGovern had asked, as late as July 15th, in his letter?

A.—I can only assume that that is what he was referring to, because in our meeting with the District Medical Society we discussed it very openly, and as I mentioned in my opening remarks, we laid our cards on the table and we withheld nothing so far as information was concerned with what we were attempting to do.

We answered their questions and we gave them our ideas.

Q.—Isn't it a fact that you, yourself, stated that you did not put all the cards on the table and that you did not answer all of the questions but you answered the questions which you felt they would receive any benefit from?

A.—Well, I don't know. We answered their questions. I don't think at the meeting we denied an answer to any question propounded by the doctors that we had the answer for.

Q.—Now, didn't Dr. Macatee also explain to you the reasons why the Executive Committee of the District of Columbia found itself in an embarrassing situation, and didn't he tell you there that "those reasons are bound up in a number of considerations which are very clear and familiar to us as medical men, growing out of the difficulty of finding acceptable contracts by which medical men might lend themselves to plans of this sort without incurring certain infractions of the principles of medical ethics by which we are bound"? Do you remember that statement?

A.—I think so.

Q.—Then did Dr. Macatee discuss with you the articles of incorporation, which you told him were on record, and which he could find?

A.—Yes.

Q.—And did he have anything to say to you there as to what the District Medical Society would like to do to help and cooperate with you but couldn't in the doubt in which they were with reference to the status of your organization?

A.—He may have, sir. I don't recall it.

Q.—Don't you remember what he said on that point?

A.—No, I can't remember.

Q.—See if I can refresh your recollection, Mr. Penniman.

A.—Good.

Q.—

"The first thing that occurs to us is this: that yours is a corporation which is intended to provide for the service of physicians, and other medical attendants, of any and all kinds of medical, surgical and hospital treatment to the members."

Do you remember that opening up the discussion?

A.—Yes. Was he quoting from the charter?

Q.—He was just giving his review of what he said the charter was.

A.—Well, then, he did have a copy of the charter.

Q.—In looking over your articles of incorporation, you had already told him where he could get it?

A.—And he had it.

Q.—"I find among the objects and purposes for which this corporation is formed are the following." Now, didn't he say this:

"One of the things we are quite uncertain about and would like to have information about, if you have it, is that in many of the states of the Union, the courts have found that a corporation cannot practice medicine, for the reason that a corporation cannot be licensed to practice medicine, and for that reason, although we realize that in the District of Columbia, that question has not arisen hitherto, and there have been no judicial decisions on it, such question might arise and the Medical Society would therefore be very uncertain what it could advise its members to do with respect to cooperation with such an organization."

"So far as the District of Columbia, therefore, on that ground at any rate, your organization is, in the words of Secretary Perkins, 'Its legality has not yet been determined.'"

Do you remember that?

A.—Yes.

Q.—So that at that time that was one of the reasons which Dr. Macatee said to you that he would like additional information on, the assistance of your organization, on the question of whether you were legally existing at that time?

A.—That's right. And that brings back to my mind the reasons, and from Dr. Macatee's statement there, that the Board of Trustees felt that their request for the charter and for the contract and the by-laws was not based on the desire to be in cooperation with us, but it was to get information to test the legality of Group Health Association.

Q.—Well, the articles of incorporation were of record, weren't they?

A.—Yes.

Q.—Has he said anything yet about by-laws?

A.—No. But you talked about it yesterday. You had them.

Q.—You said he had them.

By Mr. Leahy:

Q.—Did you ever supply Dr. Macatee with any information at all to satisfy his uncertainty with reference to how he should advise the members of the District Medical Society?

A.—Well, aren't we going back to the same question?

Q.—Same question, on the question of legality.

A.—I have already answered that he wanted the contract and the by-laws.

Q.—I am not asking you about the contract and the by-laws.

A.—What are you asking me about?

Q.—I am asking you now in the information he asked you as late as July 26th, could you give him any information so the members of the Society would be able to advise its members what to do?

A.—Would you read again what he asked for?

Q.—

"One of the things that we are quite uncertain about and we should like to have information about, if you have it, is that in many of the States of the Union, the courts have found that a corporation cannot practice medicine for the reason that a corporation cannot be licensed to practice medicine and for that reason, although we realize that in the District of Columbia that question has not arisen hitherto and there have been no judicial decisions upon it, such question might arise and the Medical Society would therefore be very uncertain what it could advise its members to do with respect to cooperation with such an organization. So far as the District of Columbia, therefore, on that ground at any rate, your organization is, in the words of Secretary Perkins, 'Its legality has not yet been determined.'"

Now, did you, as president of Group Health Association, extend to the District Medical Society, any information upon that question?

A.—On the legality?

Q.—Yes.

A.—No. There wasn't any question in our minds about it.

Q.—Well, did you answer the question, or did you in any way attempt to assist Dr. Macatee, to convince him that what you thought about it was right?

A.—Oh, I think so. I think we went into a great deal of detail about the operation of Stanocola and the Civic Medical in Chicago and the Ross-Loos in Los Angeles. I think we went into all those details very clearly.

Q.—I am not asking you about Civic Medical and Ross-Loos and Stanocola, I am asking you about your own organization Group Health. Did you supply any information on that point which had caused uncertainty in the minds of those gentlemen?

A.—That point had not arisen with us at all. We had no doubt at that time about it.

Q.—Now, then, did he discuss with you further another reason why they were uncertain about the matter?

"Now, then, one of the other, or at least not one of the others, but the principal difficulty that we are facing at the present time also is the knowledge that certain members of the Medical Society have already been approached with a view to serving your organization in a medical capacity, a professional capacity. There is in the Constitution of the Medical Society of the District of Columbia a provision which is mandatory upon all of the members of the Medical Society that contracts to render medical service must be approved by the appropriate committee of the Medical Society, taking into consideration the objects of the contract, the terms of the contract, and whether those terms and objects are in accord with the principles of medical ethics."

Do you remember his asking you about that?

A.—I do.

Q.—Does he say at any time in that meeting, to your knowledge, that he ever knew the terms or objects of the contract under which members of the Medical Society had been approached with a view to rendering professional services to your organization?

A.—No. I think he said a contract would be necessary to be submitted.

Q.—Now, then, they discussed—we won't go into that because it would take too much time—they discussed principles of medical ethics which Dr. Macatee brought to your mind specifically, did he not?

A.—Yes.

Q.—And those principles which he said caused him doubt; among which were

"solicitation of patients, directly or indirectly; where there is underbidding to secure a contract; when the compensation is inadequate to assure good medical service; when there is interference with reasonable competition in the community; when free choice of a physician is prevented; when the conditions of employment make it impossible to render adequate service to the patient; when the contract, because of any of its provisions or practices, results are contrary to sound public policy."

Did you all discuss those matters that night?

A.—I think we did.

Q.—And you knew that night, then, that the contract which they were asking to see was one which they would want to know met the requirements which I have just put to you?

A.—Yes.

Q.—Now, did he further bring to your attention:

"The other thing that has occurred to us is that seventh item in the criteria for the ethical character of a contract with a corporation, and that has to do with whether it is consistent with sound public policy. We conceive ourselves to be responsible in a measure for the welfare of the citizens of the jurisdiction in which we practice and we wonder whether the plan which has been so carefully worked out for your organization, whether it will actually perform for the members who join it, just the function that you design for it. We know in our contacts a good deal about human nature; we know how people when they have trivial illnesses most any doctor who is licensed and who can be found on the corner will do, but we also know that when serious illness, when complicated and difficult cases arise, and those are the cases which strike heavily upon the budgets of families, that nothing but the best will do."

Do you remember a discussion on that?

A.—Very well.

Q.—And do you remember his asking you what would happen if an epidemic broke out and how you would take care of your members?

A.—Yes.

Q.—And what provision would be made?

A.—Yes.

Q.—And did he ask you whether there were funds or surplus funds available to take care of that situation?

A.—Yes. What we would do generally in an epidemic.

Q.—Call on other doctors in the Medical Society. Is that right?

A.—The answer is in there.

Q.—Yes.

A.—If we got in a predicament of that kind we would certainly again solicit the aid of the members of the District Medical Society to help us.

Q.—Do you remember whether any other doctors spoke there that night further?

A.—Yes, I think Dr. Groover spoke.

Q.—And did Dr. Macatee ask if some of you gentlemen wouldn't talk to him there and discuss the things which he had said?

A.—I don't remember that.

Q.—Do you remember his saying:

"I wonder if some of the members of the committee have some questions to ask or suggestions to make for the benefit of this Board of Trustees. Some of the things I have said may need elaboration."

A.—He was speaking of his own committee.

Q.—"Do you think of anything I have omitted," as he turned to Dr. Groover.

Do you remember Dr. Groover talked?

A.—Yes. I remember the substance of it.

Q.—Do you remember the discussion was with reference to the aims and purposes of the organization as you had described them?

A.—I cannot say that I remember that in detail. I remember Dr. Groover there saying that wherever clinics of this type had been organized in foreign countries, in Cuba, Germany, and elsewhere, that there had been a depreciation in medical service and things of that kind. There was quite a lecture on that.

Q.—Do you remember Dr. Groover saying this:

"In the first place, before I say anything, let me make it plain that I have no personal interest in what this group does for the very simple reason that I have practiced medicine now some 40 (30) years and my days of practice are nearing an end in five years or six years, so it doesn't make any difference to me personally what you do or what you don't do."

A.—Right.

"To some extent, that is true to some of my colleagues who are with me. I think when we boil the whole thing down we will find that the fundamental thing that concerns the medical profession and actuates it to look askance at such developments as this, is the consideration as to the effect it may have on the quality of medical care, and I believe that the medical profession as a whole would be perfectly willing to waive almost any other consideration if they could be convinced that it would not tend to the deterioration of the quality of medical care. The medical profession generally believes that. Now, they may be wrong, but they are overwhelmingly of that opinion. It is difficult to convince a layman of that, I know, and perhaps to do so would be an almost futile undertaking. I will call your attention to just one thing that will give you something to think about: When I graduated in medicine in 1898, Germany was a leader in medical science, perhaps next would come France, next would come England, and somewhere way down at the bottom of the list, came the United States. We were backward. Well, now, it is at least significant that at about that time these social schemes began to be introduced into Germany first under Bismarck as a purely political movement, and later on they have spread. Now what has happened. This is not proof, I know, but it is suggestive. Is Germany any longer the leader in medical science? No, it is not. Is France? No, it is not. Is England? No, it is not. Leadership has passed from Europe where these various social schemes have been tried out, to the good old U. S. A. Now that at least is significant and I think that while we must be coming up the scale, they have to some extent gone down. America no longer goes to Germany for its postgraduate education. As a matter of fact, many Europeans are now coming to the United States for training, and I mention that one thing to indicate that the thing that concerns the doctor is how these different things are going to affect the quality of medical care in the United States and if we don't have a broad enough vision to sustain and to constantly increase the quality of medical care, your economic considerations are worse than failures and I think you should give careful consideration as to this for that is the thing in the last analysis that concerns the medical profession, as to how and what effect it is going to have on the quality of medical care. Doctors who have studied it feel that it will be bad. Maybe they are wrong, but there is certainly sufficient evidence to justify that opinion. I think that is about all I have to say."

Do you remember that statement?

A.—Yes, sir.

Mr. Lewin:—Now, just a moment. I would like to make a suggestion to your Honor, if you will excuse me.

Mr. Leahy:—Yes, sir.

Mr. Lewin:—We offered this transcript in evidence yesterday, and your Honor held it under advisement. I think it is perfectly competent evidence.

THE COURT:—I will hold it is in evidence now, and either side can read any part.

Mr. Lewin:—Your Honor, I hadn't quite finished my suggestion. I think if you would bear this sort of procedure in mind in offering proof, I think we are entitled to this consideration. This was offered by us and should be considered as a whole, that statement. It shouldn't be read in piecemeal fashion such as this by reading paragraph after paragraph and asking him if he remembers.

THE COURT:—I will tell you what I will do if you wish. If you wish, I will suspend now the cross examination and you may read it. Or, if you prefer, after Mr. Leahy gets through you may read it.

Mr. Lewin:—I think it would take time.

THE COURT:—Suppose you gentlemen take a rest.

Mr. Lewin:—May Mr. Penniman step down?

THE COURT:—Yes. You may be a little more comfortable if you step down. You may go out, if you prefer.

The Witness:—Thank you.

(Mr. Lewin read the report to the jury repeating to where Mr. Leahy had discontinued, including and then going on:)

Dr. Verbruyke:—Mr. Penniman, ladies and gentlemen, I hadn't intended to say anything, but I think there are several points. First, most of you are laymen and I think perhaps we might bring out a little about what medical ethics are. The system of ethics was not devised for the protection of the doctor or his interests, but in every case from the time of Hippocrates down, has been made for the good of the patient. I think that you will know, that you will realize in the long run the doctor is not selfish by reason of our emphasizing two points: First, if a doctor ever invents some wonderful discovery of some sort, he is not allowed by medical ethics to patent it, it goes for the good of humanity, and, second, the doctor is unceasingly developing preventive measures, which takes money right out of his own pocket. We now have the tests for Scarlet Fever, Diphtheria, etc. where they can be prevented. I think those two examples will show that we are not speaking from a selfish standpoint, but we do have the good of the patient at heart. I am sure that all of us appreciate the high ideals and aims of this organization, and we are heartily with you in that. The only thing is the method of achieving that and I don't think there is such a very big difference between what the doctors can agree to and what you wish. I think there are just two small points but that the first and main consideration lies more upon the sixth one of those principles of medical ethics, I think it is the sixth, and that is that the patient should have always a free choice of physicians. Now to bring that down to a practice, to your own group from a practical standpoint, I have no doubt that you can get good doctors on your staff as full time salaried doctors. You can't have the best. There are two or three reasons why you can't have the best. One, there is no such thing as the best in a broad classification. In other words, we may have fifty good Ear, Eye, Nose and Throat Specialists in Washington and maybe only one or two who are capable of taking an open safety pin out of a lung. We may have an excellent surgeon when it comes to certain things like Thyroid operations. He may be way below the best when it comes to . . . There can't be any best. Medicine is so specialized that certain men stand out in one little tiny thing, perhaps in which they are best.

In the second place, because unless an organization has free choice of physicians the best doctor is not permitted. All members of the American Medical Association are not permitted to have a part with it. Now, doctors are very jealous of the privilege of belonging to the American Medical Association because practically all good doctors in the United States are members and they wouldn't give up the prestige to accept a salaried position if they knew it meant the likelihood of their not being able longer to continue their membership in the American Medical Association, and it is mandatory and absolutely compulsory upon us. Unless the American Medical Association would see fit to change them, no member of our Society could have anything to do with an organization which would not permit free choice of physicians.

From another standpoint the income of good doctors is higher than any salary you could afford to give. That is not accomplished by big fees. You aim to spread the cost of medical fees over many. The doctors in the higher income brackets spread many fees over many patients, but the best doctor would not accept a salaried position for anything you could possibly pay.

That brings you down to two practical points. I see no reason why your organization should not instead of having salaried—I am speaking personally now, not for the Medical Society. I see no reason why you couldn't have free choice of physicians, that is having every member of the Medical Society who would agree to live up to certain fee tables, to have the choice of being chosen by the patients, to have only one salaried man in your organization, the Director, who would serve not in a medical capacity, but in an administrative capacity entirely, and that sort of proposition would entail something such as Dr. Macatee suggested, whereby the patients pay a little bit of the cost. Of course, the Medical Director would have to have a certain amount of supervision as where any patient was running up too large a bill, or if there were some unscrupulous doctor running bills up too large but with those two things in mind, I feel pretty certain that the Medical Society and this organization could get together and be very helpful to each other; so I want to leave, from my standpoint, that one thought, to see whether instead of having salaried personnel, you couldn't find it possible to allow the patient the free choice of physicians, which is the big stumbling block as far as the doctors are concerned.

Mr. Russell:—Expresses appreciation for the doctors coming here.

Mr. Loomis:—I would like to inquire whether the committee has given consideration to the fact that there are other group associations in existence whose history over a period of time and through a fairly large clientele has been highly commendable and helpful and whether that fact, taken with the fact that in our own organization we are a voluntary association operating through the corporation patterning our work after the successful operation of a very large number of these group associations; whether that has been taken into account and the success of those organizations recognized, or whether you have given consideration to the development of those associations, that have done such capable work, that other associations are steadily growing up, of which ours is not a direct pattern, but certainly taking a leaf out of their experience and being carefully developed along lines which are not new to us or new in the field, but have proven over a sufficiently long time useful service to groups similar to ours. Has the committee given consideration to that?

Dr. Macatee:—I might say that the committee has given consideration to these groups which have grown up throughout the country, the most notable of which is the Endicott-Johnson Corporation in New York. There are others, however, and we have felt that there were conditions surrounding those groups and organizations which set them aside particularly as specially favorably placed to succeed. We notice in your Articles of Incorporation that, what shall I say, that the benefits of your purpose is available for any employee of the Federal Government wherever he may be placed unless his employment happens to be in the Army or Navy where medical care is part of his emoluments; and we have felt that we should have to be very slow before we gave our endorsement to a matter of this sort because we must recognize that, potentially at any rate, this organization by virtue of its Articles of Incorporation might involve about one third of the population of the District of Columbia and, therefore, the question of public policy and its effect upon the general medical care of the whole community would have to have our careful consideration for the reason that, suppose this organization should achieve at least the theoretical possibility, that would leave the care of the rest of the population of the District of Columbia in the hands of the medical profession as it exists, with the total obligation for the indigent, the unemployed, the dispensary and staff work of the hospitals, and leaving the very large colored population to the colored profession in whose hands that practice largely rests, that, of course, would have a profound effect upon the whole public economy of the District of Columbia and we would need to give careful consideration of it.

Mr. Russell:—(Raised the question, as the doctor had said, if we get real sick, would we not go looking for an outside doctor?)

Dr. Macatee:—You will, and I think it will rack your organization.

Mr. Kirkpatrick:—You mentioned in the opening part of your remarks, I understood you to say that, you stated from the premise that this corporation started to practice medicine. One of the purposes of this organization is to provide medical attention for those who—

Dr. Macatee:—May I interrupt to say that I did not state that as a premise, but as one of the things we would have to examine carefully before we can give approval and advice (cooperation) to the corporation.

Mr. Russell:—We expect to avoid that situation.

Mr. Kirkpatrick:—One of the purposes of this organization is to provide medical attention for those who don't receive it because they can't afford it.

Dr. Macatee:—I would say I don't know that that would enter into the situation if it came to the question of judicial interpretation whether it is a corporation practicing medicine, or not, I don't know; I am not a lawyer, but I would say I don't believe that question would arise. It would arise entirely from the fact that a corporation is in fact a person and a person must be licensed, and it would depend upon whether the corporation is entitled to practice medicine. The Medical Society takes an entirely different view of the situation for the reason there is no, in our opinion, there is no person in the District of Columbia, Federal employee or otherwise, who can't get medical attention when he needs it, and if he has no money and no prospects of having money, he can get it under municipal auspices. If he is short of money and by reason of illness is unable to pay in cash, the cost of his medical care, the medical and dental professions have already set up a mechanism by which he may budget the cost of his care over a period of five, six, seven, eight or nine months, the cost of which is defrayed by the doctor, dentist or hospital involved.

Mr. Kirkpatrick:—The cost would be on a higher scale than we could provide the same service for.

Dr. Macatee:—I think you will find that the scale of fee for people in that level will always be scaled down to their level. When it becomes necessary for them to apply to . . . I am speaking by and large and not with reference to an occasional fee. When a doctor by had judgment or by occasionally may oppress someone, but when a patient is in an economic level where he has to apply for relief of that sort, the scale of costs immediately goes down to his own level. Of course, if he can't meet the cost on a reasonable basis of compensation for services rendered, then the resources of the Community Chest come into play on his behalf and he may receive his services gratuitously and at the hands of the medical profession who compose those staffs entirely gratuitously. I want to bring out for the benefit of all the laymen present, because there is a singular lack of information on that point, that the staffs of the hospitals who attend any patient in the wards of the hospitals who receive any help from the Community Chest, do so without any compensation from the patient or from the institution.

Dr. Groover:—May I say something regarding one or two points that have been raised. Doctors generally extend unlimited credit; they are the only group of people in the country that I know of who do extend unlimited credit. Anybody can come into my office tomorrow, it has been so and I am sure it is so with all of these doctors here; their credit rating is never looked up before we treat them. We treat them first and do the best we can for them, and the question of getting paid for it is the last thing that is considered. Now, a business man would consider that rotten, and maybe it is. We know perfectly well that doing business on that basis results in a very considerable loss and we know perfectly well from experience, for instance, under the Workmen's Compensation, which by the way we don't consider approved, but we practice under the Workmen's Compensation. We know by experience we can attend groups of individuals where we know there will be no loss in collections, about 25 per cent cheaper than we can under the present scheme. Is that clear? The medical profession extends unlimited credit and for that reason there is necessarily a large loss in collection. They never ask the patients who may come in the office . . . but few of them I dare say are wise enough to know better. I should say at least 90 per cent of the doctors practicing in the District of Columbia do. If you go into his office or send for him to go to your home to see you, he will not raise the question of money. He will do what he can for you and run the risk of getting paid when he can. It is true that under such a system, good or bad, there is a considerable loss in collections. Certainly doctors can't get it when the patients haven't got it. That is obvious. He might as well stop trying. I have stacks of hundreds of files in my office now, and it is perfectly true that if we deal with a group, making a bargain with a group, we can do it about 25 per cent cheaper.

Mr. Zimmerman:—Is it true that about 60 per cent of doctors' accounts are collectible? The national average about 40 per cent of their accounts are never paid?

Dr. Groover:—I presume there is some evidence on that point, but I don't know and I doubt if there are any very accurate figures on it. It varies so in different types of practice. I will give you something in my own experience if that will be helpful. Our losses are about 25 per cent. Strange as it may seem, most of those losses are

because they deal with a different type of individuals and I think we are perhaps slightly high.

Mr. Zimmerman:—Doctor, do you feel—I am wondering if you feel that a cooperative arrangement to make certain that the doctors will be paid for what they do, thereby stabilizing the income of the doctors who do the work, if that would be desirable to the medical profession. Etc. Etc.

Dr. Groover:—I think it would be exceedingly unfortunate to stabilize the income of the medical profession, because there is just as much difference in the qualifications of doctors as there is in the qualifications of stenographers. Some of them can do it and some of them are rotten . . . I may pay one stenographer \$200 a month. I actually have another who isn't worth \$50 . . . would be unfortunate to stabilize the pay of doctors.

Mr. Kirkpatrick:—Dr. Macatee, I think you stated that group practice in foreign countries has tended to deteriorate the quality of medical (?). Is there any evidence in this country so far as it has gone?

Dr. Groover:—I should say none, for really it hasn't gone very far.

Dr. Verbruycke:—The most successful, apparently, project of the kind is a privately owned concern, the . . . Of course, all of the different cooperatives vary a little bit. The Endicott-Johnson is an industrial concern. There are a few which have been sponsored by doctors out in the far west, in Washington and Oregon. One sponsored by the Medical Society of . . . County, Georgia. They are apparently having good results, except that they are having troubles with their finances. Their bills are behind and they have not been able to keep up.

Mr. Russell:—How old is that?

Dr. Verbruycke:—That's about a year or a year and a half old.

They are so few and they are so different, we don't have a great deal to go on. I would like to ask Mr. Zimmerman, 'Did you not mean by stabilizing the doctors' income not so much putting it on a fixed basis as eliminating the loss, stabilizing more than equalizing, and that meant, I think, on Dr. Groover's assertion that we could practice medicine at a 25 per cent less cost than we do if we were assured of our income. There is no question but that we could do that. There is no question but that the members of the Medical Society would probably be for such an organization if the patient had free choice of physicians.

Mr. Zimmerman:—We would like to look on this arrangement as an arrangement which provides through cooperation the possibility of a method of payment and from what you have said this evening I sense that you are in sympathy with that aspect. I am interested in what you say about the free choice of doctors. I think it would be helpful if we explore that a little further together. Do you have the notion, tell me, that with a group of employees whose incomes average—that is, 60 per cent of the incomes are \$1,800 or less, who must provide shelter, clothing, food, school books and . . . that families have to purchase, do you have any notion that that group of people have a free choice of doctors now in our present arrangement?

Dr. Verbruycke:—Emphatically, I do, . . . and they could do even better if losses were cut out.

Mr. Zimmerman:—I don't think they have a free choice of doctors.

Dr. Verbruycke:—I doubt if the patients who come to me have average incomes of over \$1,800, and I am supposed to be a doctor in the higher brackets.

Dr. Groover:—Same here.

Mr. Russell:—The average income in Washington is \$1,500 to \$. . .

Dr. Macatee:—I would like to ask Mr. Zimmerman . . . whether he means by that an income of \$1,800 per year automatically limits people with such an income in their choice of physician to the poorer class of physician. Is that what you mean?

Mr. Zimmerman:—My point is that most of these people have no financial reserve, have no savings and can't afford to have the annual periodic physical examination and for that reason they only employ the services of a doctor when they are in trouble, sick and think they are going to die, and they are going to have to select their doctor from the group for whose services they can pay. I don't think they have a free choice of doctors in the sense that you gentlemen have been discussing it tonight.

Dr. Conklin:—I would like to say for the information of the ladies and gentlemen present that the Medical Society of the District of Columbia took cognizance of the rather desperate situation that most everybody was in, including the physicians themselves; the financial outlook was not good. In the midst of that the Medical Dental Service scheme was worked out. I believe that most of you are familiar with it. We have certainly tried to publicize it. It means that the whole fee and the whole expense may be definitely budgeted; the doctor's fee, the hospital fee, the laboratory fee, that is money that would go to . . . would all be lumped right in one sum and that is collected through this Medical Dental Service Bureau at 8th and I. Ten per cent is retained to maintain the overhead and we may say that the Medical Dental Service Bureau has just gotten by financially, and that is all we expected it to do. We have taken care of a great number of people and I am sure that Mr. Zimmerman's question can be answered right now by saying that if we will take Jones down here on Section Street, wanting to have his tonsils taken out, and he picked one of our Nose and Throat men who has a large practice. He would go down to the Medical Dental Service Bureau and say 'I want Dr. . . . to take my tonsils out. I haven't but so much income.' Right down there a man by the name of Trainor takes out a pencil and paper and finds out what his income is, how it is budgeted, how much goes for clothing, shelter, etc. He finds that the man has left about \$5.00 or \$10.00 which he might possibly put on a medical bill. This has actually happened. It is not theoretical or hypothetical. They say I don't see how I am going to do it. He charges \$75 or \$50 to take tonsils out and this is all I have.

That bureau has called up doctors innumerable times and says here is someone who wants his tonsils out. We have gone over his income and he can't possibly pay more than \$35 to take his tonsils out. Will you accept it? Those cases have been accepted and they have been accepted by outstanding Nose and Throat men. The same thing has been done for appendectomy. Those fees have been adjusted.

Now, then, furthermore, I would like to say there was a great number of people that were unable to pay, certainly unable to pay \$3 for a house visit, they might possibly pay \$1 for a house visit. They might possibly pay \$25 for an obstetrical situation. I believe I was really proud of the local medical profession and its reaction to the attempt to get a panel of doctors who would be willing to accept \$1 for a house call, \$25 for an obstetrical case and other fees in proportion. We have that list in the Medical Society Office; on that list are men who you would be actually surprised to see there; Obstetricians who would be willing to go out and take cases for \$25. The names are there. They signed up. We had this panel. The only requirement—they would have to be certified by the Medical Dental Service Bureau as being unable to be more than \$25 for an obstetrical and \$25 for appendectomy and I think that very well answers what Mr. Zimmerman had in mind, certainly as far as the effort made by the local medical profession, to take care of those individuals who would not have sufficient funds.

As far as the periodic health examination is concerned, you may or may not remember. In about 1930, the American Medical Association started its insistence that more periodic health examinations be made. The slogan was established 'Get a physical examination on your birthday annually.' Not one single word was said about how much to pay for this examination. The thing was to have the physical examinations, I want to say that we had public meetings; the Medical Society of the District of Columbia sent speakers to various organizations to sell this idea and I also want to add most emphatically that these annual physical examinations brought the doctor from zero up to \$10 say, and I am just as sure as I set here, that if these individuals about whom you are speaking had the idea sold to them about a physical examination, they could go out tomorrow to get those physical examinations without the necessity of putting any money down. I believe it is more the lack of willingness on the part of the individual or lack of knowledge that those things haven't been done more; that is one of the main things. They are going to take care of the individual while he is well. I just believe that sort of thing can be taken care of and I believe that this Medical Dental Service Bureau has answered many of the economic problems as far as medicine is concerned. If any of you haven't been down there, I would suggest that you just drop in and say you have an income of \$1,800 and that you want to have an appendectomy by a surgeon. Go down there and find out what happens to satisfy yourself.

Dr. Groover:—I want to say one more word, in regard to periodic examinations. I think the reason that periodic examinations are sought after is that the American Medical Association had given such a boost and because the doctor can't realize . . . If we accept the care of infants and pregnant women, the periodic examinations of infants and pregnant women, the ordinary physical examination that one would get once a year at a doctor's office is worth very, very little. I know that don't sound right, but it is true. I could have all of my colleagues here examine you tonight and what they can find out by the ordinary physical examination is really very little, and they can't accomplish much; and for that I think the doctor is to blame for putting so much emphasis on its importance. It does have considerable value in the periodic examination of infants and pregnant women and I think, the slogan about 'consult your dentist twice a year' is all right, take it by and large, the periodic examination by this group of people would be worthless. Am I right?

Dr. Mocatee:—No, sir, you are not. It is true that anyone of this group might come into my office and have a thorough physical examination and might go home and drop dead. That is based on the fact that you might have coronary sclerosis, which simply means you have hardening of the arteries, and that . . . to the internist is without physical signs. I think I will be able to tell you, however, that there are some indications that you are having some sporadic changes and your pace of life ought to be modulated, and that is a good deal. To answer Mr. Zimmerman's question practically, anybody with any income, unless he has to spend 100 per cent of his income for the actual necessities of life, in which case he is medically indigent so far as our experience is concerned, and we would find it necessary, unless we supply gave what they required, we would refer them to a clinic where some other doctor or perhaps ourselves, would do it in the setting of a clinic where we knew we were working gratuitously, in such hours as we set aside for that purpose. From the practical point of view, anybody can get a physical examination, and that requires a careful history taken if he is a new patient, that takes time, and then it requires the careful going over of the patient himself, and then it requires the doctor going back into his laboratory for the examination of the blood and urine, and what not. Altogether, if a man is careful and really wants the physical examination to amount to anything, it is going to consume about an hour of his time. If it doesn't require an hour of his time, it is going to require the services of his secretary, which, of course, is going to enter into the cost of the thing. If we take about \$10.00 as the cost anybody getting \$1,800 or \$1,400 in the Government can, I think, in 95 per cent of the doctors' office, in this city, get the thing done and pay for it \$1.00 a pay day.

Dr. Brown:—I think the greatest value of the periodic check-up is the early diagnosis and the . . .

Dr. Mocatee:

Dr. Brown:—Therefore, it comes in that preventive field. Another thing I want to ask . . . the statement was made that a deterioration of the medical practice has resulted . . . of clinics. Have any of you gentlemen investigated the results of the Endicott Johnson . . . or any of the large clinics? . . . an improvement and a better practice of medicine because of the availability of every . . . means or any consultation—

Dr. Mocatee:—I would say that the statement was made as to the deterioration as to the general practice of medicine in a nation. It

would depend upon the universality of the application of the principle in a case of that sort. Any cooperatives or groups in the United States have touched such a very small . . . of the population of the country that it has not affected the general status of the . . . But let's get down to cases and consider what would happen in the District of Columbia provided you were able to obtain the maximum of enrollment in this corporation. As I pointed out a while ago, it would involve about one-third of the population of the District of Columbia. Well, even sixth anyhow, of actual subscriptions, because there are about 100,000 employees. Multiply that by 3.3, you see what it would do here as economic thing. . . . It would simply result in the necessary exodus of a large part of the medical profession of the District of Columbia except those of us who have been in practice 30 or 40 years and are about to go on the shelf anyhow. It would result in the new blood, which is necessary to keep-up that end of it. It is impossible in the spur of competition in which medical men are in times and a little ahead, if they are going to get anywhere and in addition to that I would like to call your attention to the fact that we are all in accord with the idea that if people can't lump their resources and those who are fortunate, their money goes to those who are unfortunate, recruits itself. It educates itself, it enlarges its capacity of itself and it is done by the social underwriting of the sum of medical fees that the whole population pay so that any social arrangement by which that underwriting is so manipulated that free competition, the free choice of physicians is limited, then you wreck the works. Now that will happen just in proportion as a social experiment involves larger and larger blocks of the . . .

Dr. Brown:

Mr. Pennimon:

Mr. Loomis:

Medical Society:—It seems to me that these gentlemen representing the concern and apprehension about the effect of the operation of this voluntary organization in this area, a concern which we want to recognize honestly and deal with sympathetically. The point raised by Dr. MacIntee that such a large element of this population is made up of Government employees and that if the membership of this corporation reaches the nth degree, that a large proportion of the doctors in the District will be driven out of business, seems to me to be easily answered, that as we grow to that size, if we ever do, we will absorb the physicians here in the District presumably very much like the . . . that we can template for our present organization and that if that number of physicians is needed in this area, and are now making a living, that number would continue to be employed and continue to make a living on a basis of employment and income and because I recognize the serious concern of the group here reflected, I have no doubt but . . . runs through the profession in the District. I would like to ask a representative of this group whether it would not be agreeable to the committee and their associates to let this program of ours which is equally serious and built on the same principles which they hold in their medical fraternity of ethical service to our associates in this membership, if they wouldn't and can't very properly defer any decision or endorsement of this group until we have lived along a while and they have had an opportunity to judge us, not from a standpoint of what any other group has done, but from the standpoint of how we operate here. I assume, although I don't know, and haven't asked, that the Medical Society has not endorsed any considerable number of the other group associations and they are continuing to perform a very satisfactory service. I don't know and would seriously question until informed whether the American Medical Association has endorsed the Endicott-Johnson plan or whether they have endorsed any of these other plans and if that is a fact, can't they realize that we are just as seriously interested in doing the right thing by the medical group as they would do for us, simply delay any decision or any expression of point of view until we have operated, we being free all the time to consult them, they being free all the time to consult us, working together cooperatively, each recognizing the others ability and honesty, working it out together on a plan satisfactory to this group here.

Dr. Brown:—The question was stated that Germany has lost her place in the sun and her power to impart knowledge. I would like to ask you if the Hitler regime in Germany has not been responsible. After the war these things have changed in Germany, Vienna, Paris and London, and since the war all of that has been lost to the United States, who has been much more progressive, who has had more means and more funds to proceed along these lines.

Dr. Groover:—I think about Germany, there are many factors, but it is merely an implication . . .

Dr. Brown:—As a matter of fact, our investigation and my own investigation of these clinics—we find that better medicine is practiced than was practiced before in the same locality. I think that can be borne out also by the District.

Dr. Mocatee:—Mr. Loomis made some statements to which I would like to reply, that the economic aspect of this project—I had not intended to touch upon it at all. It is not at present a matter that had received very much consideration but the discussion grew out of other things and if all of the other factors which I adverted to when I first spoke were ironed out, then of course the services of the organization would have to be conducted by the medical profession, because that is the . . . of the service, and they would be recruited from somewhere, presumably to the extent that they . . . from the District of Columbia, but the difficulty at present that we came to discuss with you and advance was the . . . concrete plan of cooperation and that we were unable to bring some of these principles of ethics by which we are bound to see how certain information as we could so that we will be able to advise our membership what their attitude should be.

Mr. Penniman:—Gentlemen, speaking in behalf of the Board of Trustees of this organization, I want to express to you gentlemen our very sincere appreciation of the courtesy of this visit, your remarks and your contribution to this meeting and to give you our assurance that everything that you have had to say here this evening will be given very careful consideration. We thank you for coming up and we hope that we may have the opportunity of seeing much more of you.

By Mr. Leahy:

Q.—Have you any recollection now, Mr. Penniman, as to how long after this meeting, the minutes of which have just been read, it was that Group Health Association entered into negotiations with Drs. Lee and Scandiffio?

Mr. Levin:—I don't know whether I read it; the date of that meeting was July 26, 1937, this meeting from which I read.

The Witness:—I am not sure I can give you the date exactly; I think it was subsequent, of course, to the meeting.

(The discussion was then concerned with the time of subsequent conversations with prospective members of the staff.)

(The question was raised as to calling of legal counsel by G. H. A., Inc.)

Q.—You advised with them [Lee and Scandiffio]? You told them to withdraw the resignations, did you not?

A.—Yes.

Q.—And you did that because you wanted to put the District Medical Society in the position of expelling them, is that right?

A.—No.

Q.—Why did you tell them to withdraw their resignations?

A.—Because Mr. Sandidge of the Emergency thought that Lee was not entitled to hospital privileges since he was no longer a member of the society. I told him that so far as I knew he was a member. His resignation had been sent in, it is true, but not acted on; therefore in order "that you may continue with the privileges of the Emergency I suggest that you withdraw the resignation."

Q.—Did you suggest that with reference to Dr. Scandiffio for the same reason?

A.—I did.

Q.—Although you knew at the time that Drs. Scandiffio and Lee had resigned, or tendered their resignations, because they knew they could no longer remain members and continue to violate the society rules at the same time, you suggested that they withdraw those resignations?

A.—That is right. We were hopeful that some arrangements might be made and they would forget the charges.

Q.—Then you knew, did you not, that when the rule which Dr. Macatee had drawn to your attention on the 26th day of July, that a member of the association could no longer remain a member of the District Medical Society?

A.—He said that was the rule.

Q.—You knew, then, when you advised these doctors to withdraw their resignations that there was that rule in effect, and that Dr. Macatee had stated on the 26th day of July that that was one of the grounds of the uncertainty of the association as to how they should advise their members?

A.—That is right.

Q.—You will recall that after the resignations were withdrawn that the charge was then made that you referred to yesterday?

A.—Yes.

Q.—And that resulted in a trial?

A.—A hearing.

Q.—Did any members of the staff of legal counsel of H. O. L. C. represent Dr. Scandiffio?

A.—Yes. I testified to that yesterday.

Q.—The whole battery came up?

A.—On both sides; there was a battery for the District Medical Society, also.

Mr. Levin:—Who was the heavy cannon in this battery?

By Mr. Leahy:

Q.—Dr. Russell, or Mr. Russell, was he not the chief counsel?

A.—Not for Group Health Association.

Q.—Was he chief counsel for Dr. Scandiffio?

A.—I wouldn't say he was chief counsel; I think Mr. York was the counsel.

Q.—How many hearings did you attend?

A.—Three.

Q.—Was there a hearing subsequent to them?

A.—I understood there was; I was out of the city on official business.

Q.—And each one of the three you attended was rather extensive?

A.—Yes.

Q.—Did you tell us yesterday that the reason why the contract which Dr. Macatee had inquired about, and also inquiry

had been made in the meeting of June, at the executive committee, wasn't produced was because the Home Owners Loan Board had to give authority so it could be produced, is that right?

A.—Yes.

Q.—Did you ever seek the authority of the Home Owners Loan to do that?

A.—No.

Q.—Never did?

A.—No, nor do I know that the doctors made application to the board for it.

Q.—What doctors do you refer to, the American Medical Association?

A.—No, I had no contact with the American Medical Association.

Q.—The District Medical Society?

A.—Yes.

Q.—You knew that Dr. Woodward had inquired early in June concerning it?

A.—He never inquired of me.

Q.—You had no information on the subject?

A.—I was told, hearsay.

Q.—Did anybody of Group Health Association make application to the Home Owners Loan Bank Board for that contract?

A.—Not that I know of.

Q.—Under whose authority was it produced at the Scandiffio trial?

A.—The contract?

Q.—Yes.

A.—I guess general counsel of the Home Owners Loan Corporation.

Q.—You saw it produced there?

A.—No, I don't remember that it was.

Q.—Don't you remember that on the first night of the meeting that counsel representing the District Medical Society asked for the production of the contract and it was denied on the first hearing?

Mr. Levin:—Which contract?

By Mr. Leahy:

Q.—Between Home Owners Bank Board and G. H. A.?

A.—I am not entirely clear on that; I think perhaps it might be true.

Q.—Don't you know it was emphasized by counsel there representing the society that he would like to have the contract; and counsel continued to say, "Why don't you produce the contract?" and, "Why can't we have the contract?"

Mr. Levin:—I will have to object to that; this is not proper cross examination.

THE COURT:—He may answer.

The Witness:—I don't remember that.

By Mr. Leahy:

Q.—Didn't you know other people were interested in the contract; to find out what was in it?

A.—Yes, we knew there was a very determined effort to produce it.

Q.—And you were just as determined that it would not be produced?

A.—We couldn't see any reason for its production.

Q.—Why didn't you want it produced, that contract?

A.—The particular reason I didn't want to produce it was I didn't have authority. It was filed with the secretary of the Home Owners Loan; it wasn't in my possession.

By Mr. Leahy:

Q.—Now, passing that for the time being, did you say a short while before recess, when we were discussing Dr. Macatee's statement with reference to the legality of Group Health, that you never had any doubt about the legality of Group Health?

A.—Personally, I didn't; no question had been raised about it at that time.

Q.—Was that the belief of counsel, also, for G. H. A.?

A.—Very definitely.

Q.—Did there come a time when you changed your views?

A.—After we found out there was a good deal of action directed against Group Health, we decided there would be a test.

Q.—Did your own board of trustees change their views about the legality of G. H. A.?

A.—No.

Q.—Did you never discuss with Mr. Russell, after Dr. Macatee had brought the attention of the group to the question of the legality of Group Health Association, after he had brought attention of the board to that in July, as to whether or not its by-laws should be revamped?

A.—No, I didn't discuss that; I recall that that was suggested to the board of trustees and, I think, by Mr. Russell.

Q.—And why were the by-laws to be revamped?

Mr. Kelleher:—We object to this; it is clearly beyond the scope of cross examination. We did not go into any of these matters on direct examination.

Mr. Leahy:—He brought that out himself, with reference to the cross examination.

Mr. Lewin:—Well, then you brought it out.

Mr. Leahy:—Well, then I have the right to search him on it. He said that one of the reasons why the Medical Society was uncertain as to what it could or should do was because of the question of legality; that such question had come up.

Mr. Kelleher:—He is now attempting to go into something on cross examination which was not testified to or concerning on direct examination.

Mr. Leahy:—Now, then, if your Honor pleases, he stated in response to a question as to whether he had supplied the information which Dr. Macatee asked for in that statement, with reference to the legality of the organization, he stated: "No, we didn't, because we had no doubt about the legality of the thing at all." Now, to search that answer I have a right to determine whether there was any doubt in his mind, or whether he was certain of the legality of the plan.

THE COURT:—I think the question may be answered; the objection is overruled.

Mr. Lewin:—Well, your Honor, should it not be limited in point of time?

THE COURT:—I can't be too restrictive; the whole examination is very extensive; particularly on cross examination.

Mr. Lewin:—Doesn't your Honor think that the question should be limited as to time?

THE COURT:—I think this apparently is shortly after that meeting.

Mr. Leahy:—Yes, your Honor.

THE COURT:—I will permit it; I don't mean that I won't put some limitations on the line.

Mr. Kelleher:—This matter relates to something, it is six months afterward.

THE COURT:—Let us go on.

By Mr. Leahy:

Q.—I ask you, Mr. Penniman, if the statement which Dr. Macatee made to you that night, on July 26, didn't cause you as a member of the board of trustees, through your counsel, Mr. Russell, to begin an investigation into the legal setup of G. H. A., as it then stood?

A.—I don't think so, just from the way you put it. I think Mr. Russell perhaps, investigating the by-laws, suggested certain changes which he thought should be made, and I think the board of trustees, relying on his judgment, agreed that they be made.

Q.—Why was the change in the by-laws suggested?

A.—I don't think it was suggested.

Q.—I will show you something to refresh your recollection; take a peek at that.

Mr. Lewin:—I should like to have the record show that we have no objection to this letter.

(Mr. Leahy handed the witness a document.)

By Mr. Leahy:

Q.—Doesn't that refresh your recollection?

A.—Yes.

Q.—Now, then, is it not a fact, having read that letter of Mr. Russell's, that you know that the legality of G. H. A., as to whether it was conducting an insurance company business at that time, was seriously in question, even among yourselves, even among yourselves, forgetting the medical profession?

Mr. Kelleher:—I make the same objection, because this letter is dated Nov. 16, 1937, a great many months after this statement about the legality.

THE COURT:—Overruled.

The Witness:—I think there had been a great deal said about the question of legality. I had heard it and seen it in the papers. There was a great deal of discussion. My recollection is that Mr. Russell, as we progressed, as we went along, as our legal adviser, made recommendations for such changes as he thought would be beneficial to the organization, presented them to the board, and the board agreed with him and followed his recommendations.

By Mr. Leahy:

Q.—Was it beneficial to the organization, or to strengthen the legal position of the organization?

Mr. Lewin:—Well, is there any difference in that? Any difference between those two things?

Mr. Leahy:—Yes, I think so; I think there is a difference.

By Mr. Leahy:

Q.—The motive was to strengthen the legal position of G. H. A., was it not?

A.—I think you will find the by-laws were written some time earlier in the year, and that Mr. Russell, as we went along, where he found any situation where he needed it to be strengthened, recommended to the board such changes, and the board adopted the recommendations.

Q.—Now, with that letter before you, let me ask you if, on the 16th day of November, 1937, Mr. Russell then didn't present to the Federal Home Owners Bank Board what was then a revamped set of by-laws, and if he didn't assign as the reason for the amendments that they were "to strengthen the legal position"?

A.—Yes. He didn't revamp the by-laws; he made certain changes which he felt, as an attorney, were necessary to strengthen the association's position.

Q.—He revamped the by-laws to get around the situation that it was conducting an insurance company business in the District of Columbia without authority, did he not?

A.—I think he limits, in that letter, the reasons for the amendments.

Q.—And those changes were made at that time because he, as general counsel, felt it necessary to amend its by-laws in order to strengthen the legal position of G. H. A. if it should be determined that the association was in the insurance business, isn't that true?

A.—I think that is the position that Mr. Russell took; it was his idea.

Q.—Now, were you so certain then, even after the amendments had been submitted to the board and, as you say, approved, that you were still not violating the law?

A.—What? Were we certain that we were not violating the law?

Q.—Yes. Were you certain of that?

A.—I had no idea we were violating the law.

Q.—Will you be good enough to take a look at the second sentence of the last paragraph of the letter and see if that refreshes your memory?

A.—Yes, that refreshes my recollection.

Q.—That refreshes your recollection?

A.—Yes.

Q.—Now, does Mr. Russell there state or reflect the views of the board which approved these by-laws when he stated, "This revision excludes memberships except in the case of employees of the executive branches of the Government, excluding the Army and Navy, and this provision is made to assure us the benefit of an exception from insurance regulations if we are held to be an insurance company"? Does that reflect the views of the board of Home Owners Loan?

A.—Well, I am not an attorney, Mr. Leahy, and Mr. Russell undoubtedly went into this question very carefully; and he presented his views to the board, we accepted his views.

Q.—Do you recall now, after reading this letter, why it was that Mr. Russell made the statement, "if we are held to be an insurance company"?

A.—I think there was a great deal said about Group Health; that it would be held to be in the insurance business, an insurance company.

Q.—That was the thought in your own group?

A.—No, that was the thought outside the group.

Q.—And your own group was not certain about it?

A.—I personally wasn't, but the lawyers would have to work that out.

Q.—Then your lawyer advised you he was not certain?

A.—Yes.

Q.—And what he was trying to do was that he was trying to get the advantage of the insurance laws in force in the District of Columbia if you were held to be an insurance company; isn't that it?

THE COURT:—He would only know if Mr. Russell expressed that view to him.

By Mr. Leahy:—

Q.—Well, I will ask him the question if this is the letter that reflected the views?

Mr. Lewin:—Of whom? I think you ought to read the whole letter. You are taking bits of it.

Mr. Leahy:—I don't wish to offer it at this time; this is not our case.

Mr. Leavin:—You Honor, I think he ought to read the whole letter.

THE COURT:—Well, you will have the right to offer it on re-direct examination. That particular piece of paper doesn't belong to any particular side. You may offer it if you wish.

Mr. Leavin:—Well, your Honor, I don't think he is using it as refreshment material for the benefit of this witness.

THE COURT:—If you think it ought to go in evidence, you may offer it and I will rule on it.

Mr. Leahy:—If your Honor please, I have submitted to counsel a letter dated July 27, 1937, to which there was no objection. I don't care to offer it in evidence.

THE COURT:—You are not going to offer it at this time?

Mr. Leahy:—No; I just wish to refer to certain portions of it.

By Mr. Leahy:

Q:—I am just going to ask you whether you collaborated in the preparation of the third paragraph with Mr. Childress: the third paragraph on the second page. Did you collaborate with Mr. Childress in writing that document?

A:—No, I don't recall that, and of necessity I would not be the one.

Q:—Why do you say "of necessity"?

A:—Because Mr. Childress is liaison officer between the Home Owners Loan and Congress, and all communications to Congress are referred to him. He investigates the circumstances of the inquiry and makes reply to Congress. That being one from Congress, it could have gone to Mr. Russell or Mr. Kirkpatrick, or any one.

Q:—Did you know that senators were making inquiry about this contract that we have mentioned at this very time?

Mr. Leavin:—This is certainly beyond the scope of our direct examination.

THE COURT:—Yes, I think so.

Mr. Leahy:—It is just on the point as to why they didn't want to produce the contract.

THE COURT:—I think he has given his answer that he assumed he didn't have any authority to produce it. It makes no difference if other people were interested in the contract.

By Mr. Leahy:

Q:—Now, Mr. Penniman, following the meeting of July 26, the minutes of which were read, did you discuss with any member of the Medical Board of the District of Columbia the question which had been raised at that meeting?

A:—Not that I recall.

Q:—See if I can refresh your recollection. Do you know Dr. Hooe? Do you know the gentleman?

Will you kindly stand up, Doctor?

(Thereupon Dr. Hooe stood up in the courtroom.)

A:—Very well.

Q:—Did you have luncheon with him shortly after that meeting, in the Metropolitan Club in the District of Columbia?

A:—I had luncheon with Dr. Hooe, at his invitation, at the Metropolitan Club, but I don't know whether it was before or after or how soon after that meeting.

Q:—Do you recall discussing with him the matter of Group Health Association and the District of Columbia Medical Society's attitude with reference to it?

A:—Yes.

Q:—And do you recall what word you left with Dr. Hooe with reference to the attitude of Group Health with reference to cooperating with the District Medical Society?

A:—I can't say what I told him; we were there at the Metropolitan Club about two and a half hours.

Q:—I will ask you if you stated to Dr. Hooe on that occasion that if Group Health Association didn't conform to what the American Medical Association thought the practice of medicine should be, as expressed in its code of ethics, that the American Medical Association could change its code of ethics, but you were not going to change Group Health Association; you were going forward?

A:—No.

Q:—Nothing in substance similar to that?

A:—Not even in substance do I recall any such statement.

RE-DIRECT EXAMINATION

By Mr. Kelleher:

Q:—Did you explain to Dr. Neill that Group Health Association involved group practice?

A:—Yes.

Q:—Did you explain to him that it involved prepayment?

A:—Yes, I think so.

Q:—Did you explain to him the duties of a medical director?

Mr. Leahy:—I think he has been all over that.

Mr. Kelleher:—Yes, but you have also tried to bring out from this witness that his disclosures were partial, not complete.

THE COURT:—Oh, he may answer that.

The Witness:—I think we went into that pretty thoroughly.

By Mr. Kelleher:

Q:—Did you refrain from discussing with him anything about the organization of Group Health except the contract between Group Health and the Federal Home Loan Bank Board?

A:—I don't think that question came up during the discussion. We were approaching him with the hope of procuring him as our medical director. We wanted to discuss the proposed plan with him. We went into it in detail.

By Mr. Kelleher:

Q:—Do you recall what Mr. Zimmerman told you about the call of Dr. Woodward?

THE COURT:—Well, if a conversation is to be admitted we might as well admit the letter.

Mr. Kelleher:—It is material here because the question has arisen as to what he knew. During cross examination he was asked as to what he knew as to the controversy as of the time he talked with Dr. McGovern.

Mr. Leahy:—No such question was asked about that.

Mr. Leavin:—Yes, there was, I can give it to you. And just this morning Mr. Leahy asked him if he knew about the doubts the defendant had towards G. H. A. This bears directly on it. This is the very knowledge that he must have had about the so-called doubt; this communication that he got in writing.

Mr. Kelleher:—And yesterday afternoon Mr. Leahy asked Mr. Penniman what he knew about the controversy existing at the time he saw Dr. McGovern.

Mr. Leahy:—It is very clear all I was doing was asking Mr. Penniman as to his recollection of the conversation with Dr. McGovern. We already had in evidence the testimony of Mr. Zimmerman that they talked about the horses and dogs and came away, in Mr. Zimmerman's recollection, without knowing why they had the luncheon at all, and I was developing that.

THE COURT:—I think it is objectionable; objection sustained.

Mr. Kelleher:—I am not going to offer it, but I would like to use it to refresh the witness's recollection.

THE COURT:—As to what?

Mr. Kelleher:—What he knew about the call from Mr. Woodward, or Dr. Woodward, to Mr. Zimmerman.

Mr. Leahy:—Ask him if he has ever seen it before.

THE COURT:—If I am not mistaken, my recollection is that his recollection was refreshed, wasn't it?

Mr. Kelleher:—No, Mr. Zimmerman's.

THE COURT:—Will counsel come forward, please?

AFTER RECESS

WILLIAM F. PENNIMAN—RE-DIRECT EXAMINATION (RESUMED)

By Mr. Kelleher:

Q:—Mr. Penniman, I show you memorandum dated June 5, 1937, and ask you to read it please.

A:—(The witness examined paper.) Yes.

Q:—Mr. Penniman, does this memorandum which I have handed you and which you have read, refresh your recollection about what you knew about Dr. Woodward's call on Mr. Zimmerman when you talked with Dr. McGovern on July 16th?

A:—Yes.

Q:—Will you tell us now what Mr. Zimmerman told you about Dr. Woodward's call?

A:—Mr. Zimmerman told me that Dr. Woodward, I believe purporting to represent the American Medical Association, had called on him and had asked him for certain information. I think he wanted to get the contract, I think he wanted to get a copy of the Federal Home Loan Bank Act, inquiring about the money paid over by the Federal Home Loan Bank Board to Group Health Association; and several questions of that character; which Mr. Zimmerman confirmed in a memorandum to me. He wanted me to know about the visit, and he gained the impression from Dr. Woodward—

Mr. Leahy:—I object to any impressions.

THE COURT:—Objection sustained.

By Mr. Kelleher:

Q:—Will you tell us what Mr. Zimmerman said Dr. Woodward said to him?

A:—He told me that Dr. Woodward had told him he was going to oppose it, that they were very much concerned about this organization, and that if this money could be appropriated here for the organization of Group Health, it could be done elsewhere, and he was very much against it.

Q.—Did Mr. Zimmerman say that Dr. Woodward said whom he was going to oppose?

Mr. Leahy:—I object as entirely leading.

Mr. Kelleher:—He has already stated it.

Mr. Leahy:—Then why emphasize it?

Mr. Kelleher:—All I want to know is whether Dr. Woodward told Mr. Zimmerman what he was going to oppose.

Mr. Leahy:—Now, if your Honor please, a memorandum was submitted to the witness on the stand under close limitation set by the Court. The very matter now which is inquired about is within the limitations excluded. I respectfully object to any further questions on it.

Mr. Kelleher:—Will you Honor hear me on this?

THE COURT:—Well, I think I understand the situation.

Mr. Kelleher:—Well, all right.

THE COURT:—I think your question is unnecessarily suggestive. Let Mr. Penniman—in order that we won't go too far—let him give his own recollection of what factual things were stated. That would come within the limitations of my ruling.

Mr. Kelleher:—Very well, your Honor.

THE COURT:—In other words, confine yourself merely to any facts Mr. Zimmerman stated to you as distinguished from any impressions that Mr. Zimmerman may have stated to you.

The Witness:—Well, he stated to me that Dr. Woodward told him he was going to oppose the organization of Group Health Association.

By Mr. Kelleher:

Q.—Did Mr. Zimmerman tell you that Dr. Woodward had said anything about the annual meeting of the American Medical Association at Atlantic City?

A.—Yes. Yes, he mentioned that, and wanted this information, so Mr. Zimmerman told me, as they intended to make it a subject of discussion before the annual meeting of the American Medical Association at Atlantic City.

Q.—Will you look at this memorandum again, please, refer to the last paragraph?

A.—(The witness examined paper.) Yes.

Q.—Will you tell us whether Mr. Zimmerman told you that Dr. Woodward said that he would oppose the organization personally or not?

A.—No, he was going to organize—

Mr. Leahy:—Why lead?

THE COURT:—Yes. That is very leading, Mr. Kelleher. In other words, when it comes to refreshing his recollection, you you don't want to put the words in his mouth.

Mr. Kelleher:—I don't intend to.

THE COURT:—I am sure you don't intend to?

Mr. Kelleher:—May I rephrase the question, then.

By Mr. Kelleher:

Q.—Will you tell us whether Mr. Zimmerman told you what Dr. Woodward meant when he said that he was going to oppose this organization?

Mr. Leahy:—I object. It calls for a conclusion of the witness.

Mr. Kelleher:—Not at all, your Honor. I am asking whether he said what Dr. Woodward meant.

THE COURT:—The question is, what did Dr. Woodward say, not what Dr. Woodward meant. Let the jury draw the conclusion as to what he meant. What did he say? Quote what he said.

The Witness:—Well, I can't quote what Dr. Woodward said because I wasn't there.

By Mr. Kelleher:

Q.—What Mr. Zimmerman told you Dr. Woodward said.

A.—Mr. Zimmerman told me that Dr. Woodward said he was a member of the American Medical Association, and that they were going to organize to oppose this group Health Association.

(The witness was questioned again about conversation with Col. Glen I. Jones and Dr. Hooe.)

By Mr. Kelleher:

Q.—Had you finished your testimony concerning what Dr. Hooe said at the Metropolitan Club?

A.—Yes. It was a general conversation. He just had this other plan.

Q.—Did he explain the plan, the other plan which he had in mind, to you at the Metropolitan Club?

A.—I think in general terms he did that.

Q.—Will you tell the jury what he said concerning his plan?

A.—Well, as near as I can recall the plan he proposed was that we could have membership in an organization such as Group Health and collect dues, but that we need not have a staff of doctors or nurses or space, or equipment, or what not, that we could use the local doctors and out of the dues collected from the membership, we could pay for the services

performed on its members by these doctors; that those that were not sick would help to defray the expenses of those that were in need of it.

Q.—Did his plan as explained to you contemplate group practice?

(Then came interrogation regarding a telephone conversation with Dr. Hooe.)

By Mr. Kelleher:

Q.—Did you discuss the Lee and Scandiffio hearing at that conversation?

A.—I did that evening over the telephone.

Q.—Will you tell us the substance of that conversation, please?

A.—Well, I told Dr. Hooe I felt very keenly about the way Dr. Lee and Dr. Scandiffio had been treated, and that if my understanding was correct, they were entitled to a hearing, by virtue of a letter sent over his signature, and that Dr. Lee and Dr. Scandiffio replied to that letter requesting a date to be set for the hearing, and also stating they would like to appear with counsel, and it was the understanding that that hearing would be before this C. C. & I. M. Committee, and that that hearing had never been granted.

As a matter of fact, Dr. Lee tendered his resignation before the second meeting and Dr. Scandiffio was tried on the basis before the Executive Committee, and never did go before the C. C. & I. M. Committee. And I told Dr. Hooe:

"You knew at the time that you had promised Dr. Lee that if he would give his resignation to Group Health, that you would be glad to recommend the cancellation of all charges against him."

I said "You knew that, Dr. Hooe."

Q.—What did Dr. Hooe say?

A.—Dr. Hooe didn't deny it, of course.

Q.—Did Dr. Lee resign from Group Health Association?

A.—He did.

By Mr. Kelleher:

Q.—Was there anything more in the conversation with Mr. Sandidge?

A.—I did testify that Dr. Sandidge said that that was the occasion for them sending the usual form notice; and that they would write him a letter. And I thanked him very kindly, and he said they did reinstate him.

Q.—Did you tell Mr. Sandidge about a conversation which you had had with Dr. Neill?

A.—Yes, I told him that Dr. Neill had told me that he was still a member, and that his resignation had not been acted on.

Q.—Had you talked with Dr. Neill?

A.—Yes, I think I had.

Q.—Will you give us the substance of that conversation?

A.—Yes. I just called him up and told him what Mr. Sandidge had done, and what Mr. Sandidge had written Dr. Lee, and asked Dr. Neill if that was the procedure, and he said "Why, no. Dr. Lee is still a member of the Medical Society by reason of the fact that we have not acted on his resignation"; and he was going to get in touch with Mr. Sandidge himself; and I think he did.

Q.—One other thing, Mr. Penniman, and I am through. Will you tell us what action was taken by the District Medical Society concerning Drs. Lee and Scandiffio between the period when those two gentlemen tendered their resignations from the society, and the time when they withdrew their resignations?

Mr. Leahy:—I object to that. If there is any action, it is a matter of record.

THE COURT:—Well, that is true, unless Mr. Penniman was there present with the board, committee, or whatever it was, when they announced their action. If he was there and heard him announce his decision or action, of course he may state it.

By Mr. Kelleher:

Q.—Do you know whether Drs. Lee and Scandiffio received any communication from the Society during that period?

A.—Yes, they received this letter that I referred to saying that they had violated—

Mr. Leahy:—I object. The letter is the evidence.

THE COURT:—Objection sustained.

Mr. Levin:—We want the privilege of recalling this witness to put in this correspondence with hospitals.

THE COURT:—That is understood.

RE-CROSS EXAMINATION

(Mr. Leahy again questioned the others about the Zimmerman memorandum to Penniman.)

By Mr. Leahy:

Q.—When was it Mr. Zimmerman had this conversation with you?

A.—Why, it was either that same day or the next day, I think. It was immediately afterward.

Q.—Did you call Mr. Russell, to advise as to whether or not you ought to show him that contract?

A.—No, I didn't.

Q.—Did Zimmerman state he had gotten any legal advice as to whether he could show the contract or not?

A.—He didn't say to me, no.

Q.—Didn't you say Dr. Hooe's idea would make Group Health a collection agency?

A.—Yes.

Q.—What did you mean by that?

A.—We were going to collect dues. I thought you meant the amount of the dues. We were going to collect those under his plan, monthly dues.

Q.—Aren't you doing that under Group Health?

A.—Yes.

Q.—Then why is there any distinction between the collection agency you have and the collection agency of Dr. Hooe?

A.—There is a very wide distinction.

Q.—What is that?

A.—If I am to be permitted to dwell on it, a member of Group Health under the plan had an opportunity to go up to the clinic under a staff of doctors.

Q.—I didn't ask as to that.

Mr. Levin:—Certainly this is responsive to his question and he ought to have it.

THE COURT:—I think the question calls for the opinion of Mr. Penniman. He stated the proposition of Dr. Hooe as Dr. Hooe proposed it to him. Now, we can determine just as well as Mr. Penniman the difference between the two plans. I don't think we need to go into it.

By Mr. Leahy:

Q.—I will ask you this: In your collection of the dues, you did see to it that the various subscribers of the service paid their dues into G. H. A. Isn't that right?

A.—Yes.

Q.—And you collected them, didn't you?

A.—The business office did.

Q.—Did you have collectors through the department?

A.—Yes, I think so.

Q.—And, at first, you had the check-off system, didn't you, to compel the payment of dues?

A.—No, sir. Never.

Q.—I thought you did.

A.—Absolutely not. We never had a check-off system by which we compelled members to pay dues; never.

Q.—Didn't you have a form which the subscriber signed, in which he authorized deduction from his check?

A.—Yes. I am glad you brought that up.

Q.—Well, did you, or did you not?

A.—We had on our blank a space for the member to indicate whether he wanted to pay direct or whether he voluntarily, as a convenience to him, desired it taken out of his salary check.

There was no compulsion on that.

Q.—Did you have a by-law on the question?

Mr. Levin:—The by-laws speak for themselves.

Mr. Leahy:—That is what I am getting right now. (Examined papers.)

Mr. Levin:—Well, the by-laws are in evidence.

By Mr. Leahy:

Q.—I will say further, didn't there come a time when, in the amendments to the by-laws which we spoke about this morning on the Mr. Russell letter, that you dropped that from your by-laws?

Mr. Levin:—Objected to on the same ground, the by-laws speak for themselves. Your Honor sustained the same objection for Mr. Leahy.

THE COURT:—Very well.

By Mr. Leahy:

Q.—Is that a copy of the check-off? (indicating).

Mr. Levin:—He has testified there was no check-off, and Mr. Leahy is mischaracterizing the testimony in this case time and time again. I object to it.

THE COURT:—I think it would be better not to give it a name.

Mr. Leahy:—All right.

Mr. Levin:—There is no check-off, and you know it.

Mr. Leahy:—I know no such thing. I know if somebody collects, it is just like a labor union.

Mr. Levin:—This jury is going to know about it.

THE COURT:—Give the witness a chance.

By Mr. Leahy:

Q.—Is that it (indicating)?

A.—It is purely a voluntary—

Q.—I am asking you if that is what that is in the by-laws. Mr. Levin:—I make the same objection, the by-laws are in evidence; the by-laws are the best evidence.

By Mr. Leahy:

Q.—Now, did you—

Mr. Levin:—Wait a minute. I want a ruling before you get the same thing in the back door.

THE COURT:—If you insist on that I will have to sustain it.

Mr. Levin:—I am going to have to hold Mr. Leahy down to the proof. He is going perfectly wild here.

Mr. Leahy:—That isn't speaking very well for your Honor.

THE COURT:—I will look after myself.

Mr. Leahy:—I thought I had been very calm about the matter.

THE COURT:—If there is no question of that being the terms of the by-laws there is no reason for wasting time looking up the by-laws.

Mr. Levin:—I think what is sauce for the goose is sauce for the gander. We have been getting all these technical objections in order to get out a simple story.

THE COURT:—You have been getting a good many breaks.

Mr. Levin:—I don't think we have been getting, your Honor—

THE COURT:—I am dispensing them impartially and freely.

Mr. Levin:—I know your Honor means to. I think this is a highly improper way to bring this out.

THE COURT:—Suppose you go on to something else.

By Mr. Leahy:

Q.—Well, I was directing your attention to this particular assignment. I wasn't asking about the by-laws.

Mr. Kelleher:—I thought you said it was in the by-laws, Mr. Leahy.

THE COURT:—Put a question. Let us start all over.

By Mr. Leahy:

Q.—I will ask you now if that is an assignment, or a photo-static copy of the assignment which Group Health authorized in the collection of its dues.

Mr. Kelleher:—Your Honor, may I object to this as being outside the scope of the re-direct. We never went into this phase at all.

THE COURT:—Well, I sustain the objection.

Mr. Leahy:—That's all.

TESTIMONY OF THEODORE WIPRUD

DIRECT EXAMINATION

By Mr. Levin:

A.—Theodore Wiprud stated he has been secretary of the Medical Society of the District of Columbia since June 1, 1938. Before that time he was executive secretary, Medical Society of Milwaukee County. Dr. C. B. Conklin had been secretary since about 1922. From him Mr. Wiprud obtained the custody of the minutes of the District Medical Society.

Q.—And have you produced those minutes here in response to a subpoena, which designates the minutes of specific meetings?

A.—I have.

Q.—And are these the minutes that are before you?

A.—They are.

Q.—On this table. Now, do you know Dr. Conklin's signature?

A.—Yes. I do.

(Mr. Wiprud then identified the minutes of the District Medical Society, the meeting for Jan. 6, 1937 and subsequently.)

Mr. Wiprud also identified minutes of the executive committee and produced the roster of the society and the list of officers and committees.

CROSS EXAMINATION

By Mr. Leahy:

Q.—Is it not a fact that under Hospital Committee, as it is denominated here under the regular committees, there was no Hospital Committee at all in the District Medical Society from July 1, 1938?

Mr. Kelleher:—Objected to as leading, your Honor. This man may be technically called by us, but he happens to be the secretary of the defendant Society, and I do not think counsel for the defense should be permitted to lead him.

THE COURT:—The paper speaks for itself on that.

Mr. Leahy:—Was there an objection to the question?

THE COURT:—Yes. It seems to me the paper speaks for itself.

Mr. Magee:—We have a stipulation covering this, your Honor.

Mr. Kelleher:—No. There are certain members of the Hospital Committee, but both sides are free to show other members.

By Mr. Leahy:

Q.—Do you know well enough, with reference to the publication of the Medical Annals of the District of Columbia, to know that it always published accurately the membership of the various committees?

A.—Well, there were times when the committees were not accurate, when there was a death or something—a change.

(There were further questions about the roster of officers and committees.)

RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—Now let me show you Government Exhibit No. 31 for identification, which purports to be a letter from you to the American Medical Association, Council on Medical Education and Hospitals, dated Dec. 13, 1937. Is that your signature?

A.—It is; yes.

Q.—Did you send that letter to the American Medical Association, Council on Medical Education and Hospitals?

A.—I did.

Q.—I show you Government Exhibit No. 30 for identification, which purports to be a copy of a letter in reply, dated Dec. 22, 1937, and I ask you whether that is a correct copy of the reply that you received?

A.—It appears to be.

Mr. Lewin:—I offer those two letters in evidence.

Mr. Leahy:—Does your Honor care to see these?

Mr. Kelleher:—Your Honor, to clear up the record I might say this in connection with these documents, that they tie up with the offer which we made yesterday of the proceedings of the House of Delegates for 1934, and I now desire to renew the offer of the volume concerning those proceedings. There were certain portions, if your Honor recalls, that were reserved as to the ruling until counsel for the defense could see the volume and make their objections. I now offer the other portions of the proceedings.

(After considerable discussion the following material from the proceedings of the House of Delegates was admitted as evidence. Mr. Leahy asked to record exception.)

"Proceedings of the House of Delegates of the American Medical Association," referred to and discussed at the bench, are as follows:

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

3. At the New Orleans session the House of Delegates requested an analysis of hospital staffs with a view to determining how many of the physicians connected with hospitals are members of the American Medical Association. The amount of clerical work involved has prevented a check of all the 6,437 hospitals in the country, but a sampling of a large number shows that 87 per cent of the staffs of these hospitals were members of the American Medical Association.

Since the management of hospitals is a function of ownership, it does not seem to be practicable for the Council or for the American Medical Association to lay down a rule that only members of the county society may be given hospital appointments. Obviously, there would be no way of enforcing such a rule. However, it is believed that in all institutions where the staff members have a voice in the selection of their colleagues, an effort should be made to bring into the local society every physician who may be regarded as eligible for a hospital appointment."

"RESOLUTION LIMITING PHYSICIANS ON STAFFS OF HOSPITALS APPROVED FOR INTERN TRAINING TO MEMBERS OF COMPONENT COUNTY MEDICAL SOCIETIES"

Dr. G. Henry Mundt, Illinois, presented the following resolution, which was referred to the Reference Committee on Medical Education: (45) (46)

Resolved, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement.

PROPOSED AMENDMENTS TO PRINCIPLES OF MEDICAL ETHICS

Dr. George Edward Follansbee, Chairman of the Judicial Council, presented the following three amendments to the Principles of Medical Ethics, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws: (46) (47)

1. WHEREAS, The Judicial Council in its report to the House of Delegates at the Milwaukee session in 1933 recommended the simplification of the section in the Principles of Medical Ethics relating to contract practice by the addition of the wording appearing later in this resolution; and

WHEREAS, The recommendation of the Judicial Council was approved by the reference committee to which it was referred, and was adopted by the House of Delegates; therefore be it

Resolved, That the Principles of Medical Ethics, chapter II, article VI, section 2, be amended by adding to the present wording the following:

By the term "contract practice" as applied to medicine is meant the carrying out of an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization or individual, to furnish partial or full medical services to a group or class of individuals for a definite sum or a fixed rate per capita.

Contract practice per se is not unethical. However, certain features or conditions if present make a contract unethical, among which are:

1. When there is solicitation of patients, directly or indirectly.
2. When there is underbidding to secure the contract.
3. When the compensation is inadequate to assure good medical service.
4. When there is interference with reasonable competition in a community.
5. When free choice of a physician is prevented.
6. When the conditions of employment make it impossible to render adequate service to the patients.
7. When the contract because of any of its provisions or practical results is contrary to sound public policy.

Each contract should be considered on its own merits and in the light of surrounding conditions. Judgment should not be obscured by immediate, temporary or local results. The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole.

2. WHEREAS, The growth of groups and clinics has intensified the economic competition between them and individual practitioners; and

WHEREAS, The common custom of employment of "business managers" by the clinics and groups has had a tendency to submerge the ethical principles governing competition among doctors; and

WHEREAS, Clinics and groups were little known, were not serious competition and were not mentioned when the present general revision of the Principles of Medical Ethics were adopted in 1912; be it

Resolved, That the Principles of Medical Ethics be revised as follows: Chapter I shall read (heading) "In General."

Section 1 to remain as it is.

Section 2 to be added as follows (heading) "Groups and Clinics."

"Sec. 2. The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual doctors, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession."

The remainder of chapter I becomes chapter II with its present heading.

Present section 2 of chapter I becomes section 1 of chapter II.

Present section 3 of chapter I becomes section 2 of chapter II.

Present section 4 of chapter I becomes section 3 of chapter II.

Chapter II becomes chapter III.

Chapter III becomes chapter IV.

3. Resolved, That the Principles of Medical Ethics be amended by inserting as section 4 of article VI, chapter II, "It is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body or individual employing him. Such a procedure is beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and the welfare of the people, and is against sound public policy."

RESOLUTION ON APPARENT ATTEMPT OF BOARD OF REGENTS OF THE AMERICAN COLLEGE OF SURGEONS TO DOMINATE AND CONTROL MEDICAL PRACTICE

Dr. Charles J. Whalen, Illinois, presented the following resolution, which was referred to the Judicial Council:

WHEREAS, The American Medical Association, including in its membership almost 100,000 physicians, is the only body representing all of the organized profession of this country through delegates regularly elected through county and state medical societies; and

WHEREAS, Various similar medical organizations and groups, including in their membership selected groups of specialists of various types, have from time to time issued pronouncements of policies in the field of medical economics and medical practice, which do not represent the views of organized medicine; and

WHEREAS, The House of Delegates of the American Medical Association has repeatedly condemned the issuing of such announcements and policies, which seriously embarrass the attempts of your organization to secure adequate care for the health of the American people and to protect the ideals of the medical profession; and

WHEREAS, The Board of Regents of the American College of Surgeons, assembled in Chicago on Sunday June 10, promulgated a policy including a prepayment plan for medical care, restricted to the hospitals approved by the American College of Surgeons, to members of the staffs of such hospitals, and to physicians acceptable to such staffs; and

WHEREAS, This action of the Board of Regents of the American College of Surgeons has been spread to the people of the United States through the press on the opening day of the annual session of this House of Delegates; therefore be it

Resolved, That the House of Delegates of the American Medical Association express its condemnation of such tactics and of this attempt of the Board of Regents of the American College of Surgeons to dominate and control the nature of medical practice to the detriment of professional ideals and the welfare of the public.

REPORT OF REFERENCE COMMITTEE ON MEDICAL EDUCATION

3. The resolution introduced by Dr. G. H. Mundt, delegate from the Illinois State Medical Society, specifying that the staffs of hospitals designated for intern training should comprise only members in good standing in their local county medical societies, is referred to the Council on Medical Education and Hospitals with the following comment: Your committee approves the principle of this resolution but feels that its general application at the present time is inadvisable. Paragraph 3 of the report of the Council indicates that approximately 87 per cent of the staffs of the 6,437 hospitals of the country are members of the American Medical Association.

Dr. Abell moved that the first section of the report, dealing with the printed report of the Council on Medical Education and Hospitals, be adopted. The motion was seconded by Dr. Arthur J. Bedell, New York, and carried.

Dr. Abell moved that Section 3 of the report, referring to the resolution limiting physicians on staffs of hospitals approved for intern training to members of component county medical societies, be adopted. The motion was seconded by Dr. William H. Ross, New York.

Dr. G. Henry Mundt, Illinois, moved as a substitute motion that the resolution as introduced by him be adopted. The substitute motion was seconded and carried, after discussion by Drs. R. W. Fouts, Nebraska; John F. Hagerty, New Jersey; B. F. Bailey, Nebraska; James E. Paullin, Jr., Section on Practice of Medicine; Irvin Abell, Kentucky; William F. Bowen, Kansas; C. S. Gorsline, Michigan; W. E. Bannen, Wisconsin; Virgil E. Simpson, Kentucky; Charles B. Wright, Board of Trustees; Mather Pfeifferberger, Illinois; E. H. Cary, Texas; Leonce J. Kosminsky, Arkansas, and Horace Reed, Oklahoma.

REPORT OF THE REFERENCE COMMITTEE ON AMENDMENTS TO THE CONSTITUTION AND BY-LAWS

Dr. H. H. Shoulders, Chairman, presented the following report: Three amendments to the Principles of Medical Ethics were referred to your committee for consideration. They were all prepared by the Judicial Council and introduced by the Chairman, Dr. G. E. Follansbee, who came before the committee to give valid reasons for the adoption of each of these amendments.

Your committee finds that the amendments do not add any new principles. They all serve the purpose of facilitating the interpretation of the principles by the membership at large.

Your committee cannot describe these amendments in language more brief than the amendments themselves:

1. WHEREAS, The Judicial Council in its report to the House of Delegates at the Milwaukee session in 1933 recommended the simplification of the section in the Principles of Medical Ethics relating to contract practice by the addition of the wording appearing later in this resolution; and

WHEREAS, The Recommendation of the Judicial Council was approved by the Reference Committee to which it was referred, and was adopted by the House of Delegates; therefore be it

Resolved, That the Principles of Medical Ethics, chapter II, article VI, section 2, be amended by adding to the present wording the following:

"By the term 'contract practice' as applied to medicine is meant the carrying out of an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization or individual, to furnish partial or full medical services to a group or class of individuals for a definite sum for a fixed rate per capita.

"Contract practice per se is not unethical. However, certain features or conditions if present make a contract unethical, among which are: 1. When there is solicitation of patients, directly or indirectly. 2. When there is underbidding to secure the contract. 3. When the compensation is inadequate to assure good medical service. 4. When there is interference with reasonable competition in a community. 5. When free choice of a physician is prevented. 6. When the conditions of employment make it impossible to render adequate service to the patients. 7. When the contract because of any of its provisions or practical results is contrary to sound public policy.

"Each contract should be considered on its own merits and in the light of surrounding conditions. Judgment should not be obscured by immediate, temporary or local results. The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole."

2. WHEREAS, The growth of groups and clinics has intensified the economic competition between them and individual practitioners; and

WHEREAS, The common custom of employment of "business managers" by the clinics and groups has had a tendency to submerge the ethical principles governing competition among doctors; and

WHEREAS, Clinics and groups were little known, were not serious competition and were not mentioned when the present general revision of the Principles of Medical Ethics were adopted in 1912; be it

Resolved, That the Principles of Medical Ethics be revised as follows: Chapter I shall read (heading) "In General."

Section 1 to remain as it is.

Section 2 to be added as follows (heading) "Groups and Clinics."

"Sec. 2. The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual doctors, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession."

The remainder of chapter I becomes chapter II with its present heading.

Present section 2 of chapter I becomes section 1 of chapter II.

Present section 3 of chapter I becomes section 2 of chapter II.

Present section 4 of chapter I becomes section 3 of chapter II.

Chapter II becomes chapter III.

Chapter III becomes chapter IV.

3. Resolved, That the Principles of Medical Ethics be amended by inserting as section 4 of article VI, chapter II, "It is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body or individual employing him. Such a procedure is

beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and the welfare of the people, and is against sound public policy."

Your committee recommends the adoption of the amendments.

Respectfully submitted,

H. H. SHOULDERS, Chairman.

J. N. HUNSBERGER.

H. C. MACATEE.

E. A. HINES.

R. L. SENSENICH.

The recommendation of the committee that section 2, article VI, chapter II of the Principles of Medical Ethics be amended, as suggested in the first amendment submitted by the Judicial Council, was adopted on motion of Dr. Shoulders, seconded by Dr. Arthur C. Morgan, Pennsylvania, and carried. Dr. Arthur C. Morgan, Pennsylvania, then moved that section 2, article VI, chapter II of the Principles of Medical Ethics be amended as recommended by the Reference Committee. The motion was seconded by Dr. Arthur J. Bedell, New York, and carried.

Dr. Shoulders moved the adoption of the recommendation of the Reference Committee approving the amendment to chapters I, II and III of the Principles of Medical Ethics, as suggested by the Judicial Council in its second proposed amendment. The motion was seconded by Dr. Arthur C. Morgan, Pennsylvania, and carried. Dr. Arthur C. Morgan, Pennsylvania, thereupon moved that these chapters of the Principles of Medical Ethics be amended in accordance with the recommendation of the Reference Committee. The motion was seconded by Dr. A. J. Scott, Jr., California, and carried.

On motion of Dr. Shoulders, seconded by Dr. Charles H. Goodrich, New York, and carried, the recommendation of the Reference Committee that section 4, article VI, chapter II of the Principles of Medical Ethics be amended as suggested by the Judicial Council in its third proposed amendment, was adopted, after discussion by Dr. R. W. Fouts, Nebraska, and Dr. Shoulders. Dr. Arthur J. Bedell, New York, moved that the Principles of Medical Ethics, section 4, article VI, chapter II, be amended in accordance with the recommendation of the Reference Committee. The motion was seconded by Dr. A. J. Scott, Jr., California, and carried.

REPORT OF THE JUDICIAL COUNCIL

Dr. George Edward Follansbee, Chairman, presented the following report:

A resolution introduced by Dr. Charles J. Whalen, Illinois, calls attention to a recent action by the Medical Service Board of the American College of Surgeons approved by its Board of Regents, advocating and publicizing a procedure for furnishing medical and hospital care for certain classes of the population. No consideration appears to have been given to policies or procedure previously adopted by the American Medical Association, of which the Board of Regents are members. The American Medical Association is the one organization representing the entire body of physicians constituting the medical profession and by virtue of that fact is the only organization qualified to speak for the varying interests and ideas of the profession as a whole.

Recurring proposals concerning the entire practice of medicine from small sections of the profession without due regard to the policies of the entire profession as represented by the American Medical Association when presented to the public through other channels than the representative body are confusing to the public mind, are harmful to the profession and give aid and assistance to those bodies and individuals attempting to revolutionize medical practice.

The Judicial Council therefore recommends the adoption of the resolution as follows:

WHEREAS, The American Medical Association, including 100,000 physicians, is the only democratic body representing the organized profession of this country through delegates regularly elected through county and state medical societies; and

WHEREAS, Other medical organizations and groups, representing selected groups of specialists, have from time to time issued pronouncements of policies in the field of medical economics and medical practice, which do not represent the views of organized medicine and which purport to guide the medical profession and the public in the administration of medical affairs; and

WHEREAS, The House of Delegates of the American Medical Association has repeatedly condemned the issuing of such announcements and policies, which seriously embarrass the attempts of this organization to secure adequate care for the health of the American people and to protect the ideals of the medical profession; and

WHEREAS, The Board of Regents of the American College of Surgeons, assembled in Chicago on Sunday, June 10, promulgated a policy including a prepayment plan for medical care, restricted to so-called "approved hospitals" to members of the staffs of such hospitals, and to physicians acceptable to such staffs; and

WHEREAS, This action of the Board of Regents of the American College of Surgeons has been spread to the people of the United States through the public press on the opening day of the annual session of this House of Delegates; therefore, be it

Resolved, That the House of Delegates of the American Medical Association express its condemnation of such tactics and of this apparent attempt of the Board of Regents of the American College of Surgeons to dominate and control the nature of medical practice; and be it further

Resolved, That the House of Delegates request the Board of Trustees of the American Medical Association and the Judicial Council to ask the Board of Regents of the American College of Surgeons, who are themselves members of the American Medical Association, to explain the reasons for their action and to justify the attempt by this small group within a specialist organization to legislate for all the medical profession of this country, truly represented by the American Medical Association.

The report of the Judicial Council was adopted on motion of Dr. C. E. Humiston, of Illinois, seconded by Dr. Albert Soiland, Section on Radiology, and carried unanimously.

REPORT OF SPECIAL COMMITTEE

Dr. Nathan B. Van Etten, Chairman, read the following report of the Special Committee appointed to consider the resolution from the delegates of the State of Michigan submitted to the House of Delegates and a statement of the Board of Trustees concerning Sickness Insurance in the United States:

1. The following resolution was submitted by delegates of the Michigan State Medical Society:

WHEREAS, There is substantial evidence that powerful forces and agencies are working toward the development of health insurance in the United States; and

WHEREAS, During the course of its studies of medical economic problems, the Michigan State Medical Society, after a conference with officials of the American Medical Association, found it necessary to send a commission to England to inquire into the subject of health insurance; and

WHEREAS, The commission presented the following reports . . . (which has been printed in full in the *Journal of the Michigan State Medical Society* and placed in printed form in the hands of all of the delegates of this House); and

WHEREAS, The report of the commission raises certain grave questions concerning the policy of the officials of the American Medical Association toward health insurance and the effects of this policy on the practicing membership of the American Medical Association; and

WHEREAS, The report of the commission was transmitted to the Board of Trustees of the American Medical Association through the chairman in February 1934; and

WHEREAS, The Michigan State Medical Society has received no word nor has it any other evidence that the Board of Trustees of the American Medical Association has considered or acted on the report transmitted in February 1934; therefore be it

Resolved, That in order to avert a repetition in the United States of the disastrous consequences that attended the adoption of health insurance in England, the Speaker of the House of Delegates of the American Medical Association appoint a committee to investigate and consider the policy of the Association toward health insurance and present a report to the House of Delegates.

Dr. Van Etten moved that the first section of the report, dealing with the resolution on health insurance submitted by the Michigan State Medical Society, be adopted. The motion was seconded by Dr. Carl F. Moll, Michigan, and Dr. C. F. Gorsline, Michigan, and carried.

Section 2 of the report, referring to the criticisms of policy and the sincerity of officials of the American Medical Association, was adopted on motion of Dr. Van Etten, seconded by Dr. L. J. Hirschman, Michigan, and carried.

On motion of Dr. Van Etten, seconded by Dr. Joseph F. Smith, Wisconsin, and carried, the third section of the report, relative to the statement of the chairman of the Board of Trustees reviewing the action of the House on the question of health insurance, was adopted.

Dr. Van Etten moved that section 4 of the report, dealing with the pamphlet entitled "Sickness Insurance Problems in the United States," be adopted. The motion was seconded by Dr. Arthur C. Morgan, Pennsylvania, and carried after discussion by Dr. Julius B. Harris, California, Dr. William C. Woodward, Director of the Bureau of Legal Medicine and Legislation, Dr. Walter E. Vest, West Virginia, and Dr. Holman Taylor, Texas, in which it was agreed that the words "legally qualified doctor of medicine" should be substituted for the word "physician" in the third principle.

On motion of Dr. Van Etten, seconded by Dr. Arthur C. Morgan, Pennsylvania, and carried, the report, as amended, was adopted as a whole.

By Mr. Levin:

Q.—On the bottom of Government Exhibit 30 appear certain initials of the writer, and I take it of the stenographer. Will you tell the jury what those initials are and the names of the persons for whom the initials stand. First the initials of the writer.

A.—I think the writer is Dr. C. M. Peterson.

Q.—Do you know who Dr. C. M. Peterson was at that time?

A.—I can't say that I do.

Q.—Do you know whether he was connected with the American Medical Association?

A.—I know he was associated with the American Medical Association.

Q.—Do you know whether he was identified with the Council on Medical Education and Hospitals?

A.—I am not certain; I think he was.

Q.—Do you know who the secretary of that association was at that time?

A.—Dr. William Dick Cutter.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—In your letter of December 14, you asked for the requirements or regulations, did you, governing hospitals? For the hospital staffs?

A.—Yes, sir.

Q.—I notice in the blue sheet, "Enclosed are the regulations": Where are they?

A.—I don't know.

Q.—Were the regulations enclosed with the letter?

A.—I can't remember.

Q.—You don't know where they are now?

A.—I do not.

Mr. Leahy:—That is all.

THE COURT:—Those letters will be admitted.

TESTIMONY OF DOROTHY EVERETT

DIRECT EXAMINATION

Dorothy Everett, Chevy Chase, Maryland, was employed by the District Medical Society, from February, 1924, to Sept. 29, 1938 as clerk and stenographer.

She identified correspondence of Drs. Conklin, Hoce, Neill, and Sprigg.

Mrs. Everett also took notes of meetings to get the gist of the conversations, that is, of the business sessions.

THURSDAY, FEBRUARY 13, MORNING

TESTIMONY OF DOROTHY EVERETT (Resumed)

Mr. Kelleher:—Your Honor, in order to expedite the introduction of these documents through this witness, we have now given photostatic copies of the documents which we intend to offer, to Mr. Leahy, and if it is agreeable with your Honor we would like to have the witness identify the originals and I will hand them to you, which will permit your Honor to read the document while counsel for the other side is examining it.

THE COURT:—Very well.

The witness identified letters further including:

Circular letter 7/29/37 from Dr. Conklin
Letter 11/5/37 Neill to Warfield
Letter 12/10/37 Hoce to D. C. Medical Society
Letter 2/25/38 Conklin to Hoce
Letter 5/18/38 Hoce to Sprigg
Letter 5/14/38 Hoce to Tribble
Letter 5/31/38 Conklin to Tribble
Letter 6/7/38 Sprigg to Tribble
Letter 11/10/37 Hoce to Lee
Letter 11/22/37 Hoce to Lee
Letter 11/19/37 Lee to Hoce
Letter 11/24/37 Spriggs to Lee
Letter 11/27/37 Hoce to Scandiffio
Letter 11/18/37 Neill to Scandiffio
Letter 11/10/37 Hoce to Scandiffio
Letter 11/22/37 Hoce to Scandiffio
Letter 11/24/37 Spriggs to Scandiffio
Letter 1/29/38 Conklin to Blair
Letter 1/27/38 Blair to D. C. Medical Society
Letter 1/29/38 Conklin to Warfield
Letter 11/25/37 Conklin to Warfield
Letter 9/13/37 Conklin to Woodward

CROSS EXAMINATION

By Mr. Leahy:

The cross examination covered the nature of the records, the fact that Mrs. Everett occasionally had a substitute; meetings were held in a large auditorium.

TESTIMONY OF MICHAEL DAVIS

DIRECT EXAMINATION

Michael M. Davis stated he is a doctor of philosophy, graduate of Columbia University, in 1906.

From 1910 to about 1920, he was in charge of the Boston Dispensary, a large clinic with a small hospital. In 1920, he returned to New York City and was chairman of a committee on dispensary development, which was financed by a grant from the Rockefeller Foundation, to improve the standards of clinics and dispensaries in New York, and throughout the country. He was also a consultant in hospital organization, and made studies of hospitals and clinics in different cities. He was continuously occupied with that work, giving it all his time in the latter part of the period from 1925 to 1929.

Q.—Briefly, what is a consultant on hospital organization?

A.—A consultant on hospital organization; well, in that capacity I would call, invited by individual hospitals or community chests, or other organization; I would go to a city, Cleveland, New York, for example, and study the needs of the city; its hospitalization needs; whether the present existing hospitals were sufficient; whether additional hospitals and clinics were needed; make a report to the local organization as to what was needed, if anything; make a general study of the entire subject in so far as it related to that particular locality.

Q.—During the period while you were with the committee on dispensary development did you organize any pay clinic?

A.—Yes, I organized a pay clinic, which I might explain, is a clinic for people who can pay for the care they get, for the medicines, et cetera; who can pay a fee, including payment to

the doctor in the clinic; I organized a small one in Boston and a larger one in New York, under the auspices of the Cornell Medical College.

He remained with the committee on dispensary development until the beginning of 1927, and until 1929 was on a consultant basis. In 1929 he went to Chicago to be director for the Medical Service of the Julius Rosenwald Fund, a philanthropic foundation, established by Mr. Julius Rosenwald, the late president of Sears, Roebuck Company, for the welfare of mankind. The purposes of the Foundation were to give money to worthy causes within the field of the Foundation and designated for its activities.

Q.—Is it limited to the field of medicine?

A.—No, it is, or I should say, its main field was Negro welfare, Negro education; Negro health in the South. The medical side was secondary, although a fairly important part of the Fund's work.

Q.—Did you tell us what your position was with the Julius Rosenwald Fund?

A.—I was in charge of all their medical activity, that is to say, in making grants of any money for any medical purposes we thought worthy. Our business was to make a study of the desirability of making a grant where it was applied for and I was also responsible for making studies of medical development generally, and directly for the Funds in the field that is to be expended or were to be expended in the field of economics of medicine, or medical economics; that is the cost of medical care.

Q.—Did you teach at the University of Chicago?

A.—Yes, for most of the time from 1931 to 1936 I held a teaching position on the faculty of the University of Chicago, teaching a course on "Social Aspects of Medicine in the Development of Sociology"; and I also took charge of a course in hospital administration to teach men and women the management of hospitals. That course was started in the University of Chicago about 1933, and continued there while I was at that institution, and, thereafter by some one else.

Q.—During that period while you were with the University of Chicago, did you sponsor an annual institute for the American Hospital Association?

A.—It ran an annual institute which I was in charge of, the American Hospital Association; the institute being designed to help men and women who were already in charge of hospitals to improve their knowledge, by bringing them together for meeting and discussion, two or three times yearly.

Q.—Are you still with the Julius Rosenwald Fund?

A.—I am not with the Fund. I am working with a committee, to which the Fund has granted money; so while I am not directly with the Fund, I am with this committee which is operating with the assistance of the Fund.

Q.—What is the name of that committee?

A.—Committee on Research on Medical Economics.

Q.—Did you ever serve on any committee with Dr. Hugh Cabot?

A.—Yes.

Q.—Will you please tell us the name of that committee?

A.—A committee for the study of group medical practice, which Dr. Cabot and I and several other men were members of; the active work having been done a year, two years ago; about a year ago. The committee's work was organized for the purpose of studying group medical practice, and its chief task was to prepare a statement of principles under which group practice should be conducted.

Q.—You have stated that you made, as a hospital consultant, you made certain studies of hospitals in various large cities of the United States. Will you tell the jury the nature of those studies?

A.—The studies were for the purpose usually of finding out the needs of the cities; their need for additional hospitals; the adequacy of the hospitals; the extent to which they were used, and in some institutions the study might be asked by a single institution where the board of trustees wanted a study made to determine just how that hospital was being run and whether its management or organization could be improved in certain ways. Some studies were also made for the purpose of studying enlargements of any existing buildings, and extensions of facilities offered.

Q.—Did you in the course of those studies familiarize yourself with the organization of staffs of hospitals?

A.—The organization of hospital staffs, I have to do that, to familiarize myself with every phase of that in order to make such studies.

Q.—Will you also tell us whether you were affiliated with any national organization of hospitals?

A.—I have been a member of the American Hospital Association for about 25 years, or more; have been a Fellow of the American Public Health Association; have been very active in the American Hospital Association; was chairman of their council for the years 1935 and 1936, and then just finished a three-year term as chairman of a committee on education. I have been chairman of a committee of the American Public Welfare Association, and have been active in the American College of Hospital Administrators, which is an organization for the training of hospital administration. I am an honorary Fellow of that organization.

Q.—Will you tell us whether you have written anything for publication on hospitals and medical care?

A.—I have published a number of books on the subject. A book in 1907 on dispensaries; a larger book in 1937 on clinics and hospital and health matters dealing with their management and organization. Then several books on the cost of medical care, "Paying Sickness Bills" in 1931; a volume in which I collaborated with Dr. Rowland, in 1932; a book on public medical services in 1937; a book on hospital administration as a career in 1929. I have written a large number of articles for professional and lay journals on hospital subjects and the cost of medical care, and related matters.

Q.—Now, I should like to ask you a few questions on hospital matters. Will you compare first the value and importance of hospitals as of today with those of such hospitals in the past?

A.—Yes. The hospitals are very much more important today than they were 60 or 70 years ago; in 1940, as compared with 1870. In 1870 the population of the United States was 40,000,000 persons. At that time there were approximately 50,000 hospital beds in the whole country. In 1940, the population was 133,000,000, and the number of hospital beds 1,200,000. That means that during that period, while the population of the country grew about three and one-third times the number of hospital beds increased twenty-four times. There were approximately one and a quarter beds per one thousand of population in 1870, and somewhat over nine hospital beds per 1,000 in 1940.

Q.—Dr. Davis, do you know approximately what the investment in hospitals is today?

A.—The amount of investment in hospitals and clinics and their subsidiary buildings is somewhere between three and a quarter and three and a half billion dollars in the United States.

Q.—What is the source of that investment?

A.—The great bulk of that money, that investment in the hospitals has resulted from gifts or grants either by private individuals, or local and state bodies, federal government to some extent, minor extent, putting tax money in equipment of hospitals.

Q.—Are you familiar with the extent to which doctors are utilizing these hospitals today?

A.—The figures, the figures of the American Medical Association show that approximately two thirds of all doctors in the United States have some affiliation with a hospital; that is, the large majority have affiliation with hospitals.

Q.—Do you know whether doctors consider affiliation with hospitals of value to them in the practice of their profession?

A.—They consider it very valuable and important. Of course, in surgery, for instance, the connection with a hospital, which entitles a surgeon to treat and operate on his patient in a hospital, is practically essential to the conduct of his practice. It is also very important to any physician otherwise; whether he be a medical man or a surgeon.

Q.—Will you tell us what kind of hospitals there are from the point of view of service?

A.—Hospitals, general hospitals, which treat any kind of acute ailment or illness brought to them; and special hospitals, such as mental, tubercular, eye and nose and throat, and maternity; such hospitals take only those cases specified.

Q.—And the latter type of hospital is called a special hospital?

A.—Yes.

Q.—I should like now to have you describe about how hospitals are organized, first. Who handles the financing and business affairs of hospitals?

A.—The hospital usually, not always, but as a rule, hospital finances and the ownership of the property is vested in a lay board or committee, usually a board of trustees, sometimes the governing body of a church, which holds title to the property and is responsible for the finances; the business management of the institution.

Q.—What are the duties of such a lay body?

A.—It is the owner and controller of the hospital. Its duties are to manage the hospital property, to see that it is properly conducted; and its duties are also to appoint the medical staff, that is, the physicians and surgeons, who do the actual medical professional work of the hospital, for which it was established.

Q.—Is it possible for such a lay body to handle the finances of the institution, to handle the management of the business end of it, without interfering with the medical offices of the hospital, the doctors?

A.—They do it all the time. The typical American hospital is run in friendly cooperation with the medical staff, composed of the doctors appointed by the board, and the lay board; and with this body and its executive officer, or superintendent, who is the business executive or general manager of the hospital for the governing body.

Q.—You referred to the medical staff. I assume you mean the regular or attending medical staff?

A.—Yes, the regular or attending medical staff which is appointed by the lay body, and who have the responsibilities incident to the professional work, the medical work in the hospital.

Q.—Will you be a little more specific about the duties of the medical staff?

A.—Yes, the medical staff consists, not only of a certain number of physicians and surgeons who are appointed as individuals and who are given the privilege of treating patients in the hospital; it is also an organization of physicians required by national professional standards to provide medical care, so that the attending staff has its own organization, let us say, a governing body for its own professional work, and, through that body, studies and controls the professional standards of the hospital, subject, of course, to the oversight of the lay body, which has the legal control of the property of the institution. A wise lay body does not interfere with the professional work in the hospital. That is a matter which is, and properly should be, left to members of the medical profession.

Q.—Who supervises the charity cases that come to the hospital?

A.—The charity work for hospital patients treated free by the physicians is controlled by the governing board who must decide how much charity work they can do. The professional staff give each a part of their time to caring for free patients in the wards of the hospital.

Q.—And do they also supervise the work of the outpatient department in the hospital if it has one?

A.—The outpatient department for people who are able to be up and about and come to the institution for care without going to bed is supervised again by the lay governing body in general and actually controlled and managed by the physicians who are in the clinic of the hospital and do the actual work in caring for the sick.

Q.—Dr. Davis, are the regular staff of the hospital paid a salary?

A.—In some cases, yes, but as a rule most of the staff are not paid a salary. They get their remuneration by having private practice in the hospital without being paid by the hospital, in most instances.

Q.—Who pays the medical staff?

A.—If the medical staff are paid they may be paid by the hospital, but that is in the minority of cases. The attending physician or surgeon who carries on the private practice is paid directly by the patient himself and by the private arrangement between the patient and physician who cares for him in the hospital.

Q.—Dr. Davis, is membership on the regular staff of the hospital of any value to a doctor?

A.—Membership on the regular staff of the hospital is of much value to the doctor, because it gives him definite prestige, which helps his whole practice.

Q.—How does that prestige help him?

A.—Connection with a hospital is regarded in the medical profession and also by a large portion of the general public as something that is a sign of good standing in the medical profession. A physician who is a member of a good hospital staff has a definite prestige as a result of such background.

Q.—Doctor, I assume you have been speaking during your testimony about the regular or attending staff?

A.—Yes.

Q.—Do the hospitals also have what they call courtesy staffs?

A.—A great many hospitals have in addition to their regular staffs, a courtesy staff, which may be small or may be very numerous, a courtesy staff of physicians who are given by this appointment of the lay board, the privilege of treating patients in the hospitals under certain restrictions which may be laid down, but who are not members of the hospital organization and do not share in the professional responsibility and standards of the hospital.

Q.—Does the courtesy staff share in any of the affairs of the hospital?

A.—As a rule the members of the courtesy staff are invited to staff meetings in which disease problems and cases are discussed.

Q.—And when they are invited to a meeting, it is for the benefit of the doctor who enjoys that courtesy staff privilege?

A.—It is something he gets through being a member of the courtesy staff.

Q.—Dr. Davis, you stated that the lay board appoint the members of the courtesy staff. What function does the regular medical staff play in the appointment of the courtesy staff?

A.—The regular staff, usually through its staff committee or the board chosen by it, usually nominates or advises the lay board as to the physicians who should be appointed on the courtesy staff.

Q.—And as a rule, or as a matter of general practice, does the lay body generally follow the recommendations of the regular medical staff?

A.—They usually follow the recommendations of the medical staff. They appreciate the qualifications of a physician can best be determined by other physicians who act responsibly for the lay board.

Q.—Doctor, excluding emergency cases, can a doctor use hospital facilities in the United States except as a member of the regular or courtesy staff of a hospital?

A.—By and large, no, he may not. There are some hospitals which are open to anybody, but those are exceptions.

Q.—Dr. Davis, are you familiar with whether hospitals are inspected and approved by organizations in the country?

A.—Yes. Necessarily, visiting and studying hospitals, I have had to be familiar with those approval systems. The American Medical Association inspects a certain number of hospitals to determine whether they should be approved to receive interns for training.

Q.—What other organization inspects and approves hospitals?

A.—The American College of Surgeons also inspects hospitals and has an approved list of hospitals that have passed its inspection as having met its standards. There are various other bodies which in some of the states under the state law inspect hospitals; some of the nursing bodies in some of the states inspect hospitals to determine whether they are of the proper standing to train nurses.

Q.—Dr. Davis, are you familiar with the American Medical Association hospital register?

A.—Yes. The American Medical Association publishes a list of registered hospitals which is, on the whole, the most complete and authoritative list of hospitals we have.

Q.—Is registration of this register of hospitals of value to a hospital?

A.—A hospital which is not on the registered list of the American Medical Association is definitely regarded, as a rule, as suffering from the exclusion. Those hospitals are generally regarded as being inferior to hospitals that are on the registered list.

Q.—Is there any limitation in the size of the hospital as to whether it will be registered in the A. M. A. registry?

A.—The size of a hospital does not bear on inclusion in the registry list. It does bear on the list for approval for training interns.

Q.—All right. Let us get to that matter. Will you tell us, Doctor, briefly, what an intern is?

A.—An intern is a physician who has just graduated from medical school, received his four-year course, and who is taking one or more years learning in hospital work in a continuation of his training period. In a hospital he has opportunity to work with sick people under the direction of the staff.

Q.—And is an internship a part of a doctor's education today?

A.—The internship has come to be regarded as an essential part of the doctor's training. One or more years' internship in a hospital is now regarded as an essential part of a doctor's training.

It is a legal requirement in some of the states but is regarded as a professional requirement in some states.

Q.—Dr. Davis, what is a resident?

A.—A resident is one who is working in a hospital but who is further along and is working in a specialty, surgery or eye work or nose and throat work. He is working to train to practice in a specialty.

Q.—Dr. Davis, do most of the hospitals pay interns for their services?

A.—A good many hospitals pay interns but the payment is only nominal. It ranges from \$15 to \$25 a month.

A good many don't pay anything at all. The training is such that he seeks the training with little or no compensation. He is given his lodging and maintenance while he is in the hospital.

Q.—What does the hospital receive in return for training the intern?

A.—The hospital gains a certain amount of actual services in caring for sick people from the work of the intern. He is an unpaid and very hard worker during the period of his internship. He is learning by working very hard.

A hospital also gains a certain amount of prestige from being regarded as sufficiently good to train interns.

Q.—Dr. Davis, does the A. M. A. approve hospitals for the training of residents as well as interns?

A.—Yes.

Q.—Will you tell us now whether the A. M. A. considers the size of a hospital in passing on approval of the hospital for the training of interns?

A.—Yes. The general standards are a hospital which has as many as one hundred beds and as many as seventy-five patients. I believe there are exceptions to that but in general that is the size, the smaller hospitals generally being regarded as not being sufficiently large to give valuable training to an intern.

Q.—Dr. Davis, what is the importance of A. M. A. approval so far as the ability of the hospital to obtain interns is concerned?

A.—Approval by the American Medical Association for receiving interns is extremely important to a hospital. A hospital which does not have that approval will generally find it impossible to obtain young men who will be willing to go there and work as interns. So that if a hospital wishes to have interns, and most hospitals wish very much to have interns, it is extremely important from their point of view that they have approval.

Q.—What is the effect on the prestige of a hospital of the withdrawal of approval for intern training?

A.—If a hospital would lose its approval for receiving interns and it could no longer get interns willing to come to it and work there for their training, it would lose, in the first place, the services of these young men.

If it were to continue, generally speaking, the same quality of service to the patients, it would have to employ them, on salary; not a nominal amount but a salary; young medical men to do the work which the interns would do if they were there. So there would be a substantial financial loss to the hospitals if that approval were taken away.

And the hospital also loses prestige. Physicians on its regular staff would feel that the hospital had suffered substantially. They might be inclined, some of them, to shift their patients to other hospitals.

Q.—And why will graduates from medical schools refrain from taking their internship at hospitals not approved by the A. M. A.?

A.—The young medical man is keen to get the best training that he possibly can. He seeks an internship in a place which will give him not only good training as he understands it, but also will give him good standing in the profession, so that when he gets through the internship and into practice he will be able to have the good will and good opinion of other physicians; and if he has had internship in a hospital which is regarded as not up to form, it is a definite handicap to the young man if he has had his training there.

Q.—Dr. Davis, would it ordinarily make any difference in the effect upon the hospital of the loss of approval if the reason for the approval was withdrawn?

A.—Well, if the reason were publicly known and clearly defined, the local community might consider that, but in general the reasons are not likely to weigh with a great many people, doctors and lay people. The mere fact that the hospital is not on the approved list is going to be a handicap to it.

Q.—And will have the effects which you have described?

A.—Yes.

Q.—Dr. Davis, were you a member of the committee on the costs of medical care?

A.—Yes, sir.

Q.—Will you describe the formation of that committee, please? (The witness then described the organization, work of and results of the Committee on the Costs of Medical Care.)

The chairman was Dr. Ray Lyman Wilbur. The committee originally was formed of fifty members. It ended its fifth year with forty-eight, because of deaths and unfilled places. Of the forty-eight members twenty-five were doctors, one of the twenty-five being a dentist as well as a doctor. Fourteen of the twenty-five doctors were engaged in private practice. Others on the committee included men engaged in public health work who are not physicians, as well as several physicians who are engaged in public health work; several prominent sociologists and economists; There were three dentists on the committee, two nurses; two or three men connected with pharmacy or with

the drug business; and a number of people engaged in social or civic work, and men of general public interest. Nobody on the committee represented officially any organization.—

A.—The committee of the costs of medical care made a series of studies of the amount of service, the cost of service, and various other subjects, and published reports of the findings of the studies. The committee also after it had completed its studies made recommendations as to what should be done to make medical care more available.

One very important study was a study made of about nine thousand families from all parts of the United States to find out how much sickness they had in the course of a year; how much care they had for the sickness which they experienced; and what the care cost them.

This study was carried on by having each family visited approximately every six weeks or two months throughout the whole year by a trained person who found out the general facts about the family, what sickness they had had, what care they received, and what they had spent for their care.

The committee made studies of the medical care in certain communities. It studied the care in Philadelphia and Detroit. It studied some rural areas in the South and a county in Indiana and a county in California.

It made a study as to the incomes of physicians, the incomes of dentists, in cooperation with the American Dental Association.

Finally the committee made a study of new plans of medical care; it made a study of some prepayment plans where the employees of a large corporation get medical service and pay for it on a weekly pay roll deduction basis.

It studied plans of medical care furnished by universities for their students; it studied the medical care of the Army, at one of the large Army posts.

So it became familiar through its reports with various new plans and types of organized schemes of medical care.

There was an executive committee of eight persons which supervised every study. Technical people were employed to carry on the details. That staff was closely supervised by the executive committee, which planned the studies with the staff and which read and criticized the studies as the material came in from the field, with the members of the staff; the executive committee meeting every month.

The nine thousand families were selected so that they would represent in communities of different sizes all of the types of income groups, some people who were very poor, on relief, up to comfortable incomes. They were also selected from different parts of the country and different sizes of family.

The selection was made by selecting different types of community and then turning to the local people for help in selecting the family. A family known to be of a certain economic type were visited routinely. In other cases they were selected by those who were able to pick the families or advise the committee they were picking the proper families.

Each of the families was visited not more than a two months period to not more than a twelve weeks period, so the facts of the family were obtained.

The families were classified as to income under \$1,200, under \$2,000, \$2,000 up to \$3,000, \$3,000 to \$5,000, \$5,000 to \$10,000, and \$10,000 or over.

Q.—Will you tell us approximately how many individuals were involved in these nine thousand families?

A.—Approximately thirty-eight thousand individuals.

Q.—What conclusions did the committee on the costs of medical care reach concerning the relation between the amount of medical care received by the families and their incomes, as a result of the studies of these nine thousand families?

A.—Roughly, the more income families had the more medical care they received. We can measure the medical care in terms of the number of visits from or to a physician during the course of a year. For families of income under \$1,200 a year it showed an average of one and nine-tenths visits from or to a physician during the course of a year. The number of calls or visits from or to a physician increased with each increase in income, until at the top level families of income of \$10,000 and over received four and seven-tenths visits from or to a physician during the course of a year. So there was a steady progression.

Another way of measuring the amount of care, of course, is in relation to hospitalization. The average amount of hospitalization is measured in terms of the hospital days; that is, a person who goes to a hospital and spends one day there, that is recorded as a unit of hospital service, one patient-day's care. Now, in that unit we found a very interesting and surprising thing with families of the lowest income, some of whom were on relief. The average amount of care received by an individual in a hospital during a year was nine tenths of a hospital day; a little less than one day's care. When we moved to the

next group, \$1,200, the amount of hospital care dropped to about sixty-six one-hundredths; that is about two thirds of a hospital day instead of nine tenths. Then, after that, in general, the amount of hospital care received rises with income, reaching about one and two tenths hospital days' care for the families of incomes of \$10,000 and more; hospital day's care for the person in that group.

There were a substantial number of families, not quite half the total number, of individuals, who received no medical care. Of course, it is clear that there are two reasons for that; one is that they are not sick; the other is that they were sick but didn't get care. So the percentage of persons not receiving care throughout the year was about 47 per cent of the total number of persons. That percentage, however, was less among people with larger incomes than among people with smaller incomes, so there again was a shift as we went up in the income scale, the proportion of people who received no care, medical care, during the year, grew less, substantially less. Among the highest income group only about one person in seven went without any medical care during the year; whereas, of the lowest income group about half went without any care.

By Mr. Kelleher:

Q.—Did the study consider whether there was any reason why there should be less sickness in the low income groups than in the high income groups?

A.—This study did not make a particular investigation of that point.

Q.—Have you made any investigation of that point?

A.—I have not personally. I am familiar with studies which I regard as authoritative which have made investigations of that point.

Q.—What have those studies shown?

Mr. Leahy:—Let us see what the studies showed.

By Mr. Kelleher:

Q.—What are the studies?

A.—After the committee on medical care a number of additional studies have been made.

For example, several studies conducted by the Milbank memorial fund entitled "Health and the Depression"; then another study conducted in 1935 and 1936 by the Government through the United States Public Health Service, usually called the National Health Service.

Those studies led to certain conclusions on the matter you have asked me. I regard those studies as authoritative.

They reached the conclusion that there was more sickness generally among people of small income than among people in comfortable circumstances. The difference isn't as great as the difference in income, but on the whole, people in the smaller income groups have more sickness; as shown by these studies. The study of these nine thousand families led to the conclusion, which we all knew in advance, that sickness falls unevenly, and its cost likewise. It did, however, give us some figures showing how unevenly the burden does fall. For instance, in the income group of between twelve hundred and two thousand a year about 5, a little more than 5 per cent of the families, had relatively large sickness bills running through—in the year, running to a total of \$250 or more; and that 5 and a fraction over per cent of the families had spent for sickness 32 per cent of the total amount spent by all the families. If we compare that with the families who had little sickness and low costs therefore, we find that almost 70 per cent of the families spent about 24 per cent of the total; whereas, a little over 5 per cent of the families spent 32 per cent of the total. So that a relatively heavy burden falls on a small proportion of the families; who, of course, cannot predict in advance whether they are going to be the lucky or unlucky ones in most of the cases.

About 10 per cent of all the families bear about 41 per cent of the total burden of sickness costs during the year. On the other hand, 58 per cent of the families bore only 18 per cent of the burden.

A large number bore a small burden and a small proportion bore a heavy burden.

The committee made a number of recommendations, the committee making a main report signed by thirty-five of its members, and a minority—several minority reports with differing recommendations being made. The committee was not unanimous in its recommendations.

There was no criticism of the study in the minority report but the recommendation for action differed. The thirty-five included seventeen physicians.

Of the seventeen, I think nine were in private practice. The others were physicians in hospital and university and other salaried positions.

The main recommendations of the majority were to develop the medical care on a group payment, that is, on a prepayment basis, preferably in association with group medical practice.

The main minority report criticized group payment as tending towards undesirable contract practice and various evils and criticized group medical practice; so that the main minority report did oppose these recommendations.

Defendants West and Christie were among the nine signers of the main minority report.

A final report of the committee was published called "Medical Care for the American People," at the end of 1932.

FEBRUARY 13, AFTER RECESS

TESTIMONY OF MICHAEL M. DAVIS (RESUMED)

THE COURT:—You may proceed, if you are ready, Mr. Leahy. I think Mr. Kelleher is through.

Mr. Kelleher:—Yes, I am, your Honor.

Mr. Leahy:—If your Honor please, if the Government is through with this witness the defense feels that it is not necessary to go into any cross examination, and we will ask that the witness be excused.

Mr. Kelleher:—If your Honor please, I offer in evidence portions of Proceeding of the House of Delegates of the American Medical Association, marked in red pencil on pages 21, 51, 55 and 59 of the proceedings for 1933.

Mr. Kelleher:—I am now reading from the proceedings of the House of Delegates of the American Medical Association, 84th Annual Session held at Milwaukee, Wisconsin, June 12 to 16, 1933 (reading):

"RESOLUTIONS FROM CONSTITUENT STATE MEDICAL ASSOCIATIONS REQUESTING NATIONAL MEDICAL ORGANIZATIONS TO DECLARE OPINIONS ON MEDICAL PRACTICE THROUGH APPROVED CHANNELS

The following resolution adopted by the board of trustees of the Medical Society of the State of Pennsylvania, has been transmitted to this Board:

WHEREAS, There have been formed important national organizations of physicians, specialists, other than the American Medical Association, and

WHEREAS, Such organizations fundamentally formed for scientific purposes have from time to time publicly expressed opinions concerning the entire practice of medicine, especially in its social and economic relationships, and

WHEREAS, An unusual emphasis on the social and economic position of medical practice has recently been precipitated by the published report of the national committee known as the Committee on the Costs of Medical Care; be it

Resolved, That, in the interest of the welfare of the public and the maintenance of the most serviceable form of medical practice, the proper representatives of the American Medical Association request other national medical organizations whose qualifications for membership include membership in the American Medical Association to declare publicly their opinions on general social, legislative, and economic relationships of medical practice only through approved channels of the American Medical Association. To this end the Board of Trustees of the Medical Society of the State of Pennsylvania pledges its own efforts and influences to bring about this most desirable point of view in the minds of the members of the Medical Society of the State of Pennsylvania, who are also members or Fellows of the other organizations referred to. They also respectfully request the Board of Trustees of the American Medical Association to bend every effort to accomplish this purpose throughout the Association at the earliest possible moment in order that the same evolutionary progress of medical practice may not be disturbed by social experiments which endanger the health and welfare of our citizenship, and which have proved a pernicious health influence in other nations.

A similar resolution adopted by the council of the State Medical Society of Wisconsin has also been submitted. (52) (55)"

The proceedings show that the resolution was adopted.

The next is a resolution endorsing the minority report of the Committee on the Cost of Medical Care (reading):

"RESOLUTIONS ENDORSING MINORITY REPORT OF COMMITTEE ON THE COSTS OF MEDICAL CARE

Dr. Henry C. Macatee, District of Columbia, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The Medical Society of the District of Columbia has endorsed the Minority Report of the Committee on the Costs of Medical Care, and has undertaken to engage in an intensive campaign to educate and inform its constituency regarding the socio-economic aspects of medical practice, with a view to the maintenance of high ethical standards and the preservation of professional ideals:

(a) By the dissemination of literature;

(b) By the organization of a speakers' bureau for the purpose of presenting various aspects of the subject to the membership;

(c) By the organization and conduct of study groups; and

(d) By the employment of such other means as may from time to time be deemed expedient for that purpose; and

WHEREAS, The Medical Society of the District of Columbia has by resolution instructed its delegate to endeavor to secure the support of the American Medical Association both of the Minority Report of the

Committee on the Costs of Medical Care, and of the society's plan for promoting harmony of professional opinion and action on the socio-economic aspects of the practice of medicine;

Resolved, That the House of Delegates of the American Medical Association endorses the Minority Report of the Committee on the Costs of Medical Care as expressive, in principle, of the collective opinion of the medical profession; and, in order to clarify and harmonize the thinking of the individual members of the profession on the general subject of the said report, and on allied subjects.

Resolved, That the Board of Trustees be requested to undertake 'the sponsorship, direction and active participation by the American Medical Association in an intensive campaign to be conducted in cooperation with its constituent bodies for the purpose and along the lines indicated in the first paragraph of the preamble to this resolution. (58) (59)"

The subsequent portions of the proceedings show that that resolution was adopted by the House of Delegates.

TESTIMONY OF JOHN DONALD LAUX DIRECT EXAMINATION

By Mr. Kelleher:

John Donald Laux was employed by the American Medical Association. His present address is Washington Boulevard Building, Detroit. He ceased employment in July 1939, after being employed with the American Medical Association four and a half years, from 1934 to 1939. He was a research assistant to Dr. Leland in the Bureau of Medical Economics. He had charge of studies in subjects such as insurance problems and various problems in medical economics, group hospitalization, handling correspondence concerning those matters. One of the duties was in connection with organized payments for medical service, and that involved medical service plans. He answered inquiries concerning various plans of that character, working directly under Dr. Leland.

Q.—I show you Government Exhibit 85 for identification, which purports to be a carbon copy of a letter written by you to Dr. John D. Sears, dated Feb. 26, 1937. Will you identify that as a copy of a letter which you wrote?

A.—That is correct.

Mr. Kelleher:—I offer Exhibit 85 in evidence (handing document to the court). And, your Honor, may I also offer at this time Exhibit 86 for identification, which purports to be a letter from John D. Sears to Dr. Morris Fishbein dated February 23, 1937, to which letter Exhibit 85 is the reply (handing document to the court).

Mr. Leahy (after a pause):—Is your Honor waiting for an expression?

THE COURT:—Yes.

Mr. Leahy:—Exhibit 86 I do not think is proper at all, your Honor. It is a letter of inquiry dated Feb. 23, 1937, directed to Dr. Morris Fishbein.

Mr. Kelleher:—It is offered solely to explain the reply, your Honor, and for no other reason.

Mr. Leahy:—There has to be some proof.

THE COURT:—How about 85?

Mr. Leahy:—If I could ask the witness just a couple of questions I would perhaps withdraw any objection.

THE COURT:—Very well.

By Mr. Leahy:

Q.—Did you talk with Dr. Leland about the contents of this reply or of this letter which you wrote on February 23?

The Witness:—I could not say whether or not as to that particular letter, I had conferred with Dr. Leland before the reply was made, but we had discussed types of replies of this nature as to the general content of the letter.

By Mr. Leahy:

Q.—But you do not know whether or not you discussed this particular letter of February 23 with him at all?

A.—No; prior to that, no, probably not. That would be my opinion.

Q.—You were just an employee, were you, in Dr. Leland's office?

A.—Yes.

Mr. Leahy:—I object to the offer as being against the A. M. A.

THE COURT:—I think there is one other question that would be pertinent. State whether or not the contents of this letter are in harmony with the views which you say Dr. Leland approved.

The Witness:—I believe that the contents of the letter are generally from the results of studies we had made, and most of those studies were conducted fairly independently. We obtained data from plans throughout the country.

THE COURT:—I do not think you quite got my question. In response to Mr. Leahy's question you said that although you did not know that this letter itself was written in collaboration with and with the approval of Dr. Leland, its general contents

were of a nature which had been approved by him. I am not attempting to state your words, but that is the substance of what I gathered from your statement. Is that true?

The Witness:—I would not want to be certain on that, because he was a very vigorous taskmaster. Whether he would agree to every one of the statements, I would not say; but I think the general content was in accord with our conclusions as to the types of medical service plans. I don't know that he would agree with each one of the statements made.

By Mr. Kelleher:

Q.—When you say "our conclusions" whom do you mean?

A.—Mr. Simons and myself in conducting these studies would arrive at conclusions as to what the facts showed and would so interpret them. Frequently they were presented to Dr. Leland for his confirmation, and he would either agree or disagree that the facts should be so interpreted.

Q.—From your talks with Dr. Leland would you say that he approved of the substance of the letter giving your interpretations?

A.—I would say that he would tend to agree with the general implications of the letter; yes. Whether with the specific statements in the letter or not I do not know. I cannot recall an instance of that kind so far back.

THE COURT:—Did I understand you to say that this was the general type of letter which was sent in reply to inquiries of this sort?

The Witness:—Yes. That would be the general type of letter. We received inquiries from doctors asking for information about various types of plans, and we would give them replies usually pertaining to the particular plan.

THE COURT:—Was Dr. Leland familiar with this general type of letter which you were sending out?

The Witness:—Yes; that is true. He was generally familiar with the general type of letter we were sending out.

Mr. Leahy:—Is this offered as to Dr. Leland or as to the A. M. A.?

Mr. Kelleher:—Only as to the A. M. A.

THE COURT:—I think it is admissible.

Mr. Leahy:—I object to it as to the A. M. A.

THE COURT:—I think it is admissible as prima facie evidence against the American Medical Association. It may be explained, of course. If this gentleman was writing it without the approval or authority of Dr. Leland, and was expressing his own views, that may be shown. But prima facie it seems to me it is admissible against them. He was an employee and assistant to a general officer and he states that this does represent the general type of letter that was sent out with Dr. Leland's knowledge and approval concerning subjects of this sort. I think that is the substance of his testimony.

Mr. Kelleher:—Does that cover Exhibit 86, if your Honor please?

THE COURT:—I am speaking of Exhibit 85. I do not see the relevancy of 86.

Mr. Kelleher:—Your Honor, it shows—

THE COURT:—Yes; I know your explanation. But I do not think it is at all necessary, and I will sustain the objection to that. The letter is self explanatory.

Mr. Kelleher:—All right, your Honor.

The witness then identified letters as follows:

Letter 2/20/37 Laux to Sears
Letter 8/10/37 Laux to Palmer
Letter 11/30/37 Laux to Tibbals
Letter 1/12/38 Laux to Brown
Letter 12/8/37 Laux to Conklin
Letter 1/18/38 Laux to Christie
Letter 1/13/38 Christie to Leland
Letter 1/24/38 Laux to Hathaway
Letter 7/8/38 Laux to Rowe
Letter 7/6/38 Laux to Litman
Letter 7/12/38 Laux to Stanford

CROSS EXAMINATION

By Mr. Leahy:

Q.—Mr. Laux, you stated that you are employed in Detroit now?

A.—Yes.

Q.—In what capacity are you working?

A.—Director of Medical Service Plan; Michigan Medical Service.

Q.—Is that for the Michigan State Medical Society?

A.—Yes, it is a prepayment medical service plan sponsored by the Michigan State Medical Society.

Q.—And is that a constituent member of the American Medical Association?

A.—It is.

Q.—You are, or you were employed for four and a half years before that in Dr. Leland's office?

A.—Yes.

Q.—And your capacity or duties were such that you, when letters of inquiry were received you did the best you could to answer them?

A.—Yes.

Q.—And were many inquiries received?

A.—Yes, I believe the inquiries about medical service plans alone would constitute a thousand letters at least a year.

Q.—At least a thousand a year?

A.—Yes.

Q.—So that the letters which you were asked to identify represent but an extremely small proportion of the letters which you wrote?

A.—Oh, yes.

Q.—And in answering the letters did you collaborate personally with Dr. Leland?

A.—In only a very few instances was collaboration necessary, and that was usually a letter asking for some particular type of information for which we had not theretofore had inquiry.

Q.—And was its incoming mail quite voluminous?

A.—Yes, I believe the last year I was there the total volume was in excess of five thousand pieces. That is, answers out were five thousand.

Q.—And did the Bureau collect information generally about all kinds of practices of medicine throughout the United States?

A.—We conducted studies on various economic problems and plans by questionnaire, by personal investigation and by information sent in by physicians who were members of the American Medical Association. We collected a library on the economics of medicine, including these various plans, and prepared reports and published a brochure on these various topics.

Q.—And was that information solely for the medical profession, or was it for the public also?

A.—The public and the medical profession.

Q.—I notice on some of these letters that you have stated you are making enclosures of documents, "I am enclosing herewith"—let's take 101, that one you wrote to Dr. Stanford at Memphis, Tenn., where you said here, "Sent under separate cover," where you refer to certain documents, and informed him that these were being sent to him under separate cover. Did you send such documents?

A.—I presume so.

Q.—What was the nature of these documents in this particular case?

A.—That is a report which was prepared in the Bureau interpreting the principles of ethics of the medical profession in view of the economic problems which the profession faced, and indicating why adherence to such ethics was necessary, and their purpose.

Q.—And the Medical Service Plan. What would that be?

A.—It was a study of the various types of prepayment, various prepayment and postpayment plans, with a brief synopsis of such plans, their method and mode of operation.

Q.—There were many such plans?

A.—Yes.

Q.—How many?

A.—At one time I counted in excess of four thousand.

Q.—Throughout the country?

A.—Yes.

Q.—Those included prepayment and postpayment?

A.—Yes.

Q.—And what was this type of plan you refer to here?

A.—That was a plan or a study of a plan. That went through the county medical society; and the other organization it was a similar type set up with a little more in detail, regarding these various types of plans.

Q.—And also "contract practice," what was that?

A.—It was an analysis of a form of medical practice whereby doctors rendered service under contract to various organizations.

Q.—Would you say the Bureau had attempted to collect and distribute publicly in the shape of these studies and pamphlets a great many of such pamphlets or publications, of those which you enclosed were typical?

A.—Yes, in the years I was there there were thirty-five such reports, separate booklets, which were distributed as well as being contained in the pamphlet "Hygiene" which went to the doctors.

Q.—Were these reports which you collected and upon which you worked, Mr. Laux, in character or nature, a review of the various plans?

A.—Particular ones were, yes. For example, a recent report not mentioned there was the organization of medical service, which dealt with the various new types of development by pre-

paying medical service. It endeavored to analyze all the types of medical plans in existence in the country, to help persons to obtain medical service through prepayment or postpayment, or with the assistance obtained from government agencies.

Q.—Now, without taking up the time to go through these various letters which you have written, each one of those letters which you wrote and which you have just identified, were they prepared in good faith to supply information which you were asked to give?

Mr. Lewin:—I don't think they ought to be characterized in that fashion; they speak for themselves. The letters are going to be put in evidence.

THE COURT:—I think he may generally characterize or describe them; I think that will be fair. It doesn't negative anything that the letter itself says.

Mr. Lewin:—It seems to me to be—that they are the best evidence.

THE COURT:—He may state that generally without referring to any particular paper.

The Witness:—The answers to the letters and the reports which were prepared in the Bureau were always with the intention of conveying the facts, and in an endeavor to give the inquiring person information, accurate information, either adversely or favorably to what the type of plan inquired about was.

Q.—In other words, you, throughout your work in Dr. Leland's office endeavored to give accurate information in response to the letters which came to you and which you answered?

A.—Yes.

Q.—And your authority while you worked in the office of Dr. Leland was merely to answer these requests for information?

A.—Yes.

Q.—You didn't declare policy for Dr. Leland's office.

Mr. Lewin:—I don't think he ought to be asked a leading question.

Mr. Leahy:—On cross examination?

Yes.

Mr. Lewin:—Yes, on cross examination. This witness was an employee of the American Medical Association, and he is not such a witness that leading questions may be put to him on cross examination.

THE COURT:—Objection overruled.

By Mr. Leahy:

Q.—You had no authority to declare policies for Dr. Leland's office, did you?

A.—No, policies were decided on by the House of Delegates and the Board of Trustees of the American Medical Association.

Q.—Is that why you wrote in this particular letter,—I think it is Exhibit 89—that you wrote the last paragraph to emphasize what you have just told us?

A.—It is because frequently the requests would be received for information about types and plans which had not yet been brought before the House of Delegates and, consequently, it was necessary to say that "This information is given which you request and is confidential." We would advise them that until there had been received a full report concerning the plan and it had been acted upon by the House of Delegates we would be unable to take any official position with reference to the plan or type of practice.

Q.—And would you say in concluding, "Opinion is given merely as a business courtesy. No responsibility is to attach to the American Medical Association or its offices personally for the information herein given."?

A.—Yes.

Q.—Were you asked to produce these particular letters out of the many you wrote in a subpoena out of this court?

A.—The letters were taken from the files and photostatic copies were made of them. We weren't asked to locate any particular letters. I think the representative of the Department of Justice went through the files and took out what letters he thought were of interest to him.

Q.—And these particular letters which you have seen here were identified by you before?

A.—Yes, they were.

Q.—Can you give us any idea how many letters you wrote in the four and a half years?

A.—I judge about eight or ten thousand letters.

RE-DIRECT EXAMINATION

By Mr. Kellcher:

Q.—When did the prepayment plan with which you are now associated commence operation?

A.—In March, 1940.

Q.—In so far as the letters which have been offered through you criticize a particular plan, does that criticism expressed in these letters reflect the policy of the American Medical Association?

A.—The criticisms on the particular plans mentioned in those letters were in accordance with the policies advanced by the American Medical Association.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Let me be specific: let us take 89, which we had before. Wherever there is any expression of opinion contained in the letter is that expression given in accordance with what you stated in this letter of Nov. 30, 1937; that the opinion was given merely as a business courtesy?

A.—Yes, the endeavor was to give to the inquirer the facts as we had them in our files, that is about the particular type of medical plan. There was no particular reason other than that to give them the information as to what the plan was. If they asked whether such a plan was operating satisfactorily we tried to give them the information as we had obtained it through investigations or other information or data received through the members, or otherwise; often from those engaged in the plan or from members in the locality.

Q.—Now, you stated on the second page of your letter—the first page is an outline of the medical service plan at Trinity Hospital at Little Rock, Ark., is it not?

A.—Yes.

Q.—Now, where did you get your information about that?

A.—We had a rather complete report of some 48 pages made by an investigator who was there to study the plan.

Group Health Association, Inc. at Washington:—"The enclosed article prepared by Dr. Woodward, would probably give the information you want. As you know this Association was discussed rather extensively at the Secretary's Conference" and the Hospital Group, where did you get that? The Economy; and the Bassett; the Thompson Benefit Association, Brattleboro, Vermont: Where did you get your information about those?

A.—The Bassett Plan published a report on its experience over a period of three or four years. In addition we have considerable correspondence pertaining to it. The Economy was a rural medical plan; we had a number of pieces of correspondence from the doctor who was formerly in charge of that plan, and from others in the society. The Thompson Benefit Association, Brattleboro, was a hospital service and a surgical insurance plan; they published a number of, two or three reports, over those years that we had received.

Q.—And is that what you enclosed when you stated, "The enclosed outline of those plans" was going forward?

A.—Yes, that was a kind of synopsis of the plans and reports which we prepared to make the information more readily available to the inquiring person.

Q.—And you added, "There are several other plans of a similar type, but as a general rule they do not provide the complete services claimed nor are they solely supported by dues collected from the members."

"A number of independent services have agreed that medical services cost an average of not less than \$100 per family, or \$25 per person. It is inconceivable that any insurance or prepayment plan can provide the same services for lower average charges. Either the services are not as complete or the quality of the services is impaired. Frequently the members who ask for services are given the complete run of the mill which always entails special charges for special services. It is also not uncommon to find that dues and special charges are insufficient to support the plan and that the deficits are made up from profits derived from extra activities, such as soda fountain, magazines, or direct sales.

"Income from non-members is also an important financial item. "This information is given which you request and is confidential. Opinion is given merely as a business courtesy. No responsibility is to attach to the American Medical Association or its officers personally for the information we have given."

Were those comments based upon service reports you had, and which were read and studied by you?

A.—Yes, they were an analytical study of those plans.

Q.—Are those comments, whether critical or otherwise, based upon what those studies show?

A.—They were based upon studies of these plans.

Q.—And do you think that while you were there that you studied plans for the distribution of medical care which would run up into the thousands?

A.—Yes, that is certainly true.

TESTIMONY OF HATTIE A. NIEHOFF
DIRECT EXAMINATION

By Mr. Kelleher:

Hattie A. Niehoff said she had been employed by the American Medical Association about a month less than twenty-seven years and, in response to the question as to her position during the last ten years, stated that she was secretary to Dr. Olin West.

Miss Niehoff then described the filing system and identified exhibits as follows:

Letter 6/22/37 Hendricks to West
Letter 6/28/37 West to Herbst
Letter 6/25/37 West to Herbst
Letter 10/7/37 Conklin to Fishbein
Letter 10/19/37 West to Conklin
Letter 10/14/37 West to Conklin
Letter 10/9/37 Conklin to West
Letter 10/29/37 West to Tibbals
Letter 11/6/37 West to Tibbals
Telegram 11/4/37 West to Hooe
Telegram 11/5/37 Hooe to West
G. H. A. Conference 11/6/37
Letter 11/9/37 West to Hooe
Letter 11/9/37 West to Wall
Letter 11/16/37 West to Wise
Letter 2/24/38 West to Talley
Telegram 4/21/38 West to Talley
Letter 5/5/38 West to Coole
Letter 5/5/38 West to Follansbee
Letter 9/21/38 West to Erskine
Letter 10/8/38 West to Erskine
Letter 10/12/38 West to Hammerly
Pages 295, 296, 297 of minutes of Judicial Council
Pages 17, 18 of minutes of Judicial Council
Pages 156, 157 of minutes of Judicial Council
Minutes Judicial Council 11/12/37
Letter 1/31/35 West to McLean
Letter 2/6/36—West to Freiberg
Letter 3/18/36 West to Freiberg

Q.—I also show you Exhibit 145 for identification and ask you to identify that as the opinion of the Judicial Council of the American Medical Association in the case—of appeal to the Judicial Council in the case of Dr. A. L. Curtin et al.

A.—It so appears to be.

Q.—Does this Government Exhibit 145 bear the signatures of members of the Judicial Council at that time?

A.—My memory isn't quite so good so far back, but Dr. O'Shea, Dr. Donaldson, Dr. Cumniffe and Dr. Follansbee are yet members of the Judicial Council.

Mr. Kelleher:—I offer in evidence Government Exhibit 144 and Government Exhibit 145.

THE COURT:—This is the original finding, is it?

Mr. Kelleher:—She so identified it as the opinion of the Judicial Council.

THE COURT:—Any objections?

Mr. Leahy:—Yes, your Honor. Objections to both of these. One goes back to 1932, Oct. 19, 1932. It purports on the subject to be a decision by the Judicial Council, but there is nothing in the decision purporting to set forth the facts or to acquaint anybody with the basis of the decision. It is back in 1932, and I think the evidence already is in the case that the change in the policy of the A. M. A. was made in 1934, so that this decision if it were admissible under any ground would have been one rendered under entirely different conditions.

THE COURT:—Well, I will have to study it.

Mr. Leahy:—This is a mere decision of the Judicial Council. The members of the Judicial Council are not named here in any way. They all have their signatures here.

THE COURT:—They signed it?

Mr. Leahy:—They signed it. They are not indicted.

THE COURT:—It all relates to the same matter, doesn't it?

Mr. Kelleher:—Yes, your Honor, it does.

THE COURT:—I imagine if one is overruled, the other is, so I will confine it.

FEBRUARY 14, MORNING

Mr. Richardson:—May we approach the bench?

THE COURT:—Yes.

(Counsel for both sides approached the bench and conferred with the Court.)

TESTIMONY OF LILLIAN LEACH

Mr. Kelleher:—Do I understand, Mr. Leahy, that the authenticity of Government Exhibits 147, 149, 150 and 151 for identification is conceded?

Mr. Leahy:—Yes, your Honor, we make no objection to the form of proof on that ground.

Mr. Kelleher:—I offer in evidence Government's Exhibits 147, 149, 150 and 151; and at the same time I offer in evidence Government's Exhibit 148, which purports to be a letter from Dr. Follansbee to Dr. Olin West dated April 27, 1938.

THE COURT:—I understood Dr. Follansbee to be an officer of the American Medical Association.

Mr. Kelleher:—Yes, he is chairman of the Judicial Council.

THE COURT:—Now, 151. Who is Dr. Anderson?

Mr. Kelleher:—Dr. Anderson; he is assistant to Dr. Holman Taylor, who was the secretary of the Texas State Medical Society.

THE COURT:—What about 151, Mr. Leahy?

Mr. Leahy:—That is objected to, if your Honor please, because it is—

THE COURT:—I will take it up later. Now, 150.

Mr. Leahy:—That is objected to, if your Honor please.

THE COURT:—I don't think that you will even have to give your name.

TESTIMONY OF IDA LEACH CASCIO

DIRECT EXAMINATION

Ida Leach Cascio said she has been employed by the American Medical Association a little over fifteen years in Dr. West's office as a stenographer.

Mr. Kelleher offered eleven exhibits for identification.

TESTIMONY OF A. M. SIMONS

DIRECT EXAMINATION

A. M. Simons said he has been working in the Bureau of Medical Economics, American Medical Association, under Dr. Leland since May 1932.

He was asked to verify eight exhibits produced by the American Medical Association in response to a subpoena in this case.

CROSS EXAMINATION

By Mr. Leahy:

Q.—What were your duties in Dr. Leland's department, please?

A.—Largely research work, but a certain amount of correspondence besides.

Q.—What is the character of the research work you would do?

A.—Making studies, for instance, beginning with compensation; then with other various problems in medical economics; factual studies.

Q.—Did those studies take your attention all over the United States? I mean in the subject matter of your studies, did you include the entire United States?

A.—Yes.

Q.—How many other workers were there in the bureau while you were there?

A.—When I came, I think there were only three.

Q.—And now?

A.—This recent preparedness work has brought in ten or fifteen.

Q.—Isn't it a fact that your bureau had collected a vast amount of data with reference to all matters concerning medical economics?

A.—Yes.

Q.—And are those preserved in the bureau for the information of anybody who asks for that information?

A.—Yes.

Q.—Does that include the general public as well as the members of the profession?

A.—Yes.

Q.—How many inquiries would come in in the course of a year, to your bureau?

A.—Well, I would say three or four a day, that I handled.

RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—You said that you discussed these reports after you made them? With whom did you do that?

A.—Dr. Leland.

Q.—And as regards the correspondence which you just looked at, and which has been offered in evidence while you have been on the stand, will you tell us whether, when you made any expressions of opinion in those letters, you were expressing the policy of the A. M. A., as you understood it?

A.—Yes.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Did you have any authority to make any policies yourself?

A.—I was told no one had authority to make policies except the House of Delegates.

Q.—Isn't it a fact that so many letters came over the desks of the Medical Economics Bureau of the American Medical Association that it would be impossible for Dr. Leland to review every reply or even read every letter of inquiry?

A.—Certainly.

Mr. Lewin:—And for that reason when you expressed opinions in those letters you made them conform with what you believed to be the policies of the A. M. A., from your discussions with Dr. Leland?

The Witness:—And from my reading of the proceedings of the House of Delegates.

TESTIMONY OF BESS T. MC DONALD

Bess McDonald said she had been employed by the American Medical Association for sixteen years as secretary to the director of the Bureau of Legal Medicine and Legislation. She identified exhibits 177 through 192.

TESTIMONY OF ALICE MILLER

DIRECT EXAMINATION

Mrs. Alice Miller, a stenographer, said she had worked for the Bureau of Legal Medicine and Legislation of the American Medical Association about eleven years; in 1937 under the direction of the defendant, William C. Woodward. She identified exhibits 193-197.

TESTIMONY OF DOROTHY CRIDLAND

DIRECT EXAMINATION

Dorothy Cridland was employed by the American Medical Association from the spring of 1931 until October 1937 in the office of William C. Woodward. She identified exhibits 198 to 203.

TESTIMONY OF WINNIFRED WELTON

Winifred Welton was stenographer for Dr. William C. Woodward. She identified exhibit 204.

TESTIMONY OF KATHRYN HARTENBURG FORD

Kathryn Hartenburg Ford said she was a stenographer for the Council on Medical Education and Hospitals, working for Dr. William D. Cutter. She identified exhibits 205-208.

TESTIMONY OF ALYCE BUCKLEY TURBUSH

Alyce Buckley Turbush said she was a stenographer in the Council on Medical Education and Hospitals. She also took dictation in 1938 from Dr. F. H. Arestad a hospital inspector. She identified exhibits 209-214.

TESTIMONY OF MARGARET WILSON

Margaret Wilson is employed with the American Medical Association as a stenographer. She identified exhibits 215-217. She also took dictation from Dr. C. M. Peterson a hospital inspector in the Council on Medical Education and Hospitals.

TESTIMONY OF MILDRED HANSON CARGILL

Mildred Hanson Cargill was a stenographer at the American Medical Association for the Council on Medical Education and Hospitals. She took dictation from Drs. William D. Cutter and C. M. Peterson. She identified exhibits marked 218 through 234.

TESTIMONY OF DOROTHY ERNSTING

Dorothy Ernsting was employed by the American Medical Association, as stenographer and typist for the Council on Medical Education and Hospitals. She identified exhibits 235 to 246.

TESTIMONY OF MARY A. MC GOVERN

Mary A. McGovern was stenographer to the Council on Medical Education and Hospitals. She identified exhibits 247-255.

TESTIMONY OF CAROLINE CHRISTOPHER

Miss Caroline Christopher was a stenographer in the employ of the American Medical Association Council on Medical Education and Hospitals. She took dictation from Dr. Peterson. She identified exhibit 256.

TESTIMONY OF DOROTHY PECHMAN TURNER

Dorothy Pechman Turner was employed with the American Medical Association from 1934 through 1939 as secretary to Dr. Leland in the Bureau of Medical Economics.

Q. Who is A. J. Cramp?

A. Dr. Cramp was formerly Director of the Bureau of Investigation.

The witness identified exhibits 259-280.

TESTIMONY OF CATHERINE E. JOHNSON

Mrs. Catherine E. Johnson was a stenographer in the Bureau of Medical Economics. She identified exhibits 257 and 258.

TESTIMONY OF ZITA WIST

Zita Wist testified that she was Dr. Fishbein's secretary in 1937. She identified exhibits 281, 282 and 283.

TESTIMONY OF RHEA H. SMITH

Rhea H. Smith is secretary to Dr. Fishbein. She identified exhibits 284-290 and 297 A.

RE-DIRECT EXAMINATION

Mr. Lewin:

Q. When Dr. Fishbein would send a communication to Dr. West or Dr. Woodward, or others of his associates in the American Medical Association for reply, was it his practice to indicate what the nature of the reply should be?

A. Well, I don't think so; he would probably give a suggestion; and sometimes he didn't.

Q. Sometimes he did and sometimes he didn't?

A. That is right.

RE-CROSS EXAMINATION

Mr. Leahy:

Q. What was Dr. Fishbein's business at the time you worked for him?

A. Editor of THE JOURNAL.

Q. He was editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION?

A. Yes.

Q. Did you know Dr. Leland?

A. Yes.

Q. Did you know Dr. Cutter?

A. Yes.

Q. Each one of those men headed distinct and separate departments, did they not?

A. Yes.

Q. And was it not the practice of Dr. Fishbein, where any communication was addressed or directed to him, where it should have been referred to some one else, that he refer it by an inter-office communication?

A. Well, sometimes it would be handled this way: The letter would be acknowledged and the original letter plus the copy of the reply would be sent to whoever handled that particular work. No memorandum would accompany that; he would simply write the name of Dr. West or Dr. Leland or Dr. Woodward on it, and it would go over with the copy of the reply which we had sent to the person making the inquiry or who had written the letter.

Q. You don't mean to indicate that Dr. Fishbein would tell Dr. West, Dr. Cutter or Dr. Leland how they should dispose of the matter, do you?

A. No. I would write the letter of reply, and the carbon copy which we would forward to whomever it was sent to by interoffice communication would be accompanied by the original letter. No memorandum would accompany the letter and reply.

Q. How many secretaries worked there for Dr. Fishbein to keep up with the mail?

A. Three.

FEBRUARY 14, AFTERNOON

Following recess, the court assembled with the attorneys for the government and for the defendants to consider the admissibility into the evidence of some of the exhibits which had been submitted during the morning session and previously. Inasmuch as this material was presented in the absence of the jury, it cannot be published until the completion of the trial. Those documents which were admitted will be read to the jury and will be published as part of the proceedings.

FEBRUARY 17—MORNING

The Court resumed session and spent the entire day in discussing the admissibility of some of the letters involved in the case, and of the minutes of the District of Columbia Medical Society. As the arguments between the attorneys on these points were held in the absence of the jury, this material is not available for publication in THE JOURNAL. Such material as was admitted by the Court will, of course, be presented by the attorneys in the course of the presentation of the case.

FEBRUARY 18—MORNING

When Court resumed, the jury was again dismissed and attorneys argued before the Court over the admission of the minutes of the Board of Trustees of the American Medical Association and of the minutes of the Judicial Council of the American Medical Association.

FEBRUARY 18—AFTERNOON

The court ruled that minutes could be introduced in evidence and it was for the jury to say after argument pro and con whether they would prove what is alleged or whether they do not.

TESTIMONY OF COL. GLEN I. JONES
DIRECT EXAMINATION

By Mr. Lewin:

Glen I. Jones stated he is a surgeon employed by the Southern Railway, on a salary. Before that he was in the Medical Service of the United States Army. He entered the service in 1909 with rank of first lieutenant and retired from the service in July 1936 with the rank of Colonel. In the Army he was compensated by rates of pay prescribed by law, on a salary basis. The Medical Service of the United States Army has a special attitude toward preventive medicine which includes the control of sanitary and other conditions which would preclude the occurrence of epidemics of diseases, principally; study of its personnel so as to discover any evidence, any symptoms or manifestations which might suggest the presence of disease among its personnel. It includes periodical physical examinations and checkups.

Q.—In the spring of 1937, were you offered the post of medical director of Group Health, Inc.?

A.—I was.

Q.—Who first suggested the employment?

A.—I had been suggested to officials in the Home Owners Loan Corporation with respect to my being a candidate for that position.

Q.—Do you know who made that suggestion?

A.—I think the Surgeon General of the Army, General Reynolds, although he might have had associated with him other officers or officials.

Q.—And to whom was the suggestion made? Can you tell us the names of the individual or individuals in the Home Owners Loan Corporation?

A.—To Mr. Zimmerman, I believe.

Q.—Did you signify to either of these gentlemen that you might be interested in the job?

A.—Well, at first I don't think that entered into it. The proposition was put to me; I was asked by Mr. Zimmerman and Mr. Penniman to make a study of it and report to them, tell them how it might be done.

Q.—And when was your first interview with them?

A.—In the month of March; the precise date I don't recall.

Q.—And where did this interview first take place?

A.—In Mr. Zimmerman's office in the Home Owners Loan Corporation.

Q.—What did Mr. Zimmerman tell you of the proposition?

Mr. Leahy:—I object; hearsay.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—What was the proposition you were asked to take?

A.—The first proposition that was put up to me was how physicians might be organized to give medical attention to subscribers in an organization in the H. O. L. C., on the basis of insurance or prepayment for medical attention.

Q.—And who put that proposition up to you?

A.—Mr. Zimmerman and Mr. Penniman jointly.

Q.—Did the proposition include the establishment of a centrally located clinic?

Mr. Leahy:—I object to it; it is leading and, secondly, violation of the hearsay rule.

THE COURT:—I think that is a good objection.

By Mr. Lewin:

Q.—Was anything said to you about the establishment of a clinic in connection with the establishment of this plan?

Mr. Leahy:—The same objection, hearsay.

THE COURT:—Yes.

By Mr. Lewin:

Q.—What other features of the plan were present as first explained to you?

Mr. Leahy:—The same objection. Hearsay.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—How long a period of time did you negotiate with these gentlemen?

A.—About two or three months.

Q.—And when the proposition was made to you, what post was offered to you?

A.—To organize and direct the operations of the medical unit which might be organized.

Q.—What salary was discussed for you?

A.—They spoke of \$10,000 a year; I don't know whether that was a direct offer, because the development did not materialize.

Q.—And was any statement made to you as to the duties you were expected to perform?

Mr. Leahy:—I object to that as hearsay.

THE COURT:—Sustained.

By Mr. Lewin:

Q.—What duties were you expected to perform in connection with this offer?

A.—To organize the unit and operate it.

Q.—Were you to be the only doctor, or were other doctors to be assistants to you?

A.—I was to organize the unit of physicians.

Q.—And how were those physicians to be compensated?

A.—On a salary basis; as far as we went.

Q.—What was your inclination toward that offer?

Mr. Leahy:—Objected to.

THE COURT:—Sustained.

By Mr. Lewin:

A.—This offer of the directorship was not made to me until I had drawn up some plans at the request of Mr. Zimmerman and Mr. Penniman how such a prepayment plan might be operated.

Q.—Will you describe the plans that you drew up?

A.—I studied and submitted to them three plans.

Q.—What were they?

A.—The first plan was the organization.

Mr. Leahy:—Is this all material and relevant, these plans that he studied?

THE COURT:—I don't know.

Mr. Lewin:—Certainly it is.

Mr. Kelleher:—It will appear in just a few minutes; its relevancy and materiality will appear in a few more questions.

Mr. Leahy:—Were they in writing? If so, let us have them. It would be the best evidence.

Mr. Lewin:—He knows the fact. What could possibly be better than his knowledge? What objection is there to having the jury hear it from him?

Mr. Leahy:—That is not the question. There is a right way and a wrong way.

Mr. Lewin:—And we do not propose to learn the right way in a school conducted here by defense counsel.

Mr. Leahy:—I can't see how the plans studied and submitted by the colonel are material.

THE COURT:—The question as to what was adopted; only that plan is relevant.

Mr. Lewin:—We are going to prove that this witness never accepted the job, and give the reasons why he did not. It is charged in the indictment.

THE COURT:—Well, go to it, but let us get to that point.

By Mr. Lewin:

Q.—Will you describe the plans which you suggested?

Mr. Leahy:—I still object. I think it is entirely incompetent, irrelevant, and immaterial.

Mr. Lewin:—I am entitled to show the scope of these plans. If you will wait until this witness testifies, you will see the materiality. You are a wonderful witness yourself but I would rather have him testify at this time.

Mr. Leahy:—The objection is to the point that this witness says he studied and submitted three plans. What have we to do with that?

THE COURT:—I will rule that the plans submitted are not relevant. Perhaps it may be relevant to show that the plan adopted is relevant. If your purpose is to prove he had this offer and was restrained from accepting it, for one reason or another, go ahead and prove it. Let's proceed the way I have suggested.

By Mr. Lewin:

Q.—Describe the plan that you were to be medical director of in these discussions.

A.—There was no plan adopted.

Q.—What was the plan that was considered?

Mr. Leahy:—Objected to as immaterial; it was not adopted.

THE COURT:—I don't think you understand me. Will you step up here.

(Counsel for both sides approached the bench and conferred with the Court).

By Mr. Lewin:

Q.—Did you have occasion to consult anybody else about these plans except the members of the H. O. L. C.?

A.—Not specifically about the plans, but in general, about the project, I did.

Q.—Whom did you consult?

A.—The organization of this unit I felt to be successful, that is, to give the proper service to the people who might subscribe,

must be the best that we could procure, among the profession in the District of Columbia. I therefore felt that I should canvass representative men of the Medical Society of the District of Columbia and determine whether I would get their support.

Q.—Whom did you see?

A.—I saw several members of the District Medical Society whose judgment I respected.

Q.—Did you see any of the defendants in this case?

A.—I don't know who the defendants are.

(The witness testified he saw Dr. Arthur C. Christie, Dr. Thomas A. Groover, Dr. Charles Stanley White.)

A.—Individually I do not recall any others. I saw others collectively by invitation later.

Q.—What did Dr. Christie say to you?

A.—He indicated his disapproval of the project.

Q.—What did he say? Do you remember?

A.—Oh, not specifically; no. In general he said that they were opposed to it—the District Medical Society was opposed to it, and we could not expect their support; that members of the medical profession of the District of Columbia who might be invited to join such a unit and did join it, could not expect to continue with the District Medical Society nor could we expect the members of the medical profession in the District would consult with members of such a group.

Q.—Did these other doctors whom you talked to take a similar position?

A.—They did.

Q.—What effect did their observations have upon you?

Mr. Leahy:—I object as immaterial.

THE COURT:—Colonel, were you a member of the Medical Society?

The Witness:—Not of the District Medical Society; no, sir.

THE COURT:—I think you may answer the question.

The Witness:—Will you state it again?

(The pending question was read by the reporter as recorded.)

A.—It made me skeptical about the success of the prepayment plan, with that unit.

By Mr. Lewin:

Q.—Did you report back to Mr. Zimmerman and Mr. Penniman?

A.—I did.

Q.—Why were you skeptical of the success of the plan then?

A.—Because I felt that such a unit should be composed of the very best that could be procured from among the medical profession of the District of Columbia, in honesty to the subscribers.

Q.—Did you have any opinion about the success of the enterprise if the District of Columbia Medical Society withheld its cooperation?

A.—Not immediately. I felt that there was a breach there that probably might be closed by communications between the H. O. L. C. representatives and the District Medical Society.

By Mr. Lewin:

Q.—What effect did it have upon the continuation of the idea?

Mr. Leahy:—I object to that. It would be necessarily a conclusion.

THE COURT:—Yes. I think you might ask him what, if any, effect it had upon his further connection with the matter.

By Mr. Lewin:

Q.—I will adopt his Honor's question. What effect, if any, did it have upon your further connection with the matter?

A.—At that time, none. It prompted Mr. Zimmerman and Mr. Penniman to call a meeting of the Surgeon Generals of the several services who they, Zimmerman and Penniman, had reported as giving a green light on this project. When I say a "green light" I mean in a general way.

Q.—Who were those Surgeon Generals?

A.—General Rossiter of the Navy, General Cummings of the Public Health Service, General Reynolds of the Army, and the Commissioner of Health of the District of Columbia, Dr. Ruhland.

Q.—Was this meeting held?

A.—It was.

Q.—Where was it held?

A.—In the apartment of Mr. Zimmerman.

Q.—Who else attended except the three Surgeon Generals and the Health Officer?

A.—Mr. Zimmerman and Mr. Penniman.

Q.—And yourself?

A.—And a representative of the Twentieth Century Foundation.

Q.—Do you remember his name?

A.—I do not.

Q.—What transpired at this meeting?

Mr. Leahy:—I object as immaterial.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Were any decisions arrived at at the meeting?

Mr. Leahy:—I object as immaterial.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Did you make any suggestions as to what to do next?

Mr. Leahy:—I object as immaterial.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—What did you do as the result of the discussions at the meeting?

A.—That was the beginning of my withdrawal from participation in the project. However, I was invited to attend a meeting of the District of Columbia Medical Society shortly after that.

Q.—Was that meeting held in a doctor's office?

A.—No; in the building of the District of Columbia Medical Society.

Q.—Did you before that time attend a meeting in Dr. William Gerry Morgan's office?

A.—I did.

Q.—Who was present?

A.—I can tell you in part; probably not as to all of them. Dr. Gerry Morgan, Dr. Macatee—

Q.—Dr. Henry Macatee?

A.—Yes; Dr. Prentiss Willson—

Q.—That is, the defendant Prentiss Willson in this case?

A.—I don't know the defendants in this case, sir. Dr. Verbyck; probably one or two others that I do not recall.

Q.—What transpired at that meeting?

A.—I was interrogated about the proposed medical project in the H. O. L. C., and it was discussed.

Q.—What opinions did you express?

A.—I think I expressed the opinion that the medical profession should take hold of a project somewhat like this and organize it and lead it.

Q.—What decision, if any, was arrived at?

A.—There was not any reached, so far as I know.

Q.—You say after that you attended a meeting of the Executive Committee of the District Medical Society?

A.—I did; yes.

Q.—Did you speak at that meeting?

A.—I did; yes. I did not give an oration. I made some comments and answered some questions.

Q.—I show you an excerpt from the minutes of the meeting of the Executive Committee of the Medical Society of the District of Columbia held on Tuesday evening, June 1st, 1937, which shows that you were present by invitation, and I will ask you to read that excerpt, if you will.

Mr. Leahy:—I think if he has a recollection of the meeting he can give it.

Mr. Lewin:—I would like to know whether these minutes are substantially accurate or not.

Mr. Leahy:—You cannot prove that by his reading them.

A.—(After examining document referred to) Why, in substance, yes. There is one part there that I don't understand at all.

By Mr. Lewin:

Q.—Will you point that out?

A.—Yes. This part (indicating), "he told them"—"frankly that if the Medical Society of the District of Columbia disapproved their efforts that there would not be any available medical assistance that could be depended upon." I don't know what that means at all.

By Mr. Lewin:

Q.—Did you decline the medical directorship as a result of this conference?

A.—I did.

Q.—Did you state your reasons for doing so?

A.—Yes.

Q.—What were those reasons?

Mr. Leahy:—To whom were they stated?

Mr. Lewin:—I want to know what the reasons were.

Mr. Leahy:—Ask him that.

Mr. Lewin:—I have asked him that.

Mr. Leahy:—I object as immaterial.

THE COURT:—Objection overruled.

A.—I gave as my reasons that—first of all, I indicated that I held the opinion individually that there was a wage group who could be better cared for if a better arrangement were made for medical attention to that group.

By Mr. Lewin:

Q.—What was the better arrangement?

A.—There are a number of them.

Q.—Which was the one that you preferred and recommended?

A.—I don't know that I had any choice of the three. I made a recommendation to them for theirs, but for a general organization to affect all people who might need medical attention I had another view.

Q.—I did not ask you about that. I asked you what the plan was that you said you preferred, that you thought would help these people with a certain income. What was it?

A.—I had no plan, myself. I say I had an opinion.

Q.—Let us have that opinion. What was your opinion as to a plan that would help that group?

A.—I had no specific plan. It was any one of three or four that I can state to you.

(The witness was again asked why he refused the directorship. Defense counsel objected to the nature of the question.)

THE COURT:—Objection sustained. Go back to that same question. You got off of that. The question was, what reasons did he have for declining the directorship?

The Witness:—My reasons for declining the directorship were that I felt that such a project, if engaged in, should be composed of the best that could be produced in the medical profession and be guided by the people who represented the best interests in the medical profession.

By Mr. Lewin:

Q.—Why did you decline? Did you find that that could not be done?

A.—I felt so.

Q.—Why did you feel so?

A.—For obvious reasons.

Q.—What were those obvious reasons?

A.—That the District Medical Society or individuals in the District Medical Society had indicated their unwillingness to proceed and had indicated that they would not consult with the group, which automatically denied to the unit the best that the medical profession had to offer in the city of Washington.

Q.—I show you what purports to be a letter from M. W. Ireland to Dr. William D. Cutter, dated March 27, 1937. I ask you to look at that letter, if you will. Who was General Ireland?

A.—He was an ex-Surgeon General of the Army.

Q.—Do you know whether or not General Ireland had held any position with the American Medical Association?

A.—I think he was a member of the Council on Medical Education.

Mr. Lewin:—I ask that this be marked as an exhibit (handing a paper to the reporter).

(Letter dated March 27, 1937, from Ireland to Cutter, was marked U. S. Exhibit No. 295 for identification.)

By Mr. Lewin:

Q.—I would like you to read that letter over to yourself. I want to ask you a question or two about it.

Did you ever state to the Surgeon General or to General Ireland the things which are attributed to you there?

Mr. Leahy:—We object. I do not know what he is trying to do—impeach the letter or impeach his own witness.

Mr. Lewin:—I am trying to get at the fact.

THE COURT:—The letter is in without objection. Under those circumstances, if Colonel Jones is familiar with it I see no objection to his being asked about any incident that relates to him or any statement which relates to him.

By Mr. Lewin:

Q.—Let me read you this. It says:

"After this visit—

Speaking of your visit—

"with the men from the Home Owners Loan Corporation, which lasted for a period of two or three hours, Jones telephoned to the Surgeon General to the effect that this was nothing but an entering wedge to the establishment of state medicine." Did you state that to the Surgeon General?

A.—I made some observations which were not as positive or direct as stated by General Ireland in connection with that, in that particular, both to General Ireland, General Reynolds and all of the members of the group, all of the generals who met with the District Medical Society collectively and individually.

Q.—Did you state that in your opinion what you were asked to head was nothing but an entering wedge to the establishment of state medicine?

A.—Not in those terms.

Q.—Did you say that in substance?

A.—I made this observation substantially as follows, that I felt the medical profession had a job to do in providing some way to take care of a prepayment plan—

Mr. Leahy:—Pardon me, Colonel. I do not like to interrupt you, but I submit that that is not proper, if your Honor please.

THE COURT:—Are you objecting to it?

Mr. Leahy:—Yes, sir.

THE COURT:—Objection sustained.

By Mr. Lewin:

Q.—Did you say this? Did you say to anybody that you were dropping this plan like a hot cake, as early as March 27, 1937?

A.—No.

CROSS EXAMINATION

By Mr. Leahy:

(Colonel Jones recapitulated the record of his career.)

Q.—Did you do any private practice of medicine after you retired?

A.—Yes, I did, for three or four months, in an institution.

Q.—What institution was that?

A.—The North Shore Health Resort.

Q.—You were asked a question whether or not you were interested in preventive medicine. Do you recall that question?

A.—I do.

Q.—Could you tell the jury in general what the phrase "preventive medicine" means?

A.—Yes. Preventive medicine means proper care as to ventilation, disposal of waste, the care of streets and grounds, the early recognition of individual cases of infectious diseases, the inspection and preservation and proper care of food, the testing and care of water supplies and similar things.

Q.—Doctor, is it not a fact, from your experience, that all reputable doctors are interested in preventive medicine?

A.—Without question.

Q.—You are a member of the A. M. A., are you not?

A.—I am.

Q.—And is it not a fact that over a period of years, so far as you have been a member, and longer, the members of the American Medical profession have been very generally interested in preventive medicine?

A.—Actively.

Q.—How many years have you been a member of the A. M. A.?

A.—I think, all my service, ever since I became a doctor.

(The witness stated he had known Drs. Christie, Groover, Macatee and Verbrycke for twenty-five to thirty years.)

(He had known Dr. Morgan and he had known Dr. C. S. White for thirty-seven years.)

Q.—And you had confidence in the judgment of those men, did you?

A.—I did.

Q.—And that is why you went to chat with them?

A.—I did—that is the reason.

Q.—Did you consider that those men whom you met were the outstanding or some of the outstanding physicians of the District of Columbia?

A.—I would identify them as such; yes.

Q.—Did you explain to them or talk to them with reference to your own plan?

A.—I don't think I talked about any plan that I had to anybody except Mr. Zimmerman and Mr. Penniman. It was prepared for them as ways in which the project they had in mind might be accomplished. I put it in their hands, and so far as any specific plan that I had, I think I kept that with myself after I communicated it to them. That was the job they gave me to do and I did it, and I did not discuss it.

Q.—You did not discuss that plan with any of the doctors whose names we have mentioned?

A.—No; I did not.

Q.—Did you discuss the matter with General Ireland?

A.—My plan? No; I did not.

Q.—Did you discuss the fact that you had chatted with any one from the H. O. L. C., with General Ireland?

A.—I did, and with all of the other doctors.

Q.—Do you recall about when it was you chatted with General Ireland about that?

A.—Any number of times during the period that the thing was under consideration.

Q.—Do you think you talked with General Ireland at or about the time the General wrote this letter?

A.—I may have. If General Ireland says I did, I did.

Q.—The General says:

"At the early part of the week a couple of men from the Home Owners Loan Corporation visited the Surgeon General of the Army to say that they wanted to obtain the services of a doctor to look out for the health of their personnel, which

incidentally is quite large. After the consultation the Surgeon General asked Colonel Glen Jones, a retired medical officer, to visit these people."

Did General Ireland request you to visit them?

A.—No.

Mr. Lewin:—It does not say he did. It says the Surgeon General did.

By Mr. Leahy:

Q.—Who was the Surgeon General?

A.—General Reynolds.

Q. (Reading):—"After this visit, which lasted for a period of two or three hours"—Do you think the visit lasted that long?

A.—I think so; yes.

Q. (Continuing reading):—"Jones telephoned to the Surgeon General to the effect that this was nothing but an entering wedge to the establishment of state medicine, and so far as he could make out, the Twentieth Century Foundation Corporation of New York City was going to pay the expenses of this so-called medical care for the personnel of H. O. L. C." Do you recall telling the Surgeon General that?

Mr. Lewin:—That is a double-barreled question. There are two things there that he said he told them.

Mr. Leahy:—Very well. We will pick them apart.

By Mr. Leahy:

Q. (Reading):—"After this visit, which lasted for a period of two or three hours, Jones telephoned to the Surgeon General to the effect that this was nothing but an entering wedge to the establishment of state medicine." In substance did you tell the Surgeon General that?

A.—No. I made a report to the Surgeon General, since he had sent me to the H. O. L. C., on my observations and my opinion, but it was not like it is stated in that letter.

Q.—Was it words in substance, or was the thought in substance that you expressed to the Surgeon General, that it was an entering wedge to the establishment of state medicine?

A.—Not that way; no.

Q.—Whether in those words or not, was that the thought which you expressed to the Surgeon General?

A.—No.

Q.—There was no thought about state medicine concerned in it?

A.—There was.

Q. (Reading):—"So far as he could make out, the Twentieth Century Foundation Corporation of New York City was going to pay the expenses of this so-called medical care for the personnel of the H. O. L. C." Did you mention that to the Surgeon General?

A.—Not in those terms. I mentioned the Twentieth Century Foundation; yes.

Q.—And your information at that time was that the Twentieth Century Foundation was going to pay the expenses of the so-called medical care for the personnel of the H. O. L. C.?

A.—I qualify that—that the Twentieth Century Foundation was interested in supporting it.

Q.—Financially?

A.—Well, I don't know about that. Nothing was ever said to me about financially.

Q.—What did you think they were supporting it with?

Mr. Lewin:—I object to that.

By Mr. Leahy:

Q.—Did you report it to the Surgeon General?

A.—That they were getting financial support?

Q.—Yes.

A.—I told him the Twentieth Century Foundation was interested in putting us off this project. If I may give you in words what I think as to that, the Twentieth Century Foundation is set up to finance such institutions, so the natural inference was that it was financial. But I did not use the word "financial," because I was not interested in the way the unit was promoted in the H. O. L. C. Where it got its finances was not a thing that was submitted to me at all.

Q. (Reading further):—"Needless to say, Jones and the Surgeon General are dropping it like a hot cake." Did you say anything to the Surgeon General at that time about dropping the matter?

A.—No.

Q.—Was anything said by you at the time with reference to dropping it, in substance, such as General Ireland reported?

(Reading):—"Needless to say, Jones and the Surgeon General are dropping it like a hot cake."

A.—I more than likely made an observation to the effect that I did not see how this project could succeed, since it was violently opposed by the members of the District Medical Society.

Q.—Had you found that out on March 27, 1937?
A.—I found it out within three or four days after I had first interviewed Mr. Zimmerman.

Q.—The statement is that it was in the early part of the week, and the letter is dated March 27. Do you think within a week you talked with the Surgeon General and told him that the District Medical Society was opposed to it?

A.—Yes; I did that immediately.

Q.—Was there anything at all that you reported to the Surgeon General which approached the thought that "Jones and the Surgeon General were dropping it like a hot cake"?

A.—No.

Q.—Do you know General Ireland pretty well?

A.—He is my most intimate and respected friend.

Q.—Did you know he had written this letter?

A.—No; I did not.

Q.—Did you know he had written any letter to Dr. Cutter?

A.—No; I did not, until I saw it here.

Q.—Did you ever discuss the matter with your trusted friend?

A.—The matter of this letter?

Q.—Yes.

A.—No.

Q.—You never discussed with General Ireland anything at all about your visit to H. O. L. C.?

A.—Oh, yes; many times.

Q.—And you discussed it with him prior to the date of this letter, March 27, did you not?

A.—Yes, sir; I did.

Q.—But these facts, which General Ireland wrote on March 27, 1937, were not statements which came from you at all?

A.—Not as stated; no. I made observations to General Ireland on state medicine, which I can tell you if you care to hear them.

Q.—Did you make the observation that this was an entering wedge to state medicine?

A.—Not in those words; no.

Q.—In substance?

A.—It depends on what you mean by "in substance."

Mr. Lewin:—Why don't you let him state what he said?

Mr. Leahy:—If he doesn't understand that, I'm satisfied.

The Witness:—I understand it perfectly, if you will let me answer it the way I stated it.

By Mr. Leahy:

Q.—Did you in substance tell General Ireland as it is stated there?

Mr. Lewin:—I object to that, if your Honor please. Counsel ought to be required to ask the witness what he said.

The Court:—He has answered that. Objection sustained.

By Mr. Leahy:

Q.—I will ask you what you did tell General Ireland about state medicine in connection with this project?

A.—I told General Ireland, along with the other members of the medical profession with whom I conferred, voluntarily and by invitation, that I felt the medical profession had a job to do in providing some way to take care of the low-wage group, and that I felt to let it get out of the hands of the medical profession and into the hands of laymen who knew little about the medical side, would finally resolve itself into probably—not entirely, but we would have state medicine or socialized medicine. That was my opinion at the time, and that is the way I expressed it.

Q.—Did you think that a group of laymen organizing a corporation to provide medical care was an entering wedge to state medicine?

A.—Unless it was supported by the medical profession as a whole; yes.

Q.—And unless it was controlled and managed by the medical profession; is that right?

A.—Directly and positively influenced; yes, sir.

Q.—For instance, did you discuss with General Ireland the fact that a group of laymen who would organize such a corporation as that would not be the proper parties to attempt to distribute medical care to the low-income group?

A.—I have no doubt that I did, because I hold that view.

Q.—In other words, your view was that any attempt on the part of laymen to distribute medical care would be what you would call an entering wedge to state medicine?

A.—Yes.

Q.—That is what you felt?

A.—It would incline to it; yes.

Q.—Do you recall what Dr. Christie or Dr. White or Dr. Morgan or Dr. Groover or Dr. Verbrycke felt about the matter at the time, as they expressed themselves to you, Colonel?

A.—Some of them expressed themselves as I have stated in my previous testimony, that they were opposed to it, that they

could not be sympathetic toward the project; that any member of the medical profession in the District of Columbia who joined it would be kicked out of the District Medical Society or lose his membership therein, and any member of the medical society of the District of Columbia who consulted with a member of the group would likewise be put out of the District Medical Society.

Q.—Did they give their reasons why they were not in favor of it?

A.—The thing which you have been very much interested in bringing out, and that is their fear of socialization of medicine, state medicine.

Q.—Colonel, may I ask you this, do you think that state medicine is in the public interest?

A.—No; I do not.

RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—Did you think that the plan which you were asked to head as medical director was itself an entering wedge for state medicine?

A.—I think I will have to answer that my own way. You keep talking about my plan when no plan was ever adopted.

Q.—Let me ask you this, if you had been able to secure the support of the District Medical Society so you could have gotten consultants from them and could have gotten members of the District Medical Society to serve under you in the Group on a salary, would you have regarded that as an entering wedge for state medicine?

A.—No, I don't think so. I think it would have been a substitute.

Q.—Would you regard it as unethical?

A.—I don't think so.

Q.—Did you think it was necessary that there should be lay enterprise in the handling of medical care?

A.—Well, from my training I wouldn't want a layman around it.

Q.—Who would you leave to make the collection of dues? Would you leave that to the laymen?

A.—A subordinate, yes, I would leave that to a layman, a subordinate.

Q.—You were willing to take the proposition that was offered you by Zimmerman and Penniman and become the Medical Director of this group if you could have gotten some support from the District Medical Society, instead of opposition. Is that right?

A.—I think if you take all of the actions throughout the whole period of time—you are separating things here. Throughout the whole period of time if the District Medical Society had agreed, I would have taken it, yes.

RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Because, just as you have said, Colonel, the care of the sick should be under the direction and control of the doctors, should it not?

A.—Without any question.

Q.—And there should not be any lay interference coming between the doctor and his patient?

A.—Again without any question.

Q.—And you wouldn't have been connected with a plan which permitted such condition?

A.—No.

Q.—And you wanted the management and control if you were the director in any scheme so that you, as the head of it, would be in full charge of the medical care and control of your patients?

A.—Yes.

FURTHER RE-DIRECT EXAMINATION

By Mr. Lewin:

Q.—Did Zimmerman ever suggest to you that you wouldn't be in full charge if you accepted his offer?

Mr. Leahy:—I object.

Mr. Lewin:—I think I am entitled to this.

Mr. Leahy:—A suggestion by somebody else.

Mr. Lewin:—It is a proposition that was offered.

The Court:—The examination takes such a broad field without objection from either side, it makes most any question that might be asked admissible. One thing goes to another until you get to a point where you have broadened the field of examination so that I cannot very well limit it. Answer the question.

The Witness:—You will have to state it.

(The pending question, as above recorded, was read by the reporter.)

By Mr. Leahy:

Q.—You wouldn't have received such a suggestion, would you?

Mr. Lewin:—I object to that.

THE COURT:—Sustained.

FURTHER RE-CROSS EXAMINATION

By Mr. Leahy:

Q.—Well, Colonel, was there any plan ever adopted?

A.—Not in relation to me specifically, no plan was ever adopted.

Q.—Did you ever see the plan which was finally adopted by H. O. L. C.?

A.—No.

By Mr. Lewin:

FURTHER RE-DIRECT EXAMINATION

Q.—Isn't it true that one other plan which you suggested and which you were willing to undertake involved prepayment on the one hand and group practice on the other, under a medical director, the physicians being compensated by salary, with a centrally located clinic with hospitalization given in the private hospitals and with consultants obtained from the District Medical Society or any other private doctors?

A.—That is correct.

TESTIMONY OF GEORGE GORDON PAYNE

DIRECT EXAMINATION

By Mr. Kelleher:

George Gordon Payne, a court reporter, transcribed a hearing of the executive committee of the District of Columbia Medical Society in 1937.

Q.—How many nights did the hearings cover?

A.—There were four sessions.

The witness identified transcripts of sessions of the executive committee of the District of Columbia Medical Society on Dec. 6, Dec. 10, Dec. 16 and Dec. 20, 1937.

TESTIMONY OF THEODORE WIPRUD

FURTHER DIRECT EXAMINATION

Mr. Wiprud identified minutes of the executive committee of the District Medical Society for June 6, 1938. He also

identified minutes of the District Medical Society for Feb. 3, March 10 and Oct. 20, 1937, Feb. 23, March 23, April 13 and Oct. 12, 1938. He also identified minutes of the executive committee of March 9, April 25, July 1 and Oct. 24, 1938.

FURTHER CROSS EXAMINATION

By Mr. Leahy:

Mr. Leahy:—May they be subject also to our review and looking of them over this evening?

THE COURT:—What?

Mr. Leahy:—The offer that they be received in evidence, may it be reserved until we look over those this evening?

THE COURT:—Oh, I think so, yes.

TESTIMONY OF BETTY LOGSDON

DIRECT EXAMINATION

Mrs. Betty Logsdon, secretary to Dr. J. Ogle Warfield, took dictation from him concerning or relating to correspondence between him and the various hospitals, and between him and the doctors of the hospital committee of the Medical Society of the District of Columbia. She sent a questionnaire to the Emergency, Homeopathic, Providence, Sibley, Garfield, Georgetown, George Washington, Columbia, Childrens and Casualty hospitals on the instruction of Dr. J. Ogle Warfield. These she identified with the answers. She also identified the report of the Hospital Committee dated Dec. 1, 1937, on the letterhead of Dr. J. Ogle Warfield Jr., also the report of the hospital committee submitted to the executive committee of the Medical Society of the District of Columbia on March 28, 1938, which report bears certain handwritten interlineations.

CROSS EXAMINATION

By Mr. Leahy:

This dealt with identification of documents and signatures thereon.

When the witness failed to identify certain signatures Mr. Leahy said: "Might we reserve the objection until the morning on this, if your Honor please?"

THE COURT:—Yes, we will take this up first thing in the morning.

(To be continued)

MEDICAL LEGISLATION

HEARINGS ON PROPOSED HABIT FORMING DRUG REGULATIONS

The Federal Food, Drug and Cosmetic Act, as amended, declares in section 502 (d) that a drug shall be considered misbranded if it contains any quantity of the "narcotic or hypnotic substance alpha-eucaine, barbituric acid, beta-eucaine, bromal, cannabis, carbromal, chloral, coca, cocaine, codeine, heroin, marihuana, morphine, opium, paraldehyde, peyote or sulfonmethane" or any chemical derivative thereof which the Administrator of the Federal Security Agency has found to be and by regulations has designated as habit forming, unless its label bears the name and quantity or proportion of such substance or derivative and in juxtaposition therewith the statement "Warning—May be habit forming." Under the authority thus granted, the Federal Security Administrator has announced¹ proposed regulations designating as habit forming each of the chemical derivatives listed below:

A. Chemical derivatives of barbituric acid—

Barbital	Sandothal	Sigmodal
Phenobarbital	Alurate	Butisol
Amytal	Pernoston	Rutonal
Neonal	Evipal	Eldoral
Ipral	Nostal	Eunarcen
Ortal	Pentothal	Rectidon
Phanodorn	Seconal	Prominal
Pentobarbital	Proponal	Narconumal
Mebaral	Pental	Delvinal
Dial	Cyclopal	

All lithium, sodium, potassium, magnesium, calcium, strontium and ammonium salts of any of the foregoing acids.

B. Chemical derivatives of alpha-eucaine or beta-eucaine—
Any salts of alpha-eucaine or beta-eucaine formed by the combination of any such substance with any acid.

C. Chemical derivatives of bromal—

Bromal hydrate
Brometone
Bromoform

D. Chemical derivatives of cannabis (marihuana)—

Extract of cannabis
Fluidextract of cannabis
Tincture of cannabis

E. Chemical derivatives of carbromal—

Sedormid
Bromural

Neuronal
Acetylcarbromal

F. Chemical derivatives of chloral—

Chloral hydrate
Chlorobutanol
Chloralimide

Chloralformamide
Alpha-chloralose

G. Chemical derivatives of cocaine—

All salts of cocaine formed by the combination of cocaine with any acid.

H. Chemical derivatives of codeine—

Dicodid
Eucodal
Eucodin

Any salt of dicodid, eucodal or codeine formed by the combination of any such substance with any acid.

I. Chemical derivatives of heroin—

All salts of heroin formed by the combination of heroin with any acid.

J. Chemical derivatives of morphine—

Dilaudid
Paramorphan
Ethylmorphine

Any salt of dilaudid, paramorphan, ethylmorphine or morphine formed by the combination of any such substance with any acid.

1. Federal Register 6: 680 (Jan. 30) 1941.

K. Chemical derivatives of opium—

Extract of opium
Fluidextract of opium
Tincture of opium

L. Chemical derivatives of paraldehyde—

Metaldehyde

M. Chemical derivatives of sulfonmethane—

Sulfonethylmethane
Sulfondiethylmethane

MEDICAL BILLS IN CONGRESS

Bills Introduced.—S. 860, introduced by Senator Sheppard, Texas, proposes to provide for the common defense in relation to the sale of alcoholic liquors to the members of the land and naval forces of the United States and to provide for the suppression of vice in the vicinity of military camps and naval establishments. S. 869, introduced by Senator McNary, Oregon, provides for the payment of annuities to persons 21 years of age or over who are citizens of and residents within the United States and who have not more than 20/20 of visual acuity in the better eye with maximum correction or whose field of vision is limited to 20 degrees or less from the fixation point in all quadrants, if the annual income of such persons is less than \$1,200. S. 907, introduced by Senator Walsh, Massachusetts, provides for the continuation in the service of the Army, Navy, Marine Corps and Coast Guard beyond the term of their enlistment those suffering from disease or injury incident to service and not due to misconduct and in need of medical care or hospitalization. H. R. 143, introduced by Representative Welch, California, extends the benefits of hospitalization and the privileges of the soldiers' homes to certain persons who served in a civilian capacity under the jurisdiction of the Quartermaster General during the War with Spain, the Philippine Insurrection or the China Relief Expedition. H. R. 2488, introduced by Representative Bradley, Michigan, proposes a federal appropriation of \$700,000 to construct a veterans' hospital, with a capacity of 150 beds in or near the city of Gladstone, Michigan. H. R. 2504, introduced by Representative Izac, California, proposes to construct a marine hospital in San Diego, Calif. H. R. 2508, introduced by Representative Izac, California, proposes to amend the Social Security Act so as to provide benefits to persons permanently crippled. H. R. 2510, introduced by Representative Izac, California, proposes an appropriation of \$1,000,000 to construct a veterans' hospital, with a capacity of at least two hundred beds, in or near the city of San Diego, Calif. H. R. 3154, introduced by Representative Rolph, California, proposes an appropriation of \$600,000 to construct a one hundred and thirty-four bed patient capacity addition to the existing veterans' hospital at Fort Miley, San Francisco, for the treatment of general medical and surgical disabilities. S. 818, introduced by Senator Barbour for himself and Senator Smathers, both of New Jersey, proposes to amend the act providing for the promotion of vocational rehabilitation of persons disabled in industry or otherwise by defining the term "vocational rehabilitation" to include medical, surgical, corrective and other services and care furnished for the purpose of rendering a person disabled fit to engage in a remunerative occupation. H. R. 3318, introduced by Representative Healey, Massachusetts, proposes to authorize the Administrator of Veterans' Affairs to furnish domiciliary and hospital care and medical treatment to World War veterans of the United States merchant marine. H. R. 3383, introduced by Representative Kefauver, Tennessee, proposes to reduce the tax on nonbeverage ethyl alcohol used exclusively in the manufacture of medicinal preparations, flavoring extracts, flavors and for other nonbeverage purposes. H. R. 3463, introduced by Representative Voorhis, California, proposes to promote the national health and welfare through appropriation for hospitals and for the prevention, education and control of tuberculosis. To provide adequate hospital facilities, the sum of \$25,000,000 would be made available for the fiscal year ending June 30, 1941, the sum of \$50,000,000 for the fiscal year ending June 30, 1942 and thereafter \$100,000,000 for each of the ten succeeding fiscal years. From these appropriations, loans would be made to states, counties, cities and other political

The hearing on these proposed regulations will begin at 11 a. m. on March 3 in rooms A, B and C of the Departmental Auditorium, Constitution Avenue between Twelfth and Fourteenth streets, Washington, D. C. All interested persons are invited by the administrator to attend the hearing and offer evidence relevant and material to the subject matter under consideration.

subdivisions for the construction of hospitals and for their maintenance for a period not over four years. In addition, for the fiscal year ending June 30, 1941, an appropriation of \$3,000,000 would be authorized, for the fiscal year ending June 30, 1942 an appropriation of \$5,000,000, and for each of the ten fiscal years thereafter an appropriation of \$10,000,000 a year for grants in aid in the prevention, education and control of tuberculosis. The bill contemplates that free diagnostic and treatment facilities shall be provided by all health departments or clinics receiving funds under the act (1) for the diagnosis and emergency treatment of any patient referred by a private physician either for continued treatment or for consultative or diagnostic advice and opinion and (2) for any patient unable to afford private medical care. The determination of the ability of patients to pay for medical care, the bill proposes, shall be the responsibility of the director of the health department or clinic in conjunction with a committee from the local medical societies. If and when tuberculosis shall cease to be a national health problem, the bill provides that such physical equipment and facilities as the federal government may have acquired by virtue of the operation of the bill shall thereafter be utilized in the control of cancer or other major health hazards. H. R. 3484, introduced by Representative Byron, Maryland, proposes to provide retirement pay and hospital benefits to certain reserve officers, Army of the United States, disabled while on active duty. H. R. 3492, introduced by Representative Kilday, Texas, proposes to impose additional duties on the United States Public Health Service in connection with the investigation, treatment and control of tuberculosis. This bill proposes for the fiscal year ending June 30, 1941 a federal appropriation not to exceed \$7,750,000, for the fiscal year ending June 30, 1942, \$33,500,000, for the fiscal year ending June 30, 1943, \$37,000,000 and for each fiscal year thereafter such sum as may be necessary, subject to the limitation that subsequent to the fiscal year 1946, the appropriations authorized under the act shall not exceed \$17,500,000. From this federal money, it is proposed, allotments will be made for the purpose of assisting states, counties, cities, health districts and other political subdivisions to establish, extend and improve measures for the prevention, treatment and control of tuberculosis, including the provision of facilities for sanatorium and other care for persons with tuberculosis and for the purpose of making studies, investigations and demonstrations to develop more effective measures of prevention, treatment and control of tuberculosis. State plans must be submitted for approval to the Surgeon General of the Public Health Service. Furthermore, the bill proposes to establish in the Public Health Service a Division of Tuberculosis Control.

STATE MEDICAL LEGISLATION

Arkansas

Bill Introduced.—H. 381, to amend the medical practice act, proposes to authorize the revocation of the license of a licentiate who has been convicted of any crime involving moral turpitude. The fact that the sentence has been suspended or that the convicted licentiate has been granted probation or any other leniency by the court or that he has not been required to suffer the punishment prescribed in the judgment is not to prevent the board from revoking the license of the convicted licentiate.

California

Bills Introduced.—A. 1683 proposes to grant to a hospital treating a person injured through the fault of another a lien on all claims, rights of action, judgments, settlements or compromises

accruing to the injured person by reason of his injuries. A. 2247, to amend the workmen's compensation act, proposes to permit an injured employee to select a doctor of chiropractic to treat his industrial injuries at the expense of the employer or his insurer. A. 2329 and A. 2509 propose that "Any hospital accepting pay patients who denies to any licensed physician and surgeon desiring to practice in such hospital for the reason that the physician and surgeon denied such opportunity is not a member of any association or society of physicians and surgeons shall be liable in damages in an amount not less than one thousand dollars (\$1,000), which may be recovered in an action at law brought for that purpose." A. 2439 proposes to prohibit the operation of a clinic or dispensary without a permit from the department of health. A. 2471 proposes to establish a tax-supported system of compulsory health insurance. S. 980, to amend the law permitting the court in any civil or criminal proceeding to appoint one or more expert witnesses to investigate and testify concerning matters on which the court deems expert evidence advisable, proposes to give this right also to juvenile courts. A. 1854 proposes to permit drugless practitioners to execute the certificate as to freedom from syphilis required of each party to a proposed marriage. A. 2148, to amend those portions of the insurance code authorizing the operation of nonprofit hospital service plans, proposes (1) to permit the formation and operation also of nonprofit medical service plans and (2) to permit hospital service plans to cover also the costs of "x-ray diagnosis and therapy and clinical laboratory procedures." A. 2474 proposes that "Every person engaged in the preparation of food to be served or sold to others, except agricultural employees and domestic employees, shall have obtained within the next preceding three months a certificate that he or she is free from every communicable disease from the state board of public health." A. 2088, to amend the medical practice act, proposes to make the following unprofessional conduct: "All advertising of the medical business in connection with which the holder of any certificate fails to use his name constitutes unprofessional conduct within the meaning of this chapter."

Connecticut

Bills Introduced.—S. 520, H. 1970, S. 1554 and H. 653 propose to authorize the licensing as an industrial attendant of any person who has pursued a course of study in the field of first aid and treatment for traumatic injuries and whose proficiency has been certified to by a duly qualified physician. An industrial attendant is to perform work only under the direction of a licensed physician and is to perform for their employer only such work as is directly connected with the operation of an industrial dispensary or hospital. S. 1070 and H. 2438 purport to be "A bill to prevent any doctor from receiving more than five dollars for making outside calls and more than \$1.50 for office calls, so that a poor person can live." S. 518 proposes to require every hospital in any city, town or fire district having a general fire alarm station and an electrically operated fire alarm system to be equipped with a fire alarm box or boxes of the type and character used in such district. S. 823 proposes that "Hospitals or other institutions, receiving state grants, and health institutions supervised by at least five licensed physicians may advise and prescribe for married persons regarding marriage problems and may give them access to medical information and supplies conducive to health, notwithstanding the provisions" of the law prohibiting the use of contraceptive articles. H. 1203, to amend the medical practice act, proposes, in effect, to reestablish a board of examiners for eclectic practitioners. H. 1813 proposes that "Hospitals or other health institutions receiving state grants and other health institutions under the supervision of practicing physicians may disseminate information or prescribe contraceptive devices to meet health problems of married women." S. 529 and H. 1979 propose to establish a system of compulsory health insurance. H. 1204, to amend the medical practice act, proposes (1) to eliminate the requirements that an applicant for a license to practice must be a citizen of the United States or must have declared his intention of becoming such, and (2) to require an applicant to have received a degree of Doctoris Medicinae from some incorporated and reputable medical college.

Delaware

Bills Introduced.—H. 37 and H. 69 propose that the medical council of Delaware consist of a licensed osteopath and the presidents of the two state boards of medical examiners, thus proposing to eliminate from membership on the council the chief justice of the state and substituting in his place an osteopath. H. 37 was stricken from the calendar, February 12.

Georgia

Bill Introduced.—H. 371 proposes that a hospital shall have a lien on all property brought into the hospital by any patient to secure the payment of all sums due for food, lodging, treatment, hospitalization or other accommodation.

Idaho

Bill Passed.—H. 207, to enact a so-called uniform pharmacy act, passed the house, February 19. This bill, if enacted, would prohibit a licensed physician from dispensing or using on patients drugs or medical supplies, such as sutures, compacts, compresses and surgical dressings, unless the physician possesses a special permit from the board of pharmacy.

Maine

Bills Introduced.—S. 344 proposes to enact what appears to be the uniform narcotic drug act. S. 410, to amend the chiropractic practice act, proposes (1) to condition the annual renewal of a license on presentation by the licensee of satisfactory evidence that in the preceding year he has attended one of two educational programs conducted and supervised by the chiropractic board and (2) to define chiropractic as "the science of locating and correcting interference with nerve transmission and expression, without the use of drugs or major surgery." The present law defines chiropractic as "the science of palpating and adjusting the segments and articulations of the human spinal column by hand only." S. 412 proposes to condition the issue of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party has been given a physical examination, including a standard blood test, not more than thirty days prior to the date on which the license is applied for and that in the physician's opinion the party is not infected with syphilis or, if so infected, is not in a stage of that disease whereby it may become communicable.

Maryland

Bill Introduced.—S. 260 proposes to enact a separate naturopathic practice act and to create a board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. The bill defines naturopathy to be "a drugless branch of the healing art and embraces the diagnosis and practice of physiological, psychological, physical, mechanical and material methods and agencies of healing." The bill proposes to prohibit naturopathic licentiates from using drugs or surgery.

Michigan

Bills Introduced.—S. 134 proposes to prohibit the retail sale or distribution of oil, tincture, elixir or fluid of valerium, valeric acid or crystals of ammonium valerate except on the prescription of a licensed physician or surgeon. The bill proposes, however, that no such prescription shall be filled until the person presenting the prescription places an inked impression of his thumb or finger on the prescription and writes in ink his name and address on the prescription. The dispensing druggist must then make a report of the sale, including the name and address of the buyer, to the commissioner of the Michigan state police. H. 119, to amend the law requiring both parties to a proposed marriage to possess a physician's certificate as to freedom from syphilis, gonorrhea or chancroid, proposes to limit the fee of the physician for making the necessary examinations and for executing such certificates to \$3. H. 129 proposes to prohibit the retail sale and distribution of venereal prophylactics except by licensed physicians and registered pharmacists. H. 133 proposes to repeal the chiropractic practice act.

Minnesota

Bills Introduced.—H. 564 and S. 639 propose that "Any subordinate lodge of a fraternal organization may out of its funds provide medical services for its members and the families of such members and may make contacts [sic] with duly licensed physicians to perform such medical services."

Missouri

Bills Introduced.—S. 7 proposes to grant to every public hospital or clinic and every privately maintained hospital, clinic or other institution for the care of the sick supported in whole or in part by charity and treating a person injured through the fault of another a lien on all rights of action, claims, judgments, settlements or compromises accruing to the injured person by reason of his injuries. S. 15 proposes to require every person undertaking obstetric and gynecologic care of a pregnant woman to take or cause to be taken a sample of venous blood of such woman not later than twenty days after the first examination and to submit the sample to an approved laboratory for a standard serologic test for syphilis. H. 61 proposes to require every applicant for a license to practice any form of the healing art, as a condition precedent to examination and licensure by his respective professional board, to pass examinations in anatomy, physiology, chemistry, bacteriology and pathology to be given by a board of examiners in the basic sciences. Each member of the board must be a professor or an assistant or associate professor on the faculty of the University of Missouri, a state teachers' college of Missouri or a university or college of equal standing, and no member may be actively engaged in the practice of the healing arts. H. 62 proposes to prohibit any person licensed to practice any form of the healing art from using the prefix "Doctor" or "Dr." in connection with his name in any letter, business card, advertisement, prescription blank, sign or public listing or display without affixing thereto suitable words or letters designating the degree held and representing the profession he is authorized to practice. H. 63 proposes to authorize the attorney general or any prosecuting attorney to institute an action to enjoin any person from the unauthorized practice of medicine and surgery. H. 64 proposes to require every person licensed to practice medicine and surgery in the state to register biennially with the state board of health and at that time to pay a registration fee of \$1. H. 67, to amend the medical practice act, proposes to require applicants for licenses to practice medicine and surgery, in addition to the qualifications now required by law, to have completed a premedical education consisting of a minimum of sixty semester hours of college work.

Nebraska

Bills Introduced.—Bill 187 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party is free from any venereal, contagious and infectious disease. Bill 236, to amend the basic science act, proposes that the board of examiners in the basic sciences shall consist "of at least one member of the profession of medicine and surgery, one member of the profession of osteopathy and one member of the profession of chiropractic." Bill 252 proposes to authorize the state treasurer to credit 10 per cent of all fees remitted into the state treasury by each of the special boards, divisions, bureaus and commissions, including the state boards of examiners in medicine, osteopathy, chiropractic, dentistry, optometry and pharmacy, to the general fund of the state for the purposes provided by law.

Nevada

Bills Introduced.—S. 15 proposes to make it the duty of the state board of health to formulate a plan for the care and treatment of indigent persons suffering from cancer and to establish and designate standard requirements for the organization, equipment and conduct of cancer units or departments in general hospitals in the state. The board is also to be directed to formulate and put into effect an educational plan for preventing cancer throughout the state and for aiding in the early diagnosis of the disease. The bill also proposes to appropriate \$50,000 for the ensuing two years for the purposes stated. A. 62 proposes to enact an entire new medical practice act, which, among

other things, will permit the issuance of a limited license to practice physiotherapy to persons not possessing the qualifications required of applicants for licenses to practice medicine and surgery without restriction. A license to practice physiotherapy is not to permit the holder to administer drugs or to diagnose or prescribe medicines or to practice medicine as defined in the bill except to treat diseases under the written prescription of a duly licensed doctor of medicine or osteopathy. The bill defines physiotherapy as the use of "actino therapy, hydrotherapy, machino therapy, thermo therapy excepting those procedures involving general hyperpyrexia, and electro therapy, exclusive of the x-ray, radium, electro coagulation, desiccation, and cauterization or other means involving tissue destruction." The bill also proposes to permit a registered nurse to give anesthetics for any regularly licensed physician under his direction for minor surgery, obstetrics or in any emergency.

New Hampshire

Bill Introduced.—H. 312 proposes that "all persons handling food in any public eating house shall submit to a physical examination at least once in every twelve months."

New Jersey

Bill Introduced.—A. 4 proposes to repeal all laws regulating the practice of the healing art.

New Mexico

Bills Introduced.—H. 83 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. A license to practice naturopathy, the bill states, is to entitle the holder to diagnose and treat human beings as taught in standard chartered naturopathic colleges, schools or universities. H. 88 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party not more than thirty days prior to the application for the license has been given such an examination, including a standard serologic test, as may be necessary for the discovery of syphilis and that, in the opinion of the physician, the person is either not infected with syphilis or if so infected is not in any stage of that disease which may become communicable to the married partner. H. 123 proposes to require every applicant for a license to practice any form of the healing art, as a condition precedent to examination and licensure by his respective professional board, to pass examinations in anatomy, physiology, chemistry, bacteriology and pathology to be given by a board of examiners in the basic sciences. The board is to consist of five members, none of whom may be actively engaged in the practice of the healing art or any branch thereof.

North Dakota

Bill Introduced.—H. 219 proposes to enact a separate naturopathic practice act and to create a board of examiners to examine and license applicants for licenses to practice naturopathy. The bill defines naturopathy as "the act and science of applied therapy as heretofore or hereafter taught by the recognized schools and colleges of naturopathy, except materia medica and major surgery." The bill provides that naturopathy and osteopathy shall be construed as synonymous terms and that "Sanipractic and Drugless Physicians shall be interpreted as the same as Naturopathy and its practice, and shall hereby be governed and regulated by this act and law." This bill was indefinitely postponed by the House, February 21.

Bills Passed.—The following bills passed the House, February 21: H. 261 proposing so to amend the chiropractic practice act as to condition the annual renewal of a license to practice chiropractic on the presentation by the licensee of evidence that in the preceding year he has attended a post graduate course in an accredited chiropractic school or college or has attended at least a two day session of the "educational" program as arranged by the North Dakota Chiropractic Association; and H. 301 proposing to require licensed osteopaths to renew their licenses annually and to condition the renewal on the payment of a fee of \$3 and presentation of evidence that the licensee

has attended at least two days of the annual "educational" program and meeting conducted by the North Dakota State Osteopathic Association, or its equivalent, in the preceding year.

Ohio

Bills Introduced.—S. 142 proposes to require every physician who attends any woman pregnant with child for conditions relating to pregnancy during the period of gestation or delivery to take or cause to be taken a sample of her blood at the time of the first examination or within fifteen days thereafter and to submit the sample to an approved laboratory for a standard serologic test for syphilis. S. 260, to amend the medical practice act, proposes that "the practice of spiritual healing as an integral part of the mode or worship of an established religious denomination shall not be regarded as the practice of medicine." Substitute H. 101 proposes a new system for the statewide registration of births, deaths and other vital statistics.

Oregon

Bills Introduced.—H. 361 proposes that "Whenever any person engaged in the practice of a profession licensed by the state of Oregon shall permit the name of a person who has been dead for more than one year to remain upon the doors or windows or any other conspicuous place upon the premises from which he is conducting such professional practice or shall permit the name of a person who has been dead for more than one year to appear upon any letterhead or other printed matter the circulation of which is under such practitioner's control and to appear thereon in connection with his own name shall be guilty of a misdemeanor and upon conviction thereof shall be punished by a fine of not more than one thousand dollars (\$1,000)." H. 382, to amend those provisions of the workmen's compensation act authorizing an employer to contract with a third person for the rendering of necessary medical and hospital care to employees, proposes that every such contract shall provide (a) that the contractor shall furnish all medicines and medical supplies prescribed by the attending physician, (b) a reasonable choice of physicians and/or specialists in the major branches of the medical profession and (c) hospitalization, when required, to be furnished in hospitals accredited by the American Medical Association. S. 248 proposes apparently that no person engaged in the practice of any healing art shall be denied the privilege of attending any inmate in a county hospital.

Pennsylvania

Bill Introduced.—S. 140 proposes a procedure to reimburse hospitals treating indigent persons injured in motor vehicle accidents.

South Dakota

Bill Introduced.—H. 205, to amend the medical practice act, proposes apparently to eliminate the requirement in the present law that an applicant for a license to practice medicine must have served an internship in an approved hospital.

Texas

Bills Introduced.—H. 79 proposes to condition the issue of a license to marry on the presentation by each party to the proposed marriage of the certificate of a physician that within fifteen days of the date of application for a license he has thoroughly examined the party and caused to be made standard serologic tests and such other laboratory procedures as are essential to the determination of freedom from syphilis and all other venereal diseases and that the results of such examinations, tests and history indicate that the party is free from any transmissible condition of syphilis. H. 189 proposes to enact a separate chiropractic practice act and to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic. The license to practice chiropractic proposed in the bill is not to authorize a holder to prescribe medicine or perform surgery, but chiropractors are to be permitted to render first aid, sign health cards and death certificates, and enter hospitals within the state for the purpose of adjusting their patients or inmates thereof. H. 324 proposes to enact a separate naturopathic practice act and to create an independent naturopathic examining board. The bill proposes to define naturopathy as the "Diagnosis and

practice of physiological, mechanical, and material science of healing as follows: The physiological and mechanical sciences such as the mechanotherapy, articular manipulation, corrective and orthopedic gymnastics, neurotherapy, Psychotherapy, Hydrotherapy, and mineral baths, electrotherapy, thermotherapy, phototherapy, chromotherapy, vibrotherapy, thalmotherapy, and dietetics, which shall include the use of foods of such biochemical tissue building products and cell salts as are found in the normal body; and the use of vegetal oils and dehydrated and pulverized fruits, seeds, barks, herbs, roots and vegetables uncompounded and used in their natural state."

Utah

Bill Introduced.—H. 130, to amend the medical practice act, proposes apparently to permit licensed naturopaths to practice "in accordance with the tenets of the professional schools of naturopathy recognized by the department of registration." This bill was reported favorably to the House, February 19.

Washington

Bills Introduced.—S. 91 proposes to make the facilities of the McKay memorial research hospital available for general hospital care and treatment of persons entitled to such service at public expense. S. 93 and H. 343 propose to create within the Department of Social Security a subdivision to be known as a division for physically handicapped to provide (1) such medical and surgical care as will tend to alleviate or remove causes of disability, (2) for vocational adjustment and training and (3) more adequate maintenance than is now available for physically disabled persons who are in need. S. 191 proposes to create in the Department of Labor and Industry the office of chief medical adviser and a board to be known as the State Medical Advisory Board. The board is to meet with the chief medical adviser and the director of labor and industries to discuss and advise on all problems dealing with the diagnosis, care, treatment and operative technic of victims of industrial accidents and occupational disease and as to the reasonableness of charges to be made by a physician, surgeon, hospital, druggist or any other person rendering service or furnishing medicine or drugs to an injured workman. The director of labor and industries with the aid of the chief medical adviser and the counsel and advice of the state medical advisory board is to adopt a fee bill of the maximum charges which may be made by any physician or other person rendering services or medicines because of a disability suffered while engaged in extrahazardous work. Any fee or charge in excess of the maximum contained in the fee bill referred to is to be invalid as to the excess. H. 175 proposes to authorize the establishment of public hospital districts except in class A and first class counties. The public hospital districts, when established, are to own and operate hospitals and supply hospital services to the residents of the territory within the jurisdiction of the district. H. 202 proposes that no corporation or other organization or any individual or any governmental subdivision shall require that any individual, as a condition precedent to obtaining or retaining employment, shall be compelled to receive or be given vaccine, serum shots, toxins, antitoxins or serologic by-products "nor adopt rules or regulations requiring such compulsory methods." H. 370, to supplement the medical practice act, proposes to require every licensed physician to renew his license with the Director of Licenses on or before July 1 of each year, and to pay at that time a fee of \$5. H. 371 proposes to enact a separate drugless therapeutics practice act and to require the director of licenses to appoint an examining committee of three practitioners of drugless therapeutics to examine applicants for licenses to practice drugless therapeutics. The bill proposes to define drugless therapeutics as "the practice of the psychological, mechanical, and material sciences of healing, for the relief of any wound, fracture, bodily injury or disease, either mental or physical, as follows: The psychological sciences, such as psychotherapy and suggestive therapy; the mechanical sciences, such as mechanotherapy, physiotherapy, electrotherapy, thermotherapy, phototherapy, chromotherapy, vibrotherapy, concussion and pneumatotherapy; and the material sciences, such as dietetics and food sciences, and external applications; but shall not mean the administering, prescribing or using of drugs or medicines, either internally or externally." S. J. Res. 10

proposes to submit to the electors a proposal so to amend the constitution of the state as to authorize the legislature to establish a state owned and operated lottery, the proceeds from which shall be confined to old age assistance, public assistance and publicly owned hospitals. S. 246 proposes to authorize every board of directors of school districts of cities of the first class to arrange at school expense for the medical examination of students whose parents or guardians are unable to pay for the same. H. 360 proposes to repeal the law authorizing the compulsory sterilization of certain socially inadequate inmates of state institutions. H. 310 proposes to enact what it designates as the uniform pharmacy act. The bill does not expressly exempt physicians from its provisions and is framed in such broad language as to raise a doubt as to the right of a licensed physician who has not obtained an additional license from the board of pharmacy to dispense or use on a patient drugs and such medical supplies as absorbent cotton, bandages, gauze, sutures, compacts, compresses and surgical dressings.

West Virginia

Bill Introduced.—H. 246 proposes to prohibit the operation of a hospital unless licensed by the state committee on hospitals, which the bill proposes to create as a division of the state department of health.

Wisconsin

Bills Introduced.—S. 160 proposes that in prosecutions involving the issue of the operation of a motor vehicle while under the influence of intoxicating liquors the court may admit evidence of the amount of alcohol in the defendant's blood at the time alleged as shown by a chemical analysis of his breath,

urine or other bodily substance. A. 245 proposes to authorize the organization and operation of cooperative associations to provide medical or hospital care for their members. The bill also proposes that no hospital supported in whole or in part by public funds or which is wholly or partially tax exempt shall deny to any physician the facilities of the hospital nor discriminate against him in their use because the physician is affiliated with a cooperative association which undertakes to furnish medical and hospital service to its members. The bill also proposes that no physician being otherwise eligible for membership shall be excluded from membership in the state medical society or any county medical society because of his affiliation with such a cooperative association.

Wyoming

Bill Passed.—S. 78 passed the senate, February 11, proposing that, whenever in any civil or criminal proceeding issues arise on which the court deems expert evidence desirable, the court, on its own motion, or on the request of either party, may appoint one or more experts, not exceeding three on each issue, to testify at the trial.

Bills Introduced.—S. 94, to amend the medical practice act, proposes to add the following as an additional ground for the revocation of a license to practice medicine: "failure, neglect or refusal [of the licentiate] to take a post graduate course of study in medical subjects in a qualified medical school for a period of not less than six weeks in every five years." S. 89 proposes a new act relating to the registration, compilation, preservation data pertaining to births, deaths, stillbirths, adoptions, legitimations and marital status.

OFFICIAL NOTES

RADIO BROADCASTS

"Doctors at Work" is the title of the sixth annual series of dramatized radio programs being presented by the American Medical Association and the National Broadcasting Company.

The series opened Wednesday, Nov. 13, 1940 and will run for thirty consecutive weeks, closing with a broadcast from the annual session at Cleveland on June 4. The program is scheduled for 10:30 p. m. eastern standard time (9:30 central, 8:30 mountain, 7:30 Pacific time) over the Blue network, other N. B. C. stations and Canadian stations.

The programs are broadcast on what is known in radio as a sustaining basis; that is, the time is furnished gratis by the radio network and local stations, and no revenue is derived from the programs. Therefore, local stations may or may not take the programs at their discretion, except those stations which are owned and operated by the National Broadcasting Company.

Some radio stations may be unable to broadcast the program at the regular scheduled time and may transcribe and broadcast it at another hour or even on another day. It is advisable therefore to verify the time by reference to local newspapers or by telephoning the local Blue network stations.

The programs will dramatize what modern medicine offers the individual in the way of opportunities for better health and the more successful treatment of disease. Incidental to this main theme the programs will explain the characteristics of the different fields of modern medicine and its specialties.

Descriptive posters for local distribution may be had gratis from the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago. Program titles will be announced weekly in *THE JOURNAL* and monthly in *Hygieia*, the Health Magazine.

Tickets are available for each broadcast. Address the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago. Tickets are free, but a stamped self-addressed envelop should accompany requests.

The next three programs to be broadcast, together with their dates and titles, are as follows:

- March 5. Fit to Fight.
- March 12. Brain Surgeon.
- March 19. First Line of Defense.

ADDRESSES BY OFFICIAL STAFF

DR. PAUL C. BARTON:

- March 10—Y. M. C. A. Forum, Chicago.
- March 19—Woman's Auxiliary to the Jackson Park Branch of the Chicago Medical Society.
- March 26—Avondale Methodist Church, Chicago.

DR. W. W. BAUER:

- Feb. 28-March 1—National Conference for Cooperation in School Health Education, New York.
- March 3—Chicago Medical Society Woman's Auxiliary, North Shore Branch, Chicago.
- March 14—Bowen High School, Chicago.

DR. MORRIS FISHBEIN:

- March 16—Jewish Community Center, Atlantic City, N. J.
- March 17—Executive Club, Asheville, N. C.

DR. FRANK H. LAHEY:

- March 10—Southeastern Surgical Congress, Richmond, Va.
- March 12—New York Surgical Society, New York.
- March 13—American Institute of Electrical Engineers, Steinmetz Lecture, Selenelectady, N. Y.
- March 19—Bronx County Medical Society, New York.
- March 24—New Jersey State Medical Society, Newark.

DR. CARL M. PETERSON:

- March 3—Industrial Hygiene Course for Nurses, Marquette University, Milwaukee.

DR. PAUL A. TESCHNER:

- March 6—Ladies Aid of Community Church, Gurnee, Ill.
- March 14—Chicago West Town Auxiliary to the Railway Mail Association Woman's Club, Maywood, Ill.

MARCH 1, 1941

CALIFORNIA

Dr. Wilbur to Retire as President of Stanford.—Dr. Ray Lyman Wilbur observed his twenty-fifth anniversary as president of Stanford University January 19. An editorial tribute in the *San Francisco Call-Bulletin*, January 24, also announced Dr. Wilbur's retirement at the close of the present year. Dr. Wilbur was born in Boonesboro, Iowa, April 13, 1875 and graduated at Cooper Medical College, San Francisco, in 1899. His association with Stanford began in 1896 when he was instructor in physiology; subsequently he was lecturer and demonstrator in physiology at Cooper, 1899-1900, and at Stanford, assistant professor of physiology, 1900-1903, professor of medicine, 1909-1916, and dean of the medical school, 1911-1916. He became president of the university in 1916. From 1929 to 1933, on leave of absence from the university, he served as Secretary of the Interior in President Hoover's cabinet. Among other positions Dr. Wilbur served as chairman of the Federal Oil Conservation Board, 1929-1933; chairman of the Committee on the Cost of Medical Care, 1927-1935; president of Better Homes in America, 1929-1935; chairman of the White House Conference on Child Health and Protection, 1929-1931; chairman of the National Advisory Committee on Illiteracy, 1930-1931. Dr. Wilbur has been a trustee of the Rockefeller Foundation since 1923 and of the General Education Board since 1930. He was President of the American Medical Association, 1923-1924, and a member of its Council on Medical Education and Hospitals, 1920-1923, and since 1925; he has been chairman of the Council since 1929. He has also been president of the Association of American Medical Colleges and of the California Academy of Medicine. He has been president of the California Physicians Service since 1939 and of the American Social Hygiene Association since 1926.

DISTRICT OF COLUMBIA

Two Cases of Typhus Fever.—Two cases of typhus fever have been reported in a man and woman working in the same eating establishment in Washington, according to the *Washington Star*, February 11. The District health department has started a program to prevent the spread of the disease.

Personal.—Dr. Custis Lee Hall, Washington, recently received a silver tray and candelabra from the Kiwanis Club in recognition of his sixteen years' service in treating crippled children in the Kiwanis Clinic. Dr. Hall has retired from active practice in the clinic but will continue in an advisory capacity, it is reported.

Society News.—The Medical Society of Virginia, Maryland and the District of Columbia devoted a recent meeting to two symposiums. The speakers in a symposium on the modern concept of pneumonia were Drs. Theodore J. Abernethy, Oscar B. Hunter, Claude Moore and James A. Gannon, Washington. A symposium on the diagnosis and treatment of acute osteomyelitis was presented by Drs. Custis Lee Hall, Guy W. Leadbetter, Washington, and Martin B. Hiden, Leesburg, Va. Mr. Constantine Brown, foreign news editor of the *Washington Evening Star*, was guest speaker at a luncheon.

FLORIDA

New President of State Board.—Dr. Shaler A. Richardson, Jacksonville, has been elected president of the state board of health, succeeding the late Dr. Nicholas A. Baltzell, Marianna. The vacancy on the board created by Dr. Baltzell's death has been filled by Dr. Herbert L. Bryans, Pensacola.

Officers of Health Association.—Dr. Leander J. Graves, Tallahassee, director of the Leon County health unit, was chosen president of the Florida Public Health Association at its meeting in December, succeeding Dr. Albert B. McCreary, Jacksonville (now deceased). Miss Mary Matthews, West Palm Beach, is vice president, and Dr. Edward M. L'Engle, Jacksonville, is the secretary-treasurer. Orlando was designated as the place for the 1941 annual session.

Physical Examinations for Servants.—An ordinance requiring physical examinations and health cards for domestics in Coral Gables became effective on February 1. Newspapers

reported that at a recent meeting the city commission decided to include domestics in the ordinance which provides for the health cards for food handlers in public places. The card will have an identification from the police department on one side and a certificate of good health on the other. In the future only domestics with both identifications will be permitted to work in Coral Gables. The city health department will conduct the examinations, which will include a blood test. A fee of 50 cents will be charged for the examinations. An "open house" will be held every six months.

ILLINOIS

Dr. Orr to Speak in Springfield.—Dr. Hiram Winnett Orr, Lincoln, Neb., will deliver the ninth annual lecture of the Springfield Medical Club at the Leland Hotel, Springfield, March 20. His subject will be "New Methods in the Management of Compound Fractures."

New Laboratory Building.—New accommodations have been provided for Flint, Eaton & Company, manufacturers of pharmaceutical preparations, Decatur. One half of the three story building is new construction; the other half has been remodeled. The building houses the control laboratories, library, research and manufacturing departments. An "open house" was held recently to celebrate the completion of the new structure.

Chicago

Personal.—Dr. James B. Herrick has been reappointed chairman of the medical advisory committee of Sunset Camp, a convalescent colony sponsored by the Chicago Heart Association for children afflicted with diseases of the heart. Sunset Camp is situated near Bartlett in the Fox River valley. It is free to children whose parents cannot afford to pay for their treatment.

Memorial Plaque to Dr. Hruby.—A bronze memorial plaque was recently unveiled in the Chicago Municipal Sanitarium and dedicated to Dr. Allan J. Hruby. Dr. Hruby served as dispensary physician to the sanitarium 1917-1918; superintendent, 1918-1923, and secretary and member of the board of directors from 1931 until his death on Nov. 18, 1939. Dr. Hruby's son, Allan Jr., and daughter, Jean, removed the covering from the tablet.

Society News.—The department of otolaryngology of Rush Medical College presented the program before the Chicago Laryngological and Otological Society, January 6. Among others, Drs. Gordon H. Scott and Linden J. Wallner spoke on "Chondroma of the Septum" and "Orbital Cellulitis" respectively. The Chicago Council of Medical Women was addressed, January 8, by Dr. Beulah Cushman on "Vascular Changes in the Eye"; Marion Hood, Ph.D., "Parasitic Infestations: Slides and Actual Specimen," and Dr. Gertrude M. Engbring, "Medical Work of Hildegard of the Rhine."—Papers were presented before the Chicago Roentgen Society, January 9, by Drs. Byrl R. Kirklin and Harry M. Weber, Rochester, Minn., on "Roentgenologic Aspects of Small Bowel Lesions," and Albert M. Snell, Rochester, "Clinical Phases of Small Bowel Lesions."—At a meeting of the Chicago Pathological Society, January 13 the speakers included Drs. Arthur Earl Walker on "Astrocytosis Arachnoideae Cerebelli, a Rare Manifestation of von Recklinghausen's Neurofibromatosis," and Hans P. Popper, "Lipoid Nephrosis and Fat Deposition in the Kidney."—Dr. Ludvig Hektoen was chosen honorary chairman of the board of governors of the Institute of Medicine of Chicago at its recent annual meeting. Dr. Hektoen, who has been chairman of the board, was succeeded by Dr. William F. Petersen. Other officers are Drs. Edwin W. Ryerson, vice chairman of the board; Rollin T. Woodyatt, president of the institute; George H. Coleman, secretary, and Grant H. Laing, treasurer.

INDIANA

Personal.—Dr. Theodore S. Schuldt, Pierceton, has been named health officer of Kosciusko County, filling the unexpired term of Dr. Max D. Garber, Warsaw, who resigned to do research work at Johns Hopkins Hospital, Baltimore, it is reported.

Postgraduate Courses.—An announcement has been received concerning postgraduate courses to be held at Indiana University School of Medicine, Indianapolis, this year. They are: General practitioners, April 28-May 2; pediatrics, March 5, 12, 19 and 26; cardiology, June 23-27; obstetrics, March 14-26 and July 7-19; otolaryngology, April 13-26.

Society News.—The Indianapolis Medical Society was addressed, February 25, by Drs. Reuben A. Solomon on "Spontaneous Pneumothorax"; Lyman T. Meiks, "Lipoid Pneu-

monia," and Ralph U. Leser, "Pulmonary Emphysema."—Max D. Steer, Ph.D., assistant professor of speech at Purdue University, Lafayette, discussed "Clinical Aspects of Stuttering" before the Tippecanoe County Medical Society in Lafayette, January 14.—The Northeastern Indiana Academy of Medicine was addressed in Kendallville, January 30, by Dr. Clyde G. Culbertson, Indianapolis, on "The Laboratory in General Practice."

KANSAS

Society News.—The Wyandotte County Medical Society was addressed, February 18, by Drs. Maurice V. Laing, Kansas City, on "Carcinoma of the Breast" and John A. Billingsley, Kansas City, "Value of Fundus Examination with Fundus Pictures." The society was addressed February 4 by Drs. Clay E. Coburn, Kansas City, on "The Work of the Local Draft Examination Boards," and Forrest L. Loveland, Topeka, "Medicine's Part in the National Defense Program."

Spring Clinical Assembly.—The Sedgwick County Medical Society will conduct its fourth spring clinical assembly at the Allis Hotel, Wichita, March 18. Dr. George T. Pack, assistant clinical professor of surgery, Cornell University Medical College, New York, will be the guest speaker. His subjects will be "Cancer of the Breast" and "Cancer of the Stomach." Wichita physicians on the program include:

Dr. Joseph V. Van Cleve, Lymphopathia Venereum (Lymphogranuloma Inguinale).
Dr. Christian A. Hellwig, Pathology of the Thyroid Gland.
Dr. Anthony F. Rossitto, X-Ray Therapy in Endocrine Disturbances.
Dr. Claude C. Tucker, Pruritus Ani—Medical and Surgical Treatment.
Dr. Millard W. Hall, Hysterectomy—Clamp Method.
Dr. Vern L. Pauley, Anomalous Vessels.
Dr. George F. Corrigan, Pathological Physiology of the Liver.

Dr. Logan Clendening, Kansas City, Mo., has been selected as the speaker at the banquet.

LOUISIANA

Annual New Orleans Graduate Assembly.—The fifth annual meeting of the New Orleans Graduate Medical Assembly will be held at the Roosevelt Hotel March 3-6. Clinics will be conducted at the various hospitals March 7. The speakers will be:

Dr. Maurice C. Pincoffs, Baltimore, Pancreatitis.
Dr. Charles F. McKhann, Ann Arbor, Mich., Progress in the Control of Respiratory Disease.
Dr. Paul A. O'Leary, Rochester, Minn., The Eczemas.
Dr. Paul D. White, Boston, The Range of the Normal Heart.
Dr. Leo G. Rigler, Minneapolis, Benign and Malignant Tumors of the Stomach.
Dr. Lawrence W. Smith, Philadelphia, Reduced Temperature ("Refrigeration") as an Adjunct to the Treatment of Malignant Disease.
Dr. Ernest E. Irons, Chicago, Aspiration Pneumonia.
Dr. Eugene L. Bishop, Chattanooga, Tenn., Coordination of Malaria Studies and Control of Impounded Waters.
Dr. Arthur H. Ruggles, Providence, R. I., Observations on Shock Therapy in Psychosis.
Dr. Paul C. Colonna, Oklahoma City, Okla., Treatment of Compound Fractures.
Dr. Owen H. Wangensteen, Minneapolis, Studies in the Etiology of Acute Appendicitis.
Dr. George E. Binkley, New York, Treatment of Rectal Cancer.
Dr. George F. Cahill, New York, Present Urologic Conception of Non-specific Urinary Infections.
Dr. William Wallace Morrison, New York, Modern Otolaryngology for the General Practitioner.
Dr. Richard W. TeLinde, Baltimore, Organic Aspects of Uterine Bleeding.
Dr. Cecil S. O'Brien, Iowa City, Loss of Vision in Elderly People.
Dr. Louis E. Phaneuf, Boston, The Value of Conservative Obstetrics.
Dr. Frederick A. Collier, Ann Arbor, Postoperative Complications.

A joint meeting with the Orleans Parish Medical Society will be held Thursday evening with Dr. Wangensteen discussing "The Management of Acute Intestinal Obstruction" and Dr. Phaneuf, "Complete Tears of the Perineum."

MASSACHUSETTS

Society News.—Florien Heiser, Ph.D., Storrs, Conn., addressed the Massachusetts Psychiatric Society at its recent annual meeting on "The Social Etiology of Mental Disorder." Officers were elected as follows: Drs. Harlan L. Paine, North Grafton, president; William Franklin Wood, Belmont, vice president, and David Rothschild, Foxboro, secretary and treasurer.—The Worcester District Medical Society devoted its meeting in Worcester January 8 to a symposium on the surgical problem in biliary lithiasis; the speakers were Drs. John F. Kenney, Meyer Saklad, Frederic V. Hussey, Emanuel W. Benjamin and Eliot A. Shaw, all members of the staff of Memorial Hospital, Pawtucket, R. I.—Dr. Hallowell Davis, Boston, discussed "Clinical Significance of the Electroencephalogram" before the New England Society of Physical Medicine, January 22.

Public Medical Lectures.—The Harvard Medical School, Boston, opened a course of free public lectures on medical subjects, January 5, with Dr. William B. Breed discussing "The Common Cold and How to Treat It." Other lectures in the series are:

Dr. Joseph C. Aub, Hormones and Children, January 12.
Dr. Henry C. Marble, How Accidents Happen, January 19.
Dr. Alan R. Moritz, Medical Aids to Justice, January 26.
Dr. Oliver Cope, Modern Advances in Surgery, February 2.
Dr. Frederick F. Russell, Medical Problems Presented by Selective Service, February 9.
Dr. Maurice B. Strauss, Use and Abuse of Vitamins, February 16.
David B. Dill, Ph.D., Fatigue and Health, February 23.
Dr. Carl W. Walter, Transfusion of Blood and Blood Banks, March 2.
Dr. Reginald Fitz, The Pathway of Medical Discovery, March 9.

MICHIGAN

Personal.—Dr. James H. Kelsey, Cassopolis, has been appointed a member of the state board of medical examiners.—Dr. Fred M. Meader, director of medical service and deputy commissioner, Detroit Department of Health, retired on January 28; he has been with the department since 1920, newspapers reported, and is retiring on account of age.

Society News.—Dr. Hobart A. Reimann, Philadelphia, discussed "Treatment of Pneumonia" before the Calhoun County Medical Society in Battle Creek, February 4.—A symposium on pneumonia was presented before the Wayne County Medical Society, Detroit, January 20, by Drs. Alpheus F. Jennings, Emil M. Schbesta, Arthur W. Frisch and Alvin E. Price.

New State Bureau of Tuberculosis.—A bureau of tuberculosis has been created in the state department of health to provide a more intensive tuberculosis program. Dr. George A. Sherman, Pontiac, medical director and superintendent of the Oakland County Tuberculosis Sanatorium and president of the Michigan Tuberculosis Association, has been appointed director of the new unit. Heretofore tuberculosis work has been one of the several activities of the bureau of epidemiology.

Rural Community Builds Its Hospital.—The Addison Community Hospital, built largely by volunteer labor and at a cost of \$15,000, was dedicated in Addison recently as a monument to Dr. Bowers H. Growt. Residents of the rural community helped swell the building fund for this project, started by Dr. Growt, by staging benefit shows, dances, church suppers and rummage sales. Those who could not give money contributed their time and labor. The township boards of four adjacent townships voted an appropriation to help meet the expense. Dr. Growt graduated at the University of Maryland School of Medicine, Baltimore, in 1916.

MISSOURI

Dr. Doisy Awarded Gibbs Medal.—Edward A. Doisy, Ph.D., professor of biochemistry, St. Louis University School of Medicine, St. Louis, has been awarded the Willard Gibbs Medal for 1941. The medal is awarded annually by the Chicago section of the American Chemical Society. Dr. Doisy has been active in the study of vitamin K. He received his Ph.D. degree from Harvard University in 1920. He has served at Harvard Medical School as assistant in biochemistry, 1915-1917, and at Washington University School of Medicine, St. Louis, as instructor, associate and associate professor of biochemistry, 1919-1923, joining St. Louis University School of Medicine in 1923. He was honored with the gold medal of the St. Louis Medical Society in 1935; Philip A. Conné Medal, Chemists Club of New York, 1935, and the St. Louis Award in 1939. He was a member of the League of Nations Committee on Standardization of Sex Hormones in 1932 and 1935. He is a member of many scientific societies and has written numerous articles.

NEW JERSEY

Program on Hypertension.—Dr. Soma Weiss, Boston, addressed the Bergen County Medical Society in Hackensack, January 14, on hypertension. The address was followed by a panel discussion presented by Drs. Benjamin I. Aske, Arthur C. DeGraff, Asa L. Lincoln, Paul Reznikoff and Irving S. Wright, all of New York.

"Town Hall" Meeting.—The Academy of Medicine of Northern New Jersey and the Medical Society of New Jersey are sponsoring a "Town Hall" meeting, March 24, at the Mosque Theater, Newark. Dr. Frank H. Lahey, Boston, President-Elect of the American Medical Association, will speak on "The Health of the Nation."

Medal Awarded to Dr. Stanley.—Wendell M. Stanley, Ph.D., of the Rockefeller Institute for Medical Research, Princeton, received the gold medal of the American Institute of the City of New York at a dinner in New York, February 6. The award was given to Dr. Stanley in recognition of his work in "crystallizing the virus of tobacco mosaic, a feat which has opened up new fields of research, given birth to new ideas about the nature of important disease-producing agents and enlarged the human understanding of life." Dr. Stanley made an address at the dinner on his virus research.

NEW YORK

Personal.—A testimonial dinner was given to Dr. Henry T. Kelly, White Plains, January 11, in celebration of his completion of forty years of practice in White Plains. Dr. Malcolm Goodridge, president of the New York Academy of Medicine, gave an address. Dr. Kelly is chief of staff of the White Plains Hospital and is a former president of the Medical Society of the County of Westchester. The hospital staff and board of governors gave him a silver plate.

Public Lectures in Buffalo.—A series of lectures for the public was presented during January and February at the University of Buffalo School of Medicine, Buffalo, by members of the faculty. The speakers were:

- Dr. Earl D. Osborne, Carcinoma in Women—Can Women Prolong Their Lives? January 12.
- Dr. James E. King, What You Should Know About Syphilis, January 23.
- Dr. Herbert A. Smith, Appendicitis—How to Suspect It and What to Do About It, February 9.
- Dr. David K. Miller, Your Food and Your Health, February 23.

The lectures were arranged under the auspices of a new department of postgraduate and continuation teaching, of which Dr. Abraham H. Aaron is the director.

State to Distribute Sulfapyridine.—The New York State Department of Health began the distribution of sulfapyridine for the use of registered doctors of medicine and hospitals in the treatment of pneumococcal infections of patients for whom the purchase of the drug would prove a hardship, according to *Health News*. The drug will be distributed through certain of the regular laboratory supply stations. Certification of relief status or medical indigence will not be required, but physicians were requested to limit their requests in order to conserve the supply. The department has asked physicians to send to the proper health officers records of cases in which sulfapyridine is used.

New York City

Appointments at New York University.—The council of New York University has announced the following appointments to the college of medicine:

- Dr. Clair E. Folsome, assistant professor of obstetrics and gynecology.
- Drs. Willis S. Knighton, Samuel P. Oast and Brittain F. Payne, assistant clinical professors of ophthalmology.
- Dr. Francis A. Echlin, assistant clinical professor of neurosurgery.
- Dr. Harold B. Keyes, assistant clinical professor of surgery.

The Wyckoff Lectures.—The fourth series of the John Wyckoff Lectures, sponsored by the Phi Delta Epsilon fraternity, at New York University College of Medicine in memory of the late Dean Wyckoff, was delivered by Dr. John R. Paul, professor of preventive medicine at Yale University School of Medicine, New Haven, February 4-5. The subject of Dr. Paul's lectures was "The Clinical Epidemiology of Poliomyelitis."

Conference on Tuberculosis.—The thirty-ninth annual meeting and conference on tuberculosis of the New York Tuberculosis and Health Association, meeting jointly with the Tuberculosis Sanatorium Conference of Metropolitan New York, will be held March 4 at the Hotel Pennsylvania. At a luncheon meeting Dr. Wilson G. Smillie, professor of public health and preventive medicine, Cornell University Medical College, will speak on "The Ebb and Flow of Public Health," and Hon. Arthur J. Altmeyer, chairman of the Social Security Board, Washington, D. C., on "Social Security and National Security." There will be papers on a program of vocational activity for the sanatorium, staff education of public health nurses in tuberculosis work and tuberculosis among draftees.

Hospital News.—The department of urology, the James Buchanan Brady Foundation, of the New York Hospital marked the twentieth anniversary of its founding with a special program January 15. There was a clinical program in the surgical amphitheater in the afternoon and in the evening the following program was presented at the New York Academy of Medicine: Drs. Roy B. Henline on "Adequate

Treatment of Prostatic Disease, with Special Reference to Pathology"; Thomas J. Kirwin, "Management of Carcinoma of the Renal Pelvis"; Oswald S. Lowsley, "The Role of the Brady Foundation in Urology at the New York Hospital," and Colin L. Begg, "Reminiscences in Urology in New York City." Dr. Begg died a few hours after this address, newspapers reported.—Dr. Isidore Snapper, professor of medicine, Peiping Union Medical College, Peiping, China, gave a lecture at Mount Sinai Hospital, January 13, on "Chinese Lessons to Western Medicine."

OHIO

State Pathologists Meet.—The Ohio Society of Pathologists held its midwinter meeting at the Institute of Pathology, Western Reserve University, Cleveland, January 18, with the following speakers: Drs. Howard T. Karsner on "Paget's Disease of the Nipple"; Francis Bayless, "Juxtaglomerular Apparatus," and Harry Goldblatt, "Experimental Observations of Hypertension Associated with Unilateral Renal Disease."

Personal.—Dr. David Rolland Williams, Girard, was the guest of honor at the annual banquet of the Mahoning County Medical Society, Youngstown, January 21, marking his completion of fifty years of medical practice. Dr. Williams at one time practiced in Youngstown and is a nonresident member of the society. The Trumbull County Medical Society also gave a dinner in honor of Dr. Williams in December in Warren. Girard is in Trumbull County.—Dr. Harry Bookwalter, Columbiana, was recently honored by the Kiwanis Club of Columbiana and other friends at a dinner celebrating his completion of forty years in the practice of medicine.—Dr. Alfred E. Ewing, McDonald, recently retired after thirty-seven years of service with the U. S. Steel Corporation, twenty-four years at the McDonald mills. Officials and employees of the mills gave a banquet in his honor and presented him with a watch.—Dr. and Mrs. Franklin E. Michener, Tiffin, celebrated their golden wedding anniversary on January 5 with a reception at their home.

OREGON

Lectures by Dr. Wangenstein.—Three lectures were given by Dr. Owen H. Wangenstein, Minneapolis, at the University of Oregon Medical School, Portland, February 13-15, under the auspices of the Portland Academy of Medicine. His subjects were "Studies in the Etiology of Appendicitis," "Practical Aspects of the Therapeutic Problem in Bowel Obstruction" and "The Ulcer Problem Viewed from the Standpoint of Etiology and Therapy."

PENNSYLVANIA

New Commission on Nutrition.—The board of trustees of the Medical Society of the State of Pennsylvania, at a meeting in December, established a commission on nutrition and deficiency diseases in accordance with a recommendation adopted by the house of delegates. Dr. Herbert T. Kelly, Philadelphia, has been appointed chairman of the commission, which proposes to disseminate the newer knowledge of nutrition and to study the causes, prevention, early recognition and medical management of nutritional deficiency.

Society News.—Dr. Harrison F. Flippin, Philadelphia, addressed the Dauphin County Medical Society, Harrisburg, February 4, on "Sulfathiazole and Sulfapyridine in the Treatment of Pneumonia."—Dr. Murray M. Copeland, Baltimore, addressed the Harrisburg Academy of Medicine, February 18, on "Clinical Management of Diseases and Tumors of the Breast."—Dr. Thomas Butterworth, Reading, addressed the Lebanon County Medical Society, Lebanon, February 11, on "Ten Most Common Skin Diseases."—Dr. William Leo Mullins, Pittsburgh, addressed the Lawrence County Medical Society, New Castle, February 6, on "Some Coronary Problems."—Dr. John A. McKay, Mercer, addressed the Mercer County Medical Society, Greenville, February 12, on "The Nature and Present Status of the Filtrable Viruses."—Dr. Russell L. Cecil, New York, gave an address on "Recent Advances in Chemotherapy of Pneumonia" before the Cambria County Medical Society, Johnstown, February 13.

Philadelphia

Fellowship in Penal Psychiatry.—A fellowship in penal psychiatry under the Pennsylvania Plan for Intramural Training in Penal Psychiatry is available at the University of Pennsylvania. The fellowship is provided by the Commonwealth Fund, will run two years and carries a stipend of \$2,400 the first year and \$2,800 the second year. Minimal qualifications

specify a graduate physician not older than 35, having accredited internship and at least two years of acceptable psychiatric training. Address inquiries to Dr. Philip Q. Roche, secretary of the committee on medicolegal fellowships, 255 South Seventeenth Street, Philadelphia.

Marriage Counsel Service.—Marriage Counsel, a non-profit-making community service, was started in 1932. The methods used are individual interviews, group talks, a lending library of selected books and pamphlets on marriage and family relationships, and the publication of articles evaluating and interpreting this service. The Marriage Counsel is supported by fees, by membership and by voluntary contributions. Fees are an almost negligible source of support, however, a report points out. The agency has participated in yearly courses in family relationships in several colleges. Seminar discussion groups have been held for physicians, ministers and teachers. A recent report states that there are about twenty-seven recognized counseling services in the United States. Dr. Frederick H. Allen is chairman of the executive board of sponsors of the Philadelphia organization and the counselors are Mrs. Stuart Mudd and Drs. Elizabeth Kirk Rose and Robert A. Matthews. The headquarters are at 253 South Fifteenth Street.

TEXAS

Spring Clinical Conference.—The Dallas Southern Clinical Society will sponsor its thirteenth annual spring clinical conference, March 17-20, with headquarters at the Hotel Adolphus. There will be twelve guests who will give addresses at general assemblies. There will be also lectures by Dallas physicians, round table luncheons and clinics each afternoon. The guests will be:

Dr. Clifford J. Barborka, associate in medicine, Northwestern University Medical School, Chicago.

Dr. Soma Weiss, Hersey professor of the theory and practice of physics, Harvard Medical School, Boston.

Dr. William E. Chamberlain, professor of radiology and roentgenology, Temple University School of Medicine, Philadelphia.

Dr. Harry Goldblatt, professor of experimental pathology and associate director, Institute of Pathology, Western Reserve University School of Medicine, Cleveland.

Dr. Henry G. Poncher, associate professor of pediatrics, University of Illinois College of Medicine, Chicago.

Dr. Marion B. Sulzberger, assistant clinical professor of dermatology and syphilology, New York Post-Graduate Medical School, Columbia University, New York.

Dr. Leland S. McKittrick, instructor in surgery, Harvard Medical School, Boston.

Dr. John J. Morton Jr., professor of surgery, University of Rochester School of Medicine and Dentistry, Rochester, N. Y.

Dr. James C. Sargent, clinical professor and director of the division of urology, Marquette University School of Medicine, Milwaukee.

Dr. Norman F. Miller, professor of obstetrics and gynecology, University of Michigan Medical School, Ann Arbor.

Dr. Derick T. Vail Jr., professor of ophthalmology, University of Cincinnati College of Medicine.

Dr. Fletcher D. Woodward, professor of diseases of the ear, nose and throat, University of Virginia Department of Medicine, Charlottesville.

There will be a smoker on the first evening, and the annual banquet will be held Thursday evening, March 20.

GENERAL

Society News.—Dr. Ruth E. Boynton, Minneapolis, director of the student health service, University of Minnesota, was recently reelected president of the American Student Health Association.—The annual meeting of the American Industrial Hygiene Association will be held the week beginning May 5 in Pittsburgh. Gordon C. Harrold, Ph.D., Industrial Hygiene Laboratory, Chrysler Corporation, 7900 Joseph Campau Avenue, Detroit, is the secretary.—Dr. Harold M. Camp, Monmouth, Ill., is the new president of the National Conference on Medical Service and Dr. Joseph D. McCarthy, Omaha, secretary. The conference met at the Palmer House, Chicago, February 16.

Bowling Tournament Suggested for Cleveland Session.—The organization of an American Medical Bowling Association has been suggested with a view to holding a tournament each year during the annual session of the American Medical Association. The suggestion comes from Los Angeles, where the Medical Bowling League has been formed among members of the Los Angeles County Medical Association. A team of five men from each state is invited to meet this year in Cleveland for the first tournament and to organize the American Medical Bowling Association. Bowlers who may be interested are asked to communicate with Dr. Lewis Wine Bremerman, 1709 West Eighth Street, Los Angeles.

Biologists Propose Pan American Cooperation.—The trustees of *Biological Abstracts* recently approved a plan to make a set of volumes of that publication available at a reduced price to persons, foundations and institutions who may wish

to send such sets to South American institutions, according to an announcement by Dr. Anton J. Carlson, Chicago, president of the Union of American Biological Societies. Writing in *Science*, Dr. Carlson pointed out that there are about one hundred and fifty bona fide research and educational institutions in Latin America which do not subscribe to the abstracts because of lack of funds or inequality in monetary exchange value. Organizations or persons interested in this plan can obtain a list of the institutions from John E. Flynn, Ph.D., Editor in Chief of *Biological Abstracts*, University of Pennsylvania, Philadelphia.

Amory Fund Award.—The American Academy of Arts and Sciences announces the first award of the septennial prize of the Amory Fund to four scientists for their contributions to the treatment and cure of diseases of the genitourinary system. The recipients are Dr. Joseph F. McCarthy, professor of urology, New York Polyclinic Medical School and Hospital, New York; Carl R. Moore, Ph.D., professor of zoology, University of Chicago; Dr. Hugh H. Young, professor of urology, Johns Hopkins University School of Medicine, Baltimore, and a European scientist whose name is withheld for the present because he lives in a country dominated by Nazi Germany. The prize money, which is the income from a fund established in 1912 by the late Francis Amory of Beverly, Mass., amounts to nearly \$16,000 and will be divided equally among the four scientists, that for the European recipient being held in trust for him in this country. The award covers contributions made since 1933. Dr. McCarthy was honored for his development of technical instrumental procedures for the examination, diagnosis and treatment by way of the urethra, without external incision, of certain diseases of the bladder, prostate and related organs. Dr. Moore's investigations concerned the physiology of the male reproductive tract, especially as it is influenced by the hormonal secretions of the male sex gland. Dr. Young was cited for the operation of total prostatectomy by the perineal approach, which he devised and perfected for the relief of obstruction to the outlet of the urinary bladder caused by cancer of the prostate gland.

Surgical Supply Firms Indicted.—A federal grand jury sitting in Philadelphia returned an indictment, February 17, charging the American Surgical Trade Association, twelve of its officers and agents and twenty-four corporations in the surgical supply industry, members of the association, with violations of sections 1 and 2 of the Sherman Act. The indictment charges that the defendants, through membership in the American Surgical Trade Association, control the sale of approximately 95 per cent of all surgical supplies and have conspired to limit and prevent the production and sale of articles of surgical supplies which were imitations or copies of other articles. It is alleged that this result has been accomplished by a registration plan under which any member of the association could register any article of surgical supplies which was first produced by the member; by an agreement that no member would produce or sell for five years any article that was an imitation or copy of any article registered with the association, and by a threat to boycott all articles that were imitations or copies of those registered with the association. The indictment also charges that this plan gives to each member who has registered an article a monopoly of five years in the production and sale of that article. The indictment alleges that the effects of the combination and conspiracy have been to restrain substantially and unreasonably the production and sale of articles of surgical supplies which were imitations or copies of articles registered with the association, to prevent normal competition and to give to each member who has registered an article a five year monopoly, thereby giving members the power to control the supply and price of the registered articles. The defendants, each of whom is named in both counts of the indictment, are the American Surgical Trade Association, W. D. Allison Company, A. S. Aloe Company, American Metal Furniture Company, Bard-Parker Company, Randall Faichney Corporation, Gomco Surgical Manufacturing Corporation, W. A. Baum Company, Inc., Clay-Adams Company, Inc., Glasco Products Company, Hamilton Manufacturing Company, Fred Haslam and Company, Inc., Jetter and Scheerer Products, Inc., Kny-Scheerer Corporation, E. B. Meyrowitz Surgical Instruments Company, National Electric Instrument Company, Inc., George P. Pilling & Son Company, Prometheus Electric Corporation, Scanlan Morris Company, J. Sklar Manufacturing Company, Storz Instrument Company, Edward Weck & Company, Zimmer Manufacturing Company and the following individuals: H. N. Bowman, Henry E. Reeves, William D. West, Fred B. Hovey, Oscar F. Cochrane, James Brown, David L. McKean, William H. Toohler, George W. Wallerich, William Herzog, Joseph A. Miner and Edward W. Roehm.

Limitation of Medical Students

The question of limiting the number of students admitted to the faculty of medicine has been discussed in many parts of the world during recent years for various reasons. In New Zealand, however, the problem is an immediate and a practical one. The number of students wishing to study medicine this year is almost double that which the Otago school (the only one in the dominion) can accommodate. The question is serious, since it involves the refusal to some people who desire it of the opportunity to be trained as doctors. It is no function of a medical school to decide how many it is to turn out: some schools indeed train mainly for export; but, since funds and accommodation were limited, it was surely the duty of those responsible for the design and development of the Otago school, which had no such ambitions, to form an estimate of the number of doctors the country was likely to require in the visible future and build accordingly. It was thought that an annual list of sixty qualified men per annum would satisfy all requirements. If the population is a million and a half it should be adequately served by fifteen hundred doctors: if twenty-five years is an average period of practice—a low estimate—an output of sixty per annum will maintain that number. The medical school then was constructed to accommodate sixty students in a year, but it now is receiving over one hundred, with considerable inconvenience. To extend accommodation would cost a great deal of money, a proposal to which the government is entirely averse. It is possible, moreover, that the present increase in enrolments has only temporary causes. In the first place there is the war, and many parents with adolescent sons, often only one, are anxious to put them into a reserved occupation where they may avoid the war altogether and which will enable them to serve, if need be, with the advantages of commissioned officers and in a non-combatant branch. In the second place there is the social security act. This does not establish a state medical service, but in the eyes of the public it establishes something like it. And the civil service in New Zealand is popular with the public. It is not likely that a state medical service will require a large permanent increase in the profession, and the falling birth rate combined with war casualties must surely point to a reduced rather than an increased need for future doctors. It seems then that a second school is not necessary, and limitation of students at Otago is therefore inevitable. A previous attempt to limit the influx of students in 1930 was not found satisfactory.

Proposed Fortification of White Flour with Synthetic Thiamine

Following the decision of the Ministry of Health in Great Britain that all white flour shall be fortified nutritionally by the addition of synthetic vitamin B₁, it was suggested that the Australian people might benefit by a similar means. The Nutrition Committee of the National Health and Medical Research Council considered the proposal fully but decided that the addition of synthetic vitamin B₁ alone to white flour involves a wrong principle. It is well known that there are many instances in which mixtures occurring in natural products have a more beneficial effect than the administration of the isolated single substances, e. g. in the treatment of pellagra, in which it has been found that, whereas the primary deficiency is of nicotinic acid, the best results are obtained by the administration of additional members of the vitamin B complex. There is no evidence that thiamine produces its

complete nutritional effect by its own unaided physiologic action or that it is any more deficient in the diet of the general Australian community than any other members of the B complex and other substances necessary for normal nutrition. Instead it is recommended strongly that an investigation be made into the possible use as additions to the diet of Australian products such as cereal by-products, dried skim milk and other sources of the B complex rather than the use of imported synthetic products, since such by-products would supply other known essentials besides vitamin B₁. It is also recommended that, since investigations at the Institute of Anatomy, Canberra, have indicated that the B content of Australian wheats is higher than that of wheats examined in England, and, further, since different varieties of Australian wheats show differences in content, that the vitamin B₁ content of the chief varieties of Australian wheats and wheat products be determined without delay. The council has allotted a grant for the work. The investigation will cover all those aspects of the reinforcement of vitamin B complex of flour for bread making which are necessary to insure the production of bread which is nutritionally adequate, of good baking and keeping qualities and acceptable to the public taste.

Epidemiology of Q Fever

Further investigations into the epidemiology of Q fever have yielded interesting facts. The testing of serums for agglutination with an emulsion of *Rickettsia burneti* has provided a useful means not only of diagnosing human illness but also of determining the incidence of infection in various human and animal populations. Agglutinins may be detected in human serums for some months after an obvious attack of Q fever, and they may also be found in cases in which infection has not been apparent.

Out of a total of 180 bandicoot (*Isodon torosus*) serums examined, 39 were found to agglutinate. This evidence of a high incidence of Q fever among bandicoots confirms the important role that this animal plays in the spread of the disease. The incidence of agglutination was much greater in bandicoots captured at Cowan Cowan on Moreton Island than in those captured on the mainland, a fact correlated with their high infestation with the tick *Haemaphysalis humerosa*. Out of a series of cattle serums tested, one was completely positive at a 1:10 dilution. The owner of this cow had had Q fever himself six months previously.

Surveys of human serums were made with serum from abattoir workers in Brisbane and of forestry workers at Imbil. The abattoir was chosen because most of the cases of Q fever have come from there. Of the serums from 79 volunteers, 18 showed agglutination. Four of these workers were known to have had Q fever; 8 had had a previous febrile illness, not investigated at the time, which may have been Q fever; 6 were not aware of having had any fever. Thus infection with *R. burneti* may take a symptomless or inapparent course.

Most Q fever patients have had contact with cattle or pigs, and it seems likely that the cattle in some way convey the infection to dairy or abattoir workers from the bush, particularly from scrub (rain forest) areas. To investigate the possibility of workers in the scrub contracting Q fever without intermediate cattle contact, the forestry workers at Imbil were examined. (Three of 36 rural cases of Q fever have been among timber workers.) Of 64 serums tested, 6 showed the presence of agglutinins for *R. burneti*. Two of the 6 men gave no history of fever, confirming the existence of human Q infection in an inapparent form. Also an examination was made of the blood of 186 militia men stationed temporarily at Cowan Cowan. Failure to find any agglutination in the serums tested suggests that *H. humerosa* does not readily attack men—at least where its natural host is available—and consequently is not likely to be a common cause of direct human infection.

Praise for American Medicine

High praise for the hospitality and clinical opportunities freely given for postgraduate work to visitors in America is given by Dr. Kate Mackay, who recently returned to Australia after a postgraduate tour. As well as the clinics, which serve as a model to the rest of the world, and the well equipped research laboratories, Dr. Mackay was impressed by the knowledge which all Americans have of their own case histories. They are not introspective, she says, but well trained in general medical knowledge. This she attributes largely to the number of popular scientific articles which appear regularly in papers written with the approval of medical men and to public lectures given by well known members of the medical profession. Australian graduates generally are fully appreciative of the hospitality and opportunities for acquiring knowledge afforded to medical graduates visiting America.

The Control of Unscientific Advertising

A subcommittee on unscientific advertising was set up by the New South Wales committee of the Australian Association of Scientific Workers with the object of discouraging the use of statements contrary to, or unsupported by, scientific facts in advertising matter broadcast or published in this state. The subcommittee decided in the first instance to attempt to gage the attitude of the newspapers and the radio stations toward its proposed activities and also to seek the cooperation of the British Medical Association and the Pharmaceutical Association of New South Wales, since much of the objectionable advertising matter is concerned with "patent medicines" and other medical goods. Accordingly, the aforementioned bodies were circularized with the following results:

1. The British Medical Association promised its cooperation.
2. The Pharmaceutical Association sent a guarded reply requesting more information.

3. *Sydney Morning Herald*, Associated Newspapers, Ltd. (the *Sun*), Consolidated Press, Ltd. (the *Telegraph*) and the *Bulletin* indicated general approval of the aims of the subcommittee. *Truth*, Ltd. and *Smith's Weekly* did not reply. In one reply it was suggested that the Australian Association of National Advertisers should be informed of the subcommittee's activities.

4. The commercial radio stations indicated that negotiations with the radio industry would best be carried out through the Australian Federation of Commercial Broadcasting Stations.

Further correspondence was therefore undertaken with the two bodies mentioned. The Secretary of the Australian Federation of Commercial Broadcasting Stations, in reply, stated that the matter would be put before the federation at its next meeting in November. Enclosed in the reply was a brochure, "Standards of Advertising Practice Adopted by the Commercial Radio Advertising Board." The following rules may be quoted from this brochure:

RULE 1.—Medical Advertisements: No advertising shall contain any matter which in any way departs from the truth as to the character of the product or its suitability for the purposes for which it is recommended. Further, no untruthful implications may be imported into any advertising matter.

RULE 12.—In addition to the foregoing conditions in respect of medical advertisements, commercial stations are bound not to accept any script, continuity, advertising copy, recorded commercial announcements and such matter for broadcast which introduces or incorporates:

- (a) False or questionable statements or any other forms of misrepresentation.
- (i) Statements or claims, known or believed to be false, deceptive or grossly exaggerated.

It will be seen that these rules provide an adequate mechanism for the elimination of unscientific statements from radio advertising; but the Commercial Radio Advertising Board, as constituted at present, apparently contains nobody competent to judge the truth of a statement couched in scientific terms.

The subcommittee of the Australian Association of Scientific Workers expressed the opinion that definite proposals should be put before the federation at its November meeting. Two courses of action are suggested:

1. The A. A. S. W. might point out to the federation those statements to which it objects and leave to the latter body any further action according to the rules that have been quoted.

2. Or, adopting a more positive policy, the A. A. S. W. might set up a body analogous to the American Medical Association's Council on Foods and Nutrition. Such a body would report on all advertising matter submitted to it or already incorporated in radio programs. Advertisers would then be permitted to use, in connection with broadcast advertising, a statement signifying that the matter had received the approval of the A. A. S. W. and, in conjunction with the printed advertising, suitable insignia also indicating the approval of the A. A. S. W.

The reply received from the Australian Association of National Advertisers expressed a desire to know more of the aims and objects of the subcommittee and included an invitation for three delegates from the Australian Association of Scientific Workers to meet the executive committee of the Australian Association of National Advertisers on a date to be arranged.

First Queensland Medical Students Graduate

The first of the students to graduate from the newly established Medical School of the University of Queensland will receive their degrees next week. Twenty students now have passed their final examination and are qualified to take up medical positions—positions in which they are urgently needed, as the calling up of medical men for military duties has resulted in a shortage of practitioners available for civilian duties. These graduates are well equipped to enter the profession. In the new medical school an attempt has been made to give expression to ideals which have for some time appealed to the teachers in older schools. The opportunity has been taken not only to bridge the gap between the medical sciences and clinical practice, to establish the closest link between the teaching of physiology and the problems of the general practitioner, but also to establish from the beginning of the subject a policy of progressive and coordinated transition. The incoming student armed with a knowledge of fundamental physical, chemical and biologic conceptions is first led to apply these to cellular behavior. He then proceeds to study groups of cells working together as organs, organs coordinated as systems and systems integrated into an intact organism. Finally, he discovers how this integrated being reacts to the vicissitudes of normal and abnormal environments. Also these students have been required to take an extensive course in social and tropical medicine in order that they may be equipped to deal adequately with Queensland's special problems relating to its tropical climate.

Wartime Supply of Medical Equipment

The possibility of a serious shortage in Australia of stocks of those items of medical equipment which could not be manufactured here was foreseen by Major General Downes, who, in collaboration with the Commonwealth Department of Health, obtained approval for the expenditure in January 1939 of £73,000 for the purchase of certain drugs and instruments which were to be held in reserve for emergency. The drugs included the more important alkaloids, local anesthetics, various antiseptics, arsenical preparations, sulfanilamides, sedatives, calomel, salyrgan, metrazol and nikethamide. The instruments were of types which could not be manufactured locally, such as thermometers, suture needles and syringes. Now, with the notable exception of hypodermic syringes, all the items in the list have been supplied and constitute a valuable reserve today.

Another prewar action was to constitute a medical equipment subcommittee of the Central Committee for the Coordination of Medical Services in Time of War. This subcommittee was given the task of investigating every problem relating to the supply of medical equipment and reporting to the central committee. Since the outbreak of the war, however, it has been given executive authority as an independent medical equipment control committee. This body is composed of a chairman, who must be a medical officer of the defense force, and one representative of each of the Commonwealth Department of Health, the Department of Supply and Development and the Department of Trade and Customs, and the British Medical Association. For the purpose of insuring an adequate supply of medical equipment for the navy, army and air force and the civil population of Australia, this committee may make orders to regulate, restrict or prohibit the production, storage, distribution, sale, purchase and use of medical equipment. Already it has exercised its powers considerably, and with the cooperation of doctors and pharmacists, whom it urges to "improvise and economize," Australia should not suffer any serious shortage.

Hospitality for Doctors' Children

In view of the war in Great Britain, Australian doctors have offered to take into their homes up to five hundred British children under 16 either unaccompanied or accompanied by their mothers. Selection is being undertaken by the British Medical Association. Parents will be responsible for the passage money, and individual arrangements will be made about the cost of education and maintenance. This is essentially a private scheme to place doctors' children in doctors' homes and is quite separate from the official evacuee scheme. The British Medical Association will arrange for transportation, and it will also act as a medium for obtaining the passports.

Fatal Case of Quinine Poisoning

It is well known that toxic effects may result from overdoses of quinine, but the fact that they may prove fatal, especially to children, is perhaps not so generally recognized. A case was recently reported in New Zealand. A child aged 1 year and 8 months accidentally gained possession of a bottle of quinine tablets belonging to his mother. When the woman noticed the fact and also that he must have swallowed several she immediately fed him with strong salt solution and olive oil. This would not make the child vomit, however, and he was taken to a doctor. After examining the boy, the doctor pronounced him all right and told the mother to take him home and give him another emetic. While this was being prepared, the child's lips turned blue, his body became limp and he died at once (less than two hours after the accident was discovered). Postmortem examination showed that he was a well nourished child free from evidence of organic disease. In the stomach was a fairly bulky dry meal of potatoes and vegetables but no pills or tablets. In the first 3 or 4 feet of intestine, 10 pills were found in various stages of disintegration, together with a few fragments of the meal in the stomach. It is interesting to notice that these pills passed through the full stomach to the intestine, so that emesis or even gastric lavage would have been of no avail. An analysis of some of the original tablets showed that they contained between 5 and 6 grains (0.35 Gm.) each of quinine bisulfate. No alkaloid other than quinine was detected in any of the analyses. The rapidity with which the quinine was absorbed from the small intestine is commented on. From the remains of 8 tablets (40 grains, or 2.6 Gm.) only 4 grains (0.26 Gm.) could be recovered on analysis. This is in accord with the idea that quinine is stored for only a short time in the various organs before being destroyed. The child may even have swallowed more than 40 grains.

BUCHAREST

Oct. 28, 1940.

Bachelor Tax in Bulgaria

The Bulgarian chamber of deputies passed a bill according to which the bachelor tax will be raised by 20 per cent. Exception will be made with men who were advised by the so-called marriage consulting bureaus not to marry. The property of bachelors is inherited by the state. Illegitimate children of bachelor fathers inherit a certain percentage of the property if paternity has been recognized by the bachelor. Unmarried persons older than 25 years cannot occupy any government position.

The Public Health Balance of the Past Year

In 1939 one hundred public health districts were established and the organization of the public health affairs of the capital city, Bucharest, were arranged according to the model supplied by the Rockefeller Foundation. In ten counties public health model districts have been established. Besides the sums computed in the budget for drugs, 60,000,000 lei was spent, especially for the campaign against malaria and syphilis. For prophylactic work in villages besides the twenty-five bath trains already extant, ten new trains have been installed. Twenty portable bacteriologic laboratories, twenty-four portable roentgen ray laboratories, one hundred and thirty-two microscopes, three hundred and twenty delousing ovens and twenty-five steam disinfectors have been purchased. For the nursing of patients seven hundred oxygen outfits, one thousand four hundred oxygen cylinders and six hundred pumps filled with oxygen have been put in operation. New hospital pavilions were erected at nine small cities. A sanatorium for tuberculosis patients has been erected at Valea Jasului, a special hospital for pellagra patients in Pitesti, and one for leprosy patients in Tichilesti-Tulcea. In Bucharest a cancer center has been built. Sixty-three dispensaries have been established with baths. Ten model dispensaries are in the course of construction. Twenty million lei has been distributed among the provinces for making safe wells in villages. For the study of the nutrition of the peasantry fifty-six woman inspectors did exploratory work in four counties, namely, Arges, Turda, Romanati and Lapusna. In the villages anti-scarlet fever inoculations have been introduced and 900,000 children inoculated; 1,267,678 diphtheria antitoxin vaccinations have been given; thirty-seven antirabic centers were established in different parts of the country. At present plans are being made for the construction of ten hospitals for venereal diseases and four hospitals for the treatment of patients suffering from tuberculosis. Seven hundred and thirty puericultural dispensaries have been established, where during one year 126,971 sick children have been examined. The children were visited also at their homes in 460,035 instances. The ministry of public health has distributed an immense quantity of underwear and clothing.

Marriages

CONRAD KEISTER CLIPPINGER, Dayton, Ohio, to Miss Norma Eileen Schuesselin of Piqua in November 1940.

BUFORD SOUTER CHAPPELL to Miss Mary Marjorie Cooper, both of Columbia, S. C., in November 1940.

HENRY CLAY DORRIS to Miss Betty S. Aycock, both of Atlanta, Ga., in November 1940.

WILLIAM H. HYDEN, Auxier, Ky., to Miss Bess Long Ardery of Paris in November 1940.

ALBERT R. ANDRISEK to Miss Lillian Sindelar, both of Cleveland, in November 1940.

PAUL J. DWAIHY, Detroit, to Miss Rae Nader at Cleveland in November 1940.

Deaths

Frank James Kinberger, New Orleans; Tulane University School of Medicine, New Orleans, 1908; member of the Louisiana State Medical Society; clinical assistant in diseases of children from 1912 to 1914, lecturer and instructor in diseases of children from 1914 to 1923 and assistant professor of clinical pediatrics at his alma mater from 1923 to 1940; first secretary of the Louisiana State Pediatric Society; pediatrician with the city board of health; delegate from New Orleans to the White House Conference on Child Health and Protection called by President Hoover in 1930; on the staffs of the Touro Infirmary and the Mercy Hospital, Baptist Hospital and the Charity Hospital; aged 53; died, Dec. 5, 1940, of cardiovascular disease and uremia.

Charles Bryant Cooper, Honolulu, Hawaii; Missouri Medical College, St. Louis, 1889; member of the Hawaii Territorial Medical Association; formerly police and prison physician for the Hawaiian government; joined the National Guard of the territory and served as surgeon general from 1903 to 1917; during the World War, entered the federal service in February 1918, serving in an advisory capacity with the territorial government at Honolulu and of the examining board; was discharged as a lieutenant colonel in December 1918; was later commissioned a colonel of the medical reserve; was chief surgeon of the Hawaiian Railroad; aged 76; died, Nov. 9, 1940, at his home at Aiea.

Kate Campbell Hurd Mead ♂ Haddam, Conn.; Woman's Medical College of Pennsylvania, Philadelphia, 1888; consulting gynecologist, Middlesex Hospital, Middletown, from 1907 to 1925; past president of the Public Health Association of Haddam; past president of the Middlesex County Medical Society; corresponding secretary of the Medical Women's International Association; past president of the American Medical Women's Association; author of "Medical Women of America" and "History of Women in Medicine"; aged 73; died, January 1.

Carl Lewis Wheeler, Lexington, Ky.; Hospital College of Medicine, Louisville, 1897; member of the House of Delegates of the American Medical Association in 1913, from 1916 to 1919 and in 1922; member of the Kentucky State Medical Association and the American Urological Association; fellow of the American College of Surgeons; past president of the Fayette County Medical Society; at one time health officer; aged 67; on the staffs of St. Joseph's Hospital and the Good Samaritan Hospital, where he died, Dec. 15, 1940.

Isaac Arnold Withers, Fort Worth, Texas; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1898; member of the State Medical Association of Texas; past president of the Tarrant County Medical Society; past president of the state board of medical examiners; veteran of the Spanish-American and World wars; on the staff of the All Saints Episcopal Hospital and the City and County Hospital; aged 65; died, Dec. 1, 1940, of carcinoma of the lungs.

Harry Beecher McCorkle, Santa Rosa, Calif.; Marion-Sims College of Medicine, St. Louis, 1898; member of the Colorado State Medical Society; fellow of the American College of Physicians; at one time mayor of Billings, Okla.; formerly on the staffs of the Beth El and Glockner hospitals, Colorado Springs, Colo.; aged 70; died, Dec. 25, 1940, in the General Hospital of bronchopneumonia and influenza.

George William Pressly, Verdery, S. C.; Jefferson Medical College of Philadelphia, 1892; member of the Medical Society of the State of North Carolina; secretary of the state board of medical examiners from 1902 to 1906; fellow of the American College of Surgeons; aged 70; died, Dec. 17, 1940, in the Veterans Administration Facility, Augusta, Ga., of bronchopneumonia and pulmonary tuberculosis.

Edward Nelson McKee ♂ Los Angeles; College of Physicians and Surgeons, Keokuk, Iowa, 1895; member of the Radiological Society of North America; for many years on the staff of the Methodist Hospital; served during the World War; aged 72; died, Dec. 22, 1940, in the Glendale (Calif.) Sanitarium and Hospital of aplastic anemia due to roentgen rays.

George Hanting Rockwell, Syracuse, N. Y.; Syracuse University College of Medicine, 1901; member of the Medical Society of the State of New York; formerly assistant professor of otolaryngology at his alma mater; on the staff of the Syracuse Memorial Hospital; aged 62; died, Dec. 30, 1940, of carcinoma of the bladder and coronary thrombosis.

Henry Carl Prill, Cleveland; Ohio State University College of Homeopathic Medicine, Columbus, 1915; member of the Ohio State Medical Association; fellow of the American College of Surgeons; on the staff of the Huron Road Hospital; aged 48; was found dead, Dec. 3, 1940.

Paul Hamilton Phillips, Ashdown, Ark.; Tulane University of Louisiana School of Medicine, New Orleans, 1904; member of the Arkansas Medical Society; president of the Little River County Medical Society; aged 59; died, Dec. 30, 1940, in a hospital at Texarkana.

Harry Ernschaw Gettier ♂ Littlestown, Pa.; Baltimore Medical College, 1897; past president of the Adams County Medical Society; veteran of the Spanish-American War; aged 70; on the staff of the Annie M. Warner Hospital, Gettysburg, where he died, Dec. 26, 1940, of prostatic obstruction and chronic myocarditis.

Joseph Gregory Elias Page, Southbridge, Mass.; School of Medicine and Surgery of Montreal, Que., Canada, 1895; member of the Massachusetts Medical Society; formerly member of the board of health, member of the school committee and bank president; aged 69; died, Dec. 28, 1940, of coronary thrombosis.

David E. Shields, Morristown, Tenn.; Vanderbilt University School of Medicine, Nashville, 1883; University of Nashville (Tenn.) Medical Department, 1884; member of the Tennessee State Medical Association; past president of the Hamblen County Medical Society; aged 82; died, Dec. 22, 1940, of pneumonia.

Sterling Price Bond ♂ Little Rock, Ark.; University of Arkansas School of Medicine, Little Rock, 1912; fellow of the American College of Surgeons; on the staffs of the Children's Hospital, St. Vincent's Infirmary and the Pulaski County Hospital; aged 51; died, Dec. 5, 1940, of hypertensive heart disease.

Robert Hector, Berkeley, Calif.; University of California Medical Department, San Francisco, 1904; was acting health officer of Berkeley from 1913 to 1917; aged 65; on the staff of the Berkeley Hospital, where he died, Dec. 12, 1940, of injuries received when gases in the oil furnace in his home exploded.

Thomas Pickens Russell, Center Line, Mich.; University of Alabama School of Medicine, University, 1911; member of the Michigan State Medical Society; past president of the Macomb County Medical Society; aged 67; died, Dec. 24, 1940, in the Grace Hospital, Detroit, of coronary occlusion.

J. C. F. Siegfriedt, Red Lodge, Mont.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1902; mayor; served during the World War; formerly state senator; aged 61; was found dead, Dec. 10, 1940, of subacute bacterial endocarditis.

Frank Hermann Warncke ♂ Elizabeth, N. J.; University and Bellevue Hospital Medical College, New York, 1904; aged 59; on the staff of the Alexian Brothers Hospital, St. Elizabeth Hospital and Elizabeth General Hospital, where he died, Dec. 26, 1940, of aortic aneurysm.

Vernon Offutt Heddens ♂ Pasadena, Calif.; Johns Hopkins University School of Medicine, Baltimore, 1915; served during the World War; on the staff of the Huntington Memorial Hospital; aged 52; died, Dec. 11, 1940, of bronchopneumonia and coronary thrombosis.

Albert B. Leigh ♂ Kaukauna, Wis.; University of Illinois College of Medicine, Chicago, 1927; fellow of the American College of Surgeons; aged 39; on the staff of St. Elizabeth Hospital, Appleton, where he died, Dec. 14, 1940, of a streptococcal infection.

Joseph Ansley Gustafson ♂ Orion, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1901; aged 67; on the staff of the Lutheran Hospital, Moline, where he died, Dec. 24, 1940, of coronary thrombosis.

Howard Lee Metcalf ♂ Springfield, Ill.; Rush Medical College, Chicago, 1904; past president of the Sangamon County Medical Society; on the staffs of St. John's Hospital and the Springfield Hospital; aged 64; died, Dec. 15, 1940, of coronary sclerosis.

George E. Parker, Benson, N. C.; College of Physicians and Surgeons, Baltimore, 1886; member of the Medical Society of the State of North Carolina; past president of the Johnston County Medical Society; aged 78; died, Dec. 15, 1940, of heart disease.

Manney Murdock Rice, Columbia, S. C.; University of Maryland School of Medicine, Baltimore, 1906; member of the South Carolina Medical Association; formerly member of the city council; aged 60; died, Dec. 25, 1940, of chronic myocarditis.

William Oliver Smith, Altavista, Va.; University College of Medicine, Richmond, 1898; member of the Medical Society of Virginia; aged 71; died, Dec. 17, 1940, in the Virginia Baptist Hospital, Lynchburg, of gastric hemorrhage and arteriosclerosis.

Thomas Lamar Harris, Wrightsville, Ga.; University of Georgia Medical Department, Augusta, 1881; for many years justice of the peace; formerly mayor; also a lawyer; aged 78; died, Dec. 12, 1940, in a hospital at Sandersville.

William Rudolph Wegert, Unionville, Mich.; University of Michigan Homeopathic Medical School, Ann Arbor, 1899; Saginaw Valley Medical College, Saginaw, Mich., 1901; aged 82; died, Dec. 21, 1940, of chronic myocarditis.

Ola Adolphus Kibler, Chicago; St. Louis College of Physicians and Surgeons, 1906; member of the Illinois State Medical Society; for many years on the staff of the Chicago State Hospital; aged 59; died, Dec. 15, 1940.

Edgar A. McCombs, Connellsville, Pa.; University of Louisville (Ky.) Medical Department, 1907; member of the Medical Society of the State of Pennsylvania; aged 58; died, Dec. 17, 1940, in the Connellsville State Hospital.

Charles Dean Laidlaw, Canton, N. Y.; Syracuse University College of Medicine, 1902; member of the Medical Society of the State of New York; on the staff of the Potsdam (N. Y.) Hospital; aged 62; died, Dec. 13, 1940.

Lawrence Henry Fitzgerald, Temple, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1917; served during the World War; aged 45; died, Dec. 31, 1940, in a hospital at Reading of multiple myeloma.

Hildegard Gertrude Henderson, San Francisco; University of California Medical School, San Francisco, 1928; for many years on the staff of the Children's Hospital; aged 50; died, Dec. 3, 1940, of cerebral hemorrhage.

Asa Witter Montgomery, Stella, Neb.; Rush Medical College, Chicago, 1896; past president of the Richardson County Medical Society; formerly mayor; aged 68; died, Dec. 3, 1940, in St. Catherine's Hospital, Omaha.

Lyman Averill Cheney, Washington, D. C.; University of the City of New York Medical Department, 1882; aged 79; died, Dec. 28, 1940, in the Garfield Hospital of carcinoma of the prostate and retroperitoneal glands.

John Frederick Simpson, Brooklyn; Bellevue Hospital Medical College, New York, 1895; member of the Medical Society of the State of New York; aged 74; died, Dec. 31, 1940, in the Wyckoff Heights Hospital.

Yearslaf J. Fencil, Casco, Wis.; Wisconsin College of Physicians and Surgeons, Milwaukee, 1912; for many years member of the school board; aged 57; died, Dec. 26, 1940, in Green Bay of angina pectoris.

Percy James Sandys Bird, Weyburn, Sask., Canada; University of Dublin School of Physic, Trinity College, Dublin, Ireland, 1900; member of the American Psychiatric Association; aged 63; died, Nov. 18, 1940.

Orlando Velpau Langley, Loachapoka, Ala.; Baltimore Medical College, 1893; served during the World War; for many years associated with the Veterans Bureau, New Orleans; aged 69; died, Dec. 29, 1940.

Mansfield Goldberg Levy, Buffalo; University of Buffalo School of Medicine, 1911; on the staffs of the Children's Hospital and the Memorial Hospital; aged 54; died, Dec. 31, 1940, of coronary thrombosis.

Wilson Harmon Button, Hubbard, Ohio; Western Reserve University Medical Department, Cleveland, 1885; formerly member of the board of education; aged 82; died, Dec. 12, 1940, of coronary thrombosis.

Frederick Horace Williams, Boston; University of the South Medical Department, Sevanee, Tenn., 1901; on the staffs of the Brooks and Trumbull hospitals, Brookline; aged 67; died, Dec. 6, 1940.

Frank Lincoln Kenney, St. John, N. B., Canada; McGill University Faculty of Medicine, Montreal, 1888; for many years on the staff of St. John General Hospital; aged 76; died, Dec. 3, 1940.

Van William Burns, Stuart, Fla.; University of Arkansas School of Medicine, Little Rock, 1932; on the staff of the Martin County Hospital; aged 38; died, Dec. 23, 1940, of malignant hypertension.

Siegfried A. Van Hoefen, St. Louis; St. Louis College of Physicians and Surgeons, 1902; aged 63; on the staff of the Evangelical Deaconess Hospital; died, Dec. 16, 1940, of mesenteric thrombosis.

Carl Clifford Bickley, Waterloo, Iowa; Hahnemann Medical College and Hospital, Chicago, 1906; member of the Iowa State Medical Society; aged 58; died, Dec. 18, 1940, of coronary thrombosis.

Ernest Leslie Huse, Meriden, N. H.; Dartmouth Medical School, Hanover, 1907; past president of the Sullivan County Medical Society; aged 60; died, Dec. 21, 1940, of coronary thrombosis.

John Luke Murphy, Eastport, Maine; Medical School of Maine, Portland, 1909; past president of the Washington County Medical Society; aged 55; died, Nov. 7, 1940, of coronary thrombosis.

Jacob M. Bonnette, Alexandria, La.; Memphis (Tenn.) Hospital Medical College, 1907; aged 61; died, Dec. 5, 1940, in the Baptist Hospital of carcinoma of the right lung with metastases.

Bertha Ladd Hoskins, Atlanta, Ga.; Boston University School of Medicine, 1896; aged 78; died, Dec. 13, 1940, in the Crawford W. Long Hospital of heart disease and bronchopneumonia.

Joseph Buford Boyer, Wilsonville, Ala.; Louisville (Ky.) Medical College, 1892; member of the Medical Association of the State of Alabama; aged 81; died, Dec. 15, 1940, of carcinoma.

Nicholas Young Bradford MacKenzie, Andover, N. H.; Dartmouth Medical School, Hanover, 1901; member of the New Hampshire Medical Society; aged 64; died, Nov. 27, 1940, in Franklin.

William H. Jones, Ashland, Kan.; Tennessee Medical College, Knoxville, 1900; member of the Kansas Medical Society; aged 63; died, Nov. 7, 1940, of coronary thrombosis and chronic nephritis.

James Otis Matthis, Salem, Ore.; Memphis (Tenn.) Hospital Medical College, 1909; served during the World War; aged 55; was found dead, Dec. 5, 1940, of a bullet wound self inflicted.

Cora Luarky Stitt, Stockbridge, Mich.; University of Michigan Homeopathic Medical School, Ann Arbor, 1894; aged 70; died, Dec. 21, 1940, in the Sparrow Memorial Hospital, Lansing.

Snethen Burroughs Duggan, Murfreesboro, Tenn.; University of Tennessee Medical Department, Nashville, 1903; aged 59; died, Dec. 26, 1940, in the Veterans Administration Facility.

Benjamin Richard Lokke, Marenisco, Mich.; Rush Medical College, Chicago, 1922; aged 49; was killed, Dec. 30, 1940, when the automobile in which he was driving was struck by a truck.

M. Vernon Snyder, Chicago; Chicago College of Medicine and Surgery, 1912; member of the Illinois State Medical Society; aged 53; died, January 1, at Evanston, Ill., of coronary thrombosis.

Mark Anthony McGovern, Boston; Kansas City College of Medicine and Surgery, Kansas City, Mo., 1923; College of Physicians and Surgeons, Boston, 1927; aged 48; died, Nov. 12, 1940.

Lewis Rutherford Murray, Sussex, N. B., Canada; Jefferson Medical College of Philadelphia, 1892; served during the World War; at one time mayor; aged 70; died, Dec. 24, 1940.

Frank Browne Easley, Chattanooga, Tenn.; Harvard Medical School, Boston, 1927; member of the Tennessee State Medical Association; aged 39; was shot and killed, Dec. 29, 1940.

Harold G. Craig, Davidson, Sask., Canada; Queen's University Faculty of Medicine, Kingston, Ont., 1906; served during the World War; aged 60; died, Dec. 4, 1940, in Vancouver, B. C.

Charles Christian Dreyer, Toledo, Ohio; University of Wooster Medical Department, Cleveland, 1896; member of the Ohio State Medical Association; aged 70; died, Dec. 17, 1940.

Henry Wiedow, Twentynine Palms, Calif.; State University of Iowa College of Medicine, Iowa City, 1902; member of the California Medical Association; aged 68; died, Dec. 18, 1940.

Alex F. Williams, Cornerville, Ark. (licensed in Arkansas in 1903); member of the Arkansas Medical Society; aged 62; died, Dec. 30, 1940, at Eupora, Miss., of coronary occlusion.

Reuben C. Brophy, Elgin, Ill.; Bennett College of Eclectic Medicine and Surgery, Chicago, 1895; also a dentist; aged 85; died, Dec. 22, 1940, of an injury to the left leg and anemia.

G. M. Phelps, Kankakee, Ill.; College of Physicians and Surgeons of Chicago, 1885; aged 82; died, Dec. 27, 1940, in the Cottage Hospital, West Plains, Mo., of coronary sclerosis.

Morris Winheld ☉ Philadelphia; Baltimore Medical College, 1904; an Affiliate Fellow of the American Medical Association; aged 67; died, Dec. 23, 1940, in the Mount Sinai Hospital.

Edmund Eugene Robinson, Kannapolis, N. C.; Medical College of Virginia, Richmond, 1927; aged 38; was found dead, Dec. 27, 1940, as the result of a blow on the head.

Marmaduke Atkinson, Amelia C. H., Va.; Medical College of Virginia, Richmond, 1901; served during the World War; aged 60; died, Dec. 2, 1940, of chronic myocarditis.

Frederick Arthur Van Buren, Tucson, Ariz.; Northwestern University Medical School, Chicago, 1904; served during the World War; aged 64; died, Nov. 26, 1940.

Thomas Fitzgerald McNamara ☉ Rochester, N. Y.; University of Buffalo School of Medicine, 1902; aged 73; died, Dec. 25, 1940, of bronchopneumonia and myocarditis.

William Algernon Lavender, Birmingham, Ala.; Birmingham Medical College, 1909; member of the Medical Association of the State of Alabama; aged 67; died, Dec. 2, 1940.

Harry Francis Cleverly, Scituate, Mass.; Boston University School of Medicine, 1906; served during the World War; aged 62; died, Dec. 19, 1940, of coronary sclerosis.

James Herbert Briley, Springdale, Ark.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; aged 66; died, Dec. 26, 1940, of myocarditis.

Jefferson Monroe May, Hayesville, N. C.; Southern College of Medicine and Surgery, Atlanta, Ga., 1914; aged 49; died, Dec. 18, 1940, in a hospital at Marietta, Ga.

William E. Chambers, Cleveland; University of Toronto Faculty of Medicine, 1893; aged 72; died, Dec. 20, 1940, of diabetes mellitus and carcinoma of the pancreas.

Walter Robert Best, Scooby, Miss.; University of Virginia Department of Medicine, Charlottesville, 1897; aged 80; died, Dec. 4, 1940, in Greenwood of acute hemiplegia.

John Burr Talmage, Lawrenceburg, Ind.; Cleveland Homeopathic Medical College, 1903; served during the World War; aged 74; died, Dec. 4, 1940, of angina pectoris.

Clarence Elbert Hewitt ☉ Springfield, Mass.; Baltimore Medical College, 1897; aged 78; died, Dec. 18, 1940, in the Springfield Hospital of myelogenous leukemia.

James Clint Sumner, Roanoke, Va.; Medical College of Virginia, Richmond, 1909; aged 74; died, Dec. 4, 1940, in the Shenandoah Hospital of coronary thrombosis.

Edwin Paul Fagan ☉ Portland, Ore.; State University of Iowa College of Medicine, Iowa City, 1928; aged 38; died, Dec. 12, 1940, of a self-inflicted bullet wound.

Thomas Morrison Lawton, Berkley, Mich.; Trinity Medical College, Toronto, Ont., Canada, 1884; L.R.C.P., Edinburgh, Scotland, 1884; aged 84; died, Dec. 19, 1940.

Lewis Wilbur Stidham, Alameda, Calif.; Rush Medical College, Chicago, 1891; aged 77; died, Dec. 9, 1940, of coronary thrombosis and arteriosclerotic heart disease.

James Thomas Breakey, Bonfield, Ill.; Jenner Medical College, Chicago, 1908; Chicago College of Medicine and Surgery, 1910; aged 64; died, Dec. 16, 1940.

Dana A. Sargent, Hopkins, Mo.; College of Physicians and Surgeons, Keokuk, Iowa, 1878; aged 86; died, Dec. 17, 1940, of a fracture of the hip received in a fall.

William H. Hord, Maysville, Ky.; University of Louisville Medical Department, 1886; aged 77; died, Dec. 31, 1940, in the Hayswood Hospital of cerebral hemorrhage.

Harry Hansell Preston ☉ Hot Springs National Park, Ark.; Tulane University of Louisiana School of Medicine, New Orleans, 1928; aged 38; died, Dec. 8, 1940.

Huldah Josephine Prioleau, Charleston, S. C.; Howard University College of Medicine, Washington, D. C., 1904; aged 60; died, Dec. 14, 1940, of endocarditis.

Jane Smith Devereaux, Marblehead, Mass.; Boston University School of Medicine, 1880; aged 82; died, Dec. 26, 1940, of cerebral thrombosis and arteriosclerosis.

Norman Perry Mills, Appleton, Wis.; Rush Medical College, Chicago, 1897; member of the State Medical Society of Wisconsin; aged 67; died, Dec. 15, 1940.

Roy Newton Fuller ☉ Tulare, Calif.; Cooper Medical College, San Francisco, 1908; aged 56; died, Dec. 13, 1940, of heart disease and pulmonary tuberculosis.

Martin Jay Hanna, Baltimore; University of the South Medical Department, Swannee, Tenn., 1908; aged 53; died, Dec. 2, 1940, of carcinoma of the larynx.

Bart Wayne Freer, Fort Smith, Ark.; Memphis (Tenn.) Hospital Medical College, 1902; member of the Arkansas Medical Society; aged 70; died, Dec. 29, 1940.

Lenora May Benton Hamly, Denver; Gross Medical College, Denver, 1897; aged 79; died, Nov. 29, 1940, in Port Alberni, B. C., Canada, of coronary thrombosis.

Charles Wendell Garey, Quincy, Mass.; Boston University School of Medicine, 1889; aged 74; died, Nov. 27, 1940, of acute myocarditis and arteriosclerosis.

Mary Mills, San Angelo, Texas; Southwestern Homeopathic Medical College and Hospital, Louisville, Ky., 1896; aged 80; died, Dec. 23, 1940, of angina pectoris.

James D. Milligan, San Jose, Ill.; Marion-Sims College of Medicine, St. Louis, 1898; aged 62; was found dead in bed, Dec. 5, 1940, of cerebral hemorrhage.

Milton Ashby Nelms, Walla Walla, Wash.; Cooper Medical College, San Francisco, 1893; aged 71; died, Dec. 5, 1940, in a local hospital of acute nephritis.

Alice Crawford Brown, Lancaster, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1897; aged 68; died, Nov. 23, 1940.

Hillel T. Irving, Chicago; Northwestern University Medical School, Chicago, 1913; aged 52; died, Dec. 12, 1940, in Miami Beach, Fla., of cerebral thrombosis.

George Reaves De Poyster, Fort Worth, Texas; University of Tennessee College of Medicine, Memphis, 1929; aged 40; died, Dec. 24, 1940, of tuberculous.

George W. Owings, Owings, S. C.; Atlanta (Ga.) College of Physicians and Surgeons, 1900; for many years bank president; aged 63; died, Dec. 7, 1940.

William Whitney Waterman, San Gabriel, Calif.; Columbia University College of Physicians and Surgeons, New York, 1904; aged 66; died, Dec. 10, 1940.

John D. Boileau, Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1887; aged 87; died, Dec. 26, 1940, in the Hahnemann Hospital.

Ulysses B. G. Ewing, Franklin, Ind.; Medical College of Ohio, Cincinnati, 1884; aged 77; died, Dec. 17, 1940, of chronic myocarditis and arteriosclerosis.

William John Osborne, Pittsburgh; American College of Medicine and Surgery, Chicago, 1904; aged 63; died, Dec. 26, 1940, of cerebral hemorrhage.

David Reece Bell, Lynwood, Calif.; University of Nebraska College of Medicine, Homeopathic Department, Lincoln, 1885; aged 84; died, Nov. 14, 1940.

Joseph A. Le Doux, Los Angeles; University of Maryland School of Medicine, Baltimore, 1889; aged 84; died, Dec. 23, 1940, of chronic myocarditis.

Lee Seamster, Mineral Wells, Texas (licensed in Texas, under the Act of 1907); aged 88; died, Dec. 11, 1940, in Fort Worth of chronic nephritis.

Thomas Hepburn Buckler, Baltimore; University of Maryland School of Medicine, Baltimore, 1888; aged 73; died, Dec. 27, 1940, of cerebral sclerosis.

Clarence Armor Chritzman, Mercersburg, Pa.; Jefferson Medical College of Philadelphia, 1892; aged 70; died, Dec. 23, 1940, of bronchopneumonia.

Ernest Mason Foreman, Louisville, Ky.; Louisville Medical College, 1897; aged 65; died, Nov. 19, 1940, of cerebral thrombosis and arteriosclerosis.

Augustus M. Nelson, Spartanburg, S. C.; Southern Medical College, Atlanta, Ga., 1895; aged 69; died, Dec. 31, 1940, of fracture of the femur.

John Howard Heath, Oakland, Calif.; Eclectic Medical Institute, Cincinnati, 1874; aged 89; died, Nov. 10, 1940, of cerebral hemorrhage.

Jesse Mitchell Moore ☉ Cleveland; University of Wooster Medical Department, Cleveland, 1898; aged 71; died, Dec. 28, 1940, of pneumonia.

Samuel Lindsay ☉ Winnsboro, S. C.; Bellevue Hospital Medical College, New York, 1898; aged 67; died, Dec. 29, 1940.

William A. Cromley, Columbus, Ohio; Starling Medical College, Columbus, 1888; aged 84; died, Dec. 3, 1940.

Hugh A. Campbell, Crestview, Tenn. (licensed in Tennessee in 1889); aged 90; died, Dec. 30, 1940, of senility.

Samuel H. Bourland, Arkadelphia, Ark. (licensed in Arkansas in 1903); aged 66; died, Dec. 5, 1940.

Ira Finley Harlan, Los Angeles; Barnes Medical College, St. Louis, 1897; aged 69; died, Nov. 8, 1940.

Bureau of Investigation

DROWN LABORATORIES SUBMERGED IN PSEUDO-SCIENCE

In 1923 THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION exposed the essential fakery of the various devices and principles promoted and propounded by Albert Abrams, A.M., M.D., LL.D., F.R.M.S. [sic], of San Francisco. A number of physicians had leased from him a device called the "Oscilloclast," which incidentally was also leased to osteopaths. Continuously since that time various "Wallingfords" have promoted devices of a similar nature, particularly to chiropractors. The American Medical Association has recounted the story of the Abrams business several times in both THE JOURNAL and Hygeia. The Bureau of Investigation continues to write about one hundred letters each year to inquiring correspondents concerning these various imitations. Recently THE JOURNAL published a Query and Minor Note on the subject of "radionics," now offered as a basis for the promotion of some of these machines; the particular name devised by Abrams for his supposed magic was "electronics."

From an organization known as the Drown Laboratories of Hollywood, Calif., now come letters which, according to the letterhead, indicate that the concern has other offices and a branch known as the Drown Laboratory of Radio Therapy. These communications announced that a course of instruction would begin Jan. 6, 1941, in what is referred to as the Drown School of Radio Therapy. Some of these letters have been addressed to physicians who have passed them on to the American Medical Association. One of these promotional letters sets forth a tear-fetting appeal to the disconsolate medico:

"The people of the general public are fast becoming educated to the fact that there is some way whereby they may have their physical conditions analyzed, diagnosed, and treated from a purely scientific method. They are demanding that method and it behooves every doctor, whatever the school of healing art he has graduated from, to keep up with the times, and supply the need himself and not have to send his patient to some one else and thereby lose that patient's confidence."

There it is, doctor! Surely you are convinced. But perhaps not? Let us then lay it on a little thicker. The document proceeds:

"The Doctor is not always aware of how the patient feels about it, but it leaves the patient thinking 'Well, just where can I turn for this relief?' For this reason and many more you owe it to yourself and patient to learn the Scientific Method of properly analyzing, diagnosing, and treating your case, because if your patient chooses you he wants that secure feeling that his choice can care for him in his time of great need."

And what is "the Scientific Method"? You want to know! But wait, doctor, a little more stimulation!

"The Drown School of Radio Therapy has been opened for the purpose of teaching licensed doctors and physicians the one Known Method at present that will acquaint the doctor with his patient from all angles, and help him keep his patients instead of losing them for lack of equipment, and the complete knowledge to use it."

You see, doctor, it takes time, it takes instruments—it takes money.

"Each course of instruction will last three weeks afternoon and evening. We now have the equipment to give the doctor practical training and he cannot buy our new instruments from us until he passes our examination and shows that he knows enough about the work to handle his cases according to our proven method."

But be not distressed if you fear that this life-saving boon is to escape you for lack of funds:

"In this work as well as any given Therapy the doctor must know what he is attempting to do. It has been

definitely proven to us that no doctor can just take these instruments and use them without enough instruction. We therefore have made arrangements to finance the doctor 100% in the following manner."

The financing is for the full price of the course, which is \$200. But "if the doctor passes his examination," this will be applied to the purchase price of an instrument sold by the Drown Laboratories. The doctor is given a choice of paying \$17.61 a month in place of \$200 cash and, furthermore, of buying the machine without a down payment. The promoters claim, finally: "Your business should never be below \$500.00 per month and can run as high as you desire."

The idea that such devices can be promoted and sold eighteen years after similar agencies were declared to be useless is the concern of various governmental authorities, particularly now when our government is so interested in the health of the nation.

The Drown Laboratories are not new to the files of the Bureau of Investigation. The principal seems to be one Ruth B. Drown, who is a Doctor of Chiropractic and who, at various times, has been connected with the promotion of variously named imitations of the old Abrams device. As THE JOURNAL said in 1923: "The American Medical Association will take up Abrams' fantastic vagaries for serious investigation when the American Astronomical Society appoints a committee to determine the truth or falsity of the theory of Voliva, head of the Zionites, that the earth is flat."

AN EGG, AN ORANGE AND A CARROT— ALSO SOME ALFALFA

A "Health Secret" and a Food Fad Subjects of Post Office Action

Who eats an Egg, Orange & Carrott [sic], all raw, per diem, gets the 16 Chemical Elements it takes to keep a Human alive. Thanx. Come again, soon & stay longer, sez, The Eureka Agency.

Such was the "health secret" sent through the mails by Newell R. LaRue to the credulous who answered his advertisement:

WHY DIE? SPEND 24c & LIVE

16 Chemical Elements, which wear out, keep Humans living; replace 'em, by eating 3 items Grocers sell @ 1c each: I'll name 'em and send you 3 gallons of Concentrate that'll harmlessly clean anything and remove any spot from any fabric; also Pen, writes ink if dipped in water; also \$ Razor Blade Sharpener, guaranteed to never wear out (makes any Blade last 6 months); everything sent postpaid for 24c by

THE EUREKA AGENCY, NEW ORLEANS, LA.

The Post Office Department didn't think much of the secret or the rest of what Eureka offered and issued a fraud order against LaRue and the agency.

No matter what was written to LaRue—the "secret" quoted was all the medical advice that was sent. One inquirer wrote that he had given up hope of regaining his health; another, that he wished to "live on and on"; and a third, that his physician had abandoned all hope for him.

True, the daily consumption of an egg, an orange and a carrot would provide minute quantities of calcium, phosphorus and iron, but in amounts far below the daily requirement of these elements. The fraud order emphasized that deaths seldom occur as a result of mineral deficiencies and that many diseases may progress to the incurable stage even though the patient has consumed ample quantities of both minerals and vitamins. Evidence also was presented to show that no amount of minerals or "chemical elements" (a term used by LaRue) will prevent or cure such serious conditions as cancer, tuberculosis, diabetes, high blood pressure, hookworm, syphilis, malaria and others, some of which, in spite of diagnosis and medical or surgical treatment, result in fatalities. The warning was added that persons who have diseases which might be cured if diagnosed and given prompt medical or surgical treatment but who, instead, substitute the diet advocated by LaRue would in many instances suffer disastrous consequences.

The Post Office memorandum further brought out that LaRue started his business in 1920 and that he claimed that his so-called diet instructions were given him by a physician many years ago, though he submitted no evidence to support his claim. It was shown that he had no medical training and employed no one who possessed it. He claimed that he lived on the diet that he recommended and it was noted that he appeared emaciated and in poor health. The Eureka Agency was declared to be a scheme for obtaining money through the mails by means of false and fraudulent pretenses, representations and promises, and accordingly a fraud order was issued against it on Dec. 1, 1939.

Alfalfa

Tablets which were said to contain alfalfa, kelp, milk, sugar and powdered sugar and represented to be good for overweight, underweight, influenza, colds, fevers, abscesses, constipation and some other conditions were advertised to the public by Al Morrison of San Francisco under the trade style "Al Morrison Health and Beauty Studio," as follows:

GOOD HEALTH IS EVERYTHING

Al Morrison's Alfalfa-Kelp Tablets are a proven success, they supply eleven organic minerals, alkaline substance and the Vitamins A, B, D and G. Modern Health Science has proven that these important Vitamins, alkaline substance and organic minerals are an important aid in building the human body to better health . . .

Al Morrison's Alfalfa-Kelp Tablets supply the following minerals as they are naturally found in Alfalfa or Kelp: Iodine, Iron, Copper, Manganese, Calcium, Phosphorus, Sulphur, Sodium, Potassium, Magnesium and Chlorine.

The tablets actually contained insignificant amounts of the minerals described and were to be taken "2 tablets three times daily at meal time . . . with a little water, milk or orange juice." They were obviously of no use for the conditions mentioned. The iodine content was significant, but the use of these tablets as directed is not the proper manner to treat an actual iodine deficiency.

A second Morrison product was advertised thus:

A MARVELOUS DISCOVERY—ALFALFA-KELP CREAM

ALFALFA-KELP CREAM is made from Cream of Milk, Butter Milk, Lemon Juice, Soya Bean Oil, Alfalfa, Kelp and Acid Benzoic.

ALFALFA-KELP CREAM is an aid in neutralizing an acid condition and quickly relieving muscular aches and pains such as rheumatism, neuritis, arthritis and bone diseases. Just massage well for a minute.

ALFALFA-KELP CREAM is an aid in healing skin diseases, eczema, acne, pimples, psoriasis, blackheads, warts, bunions, sore feet, sprains, sunburn, piles, chapped hands and lips, abscesses and athlete's feet.

ALFALFA-KELP CREAM is a vanishing all purpose Beauty Cream, a tissue builder and an aid in activating the epithelial tissue cells and nature [sic] in restoring weak cells to a normal condition gradually eliminating wrinkles.

Analysis of Alfalfa-Kelp Cream by government chemists revealed that it consisted essentially of water, perfume, 24 per cent of phosphorus pentoxide, 20 per cent of calcium oxide, 13 per cent of anhydrous ferric oxide, 2 per cent of magnesium oxide and a small amount of iodine. Medical experts testified that the disorders which it was represented to cure, such as psoriasis, acne, eczema and abscesses, frequently are due to systemic conditions requiring particularized medicinal treatment, whereas this product would act only as an emollient. They pointed out that it was neither antiseptic nor germicidal and contained no analgesic or sedative, nor did it offer any drug that would act as a fungicide and hence it would not draw abscesses to a head or prove useful in removing the causes of arthritis, neuritis or bone diseases, which, the testimony showed, frequently result from infected tonsils, decayed teeth, venereal diseases, appendicitis and some other conditions.

The employment of this cream also was shown to be useless for wrinkles, which, the testimony brought out, are due to a pathologic change in the tissues, usually coming on with age, and hence neither this nor any other cream would eliminate them.

Because of sufficient evidence that Morrison's business constituted a swindle, it was debarred from the mails by a fraud order issued on Aug. 26, 1940.

Correspondence

THE ST. LOUIS MEDICAL SOCIETY AND THE MOUND CITY MEDICAL FORUM

To the Editor:—In the January 11 issue of THE JOURNAL under the column Bureau of Legal Medicine and Legislation there appears an article concerning Dr. Emerson Stanley Bailey. It states that this man is in good standing in the Medical Society of the City of St. Louis.

I wish to state that Dr. Bailey is not a member of the St. Louis Medical Society. He is probably a member of the Mound City Medical Forum, which is an organization of Negro physicians.

JOSEPH C. PEDEN, M.D., St. Louis.

President, St. Louis Medical Society.

NOTE.—Dr. Peden's letter relates to the medicolegal abstract of a recent decision of the supreme court, special term, Albany County, N. Y., in *Application of Bailey*, 20 N. Y. S. (2d) 915, published in THE JOURNAL, January 11, pages 159-160, in which appeared the following statement:

He [the petitioner] is a member in good standing of the Medical Society of the City of St. Louis, of the State of Missouri Medical Society and of the National Medical Association.

That statement is a condensation of the following language of the court, which appears on pages 917-918 of the published legal report:

From 1917 to the present time, petitioner is and still is a member in good standing of the Medical Society of the City of St. Louis, Missouri, called the St. Louis Medical Forum. From the year 1919 to the present time, petitioner is a member in good standing of the State of Missouri Medical Society, called the Missouri Pan-Medical Association. Since 1910, he has been and still is a member in good standing of the National Medical Association. . . .

According to the files of the American Medical Association, as the president of the St. Louis Medical Society points out, Dr. Emerson Stanley Bailey is not a member of the St. Louis Medical Society. Neither is he a member of the Missouri State Medical Association or of the American Medical Association.

USE OF CORTICAL EXTRACT TO PROMOTE EXCRETION OF BROMIDES

To the Editor:—The observations of Bondurant and Campbell appearing in the January 11 issue of THE JOURNAL, on the use of cortical extract to promote the excretion of bromide in cases of bromide intoxication, and the favorable comment which appears in the discussion of this paper are disconcerting in view of the chemical data presented. In the first place, the rationale which prompted the use of adrenal cortex extract in the treatment of bromism deserves closer scrutiny. It is true that, in adrenal cortical insufficiency, hypochloremia is a common finding and administration of cortical extract aids in returning the electrolyte composition of the blood toward normal. According to present concepts this is accomplished by promoting the renal reabsorption of sodium chloride, a defect in this mechanism existing in Addison's disease. The low blood chloride accompanying high levels of blood bromide, however, merely represents the replacement in the extracellular fluid of one halogen by another for the reason that the kidney makes little or no distinction in the excretion of chloride and bromide. Presumably no renal defect in the reabsorption of chloride exists in bromide intoxication. To postulate that in patients with high levels of blood bromide the administration of adrenal cortex extract would result in a marked preferential excretion of bromide is not only imparting a new ability to the kidney but is also ascribing to the extract the action of promoting the excretion of halide when its known action is to increase reabsorption.

Nevertheless, theoretical considerations must give way to experimental proof if the latter is convincing. Bondurant and Campbell present a number of experimental observations in which

bromides were administered to human subjects and the bromide and chloride content of the blood followed. Their results are presented in table 2. No mention of the chemical methods employed was made. The first column at the start of the experiment represents near basal conditions when little bromide was present in the blood. First glance reveals that the serum chloride levels of these patients varied more than 300 per cent, a fact which belies the physiologic dictum that the kidney zealously guards the electrolyte composition of the blood. Presumably the figures in the table represent milligrams per hundred cubic centimeters expressed either as Cl or as NaCl, no single value being sufficiently characteristic to allow a distinction. If the results are expressed as milligrams per hundred cubic centimeters of Cl, patient 2 has a serum chloride level of 195 milliequivalents; if, on the other hand, the results are expressed as milligrams per hundred cubic centimeters of NaCl patient 3 has a serum chloride level of 34 milliequivalents. Either figure is beyond possibility, the normal level being 100 milliequivalents.

This criticism is raised because the actions of the adrenal cortex extract are by no means innocuous. From what is known of their mechanism of action, they would promote the retention rather than the excretion of bromide. Bondurant and Campbell have raised the provocative question of how adrenal cortex extract would affect the course of chloride and bromide in the renal tubule. Surely more convincing chemical data should be brought to bear on the problem before preparations of adrenal cortex are to be regarded as useful in the treatment of bromide intoxication.

ALFRED GILMAN, PH.D., New Haven, Conn.

Assistant Professor, Laboratory of Pharmacology and Toxicology, Yale University.

SURGICAL TREATMENT OF HYPERTENSION

To the Editor:—In a communication in *THE JOURNAL*, January 11, de Takats discusses the priority of supradiaphragmatic splanchnic section. He takes issue with the statement (Peet, Woods and Braden, *THE JOURNAL*, Nov. 30, 1940, p. 1875) that "bilateral supradiaphragmatic splanchnic nerve section and lower dorsal sympathetic ganglionectomy were first introduced into this country by Peet in 1933." The preceding paragraph had clearly explained that this applied only to the surgical treatment of hypertension. As a matter of fact, the operation was first performed in this country by Peet in February 1929 for gastric crises (Peet, M. M.: Splanchnic Section for Hypertension; Preliminary Report, *Univ. Hosp. Bull.*, Ann Arbor 1:17-18 [June] 1935. Kahn, E. A., and Barney, B. F.: Anterolateral Chordotomy for Intractable Pain of Tabes Dorsalis, *Arch. Neurol. & Psychiat.* 38:467-472 [Sept.] 1937).

De Takats did not perform the operation until October 1932, when he did it for juvenile diabetes (de Takats, Geza, and Fenn, G. K.: Bilateral Splanchnic Nerve Section in a Juvenile Diabetic, *Ann. Int. Med.* 7:422-430 [Oct.] 1933).

In his letter de Takats also states that "there is, of course, no question of priority in the matter, as Pieri adequately described and illustrated this approach in 1930." This statement is not entirely correct. Foerster divided the splanchnic nerves above the diaphragm in 1924 for the gastric crisis of tabes (Foerster, O.: Die Leitungsbahnen des Schmerzgefühls und chirurgische Behandlung der Schmerzzustände, 1927, Urban and Schwarzenberg, Berlin; also personal communication to the author), though he did not remove the lower dorsal sympathetic chain.

Pieri described the approach in 1927 (*La resezione dei nervi splanchnici*, *Ann. ital. di chir.* 6:678 [July] 1927) but did not perform the operation until July 1929, when he did a unilateral procedure for atony of the stomach. Pieri was the first to perform splanchnic section for hypertension (May 1930), again a unilateral procedure. (Pieri, G.: Tentativi di cura chirurgica

dell'ipertensione arteriosa essenziale, *Riforma med.* 48:1173 [July 30] 1932).

Reference has been made to the work of Foerster and Pieri by Peet, and though the work of de Takats was not overlooked there did not seem any reason to mention it in an article on the surgical treatment of hypertension.

EDGAR A. KAHN, M.D., Ann Arbor, Mich.

EFFECTS OF ALCOHOL ON DRIVING SKILL

To the Editor:—In view of the interest in our paper (*THE JOURNAL*, Nov. 9, 1940, p. 1600) dealing with the effect of alcohol, manifested by the communications of Drs. Bogen, Muehlberger, Bavis and Heise (*THE JOURNAL*, Dec. 21, 1940, p. 2198), it seems desirable to clarify our stand on certain points at issue.

It was not our purpose in the paper, as was implied by Bavis, to investigate the impairment of driving ability at a blood alcohol concentration of 0.15 per cent but rather to demonstrate the degree of variation in the loss of skill in certain tests related to driving in different persons at the same blood alcohol concentration. Muehlberger states that this biologic variation does not exceed 10 to 15 per cent, yet our experiments showed a much greater variation. For example, a loss of 8 per cent in the tests was accompanied by blood alcohol concentrations ranging from 0.55 to 0.145 per cent. This is in accord with the extremes of variation in tolerance reported by Bogen and by Jetter. The criticism that their criteria of drunkenness indicated a more severe intoxication than that which would interfere with motor vehicle operation in no way invalidates their evidence of marked differences in individual tolerance to alcohol.

Bavis states that the learning curve prejudiced the results in our cases. Space restriction did not permit inclusion of control data, which showed a mean increase in performance without alcohol of 0.7 per cent, range from plus 5.2 per cent to minus 3.7 per cent. Nor would the practice effect invalidate the one point we attempted to make, namely the range of individual variation in tolerance.

We quite agree with Bogen that blood alcohol concentration is the best single criterion of intoxication and that concentrations even lower than 0.15 per cent will produce in all persons some degree of impairment of driving skill. Whether this impairment will in all cases be sufficient to justify a conviction for being intoxicated or under the influence of liquor depends on the definition of these terms prevailing in the particular locality. Thus in Arizona "If the ability of the driver of an automobile has been lessened in the slightest degree by the use of intoxicating liquors, then the driver is deemed to be under the influence of intoxicating liquor," while in California being "under the influence" consists in that degree of influence "which causes him to operate his car in a manner different from that in which it would be operated by an ordinarily prudent and cautious person." In the first case, the person is compared with himself before drinking, and there is no doubt that concentrations below 0.15 per cent would invariably produce some lessening of ability. In the second case, the person is compared with "an ordinarily prudent and cautious person," and here the factors of variation in driving skill and tolerance to alcohol play a very important part. In fact, our work shows these variations to be so great as to overshadow the effects of alcohol in the concentrations involved, and it is on this basis that we question the tenability of a fixed limit of 0.15 per cent. That further work, with apparatus more adequate to test judgment, and over a wider range of alcohol concentrations is indicated is self evident. It is to be hoped that when these data are obtained a uniform, comprehensive and just definition of "under the influence" will have been formulated, so that our knowledge may be put to a constructive use.

HENRY NEWMAN, M.D., San Francisco.

Medical Examinations and Licensure

NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and Examining Boards in Specialties were published in THE JOURNAL, February 22, page 779.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Montgomery, June 17-19. Sec., Dr. J. N. Baker, 519 Dexter Ave., Montgomery.

ARKANSAS: * Medical. Little Rock, June 5-6. Sec., Dr. D. L. Owens, Harrison. *Eclectic*. Little Rock, June 5-6. Sec., Dr. Clarence H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Oral examination* (required when reciprocity application is based on a state certificate or license issued ten or more years before filing application in California), San Francisco, April 16. *Written*. San Francisco, June 30-July 3. Sec., Dr. Charles B. Pinkham, 1020 N St., Sacramento.

COLORADO: * Denver, April 1. *Applications must be on file not later than March 15*. Sec., Dr. Harvey M. Snyder, 831 Republic Bldg., Denver.

CONNECTICUT: * Medical. *Written*. Hartford, March 11-12. *Endersement*. Hartford, March 25. Sec., Dr. Thomas P. Murdock, 147 W. Main St., Meriden. *Homeopathic*. Derby, March 11-12. Sec., Dr. Joseph H. Evans, 1488 Chapel St., New Haven.

DELAWARE: July 8-10. Sec., Medical Council of Delaware, Dr. Joseph S. McDaniel, 229 S. State St., Dover.

DISTRICT OF COLUMBIA: * Washington, May 12-13. Sec., Commission on Licensure, Dr. George C. Ruhland, 203 District Bldg., Washington.

FLORIDA: * Jacksonville, June 23-24. Sec., Dr. William M. Rowlett, Box 786, Tampa.

GEORGIA: Atlanta, June. Sec., State Examining Boards, Mr. R. C. Coleman, 111 State Capitol, Atlanta.

IDAHO: Boise, April 1. Dir., Bureau of Occupational License, Mr. H. B. Whitlesey, 335 State Capitol Bldg., Boise.

ILLINOIS: Chicago, April 1-3. Superintendent of Registration, Department of Registration and Education, Mr. Lucien A. File, Springfield.

INDIANA: Indianapolis, June 17-19. Sec., Board of Medical Registration and Examination, Dr. J. W. Bowers, Citizens Trust Bldg., Fort Wayne.

KANSAS: Kansas City, June 17-18. Sec., Board of Medical Registration and Examination, Dr. J. F. Hassig, 905 N. 7th St., Kansas City.

KENTUCKY: Louisville, June 5-7. Sec., State Board of Health, Dr. A. T. McCormack, 620 S. Third St., Louisville.

MAINE: Portland, March 11-12. Sec., Board of Registration of Medicine, Dr. Adam P. Leighton, 192 State St., Portland.

MARYLAND: *Medical*. Baltimore, June 17-20. Sec., Dr. John T. O'Mara, 1215 Cathedral St., Baltimore. *Homeopathic*. Baltimore, June 17-18. Sec., Dr. John A. Evans, 612 W. 40th St., Baltimore.

MASSACHUSETTS: Boston, March 11-13. Sec., Board of Registration in Medicine, Dr. Stephen Rushmore, 413-F State House, Boston.

MICHIGAN: * Ann Arbor and Detroit, June 11-13. Sec., Board of Registration in Medicine, Dr. J. Earl McIntyre, 202-4 Hollister Bldg., Lansing.

MINNESOTA: * Minneapolis, April 15-17. Sec., Dr. Julian F. Du Bois, 350 St. Peter St., St. Paul.

MISSISSIPPI: Jackson, June. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson.

MONTANA: *Reciprocity*. Helena, March 31. *Written*. Helena, April 1. Sec., Dr. S. A. Cooney, 216 Power Block, Helena.

NEW HAMPSHIRE: Concord, March 13-14. Sec., Board of Registration in Medicine, Dr. T. P. Burroughs, State House, Concord.

NEW JERSEY: Trenton, June 17-18. Sec., Dr. Earl S. Hallinger, 28 W. State St., Trenton.

NEW MEXICO: Santa Fe, April 14-15. Sec., Dr. Le Grand Ward, 135 Sena Plaza, Santa Fe.

NORTH DAKOTA: Grand Forks, July 1-4. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OHIO: Columbus, April 1. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, June 11-12. Sec., Dr. James D. Osborn Jr., Frederick.

PENNSYLVANIA: Philadelphia and Pittsburgh, July. Act. Sec., Bureau of Professional Licensure, Department of Public Instruction, Mrs. Marguerite G. Steiner, 358 Education Bldg., Harrisburg.

SOUTH DAKOTA: * Pierre, July 15-16. Dir., Medical Licensure, Dr. J. F. D. Cook, State Board of Health, Pierre.

TENNESSEE: Memphis, March 26-27. Sec., Dr. H. W. Qualls, 130 Madison Ave., Memphis.

VIRGINIA: Richmond, June 17-20. Sec., Dr. J. W. Preston, 30½ Franklin Road, Roanoke.

WEST VIRGINIA: Charleston, March 3. Sec., Public Health Council, Dr. Arthur E. McClue, State Capitol, Charleston.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARIZONA: Tucson, March 18. Sec., Mr. Franklin E. Roach, Science Hall, University of Arizona, Tucson.

COLORADO: March 6-7. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

DISTRICT OF COLUMBIA: Washington, April 21-22. Sec., Commission on Licensure, Dr. George C. Ruhland, 203 District Bldg., Washington.

FLORIDA: De Land, June 7. *Applications must be on file not later than May 24*. Sec., Prof. J. F. Conn, John B. Stetson University, De Land.

OKLAHOMA: Oklahoma City, May 22. Sec. of State, Hon. C. C. Childress, State Capitol, Oklahoma City.

OREGON: Corvallis, July 12. Sec., State Board of Higher Education, Mr. Charles D. Byrne, University of Oregon, Eugene.

RHODE ISLAND: Providence, April 3-4. Sec., Division of Examiners, Rev. Nicholas H. Serror, Providence College, Providence.

SOUTH DAKOTA: June. Sec., Dr. G. M. Evans, Yankton.

WISCONSIN: Madison, April 5. Sec., Prof. Robert N. Bauer, 3414 W. Wisconsin Avenue, Milwaukee.

Florida November Report

Dr. William M. Rowlett, secretary, State Board of Medical Examiners of Florida, reports the examination held at Tampa, Nov. 18-19, 1940. Fifty-six candidates were examined, 53 of whom passed and 3 failed. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Yale University School of Medicine.....	(1935)		83.4
Emory University School of Medicine.....	(1938)		78.7

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice—Liability of Physician for Blindness Caused by Administration of Tryparsamide.—In October 1923 the plaintiff became unconscious and the defendant physician was called to diagnose and treat him. After many tests and a consultation with other physicians the plaintiff's condition was diagnosed as cerebrospinal syphilis. The plaintiff remained unconscious for nearly a month, during which time the defendant performed thirteen spinal punctures to withdraw spinal fluid so as to prevent convulsions. The published report does not indicate that any tests were made on this fluid. He also administered numerous injections of neosarsphenamine, which was at that time considered an approved treatment for syphilis. When he administered the last dose, in the latter part of November 1923, according to the plaintiff, he told the patient that "he had been cured." During the next fourteen years the plaintiff enjoyed good health. His eyesight was good but in 1930, although the examination of his eyes disclosed no disease, he obtained eyeglasses from an optical company to assist him in reading intricate plans used in his service as a machinist in the navy yard. On an extremely hot day, Aug. 14, 1937, the plaintiff fainted while waiting for a street car. When he regained consciousness he was taken to a hospital, given preliminary treatment and then sent home. The defendant was again called and he found him suffering from a violent headache and incoherence of speech. On August 30 the defendant prepared an "official affidavit" for the navy yard, to enable the plaintiff to get relief payments, and certified that the plaintiff was sick and suffering from hypertension or high blood pressure. Notwithstanding this certification and a nega-

tive Wassermann reaction of the blood, the defendant concluded that the plaintiff had a recurrence of cerebrospinal syphilis and commenced to administer a series of injections of tryparsamide, an approved treatment for that disease. This drug, an arsenic compound, was sold in ampules around each of which was a pamphlet advising, among other things, that treatment be discontinued immediately on the appearance of any ocular disturbance. After or at the time of the third injection the plaintiff complained that the injections were making his eyes a little blurry, but each time he complained the defendant advised him that his difficulty would clear up. It did not, however, and the plaintiff subsequently became almost completely blind, characterized by a "central, or 'gun barrel,' vision" due to permanent optic atrophy. The plaintiff brought suit against the defendant physician for malpractice and obtained a judgment in his favor. The defendant then appealed to the Supreme Court of Appeals of Virginia.

The plaintiff testified that after he complained of having trouble with his eyes the defendant continued the tryparsamide treatments and gave him, in all, nine injections. Dr. Diehl, an eye, ear, nose and throat specialist, corroborated this by testifying that the defendant told him he had given the plaintiff nine injections. The defendant denied that he told the plaintiff in 1923 that he was cured, that he continued the treatments after the plaintiff complained of his eyes and that he told Dr. Diehl that he had administered nine injections. He maintained that he directed the plaintiff to go to Dr. Diehl after he had administered only two injections. The evidence established that in 1923 the plaintiff was suffering from "cerebrospinal syphilis, an incurable disease," and the medical testimony was to the effect that in August 1937 he was still suffering from the disease and that the defendant was justified in treating him for that disease.

The defendant maintained that there were two schools of medical opinion as to whether the use of tryparsamide should be continued after the discovery of optic disturbances. The one theory reasoned that the continued use of the drug by helping the syphilis would help the optical disturbances; the other theory suggested that the drug be discontinued immediately on complaint of visual trouble. The defendant therefore contended that if he followed either one of these theories he had not been negligent. The court held that the defendant's testimony, that he stopped giving the injections after the plaintiff complained about his vision, committed him to the second school of medical opinion. However, since his testimony in that regard was disputed by the plaintiff, it was the opinion of the court that the important question for the jury's determination did not relate to the rule that where there are two schools of thought in medical practice and the physician follows one he cannot be negligent, but did relate to whether or not the defendant properly and carefully followed the branch of medical opinion which he had adopted. On this point, the jury resolved the question against him.

A physician, continued the court, is liable only for a failure to possess and exercise that degree of care and skill ordinarily exercised by prudent practitioners in his community. A physician, however, impliedly represents that he is keeping abreast of the literature and that he has adopted those technics which have become standard in his field of practice. Negligent practice of a physician in the diagnosis and treatment of a patient can be established only by expert testimony. If the evidence leaves it equally probable that a bad result may have been due to a cause for which the physician was not responsible as to a cause for which he was responsible, the patient cannot recover. In the present case, therefore, the plaintiff was required to show that his blindness was caused not by the cerebrospinal syphilis but by the injections of tryparsamide and that those injections were given in contravention of good practice in that community. If it was equally probable that the blindness was caused by either, the plaintiff could not recover. The evidence showed that it is well known in medical circles that either the cerebrospinal syphilis or the injections of tryparsamide could cause serious eye trouble. Two physicians did testify that in their opinion the atrophy of the plain-

tiff's optic nerves was of syphilitic origin, but they admitted that it was impossible to determine by examination whether such was due to syphilis or to arsenical poisoning. It would appear that no amount of clinical research could determine which of the forces here at work caused the atrophy, and so it was for the jury to weigh the probabilities and decide. The jury did so and found, which finding in the opinion of the court was justified by the evidence, that it was not equally probable that syphilis caused the eye trouble but rather that the defendant's treatment was the proximate cause of the optic atrophy. The evidence showed that for fourteen years after being treated for syphilis the plaintiff had had no eye trouble; that in 1937, despite a negative Wassermann reaction, the defendant treated him for syphilis with tryparsamide, a potent drug which should be administered only under ocular control and which the defendant failed to do; that in spite of the plaintiff's complaints of increasing visual disturbances the defendant continued the injections of the drug and that more than a year later the plaintiff underwent extensive examinations for the presence of syphilis which proved negative, although the blindness remained. Because there was evidence, though conflicting, that at the time the plaintiff fainted on Aug. 14, 1937 he had a headache, an elevation of blood pressure and incoherence of speech, and in view of his age of almost 62 years, the oppressive heat at the time and the negative Wassermann reaction, the court was of the opinion that there was evidence from which the jury might have concluded that there was not sufficient proof of the recurrence of syphilis to justify the defendant in administering tryparsamide in an uncontrolled manner. In fact, there was medical testimony that such treatments, persistently administered despite increasing loss of vision, may be proper only in the case of an extremely aggravated syphilitic condition, and there was evidence in the present case that no such aggravated condition existed. The court, therefore, refused to disturb the jury's verdict and so it affirmed the judgment for the plaintiff.—*Reed v. Church*, 8 S. E. (2d) 285 (Va., 1940).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1930 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Fetal Heart Arrhythmias Due to Anoxia.—Lund points out that, since the rate and rhythm of the fetal heart are the best criteria available for studying the condition of the fetus during pregnancy and labor, frequent determination and consequent treatment may forestall respiratory depression due to anoxia. Fetal anoxia, infrequently recognized and rarely treated antenatally, can quickly produce grave fetal complications. The slowing of the fetal heart rate has long been considered a sign of developing fetal asphyxia. Waters and Harris emphasized the fact that anoxia of the fetus can be recognized by change in the fetal heart rate and successfully treated by oxygen administration to the mother forestalling respiratory anoxic depression. The author cites 8 cases which demonstrate slowing in fetal heart rate due to anoxia and the response to oxygen. Now since auscultatory and recording devices have been perfected objective evidence of these arrhythmias can be presented. The response to oxygen therapy should occur within ten minutes and frequently is apparent in less than five minutes. If after fifteen minutes no improvement is noticed it may be assumed that oxygen will be of no value. Failure of the fetus to receive oxygen, when it is assumed that the maternal blood stream is well saturated

with it, may be due to disturbances of placental circulation, cord entanglement and prolapse. These constitute the most frequent causes of intrauterine asphyxia. The time required to prepare a patient for immediate operative delivery under such circumstances is usually more than ten minutes and can be done while oxygen is being given; thus no hazard is created for the infant. Frequently the improvement in the fetal heart rate will obviate the necessity of exigent operative delivery and its danger to the mother and the infant. Early recognition of fetal anoxia and its treatment by maternal oxygen therapy will prevent many cases of asphyxia neonatorum.

Effect of Antepartum Antisyphilitic Therapy on Fetal Mortality.—Dill and his associates studied the records of 386 patients (453 pregnancies) treated for syphilis at the New York Lying-In Hospital during the last seven years. They tried to determine which patients may expect a satisfactory outcome of the pregnancy and attempted to find whether the type and the amount of antisyphilitic therapy appreciably affected the fetal mortality and the incidence of infection. All of the patients treated had histories of syphilitic infection and had been treated previously for the disease, and serologic studies and family investigation failed to leave any reasonable doubt that the patient did not have syphilis. Each patient had been given more than one treatment for the suspected syphilis. More than 85 per cent of the pregnancies of these syphilitic patients terminated in living term babies, a percentage which is significantly lower than that among a nonsyphilitic control group of patients. Deadbirths and neonatal deaths accounted for the greatest loss of life; this loss exceeded control figures by more than 100 per cent. The number of premature living babies and premature neonatal deaths is also distinctly increased over control levels. With pediatric follow-up of more than six months the authors were able to find only 9 pregnancies resulting in babies which could definitely be called syphilitic, all of which were subjected to treatment. Two other babies who were subjected to treatment before the end of the first month of life had an immediate reversal of serologic findings. The percentage of syphilitic babies was higher when the maternal blood Wassermann was positive, but a significant difference was found in the number of fetal casualties. There were 4 infants in whom the blood Wassermann reaction failed to become negative even after two or three months and in 1 it remained positive for six months. These children have shown no clinical evidence of syphilis and with no treatment have remained clinically and serologically free from the disease for more than four years. Of the syphilitic babies, 20 per cent had osseous changes compatible with congenital syphilis, but among 80 per cent there were no roentgenologic changes. None of the placentas of syphilitic infants showed microscopic evidence of syphilis. Except in relation to the number of syphilitic babies and fetal deaths occurring in the different treatment groups the authors believe it is impossible to determine the effects of treatment. A steadily progressive diminution of syphilitic babies was observed with the increased amount of therapy that the mother received ante partum and only 1 fetus was found to be syphilitic; the mother had received more than 6 Gm. of an arsenical preparation. No correlation of the total amount of bismuth therapy to the evidence of syphilitic infection of the fetus was noted. Deadborn babies and neonatal fetal deaths apparently did not vary directly with the amount of either type of treatment. On the contrary, with advancing dosages of both arsenic and bismuth a steady fall in the number of fetal casualties was found until, with good therapeutic doses of arsenic a number not exceeding the control level was obtained. No syphilitic babies were obtained in the group receiving treatment both prior to and during pregnancy, even though the treatment was minimal in both instances. The incidence of syphilitic babies decreased significantly as the length of treatment increased. It seemed that the longer the age of the infection the lower was the incidence of syphilitic infants. Dystocia, pyelitis and antepartum bleeding were not observed to have an increased frequency among syphilitic mothers with or without previous treatment. However, the incidence of toxemia of pregnancy was increased although the increase could not be correlated with the amount of treatment, the time it was begun or the amounts of arsenic or bismuth

preparations received. The conclusion is that syphilis need no longer constitute a major cause of fetal mortality or a frequent disease of the newborn, as early antepartum therapy, greatly enhanced by treatment received prior to conception, promises a favorable outcome.

Roentgen Visualization of Placenta.—Dippel and Brown analyze the clinical value of the roentgenologic visualization of the placenta after using it in 262 examinations. They clearly saw the placenta in 236, or 90 per cent, of the observations. Hydramnios accounted for nonvisualization in 5.73 per cent of the soft tissue roentgenograms, unsatisfactory roentgenograms accounted for 3.05 per cent of the failures, and it was impossible to see the placenta in 2 of 8 cases of twin pregnancy. Immaturity, provided the pregnancy has advanced beyond the midpoint, and abnormal presentations and positions are not hindering factors. Placental calcification is rarely extensive enough to aid in its localization. The fetal position is not a reliable criterion of the site of the placenta. Placental implantations were almost equally divided. However, with low implantation, essentially eight times as many placentas were implanted on the anterior as on the posterior wall. The average thickness of the walls of the fundus uteri near term measured 1.24 cm. on roentgenograms made at a distance of 42 inches. Only 11 of 92 cases of vaginal bleeding were found roentgenographically and clinically to have true placenta praevia; 15 other cases presented roentgen evidence of low implantation without the usual clinical signs. Soft tissue roentgenography in cases of vaginal bleeding is of greatest value when the whole placenta is visualized above the iliac crests. These constitute 88 per cent of the instances of vaginal bleeding in the later months of pregnancy.

Nail Polish Dermatitis.—Burgess reports 10 cases with a history of repeated violent or mild exacerbations every few days of a patchy eruption of the face and neck. The eruption was not uniformly symmetrical but was frequently unilateral. The areas affected were usually about one or both eyes, about the mouth,

the sides of the neck and the supraclavicular regions. In 1 case pruritus ani was due to repeated contact with nail polish, in the eruption was on the shoulders and in 2 in the midstream areas. Obviously repeated contact with the fingers in these areas precipitated the dermatitis and, once the eruption occurred, the incessant burning and irritation greatly increased the contact. Freshly applied nail polish appeared more highly irritant than when it had been on the nails for some days. Eczema involving the fingers was encountered only once. The patch test in the reported cases was uniformly positive. In order to ascertain its value, 25 random cases were tested to different nail polishes and each gave a negative patch test. A number of other cases with similar eruptions gave negative reactions, but the eruption disappeared on discontinuance of nail polish. It is probable that a negative patch test on some other area of the body does not necessarily exclude the possibility of nail polish as a causative agent, and in the absence of other etiologic factors contact with nail polish appears indicated.

Vulval Pruritus in Unrecognized Diabetes.—Winer and Strakosch suggest that diabetes is more often the underlying cause of pruritus vulvae than is generally suspected. Itching of the vulva is often the first symptom of diabetes or rather of hyperglycemia. Many patients who do not have sugar in the urine give a history on questioning suggestive of diabetes, and the blood sugar content may be found to be elevated. A study of 31 patients admitted to the Minneapolis General Hospital Clinic between January 1939 and August 1940 complaining of vulval pruritus revealed that 26 had diabetes. Eleven of the 26 were known to have the disease and the remaining 15 were found after investigation to have it. The histories of these 15 patients showed that they were each seen by from two to five physicians. The ages of the patients ranged between 30 and 50 years. All were married, but parous and nulliparous women were equally divided. They all gave histories of polyphagia, polydipsia and polyuria. The duration of itching varied from three to fourteen months before the diagnosis of diabetes had been made. Several

of these women were under psychiatric treatment without avail and were being considered for institutional care. One patient had been scheduled for a vulvectomy, which was subsequently unnecessary. The urines of the patients were negative for sugar on two or more occasions, and the urine was free of sugar at the time of admission to the hospital. Fungi were found in 8 of 10 patients thus examined, but in these local therapy alone did not give relief. One patient with fungi was resistant to treatment until her husband was similarly treated. The fasting blood sugar content of all the patients was either at the upper limit or above normal, one being 235 mg. per hundred cubic centimeters of blood. The sugar tolerance test in all showed a decided tendency of the blood sugar to remain elevated far above normal from three to six hours after the ingestion of dextrose. All the patients responded to treatment only after their diet was regulated and the blood sugar reduced to normal. In addition to the low carbohydrate diet 2 patients required insulin. Diagnosis of diabetes mellitus requires more than a positive finding of sugar in the urine. In addition to a blood sugar determination, the sugar tolerance test was useful in verifying the diagnosis.

Bronchoscopy in Pulmonary Abscess.—Jackson and Judd believe that there is a definite place for bronchoscopy in the treatment of pulmonary abscess other than its diagnostic value. In selecting patients for bronchoscopy they chose those with a single abscess cavity determined by thorough roentgen examination, and those who although showing multiple or multilocular cavities present satisfactory evidence that the original lesion was singly cavernous. Of the 124 cases analyzed the cavities seemed to show a predilection for the right side (93 as compared to 31 in the left lung) and for the lobar apex when occurring in the lower lobe of the right lung. There was no definite relationship between the location of the cavity and the ability of the patient to survive. The conservative regimen (rest, supportive care, transfusions, vaccines, intravenous chemotherapy, postural drainage and bronchoscopic aspiration) alone was carried out in 87 cases, although 9 were under observation for so short a time that they cannot be included. There were 23 deaths among the remaining 78 patients, 33 were known to be cured, 5 were discharged cured but without follow-up within the last year and 17 were improved at the time of discharge to their referring physicians. Thirty-seven patients were referred for some form of surgical care, and of these 18 have died of various causes and of the 19 surviving patients only 4 have survived procedures other than external drainage. The poor results obtained by procedures other than external drainage coincide with the experience of other investigators and justify their abandonment except when complicating conditions demand lobectomy or pneumonectomy. The authors agree that surgical intervention should be early if progress is not rapid and unmistakable but that every patient should first be given the advantage of a rigid conservative regimen for at least a brief period. The time limit varies for each patient, and the optimal time for the various therapeutic procedures can be set best by the cooperation of the internist, thoracic surgeon, roentgenologist and bronchologist at some sort of "chest conference."

Operative Treatment of Cardiospasm.—Gray and Skinner discuss the etiology of cardiospasm, the pathologic changes, symptoms and treatment. Among the more than 1,200 cases encountered at the Mayo Clinic only 7 required surgical intervention. The authors submit reports of the cases in which operation was performed. The operations were four manual

dilations of the cardia according to Mikulicz, one esophago-gastrostomy, one thoracocervical sympathectomy and one abdominal sympathectomy combined with manual dilation of the cardia. In the authors' opinion surgical procedures will at times be necessary for those few patients whose esophagus is obviously dilated, tortuous and lengthened, with angulation at the cardia and development of a reservoir below the level of its opening. Dilation of the cardia from above by some mechanical dilator is an extremely satisfactory method of conservative treatment in most cases of cardiospasm. Of 810 cases observed at the clinic up to 1933, 805 were treated conservatively, and complete relief was obtained in 71 per cent of 670 traced patients. A large proportion of the remainder were benefited; only 32 received no help. Nine died as a result of splitting of the esophagus. All but 1 of these deaths occurred prior to 1925, when a change in technic was instituted.

Endocrine Disturbances and Cutaneous Diseases.—Lynch points out that endocrine disturbances exert a powerful influence on the skin and that cutaneous changes afford considerable diagnostic aid in endocrinopathies. Analysis of the classic endocrine disturbances (hypothyroidism, hyperthyroidism, hypofunction of the adrenal cortex, hypopituitarism, hyperpituitarism and disturbed gonadal functions) shows that most of the cutaneous anatomic structures and functions are directly influenced by endocrine associations. That the character, growth and distribution of hair are more influenced by the endocrines than by any other factor may also be deduced by analysis of the

classic endocrinopathies. The texture of hair is controlled mostly by thyroid function, growth is chiefly subject to the pituitary gland, and its distribution is a result of gonadal activity. Recent work on pancreatic hormones suggests that cutaneous lipoidoses and perhaps psoriasis may be related to the endocrines. The association between allergy and endocrinopathy has possibilities that have not been explored. That some interrelationship is present cannot be doubted; hyperthyroidism is known to exaggerate allergic symptoms, and estrogenic activity apparently decreases allergic tendencies. There are many signs of endocrine activity in neurodermatoses; the lowered blood pressure, vascular dilatation or constriction and emotional changes are most significant. A lowered metabolic rate is further evidence of such association. Since hormones act on all tissues, endocrine influence on cutaneous diseases might be expected. Syphilis is one disease which is without doubt influenced by the endocrines. The difference in the course of syphilis in the sexes and the favorable influence of pregnancy are well established clinical observations. In contrast to the endocrine influence on systemic disease, an extensive systemic disease may influence the glands of internal secretion. Generalized exfoliative dermatitis exerts a general systemic influence, and in association with this disturbance a number of endocrine abnormalities have been demonstrated. These abnormalities might be the cause of the cutaneous involvement, but it appears more likely that they are the result of the extensive disturbance of cutaneous functions. Among the dermatoses influenced by endocrine activity are necrobiosis lipoidica diabetorum, acanthosis nigricans, hemochromatosis, hypertrichosis (and baldness a hereditary trait associated with some type of mild endocrine dystrophy), menstrual dermatoses, cutaneous changes at the menopause, hyperpigmentation (linea nigra), striae and chloasma of pregnancy, scleroderma, calcinosis, impetigo herpetiformis, livedo, acrocyanosis, erythema induratum and various forms of pernio. There is some evidence that acro-dynia is closely associated with adrenal cortical disturbance. The dermatologist needs little knowledge of endocrine therapy of the cutaneous disturbances associated with classic endocrinopathies, as his assistance should be chiefly diagnostic. Such therapy should be left to the endocrinologists at least until the indications, dosage and technic are developed, when it can be applied by all practitioners, as is now true with antisiphilitic agents.

Electroencephalography.—Bennett and Cash point out that the electroencephalogram is capable of locating the site of a cortical lesion in from 80 to 90 per cent of cases. Subcortical tumors cannot be located directly, but they often can be inferred because of the electrical dysfunction produced in the cortex as in pituitary tumors, which usually produce abnormal signs in the frontal lobes. In cerebellar tumors the location may be inferred, but with difficulty. In a few instances with organic pathologic changes the electroencephalogram may be normal. Gliomas of the parietal lobes produce a decreased alpha frequency and slow pathologic or delta waves. Tumors of the frontal lobes do not usually affect the alpha rhythm. Neoplasms in themselves are electrically inactive, but by their

effect on the cortex they produce changes demonstrable electrically. Cerebral abscesses may be localized in the same manner as neoplasms. If localization is obscured by generalized increased intracranial pressure, this may be overcome by using hypertonic solutions, which are more effective than the release of pressure by ventricular tap. Less consistent but still definite changes in the normal rhythm, with the presence of abnormal waves, may be noticed in the presence of toxic encephalitis, epidemic encephalitis, paralysis agitans, presenile and senile dementia, multiple sclerosis and dementia paralytica. The electroencephalogram is extremely useful in localizing epileptogenic foci in patients showing no other localizing phenomena. This is particularly significant in view of the recent advances in the surgical treatment of epilepsy. Of practical significance is the comparative study during symptom free periods in order to evaluate the efficiency of treatment, thus guiding the clinician. The hereditary factor in epilepsy has received further confirmation by the electroencephalogram. In functional disorders (neuroses, behavior problem children, schizophrenia and manic-depressive insanity), the electroencephalogram has opened a new approach for etiologic and pathophysiologic study.

Relation of Urinary Infections to Arterial Hypertension.—Weiss and Parker classify pyelonephritis into four groups: acute (pyelitis), chronic (active), healed and healed with recurrence. The main morphologic characteristics of each group are described. Two illustrative cases of the natural history of pyelonephritis and the relation of infections of the urinary tract to the development of arterial hypertension are discussed. The renal infection of the first patient began at the age of 6 months and persisted until her death at 15 years of age. Whereas local symptoms with pyuria dominated the clinical picture in early childhood, nephritis with arterial hypertension was the presenting syndrome during the last two years. The cause of death was uremia, at which time the renal infection still persisted. The case represents chronic (active) pyelonephritis. The kidneys at postmortem examination were unusually small but without congenital abnormalities. The authors believe that this type of kidney is caused by lack of normal growth due to chronic infection rather than to renal contraction. The late effects of pyelonephritis in adult life are presented by the second patient whose first attack developed during pregnancy. The left kidney, removed surgically, was small and probably congenitally hypoplastic. Whether the right kidney has any congenital malformation is not certain. During the twenty years this patient has been under study she has suffered from repeated attacks of acute infection, suggesting healed and recurrent pyelonephritis. The gradual onset of hypertension was clearly demonstrated. For the first seventeen years, symptoms referable to the urinary system and pyuria were the main features; the blood pressure was normal. Symptoms of severe hypertension with changes in the eyegrounds and angina pectoris developed during the last three years. Renal tuberculosis, infections of the renal pelvis, hydronephrosis and cystitis are usually not responsible for arterial hypertension. In children with low renal reserves of long standing caused by pyelonephritis disturbances of bone formation with deformities (renal rickets) may be present, but the characteristic changes differ from those of true rickets. Acute pyelonephritis (pyelitis) by itself is usually not responsible for toxemia of pregnancy. It has an indirect relation to toxemia and eclampsia so far as it predisposes to arterial hypertension and to a low renal reserve. Diffuse pyelonephritis in its chronic or healed stage should be considered as one form of nephritis. The clinical course of pyelonephritis varies. In most cases the

disease is benign and self limiting, but at times it becomes chronic, leading to arterial hypertension and to renal or cardiac insufficiency.

Sanatorium Care for Patients with Rheumatic Fever.—Hubbard and Griffin present the results of two years of open air treatment of rheumatic fever and heart disease. The idea began as an experiment in an attempt to determine whether a rheumatic child in a carefully controlled, open air environment can be kept free of respiratory infections and whether the infection itself responds favorably to such an environment. During the winter of 1938-1939, 20 children who had recently recovered from active rheumatic fever were sent to the sanatorium. Some had respiratory infections at the time of admission. They remained as a closed colony during the winter and spring months. Only the child's parents were allowed to visit once a week. The parents were required to wear masks, and no one with a cold, sore throat or other infection was admitted to the building. Education of the children was continued, and a full time occupational therapist was available to keep them happy and busy when they were not at their school work. The children slept outdoors, even in the severest weather, and were kept in the open air as much as possible during the day. Throughout the winter all the children were free from respiratory infections and recurrences of rheumatic fever. During the summer of 1939, 15 children were discharged, the rest being kept for further care. Some of the discharged children since returning home from the sanatorium have had infections of the respiratory tract and other minor ailments, but none have had recurrences of rheumatic fever or evidence of increased heart disease. During the following winter only children with active rheumatic infection were placed. The policy of maintaining a closed colony was abandoned, and children were admitted as beds became available. The only restrictions were that the disease should be well established and that the children should be between 5 and 12 years of age and free from chorea and heart failure. During the second year 28 children were admitted. When they were free from all evidence of active infection a gradual increase in activity for two months was allowed and then they were permitted full activity. Instead of being sent home at this time they were kept for a further few months, during which it was hoped that any latent rheumatic infection would be overcome and a state of vigorous health attained, so as to enable them to withstand the rigors of their home environment, which was probably poor at best. The results were as satisfactory as those during the first year. The children remained free from infections of the respiratory tract except for one or two minor head colds. Rheumatic infection did not recur in any instance. During the second year, throat and air cultures were taken regularly. A considerable number of hemolytic streptococci were found in the throat cultures; the typing of these is not finished. The air cultures give bacteriologic evidence in support of the value of the open air environment. With freely circulating air that is rapidly diluted with the outer air there is relative freedom from bacterial contamination in comparison with the usual hospital wards. Bacterial determinations made during the winter, spring and summer compared favorably with similar counts obtained in a carefully supervised, air-conditioned, infection-free premature infant nursery and in infant cubicles protected with ultraviolet radiation. Hemolytic streptococci and other pathogenic bacteria were found in air samples from hospital wards, whereas only staphylococci, molds and a variety of nonpathogenic organisms were obtained at the sanatorium. The authors draw no conclusions as the time has been short and the number of cases limited, but they believe that the treatment is rational and economically sound and deserves further trial.

Calcium Gluconate in Cardiac Failure.—Rogen determined by auscultation the heart rate of 26 patients with varying degrees of cardiac failure before and after the intravenous administration of 10 cc. of a 10 per cent solution of calcium gluconate. Preliminary excitement was minimized by accustoming the patient to the routine of injection. As a control, intravenous sodium chloride was given to some patients but without significant alteration of heart rate. Twenty of the 26 patients reacted to the calcium gluconate by a slowing of the heart rate of from six to seventy-eight beats per minute and in 6 no change occurred. The time of maximal slowing varied from five minutes to more than twenty-four hours. Five of the patients who experienced no appreciable change in heart rate had auricular fibrillation. The greatest degree of slowing among half the patients with regular rhythm did not occur within ten minutes of the injection, whereas it did among the patients with auricular fibrillation. The fall in heart rate produced by calcium depends on the original rate. The relationship between percentage of fall and original rate in patients with regular rhythm and the absence of this when there are beats of ectopic origin as in auricular fibrillation suggest that one action of calcium is to stimulate the vagus mechanism. The author also studied the effect of atropinization on the action of calcium of 15 patients with cardiac failure and regular heart rhythm. Calcium failed to have any effect on 10 patients during atropinization. Slowing was noted in the remaining 5. It is assumed that in the first group the vagal paralysis produced by atropine was responsible for the absence of calcium bradycardia, suggesting that calcium exerts its effect through the vagal system. The failure of atropine to abolish completely the slowing action of calcium of the 5 patients was probably due to the fact that vagal paralysis was incomplete. The effect of calcium gluconate on the electrocardiograms of 12 patients was studied, and the results show that calcium may affect the heart indirectly through the vagal system and directly through the myocardium. Evidence of sinus slowing, the greater effectiveness of calcium in reducing the heart rate in regular rhythm and the abolition of the bradycardia effect by atropine suggest a vagal action. Increase in the amplitude of the T wave and a greater tendency to coupling and lengthening of diastole in the electrocardiograms indicate some direct action on the heart muscle. The fact that these observations are not so frequent as the sinus slowing suggests that as a rule larger doses of calcium are required to produce the myocardial effect than to stimulate the vagus control. The blood pressures of 21 patients (seventy-two determinations) were determined half an hour before and at intervals after the injection of calcium gluconate. On thirty-six occasions there was an increase in systolic blood pressure varying from 4 to 20 mm. of mercury and on thirty-six a decrease of from 4 to 24 mm. The pulse pressure was increased on eighteen occasions, decreased on eleven and unaltered on the remainder. Neither the heart rate nor the rhythm had any effect on the direction of the systolic or pulse pressure changes. The venous pressure of 18 patients was estimated, and in 11 the injection of calcium gluconate was followed by a slight fall and in 7 there was no change. The effect of the calcium on the respiration of 6 patients was studied by means of a stethograph; in 5 the rate was slightly reduced, in 3 the irregularity was diminished and in 3 the amplitude decreased. Calcium gluconate therapy of these patients lowered the viscosity of the blood and, it may be assumed, lessened the work of the heart and to that extent led to improvement in circulation. Calcium gluconate has little immediate effect on the urinary output, but it greatly enhances the diuretic action of the digitalis glycosides. Fourteen of the 41 patients given systematic calcium therapy have experienced definite bene-

fit. Many of the 41 patients had failed to respond to other forms of treatment, including digitalis. Improvement was considered to have occurred only when there was reduction in pulse rate, a diminution of edema, a reduction in the rate of breathing or a marked lessening of cyanosis, together with subjective improvement of at least three days.

Prevention of Acute Adhesive Obstruction. A. J. C. Latchmore.—p. 713.
Blindness Following Hematemesis. C. H. Bamford and H. Barber.—p. 715.

Chemotherapy of Abdominal Actinomycosis.—According to Dorling and Eckhoff, a patient with abdominal actinomycosis usually is admitted to the hospital with acute appendicitis, often with peritonitis, and an operation is performed for removal of the appendix and drainage. Discharge continues from the incision for weeks and months, and not infrequently secondary operations have to be performed for collections of pus in the pelvis, subphrenic spaces or other parts of the abdominal cavity. A typical actinomycotic abscess often develops in the liver, and when this happens death is almost certain. At some time during this period actinomycosis may be recognized from an examination of the discharge. Many methods of treatment have been tried, but no specific has been discovered, and this has led to a further search for a drug that would be of value. Several investigators having employed sulfanilamide preparations, the authors decided to try this form of chemotherapy not without some skepticism. In view of the striking benefit in 1 case, they have since instituted it whenever actinomycosis has been suspected. They describe 5 cases of abdominal actinomycosis treated with sulfanilamide, sulfapyridine or both. Although all were severe infections there were four complete recoveries and one death. In 1 case, in which high voltage roentgen therapy also had been used, a later operation showed that all evidence of disease had disappeared. The authors conclude that chemotherapy should be tried early in all cases of suspected abdominal actinomycosis. Two or three courses of sulfapyridine, each lasting a week and with a week between, are usually needed.

Oral Anterior Pituitary Extract in Diabetes.—Lawrence and Young point out that Collip claims to have observed an important "antidiabetogenic" effect produced by a primary alcoholic extract of anterior pituitary tissue administered by mouth. The authors attempted to confirm Collip's observations on diabetic human beings and on dogs made permanently diabetic by the daily injection of anterior pituitary extract for a short period. No evidence was obtained to support Collip's claim that the oral administration of the primary alcoholic extract of pituitary tissue exerts a profound antidiabetogenic effect. Collip suggested that this extract produces its effect through a pancreotropic action on the islets of Langerhans.

Pancreotropic Factor of Anterior Pituitary Lobe.—Marks and Young report investigations on the pancreotropic activity of different anterior pituitary preparations, undertaken to verify Collip's suggestion that the anterior pituitary tissue exerts its antidiabetogenic effect by virtue of pancreotropic action. The ability of such preparations to induce a significant rise in the insulin content of the pancreas of a male Wistar rat treated daily with extract for two weeks was used by the authors as an index of pancreotropic activity. The pancreotropic activity of sheep pituitary crude extract was found to be about half that of ox pituitary extract, while horse pituitary extract was found to be inactive under comparable conditions. Although a preparation of prolactin possessed a high degree of pancreotropic activity, considerations are advanced for believing that the pancreotropic factor (which is probably not a hormone) is not identical with prolactin or with the gonadotropic, thyrotropic or glycotropic substances. Treatment with testosterone, unlike treatment with estrogens, does not raise the insulin content of the pancreas of the male rat, and the

pancreotropic action of pituitary extract appears not to be mediated by the male gonads. Collip's primary neutral alcoholic extract of pituitary tissue was found not to be significantly pancreotropic when administered to rats either by subcutaneous injections or by mouth.

Reactivation of Latent Foci of Tuberculosis; Endogenous and Exogenous Reinfection. E. Sergent.—p. 953.

*Sterilization of Tuberculous Lesions and Extinction of Sensitivity to Tuberculin in Man Based on Experimental Considerations. A. Sænz.—p. 955.

Relation of Hypertrophy of Prostate to Senescence. P. Thévenard.—p. 957.

Sterilization of Tuberculous Lesions.—Sænz applies some conclusions drawn from experiments with guinea pigs, involving sterilization of latent tuberculous lesions, desensitization and reappearance of sensitization after reinfection, to man. The sterilization and extinction of sensitivity to tuberculin here discussed, never observable when guinea pigs are inoculated with even minimal quantities of virulent tubercle bacilli, concern primary lesions, communicated to guinea pigs by inoculation with greatly attenuated vaccines, such as the BCG. Sterilization varies in accordance with the original concentration of vaccine used. The author points out (1) that great individual differences observed in the time requirement for securing complete negative tuberculin reactions in the guinea pig are encountered also in man and (2) that in guinea pigs a long interval of time occurs between sterilization of primary inoculated lesions and the disappearance of sensitivity. The fact that in the animal sterilization of the lesions may be observed after three to four months, whereas tuberculin positive reactions may continue for some ten to twelve months and longer justifies the assumption that other factors besides living tubercle bacilli may be at work, namely modification of the colloidal setup of the protoplasm of certain cells, which many persist for a long time. Parallel conditions may reasonably be inferred to exist in man. Sterilization is complete in man when calcification has occurred, but tuberculin reactions continue positive for a much longer time. The author was also able to confirm the guinea pig experiments of other investigators who found that induced reinfection after spontaneous desensitization was accompanied with a marked acceleration in the recurrence of sensitivity. This condition seems also to occur in man. Hence there persists, though the skin is completely desensitized, a certain degree of allergy or an aptitude to react differently, which needs to be kept in mind when one is formulating conclusions on sensitivity and desensitization.

Spondylolisthesis.—According to Burckhardt, spondylolisthesis and spondylolysis interarticularis (Neugebauer) are essentially the same disease process in different stages of development. The beginning stage of spondylolysis, that is the stage before displacement of the vertebral body, is designated as spondylolisthesis imminens. The elicitation of the clinical symptoms can be spontaneous, but in many cases a trauma is held responsible, particularly when it caused a sudden excessive tension of the back muscles. In two thirds of the 63 cases reviewed here no accident could be demonstrated. The first clinical signs are often slight. Generally the patient complains of backache; he has a feeling of unsteadiness over the sacrum and has the sensation of falling forward and he reacts against this by lifting the pelvis. The pains radiate into the legs occasionally during the initial stage, which is explained by the close relation of the intervertebral foramen (nerve root) to the cleft of the vertebral arch (interarticular portion). Roentgenographic examination is indispensable for a reliable diagnosis. The interpretation of the

roentgenogram is easy in case of manifest spondylolisthesis, particularly if the exposure was lateral. However, the imminent spondylolisthesis is often difficult to recognize; the lateral exposure alone may be inadequate, but the anteroposterior exposure reveals the cleft more clearly, particularly if in the presence of a kyphotic lumbar vertebral column the projection is made from an anterior-inferior toward a posterior-superior direction. Oblique exposures should be added in all doubtful cases. Of the 63 cases of spondylolisthesis (37 men, 26 women), 46 involved the fifth, 11 the fourth and 2 the third lumbar vertebrae. In 3 cases the fifth and fourth and in 1 the third and second lumbar vertebrae were involved. An olithetic fifth lumbar vertebra generally shows a greater displacement than does the fourth or another lumbar vertebra. The different degrees of displacement are found in all age groups. The lumbosacral angle (that is, the angle opening posteriorly between the axes of the fifth lumbar and first sacral vertebrae) widens proportionately to the degree of displacement. This angle measures 140 degrees under normal conditions and 160 degrees in spondylolisthesis. The angle formed by the inferior articular process and the root of the arch, which is normally 115 degrees, is likewise enlarged in spondylolisthesis. This enlarged angle of the arch is not specific for spondylolisthesis. Junghanns detected this enlargement also in pseudospondylolisthesis. This angle measures 126 degrees in imminent spondylolisthesis and it contributes to the elongation of the arch. It seems to hinder the reposition. The intervertebral disk always shows secondary degeneration in spondylolisthesis, that is, the loosening of the interarticular portion of the vertebral arch is primary. However, not until the intervertebral disk starts to yield does the sliding become manifest. The author treats spondylolisthesis in adolescents, in whom recent gliding justifies it, first by a reposition of the sliding vertebra. If possible, he subjects all patients with spondylolisthesis, under local anesthesia, to the Albec-de Quervain operation with paraspinal double tibial graft. After this the patient must avoid great physical exertion for from six to twelve months and he must be fitted with a lumbar support.

*Hypovitaminosis B₁ in Cardiovascular Disease. R. de Siqueira and R. Segadas.—p. 943.
Endocrine and Sympathetic Dystonia. G. Bandeira.—p. 1039.

Hypovitaminosis B₁ in Cardiovascular Disease.—Siqueira and Segadas point to the frequency of heart disease as a result of lack of vitamin B₁. The deficiency brings about general nutritional metabolic dysfunction in which the myocardium is involved. The authors review the literature and report 8 cases of their own and several from the literature. They found that chronic alcoholism, pregnancy, diabetes, hyperthyroidism, prolonged infection, malnutrition and cachexia, chronic disease of the digestive tract and latent cardiac insufficiency are the underlying or determining causes of hypovitaminosis B₁ and of the cardiac complications. The early symptoms, palpitation, a feeling of oppression in the chest and of precordial distress, dyspnea on exertion and irregularities in the heart action are, as a rule, benign and regress on administration of vitamin B₁. The changes in the size of the heart and cardiac insufficiency appear late in the course of the condition, are more or less grave and may become permanent. The electrocardiograms exhibit abnormalities of the ventricular complex, with reduction of the amplitude of the R or S waves, lack of level of the ST segment and deformation or inversion of the T wave, which may be transient or permanent in accordance with the acuteness of the myocardial lesion. The author concludes that in all cases of heart disease in which hypovitaminosis B₁ is suspected it is advisable to clarify the diagnosis by the therapeutic test of administering vitamin B₁. The treatment of the disease consists in intramuscular injections of vitamin B₁ in daily doses of 0.01 or 0.02 Gm. for the first three weeks, after which the vitamin is given by mouth. Rest and a normal diet with abundance of fruits and vegetables are indicated. The condition responsible for hypovitaminosis should be treated in all cases. Cardiac tonics and diuretics are indispensable in the presence of cardiac insufficiency.

26:1-130 (Oct.) 1940. Partial Index

*Pharmacologic Action of Potassium, Calcium and Magnesium Ions on Respiratory Centers. B. L. Velázquez.—p. 1.

Action of Potassium, Calcium and Magnesium Ions on Respiratory Centers.—Velázquez found no reports in the literature on the action on the respiratory centers of ions when injected by the suboccipital route, or on their clinical application in the treatment of respiratory paralysis of cerebral origin. He induced a respiratory paralysis in dogs by intravenous injection of a mixture of morphine and chloral hydrate. Isotonic solutions of drugs capable of ionic dissociation were injected suboccipitally at a temperature of 38 C. after removal of an equal amount of cerebrospinal fluid. Potassium chloride in a dose of 0.02 Gm. had the effect of stimulating and regulating respiration and increasing the blood pressure. Calcium chloride, 0.05 Gm., caused respiratory paralysis without any alteration in the blood pressure. Magnesium in a dose of 0.05 Gm. also caused respiratory paralysis. Potassium chloride when administered in the mentioned dose during the effect of calcium chloride caused paralysis and lowered the blood pressure. When the drug was administered after magnesium chloride it stimulated respiration and caused a slight increase in the blood pressure. Repeated experiments gave constant results. The author concludes that potassium chloride in doses of 0.02 Gm. administered by suboccipital injection is the most efficacious drug for the stimulation of the respiratory centers and for regulation of lowered blood pressure caused by disturbances of the respiratory centers. The results suggest clinical application of the drug in respiratory paralysis due to poisoning of the nervous centers, respiratory syncope in anesthesia and paralysis from other causes. The injections should be given by the suboccipital route.

Münchener medizinische Wochenschrift, Munich

87:1045-1076 (Sept. 27) 1940

Circulatory Function Tests in Soldiers, with Special Reference to Work Test Electrocardiogram. P. Laurentius and F. Klopffleisch.—p. 1045.
*Clinical Aspects and Therapy of Lymphatic Leukemia. R. Stöger.—p. 1047.

Active Therapy of Febrile Abortion and Contribution to Problem of Secondary Sterility. H. Winkler.—p. 1052.
Bromine Preparation as Efficient Substitute for Iodine. H. Städtler.—p. 1054.

Indications for Surgical Therapy in Diseases of Digestive Organs and Peritoneum. H. Junghanns.—p. 1055.

Lymphatic Leukemia.—Stöger reviews observations on 53 cases of lymphatic leukemia. The fact that 39 of the 53 patients were men indicates that the disease is much more frequent in men than in women. The age of greatest frequency was the sixth and seventh decades, which contradicts reports in the literature according to which the disease is more frequent in younger age groups (from 20 to 40 or 30 to 39). The symptoms which brought the patients to the physician varied considerably, but swellings of the lymph nodes and the resulting pressure pains were most frequent. Increasing pallor, weakness, hemorrhages and raised temperatures were other early symptoms. In 5 cases cutaneous symptoms were observed. The skin lesions vary greatly; they may assume the form of prurigo nodularis, erythrodermia or may resemble mycosis fungoides. The blood picture or the result of sternal puncture is the decisive factor in the diagnosis of such cutaneous lesions. Lymphatic leukemia was discovered accidentally in the course of a blood analysis of 4 patients who were free from complaints although a splenic tumor was already present. Swelling of the lymph nodes in the cervical, the inguinal, the axillary and perhaps the mediastinal regions, splenic tumor and enlargement of the liver are the most striking aspects of lymphatic leukemia. Hyperplasia of Waldeyer's tonsillar ring, although not pronounced in old patients, was always present in young patients. The greatly enlarged tonsils, which are characterized by a peculiar glossiness and may exhibit submucous hemorrhages, unfortunately have been extomized at times, although tonsillectomy is not only useless but even dangerous. This justifies the demand for a thorough internistic examination and a careful blood analysis previous to a tonsillectomy, particularly in the presence of hypertrophic palatine tonsils. Gastrointestinal or

neurologic symptoms were not observed. The genital organs may become involved and priapism may result. The temperature was alternately subfebrile and normal in 35 of the 53 patients, 6 patients had septic fever curves and the temperature of 12 patients was normal. Metabolism tests usually disclosed a noticeable increase in the basal metabolic rate. Examination of the urine almost always disclosed an increased elimination of urobilinogen. The blood picture is of greatest importance. The increase in leukocytes is usually considerable. The red blood picture is often characterized by a slowly progressing anemia which the author ascribes to three causes: (1) hemolysis, which is proved by the increased elimination of urobilinogen and by heightened bilirubin content of the serum, (2) displacement of red marrow by leukemic infiltration and (3) unknown toxins. The prognosis of lymphatic leukemia is unfavorable. According to the author's observations the disease lasts from two to five years, but death is usually the result of intercurrent diseases. Dietetic treatment and the administration of vitamin C exerted no influence in the reported cases. The improvement after fever therapy was of short duration. Blood transfusions proved valuable in the cases in which the anemia predominated. Roentgen therapy may improve the symptomatic complaints, but it should be employed only in carefully selected cases. It should be postponed as long as possible and should never be tried in cases in which there are less than 4,000 granulocytes. The improvement in the general condition should be the chief aim of the treatment, and arsenic preparations have proved effective in this respect. Heliotherapy in the form of sun baths has produced excellent results in early cases.

Medizinische Welt, Berlin

14:445-472 (May 4) 1940

Gunshot Lesions of Spinal Cord and Their Treatment. H. Peiper.—p. 445.

*Causal Therapy in Angina Pectoris. M. Hochrein.—p. 449.

Modifications of Electrocardiogram and of Activity of Heart After Calcium Injections. J. Kupas.—p. 453.

Causal Therapy in Angina Pectoris.—Hochrein discusses the pathogenesis and therapeutic management of angina pectoris. Nervous disturbances as well as coronary insufficiency may characterize the syndrome. The therapy must therefore be based on the observations in each case. Coronary insufficiency seems to constitute the inciting cause. The clinical picture, however, is determined by the tonus of the autonomic nervous system and the stimulus threshold of the sensory nervous system. Anginal pain is only a symptom and not always present where coronary insufficiency is encountered. Forty per cent of the patients with coronary insufficiency and 15 per cent with coronary sclerosis were free from pain. In 163 cases, gastric symptoms occurred eighty-nine times, and obesity was present thirty-four times, both conditions predominating at the age level of from 40 to 60 years. Focal infections occurred twenty-two times. In attacking individual conditions with an individualized regimen the author was able to cure angina pectoris in granuloma affecting the teeth by care of the teeth; angina pectoris due to rectal carcinoma with secondary gastric involvement by surgical intervention; angina pectoris, ultimately traceable to a hiatus hernia and anacid gastritis, by a change in the manner of living, diaphragmatic exercises and treatment for gastritis; esophageal spasms by a dietary regimen and anesthesia tablets, and a vagus neurosis, induced by athletic inactivity, by resumption of sports activities. Coronary insufficiency was combated directly by reducing cardiac strain to a minimum and by stimulating the blood circulation of the heart. This was effected by combating intestinal fermentation and constipation and by stimulating portal circulation. Caffeine, barbituric acids, carbonic acid inhalations and short wave irradiation were variously employed. (The use of nitrites and epinephrine is discouraged.) Mental therapy is regarded as an essential part of the therapeutic program. Most cases of angina pectoris can be relieved. Causal therapy not only assuages pain but prevents the possible evolution of an acute cardiac weakness, such as myocardial infarction and instant death from heart failure. Angina pectoris in obese persons was often permanently cured by simple attack on intestinal fermentation and excess weight.

*Residual Cavities After Thoracoplasty and Their Treatment by Means of Suction Drainage. A. Schuberth.—p. 87.

Microröntgenographic Method of Abreu. H. Grass.—p. 94.

*Problem of Primary Tuberculous Infection in Young Adults. H. Gerberding.—p. 101.

Suction Drainage of Residual Cavities.—Schuberth points out that, in spite of all efforts to avoid residual cavities after thoracoplasty, there remains a certain number which even additional plastic interventions do not affect. The author sees the cause for this in the tendency of cavities to gravitate toward the so-called dead angle. Another hindrance to the shrinkage is the unfavorable air pressure conditions in the cavity. The internal air pressure is dependent on the discharging bronchus, the patency of which may be modified in the course of the thoracoplasty; the bronchus may be bent or displaced, and this may have a favorable or an unfavorable effect, depending on the nature of the case. In unfavorable cases, inflation may result from the valvular action of the discharging bronchus. The suction drainage produces a negative pressure and thus favors shrinkage and, at the same time, it removes the harmful waste products from the cavity. The method consists in introducing into the cavity a rubber catheter through the thoracic wall and in suctioning off the contents. Of four residual cavities two shrank almost completely and the sputum as well as the discharge from the catheter was free from bacilli. In another case in which the residual cavity had existed for five years the cavity shrank to one half its former size and the sputum is now free from bacilli. In the fourth case the suction was begun only recently, but a considerable shrinkage has already taken place. The results are sufficiently favorable to recommend the method for all residual cavities which show no tendency to disappear after thoracoplasty.

Primary Tuberculous Infection in Young Adults.

According to Gerberding only 50 per cent of those who leave school have been infected with tuberculosis. A large number become infected during adolescence at the time of entering an occupation. The course of the primary infection depends chiefly on the natural nonspecific resistance which develops among a population by selection of the resistant. The epidemiologic conditions prevailing in Germany at present usually exert a favorable effect on the primary infection in adolescents; as a rule, it remains latent. The morbidity of those who have a negative tuberculin test is lower in Germany than in the more northerly located European countries. Nevertheless, severe and even fatal first infections occur in adolescents and the question is raised whether some severe cases of tuberculosis in adolescents might not be due to the fact that the primary infection took place only shortly before. In addition to the nonspecific resistance, the age at which the first infection is acquired is important. The instability of the endocrine-sympathetic system at puberty often exerts an unfavorable effect. Although it is no longer generally accepted that the healed primary tuberculous focus causes a specific immunity, the author is inclined to believe that the healed primary focus provides some protection against small, occasional new infections and, on the other hand, is maintained and renewed by such infections. The tendency to exacerbation during the puberal age makes it inadvisable to let persons of the ages between 15 and 22 work in tuberculous surroundings. If young persons with negative tuberculin reactions are at all permitted to work in tuberculous surroundings, they should be kept under observation and should be tuberculin tested from time to time. Serial tuberculin tests should be made not only on school children but also on young adults. Those who have negative tuberculin tests should be reexamined at definite intervals until a specific allergy is detected. Such serial examinations would have great prophylactic value: 1. By learning place and time of infection the source of infection could be traced. 2. The tuberculosis would be detected and cured during the earliest stage before organic destruction has taken place. 3. The epidemiologic conditions could be better understood if the time of the spread of infection was known. 4. It might be possible to solve the question of whether phthisis develops more often from primary and secondary tuberculosis in which cure did not take place, or from new infection.

Book Notices

Physiotherapy in Medical Practice. By Hugh Morris, M.D., D.M.R.E., Radiologist, Manchester Corporation Hospital Services, Manchester. Cloth. Price, \$4.50. Pp. 276, with 102 illustrations. Baltimore: William Wood & Company, 1939.

The frequency with which monographs on physical therapy are offered to the medical and allied professions in England perhaps indicates that interest in its procedures has reached the broad level of the average practitioner. In the absence of official information from its national body this is now supplied by those whose views are largely drawn from personal experience and past empirical practices. While this should not be interpreted as derogatory to efforts and beliefs presented in such publications, they often lack that indirect stamp of approval insisted on by scientific bodies and demanded by modern physicians schooled in the critical interpretation of physical and speculative data. In the main this book follows in outline volumes which have been published in the past both here and abroad and often recapitulates the early horse and buggy practices with virtually the same nuances and reasons found in the writings of such departed pioneers as Sir Lewis Jones, Massey and Snow. The value of the present text lies in the fact that it presents in broad sketches the elementary principles of electrotherapy as well as the conventional use of light for clinical purposes in a diction for easy consumption but questionable as guidance for the inexperienced. By unintentioned innuendo it leaves an impression that one has but to peruse such somewhat generalized exposition of the physical nature and clinical application of at least twelve variable and important agents and innumerable but inadequately described technics to be able to apply them with precision and success. At best it is felt that the work provides a lucid but rather skeletalized exposition of the component parts of a major section of physical therapy. It is rich in illustrative material but offers no course for collateral reading in the form of references or bibliography, so that one is entirely dependent on the author's personal views and must in part rely on the uncertain guidance of pen and ink drawings or halftones that are easy on the eye but confusing to the uninitiated. The work, however, is not without merit as introductory reading for students under supervision and could well be utilized to a certain extent for undergraduate instruction.

Diathermy: Short Wave Therapy, Inductothermy, Epithermy. By William Beaumont, M.R.C.S., L.R.C.P., Physician-in-Charge Physiotherapy Department, Westminster Hospital, London. Cloth. Price, 10s. 6d. Pp. 303, with 106 illustrations. London: H. K. Lewis & Co., Ltd., 1939.

This small volume attempts to evaluate the physical and clinical action of high frequency currents embraced under the major caption of diathermy. Its purpose is to present the fundamental principles in such an elementary fashion as to render them comprehensible to that large group of practitioners interested in but unfamiliar with its therapeutic possibilities. Unfortunately, in attempting to present a total picture within what might be termed a constricted framework the author succumbed to certain faults broadly attributable to imperfect balance of his literary material and enthusiasms that lack the basis of objective experience. In the space of ten chapters Beaumont devotes nearly 80 per cent of his exposition to the elaboration of old data associated with that diminishing practice called conventional diathermy and the remainder to a sketchy evaluation of the most recent innovations in short wave diathermy and its therapeutic modulations. Apart from the fact that short wave diathermy has been proved technically superior for the deep heating of tissues, its newness and greater portent should have been the impulse to transmit all nontechnical information pertaining to its physiologic and clinical nature in that detail lavished by the author on a vanishing practice. Accordingly one may deduce that this work is largely made up of perhaps unintentioned padding that describes and evaluates a fast receding practice and, for purposes of enlightening the inexperienced, resorts to archaic illustrations which depict by pen sketches certain technics that neither obey the laws of gravity nor adequately stress those of physiology. The author pays homage to the untimely passing of his distinguished colleague Elkin Percy Cumberbatch,

to whom he dedicates his book. This grandiose gesture is supported by all who have been fortunate recently to read and appreciate the fact that this deceased pioneer wrote one of the most understanding of books on diathermy. The two chapters devoted to short wave diathermy and to electromagnetic induced fields offer little that has not already been expatiated on more clearly, detailedly and informatively both here and abroad. To Beaumont, so-called inductothermy is the alpha and omega of short wave therapy, an opinion not supported by fact.

Congenital Syphilis. By Charles C. Dennie, B.S., M.D., Professor of Dermatology, University of Kansas Medical School, Kansas City, Kansas, and Sidney F. Pakula, B.S., M.D., Visiting Pediatrician to Children's Mercy Hospital, Kansas City General Hospital, Alfred Benjamin Clinic, and Menorah Hospital, Kansas City, Missouri. Cloth. Price, \$8. Pp. 596, with 133 illustrations. Philadelphia: Lea & Febiger, 1940.

There is a need for a competent modern monograph on congenital syphilis. The authoritative presentation of Jeans and Cooke is now 10 years old, therefore largely outdated, and is moreover buried in a System of Clinical Pediatrics where it is available to relatively few readers. Dennie and Pakula have attempted to fill this need, but unfortunately without conspicuous success. The cooperation of specialists is required to combat congenital syphilis successfully. The prospective mother and the diseased as well as the apparently healthy child must all be considered before the picture is complete. True these phases are considered and there is a presentation of the management of syphilis in pregnancy. If congenital syphilis is ever to be eradicated this can be done only by the recognition of syphilis early in pregnancy and by vigorous antisyphilitic treatment throughout. The authors conclude that complications actually do not occur with the same frequency with which they appear in syphilis uncomplicated by pregnancy. Several chapters are devoted to the early and late manifestations of the disease as they affect various organs. The description of the ocular changes is good. Much of the volume is devoted to therapy in which indications for treatment, choice of drugs and the technic of syringe administration are described. Various types of pyrotherapy are discussed. The book is generously supplied with splendid clinical photographs and roentgenograms which illustrate various stigmas and malformations of congenital syphilis. The text is based on the large clinical experience of the senior author and on the literature. Unfortunately the material is not well organized. In many sections the emphasis seems to be on adult acquired rather than on congenital syphilis. Portions of the text are carelessly written and proof read, with many improper usages of words (e. g. "gravity" for "gravidity") and misspelling of proper names. Recent important contributions to the literature are often omitted from discussion, especially in the disputed field of the roentgenologic diagnosis of congenitally syphilitic bone lesions. Obviously a revision of the book which would take into account these criticisms would be an improvement.

Text-Book of Ophthalmology. By Sir W. Stewart Duke-Elder, M.A., D.Sc., M.D., Surgeon Oculist to H. M. The King. Vol. III: Diseases of the Inner Eye. Cloth. Price, \$18.50. Pp. 2097-3470, with 1,140 illustrations. St. Louis: C. V. Mosby Company, 1941.

The third volume of this momentous textbook, which really should be designated an encyclopedia, deals with diseases of the inner eye. The manuscript was completed on Jan. 1, 1940 and the printing was scheduled to be finished by April, but the material, which was bound in this country, did not arrive until September. Consider that the author is the chief consulting ophthalmic surgeon to the British army and completed the volume under the handicaps imposed by that work, that the printing was done under the bombing of London and that the material had to be transported across the submarine infested Atlantic.

This volume is divided into seven chapters, which deal respectively with the uveal tract, the retina, the optic nerve, the lens, the vitreous body, glaucoma and hypotony, and intraocular parasites. The book is large and one hundred and sixty-four of the illustrations are in color. The printing and publishing companies responsible for the work have produced a volume of which they well may be proud in every respect. Typographic errors are conspicuous by their absence. The illustrations are uniformly excellent and clear cut, and even photomicrographs

of high magnification are so precisely reproduced that they really illustrate the points the author wishes to emphasize.

In a volume of this size and detail, it is obviously impossible to do more than discuss generalities. For example, in the section dealing with the uveal tract the author has avoided the old method of discussing diseases of the tract from an anatomic point of view with consequent repetitions and has plunged boldly into a consideration of pathologic processes of the tract from an etiologic point of view. This method presents a new outlook to the reader and offers a logical sequential story that lessens the labors of study. The chapter on the retina is a masterpiece. The forty year old shackles welded by Leber of Heidelberg have been burst asunder and the author presents a picture of diseases of the retina which is a composite of his own careful observations and those of other modern investigators such as Friedenwald of Baltimore. The result is a beautiful simplification for the reader.

But in the chapter on anomalies of intraocular pressure, Duke-Elder comes into his own. Not only are the standard clinical pictures presented, but even more important are his personal views, based on exhaustive investigative work and thoughtful analyses. He hints at a time in the near future when the terms "primary" and "secondary" glaucoma will be discarded and all glaucoma will be recognized in its true light as purely a secondary affair due to known causes. This chapter must be read word for word and digested carefully, and if that is done there will be fewer failures in the diagnosis of glaucoma and more successes in the treatment, with the ultimate result of a marked step forward in the worldwide movement for the prevention of blindness.

The standards set by the author are so high that one wondered whether they could be maintained in each succeeding volume. The three that have appeared so far have answered that question to complete satisfaction, so that the only worry about the fourth and last volume is When can it be written and when will it be published? This textbook of ophthalmology is an absolute "must" for every ophthalmologist. There is no question that it will do much to raise the standards of ophthalmic practice.

America Gives a Chance. By John J. Mullaney, M.D. Cloth. Price, \$8. Pp. 171, with illustrations. Tarpon Springs, Florida: The Author, 1940.

England has (or had) a sheltering home where orphans of genteel but indigent parents are cared for while being schooled in Canadian lore, in which country they are destined to be settlers. Thousands of such boys have become citizens of Canada, and among them was John Mullaney, who found a foster home with Murdo McLeod in a cabin in the Canadian woods. After eight years of that life, Mullaney lived with McLeod's father until the latter died. John then worked on a farm in New Hampshire and there met Dr. Harry Boynton, who took to the lad. By working in the summer at hotels in the White Mountains, John was able to go to preparatory school at Exeter, where he mowed lawns and won a scholarship for three successive years. He then spent a year at Harvard and a year as principal of a small high school. In 1904 he enrolled in the University of Pennsylvania School of Medicine, Philadelphia, where in spare time, he was a laundry agent and a book agent. After graduating at Pennsylvania and passing the examination to practice, he went to China as a medical missionary. Dr. Mullaney was in China at a time when great political changes were going on. He met some of the Chinese leaders, notably Hwang Hsing, for whom he edited a book "A Revelation of the Chinese Revolution." When he came back to America he accepted a position as inspector of tenements for the Philadelphia City Department of Health and later a position in the state department of health. In four years he was appointed head of the science department of Girard College in Philadelphia. Stephen Girard left \$6,000,000 to establish a college for poor white male orphans. The first class of one hundred orphans entered its first white marble building in 1848. The original endowment of \$6,000,000 has grown now, the author says, to \$88,000,000. In describing his home in Germantown, he makes an unusual remark for a man educated as a scientist. He writes "As with all 'Cancer born' people (people born from June 20 to July 21), I was very domestic." Four years later Dr.

Mullaney was offered the presidency of Meharry Medical College in Nashville, Tenn., and there he remained until he retired in 1938 and went to live in Florida. He draws a vivid picture, first of an unrecognized school without buildings, equipment and adequate organization, and second of a recognized and new Meharry Medical College with a \$2,000,000 well equipped plant. Dr. Mullaney was able to obtain this great sum through the generosity of the Rockefeller Foundation, Mr. Edward Harkness, the Nashville Chamber of Commerce, Mr. George Eastman, the Rosenwald Foundation and the Methodist Episcopal Church. A new site was selected for the college at Eighteenth Avenue and North and Hefferman streets in Nashville, not far from the Fiske University campus. The author has great faith in the future of Meharry and in some of its fine teachers and graduates. The white race gave the \$2,000,000 plant to the Negroes, and the white group must continue for a while to help them. The Negroes have not yet developed many good administrators and disciplinarians. In this book the author expresses his gratitude for the opportunities that America offered him.

Clinical Roentgenology of the Alimentary Tract. By Jacob Buckstein, M.D., Visiting Roentgenologist (Alimentary Tract Division), Bellevue Hospital, New York City. Cloth. Price, \$10. Pp. 652, with 525 illustrations. Philadelphia & London: W. B. Saunders Company, 1940.

This book from the pen of Dr. Buckstein is welcome. It is not simply another book; it is a real contribution in which the personal observations of the author add greatly to the value of the review of the literature. This is a fair and well balanced presentation of gastrointestinal radiology, including not only the digestive tube but the biliary tract, spleen, liver and pancreas. The illustrations are well chosen and nicely reproduced. It is gratifying to find so much attention paid to the small intestine. It may be offered as a slight criticism that, since the author refers rather liberally to the literature, he might have done it somewhat more accurately. It seems a bit strange that in a six hundred page book on gastrointestinal roentgenology listing some eight or nine hundred names in the bibliographic index one finds the name of Carman referred to only twice.

In the title and in the preface the author stresses the fact that the book is a clinical treatise. The reviewer believes that clinical roentgenology is the only kind worth while. In fact, unless the roentgenologist devotes himself exclusively to research in problems relating to the purely technical side of radiology he must needs be a clinician. One who attempts to practice roentgenology from any other than the clinical point of view is foredoomed to mediocrity; the application of the roentgen rays to diagnosis and interpretation must always be clinical. The live roentgenologist is continually on his toes, missing no opportunity to familiarize himself with the underlying etiology and pathology of the various lesions and to correlate the pathologic changes found at operation and at necropsy with the changes shown by such lesions in the screen and the roentgenogram. These facts have been well emphasized by the author. Numerous case reports are interspersed throughout the text. They are interesting and help to emphasize the roentgen observations. This valuable, readable, comprehensive and dependable work merits great praise and wide distribution.

Equinococosis pulmonar: Estudio anatómico-radiológico y terapéutico. Por Raul A. Piaggio Blanco, prof. agregado de patología médica, y Federico Garela Capurro, radiólogo de Instituto de cirugía para post graduados del M. S. P. de la Facultad de medicina de Montevideo (R. O. del Uruguay). Paper. Pp. 403, with 262 illustrations. Buenos Aires: Librería y Editorial "El Ateneo," 1939.

These authors have collaborated in various other valuable contributions to the anatomy and roentgenography of the thorax. They now in a single volume review the fundamentals of bronchography and the roentgen anatomy of the lungs and discuss in order closed hydatid cyst, the complications caused by closed hydatid cyst, the treatment of closed hydatid cyst, various causes of rupture of the hydatid membrane into the bronchi, secondary complications, sequelae and residual manifestations due to the pulmonary abscess consecutive to the pulmonary suppuration and breaking down of the tissues or to operation, pleural echinococcosis, multiple pulmonary hydatidosis and hydatid infection of the bases of the lungs. The authors are especially fitted for such work, not only because of their

previous contributions to the etiology and topography of various intrathoracic lesions and for their observations on bronchography, but also by the fact that they live in that part of the world where hydatid disease is exceedingly common among the patients of their daily practice. The medical profession of Argentina and southern Uruguay have great familiarity with hydatid disease. The lesion is a rarity in the climate of the United States. An excellent bibliography is appended.

A Study of Medical Problems Associated with Transients. By Charles F. Blankenship, Passed Assistant Surgeon, and Fred Safer, Associate Social Science Analyst, United States Public Health Service. From the Division of Domestic Quarantine in cooperation with the Division of Public Health Methods, National Institute of Health. Prepared by direction of the Surgeon General, Federal Security Agency, U. S. Public Health Service. Public Health Bulletin No. 258. Paper. Price, 25 cents. Pp. 132, with 15 illustrations. Washington, D. C.: Supt. of Doc., Government Printing Office, 1940.

The term transient is used to designate "any needy person in any community who is discriminated against in that community's program of material aid or medical care by the adoption of residence and technically related requirements." Such indefiniteness may explain why the estimates of the number of such transients vary from two hundred thousand to a million. The study sought to determine "(1) the origin of transiency from migration and the importance of lack of health as a cause, (2) the statutory limitations on public assistance to transients, (3) the administrative practices of agencies giving assistance to transients, (4) the medical needs of transients, (5) the influence of transients on community health, and (6) the most equitable and practical solution of the medical problems of transients and transiency." While economic motives largely determine interstate migration, a small part is caused by ill health, usually tuberculosis, which has brought at least ten thousand transients to southwestern states. Only a few are habitual migrants, and three fourths are made up of families and individuals who are seeking permanent locations. Legislation for relief in at least thirty-nine states contains "settlement" provisions that may be traced back to the Elizabethan poor laws. Transients have a 74 per cent higher disabling rate of sickness than residents. The prevailing illnesses include typhoid, dysentery, tuberculosis, smallpox and malaria, which may be transmitted to the communities visited. Insufficient resources compel relief agencies to enforce settlement laws strictly. Most public medical agencies are closed to transients for all conditions except emergencies. Special medical provisions for transients in some localities afford more adequate medical care. Living conditions except in the camps set up under the Farm Security Administration in California and Arizona aggravate health conditions. The study recommends the allotment of federal funds to states for the maintenance and improvement of local public health facilities rather than any health program organized directly by the federal government exclusively for transients. There is a complete bibliography.

Population Trends and Programs of Social Welfare. Papers Presented in the Section on Population Trends and Programs of Social Welfare at the Eighteenth Annual Conference of the Milbank Memorial Fund held on April 2 and 3, 1940, at the New York Academy of Medicine. Reprinted from The Milbank Memorial Fund Quarterly, Vol. XVIII, No. 3 and 4, July and October, 1940, pages 189-221 and 345-402. Paper. Price, 25 cents. Pp. 99, with illustrations. New York: Milbank Memorial Fund, 1940.

The six papers included in this booklet were presented in the Section on Population Trends and Programs of Social Welfare at the eighteenth annual congress of the Milbank Memorial Fund, held on April 2 and 3, 1940 at the New York Academy of Medicine. The round table and conference was attended by most of the serious students of population trends and policy in this country, and the papers represent authoritative contributions. The discussions include the effects of the population trends on social welfare, child welfare, problems of education, programs of security, problems of public health and the adaptation of social welfare programs to a changing population. From these and other contributions in the field it is apparent that the social and economic life of the country has already become affected by the changed proportions of individuals in age groups and the slowing of population increase and will in the future be much more affected. Some knowledge of this subject is a practical necessity in understanding some of the social phenomena present in the United States today.

Diseases of the Urethra and Penis. By E. D'Arcy McCrea, M.D., M.Ch., F.R.C.S.I. Cloth. Price, \$6.50. Pp. 306, with 181 illustrations. Baltimore: William Wood & Company, 1940.

At first glance at the title of this book the reader is apt to wonder whether there is need for such a volume. The thought is soon dispelled as the pages of the book are perused. It is true that with considerable effort one could obtain the information contained in this book from the various urologic textbooks and recent articles in the current literature. The author has attempted, in this book, to make available to the busy practitioner all of this information in complete form, thereby obviating the necessity of access to a large medical library. An excellent bibliography is appended for the student interested in consulting the source of material. The volume is well written and well illustrated. The author's descriptions of operative procedures are often better than the original articles from which they were taken. The subject matter has been completely and conscientiously covered, yet in a concise and easily readable manner, with elimination of unnecessary details. The general practitioner and general surgeon especially will appreciate having in their library a small volume in which can be quickly reviewed the embryology, anatomy and diseases of the penis and urethra, as well as complete instructions regarding their treatment by medical and surgical means.

Germs and the Man. By Justina Hill, Associate in Urology, Medical School, The Johns Hopkins University, Baltimore. Cloth. Price, \$3.75. Pp. 461, with 17 illustrations. New York: G. P. Putnam's Sons, 1940.

The author attempts to present the main features of bacteriology, immunology, wound healing and the chemical attack on germs in a simple and popular style. The facts supplied are essentially accurate, but at times a certain confusion is in evidence, as is the case in discussing the virus of influenza under the heading "Influenza Bacillus." Indeed, the role of viruses as understood today could well have been the subject of at least one chapter. The scientist who reads this book may be somewhat astonished at some of the chapter headings, such as "The Wily Streptococcus and Its Brother, the Pneumococcus," "Job's Curse, the Staphylococcus, and Some Less Polite Germs" and "Rogues' Gallery." It is also a little extraordinary to find that the staphylococci "belong to the hoi-polloi and have none of the fastidiousness of more refined germs." Possibly such examples, which can be multiplied many times, add to the reader's interest, though it is a little difficult to see how bringing in the Ku Klux Klan and Napoleon are necessary even in a popular treatise on bacteriology.

Estudos cirurgicos. 3.^a serie. Pelo Dr. Eurico Branco Ribeiro, director do Sanatorio São Lucas. Faprikold. Pp. 219, with illustrations. São Paulo: Sociedade Editora Medica Limitada, 1940.

This book consists of articles of surgical interest with special reference to disturbances caused by spinal anesthesia, patelloso of adolescents (Sinding Larsen-Johannsen's disease), diagnosis and treatment of acute pancreatitis, the crusade against cancer, incisions in surgery of the liver and bile ducts, organization of a surgical department, a rare case of renal lithiasis, blood transfusion, late typhoid suppuration, tuberculous pleural fistula, drainage in abdominal surgery, rupture of the gallbladder in closed peritoneum, hemorrhagic pancreatitis, the technic of gastric surgery, myositis ossificans and some other subjects. The work reported in the articles is based on personal experience of the author. The book is written in a pleasant style and its reading is useful for surgeons.

Manual of Florida Crippled Children's Commission. Paper. Pp. 28. Tallahassee, [n. d.]

The purpose of this work is to collect into one manual all information necessary to the personnel of the Florida Crippled Children's Commission in its work with indigent crippled children. Charity and service club organizations that cooperate in locating and sending children to hospitals and clinics operated by the commission should find the manual helpful in determining the eligibility and procedure for benefit applications for children in whom they are interested. Included with the rules and regulations are official acts of the state legislature, under which this work is carried on, lists of personnel, and an explanation of all official forms and application blanks. This manual is useful in the state of Florida but appears to be too limited in scope to be used as a pattern for other state crippled children's commissions.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

"APPARENTLY CURED" TUBERCULOSIS AND MARRIAGE

To the Editor:—Five years ago a young professional man in previous excellent health and with a roentgenogram of the chest negative for tuberculosis taken six months before, incurred during a period of stress and overwork what appeared to be pneumonia of the upper lobe of the right lung but what proved to be a pneumonic type of tuberculosis. After several months two small cavities appeared, the larger less than 2 cm. in diameter, in the midst of the consolidated area. Pneumothorax was induced and after some time was satisfactory, i. e., there was no visible cavity, the sputum was negative for tubercle bacilli, there was no elevation of temperature and a collapse of about 80 per cent was achieved. Eighteen months later the pneumothorax was abandoned because of a thick pleural effusion with pocket formation. In a few months the air and fluid were absorbed, and since then the lung has appeared well healed and no evidence of cavitation is present. The other lung has always been clear. Beginning three years ago the patient lived for one year on only partially restricted activity and for the past two years has led a perfectly normal existence, avoiding only overexertion and active exercise. There have been no symptoms during this time; the temperature and the sedimentation rate have been normal. There is no cough or expectoration. Is his tuberculosis healed? What is the possibility of recurrence? May marriage be permitted?

M.D., New York.

ANSWER.—According to the standards of the National Tuberculosis Association, the best classification for a patient such as the one described would be "apparently cured." This rating is justified under the following conditions: Constitutional symptoms must be absent. If sputum is present it must be found to contain no tubercle bacilli both by concentration and microscopic examination and by culture and animal inoculation. When sputum is absent, gastric lavage should be employed and the stomach contents examined for tubercle bacilli. The lesions should be stationary and must have undergone as much improvement as seems possible on roentgen inspection. When these conditions have existed for a period of two years under ordinary conditions of life, the patient may be classified as apparently cured.

At one time there was a classification of "cured," but this has been removed. The term "healed" is never justified in any type of pulmonary tuberculous lesion during the lifetime of the diseased person, since the methods of examination available are not sufficiently refined. The evidence obtained from shadows on roentgenograms, such as decrease in extent of disease, the appearance of stringlike shadows or definite increase in density, thought to be due to fibrosis, or even shadows so dense as to indicate the deposition of calcium, is not sufficient to justify the word "healed." Indeed, lesions may so decrease that the roentgenogram reveals no shadows whatever but still foci of living tubercle bacilli remain.

Physical signs and symptoms may completely disappear and the red cell sedimentation rate and the blood picture become normal and remain so, yet definite lesions may be present in the lungs whose location cannot be detected by any or all methods of examination of the living body. There are many other parts of the body in which tuberculous lesions may develop before, simultaneously with or after those in the lungs, and all of which may contain living tubercle bacilli in the absence of external manifestations of the disease, and yet their locations may not be disclosed. As long as the tissues react to tuberculin the word "healed" should be carefully avoided, as it may give the patient a false sense of security.

Tuberculosis is a relapsing disease; it is one of remissions and exacerbations. While many patients with demonstrable lesions which come under control never have recurrence of them and never have new clinical lesions develop in the lungs or elsewhere, to the point of causing illness, there are others who do have reactivation of old lesions or incur new ones. As there is no way of determining whose lesions will reactivate or in whom new ones will appear, the only safe course is to keep the patient under close medical observation not for one or five years but for the remainder of his life. Roentgenologic inspection should be made of his chest at least every year and the condition compared with that shown in previous roentgenograms.

Some persons who have had pulmonary tuberculosis treated successfully eliminate tubercle bacilli during attacks of acute

colds and bronchitis. Therefore the sputum should be examined during such attacks. Once or twice a year the urine should be examined for tubercle bacilli even though symptoms are absent. With the appearance of symptoms in any part of the body, tuberculosis should be considered until lesions are found or ruled out.

Marriage is not contraindicated, provided the patient keeps under close medical observation and exercises extreme precaution with reference to sputum whenever it is present with an acute infection of the lower part of the respiratory tract or any other condition.

MUSCULAR IRRITABILITY AND "MOUNDING"

To the Editor:—On several occasions I have observed the physical sign which is termed "mounding." The body of a muscle is struck with a percussion hammer and there occurs a momentary and local hardening and tumefaction of the muscle at the point of contact with the hammer. Does this phenomenon have clinical application? Can you give references?

Thad P. Sears, M.D., Pueblo, Colo.

ANSWER.—The sign of "mounding" is technically an indication of myotatic irritability. The phenomenon results from a localized contraction of muscle when it is struck with a percussion hammer. "Mounding" is not quite an accurate description of what happens, for there is a "dimpling" instead of a "mounding" of the skin over the muscle, caused by the slow tonic response, lasting a few seconds, with an equally slow lingering relaxation.

Myotatic irritability is found in a number of neuromuscular diseases, particularly myotonia congenita, or Thomsen's disease, and dystrophia myotonica (myotonia atrophica). In itself the sign is not of importance, but because it occurs so consistently in both myotonia congenita and myotonia atrophica the phenomenon is one of the principal signs of these diseases.

Myotonia congenita was originally described by Thomsen, who had the disease himself. Later Nissen, his great-nephew, added three to the four generations of sufferers in his own family from this rare disease, reporting 35 cases. Although the disease is hereditary in type, occasional examples are found of sporadic and single cases. Careful investigation, however, usually reveals a hereditary tendency.

The practical importance of the diagnosis at the present time lies in the modern treatment of myotonia congenita with quinine hydrochloride as described by Wolf and by Kennedy and Wolf. The dosage of quinine is 5 grains (0.32 Gm.) three times a day. This amount is usually well tolerated and has proved to be adequate for adults in eliminating the symptom of myotonia.

Myotatic irritability is not so noticeable a feature of dystrophia myotonica. As atrophy supervenes, the myotonic response disappears. Quinine is of less value in the treatment of the atrophic type of myotonia than in the congenital group.

HUMAN PERSONALITY AND EMOTIONS

To the Editor:—What is the accepted opinion with regard to such abstract qualities in human personality as ambition, a sense of responsibility, egotism and patience? Can they be connected with any particular gland or portion of the brain? What are the latest observations on emotions in general such as anger or joy? Please send references.

M.D., Mississippi.

ANSWER.—Human personality is best understood and evaluated in terms of the psychologic and biologic components that make up each individual. There is a healthy growing tendency to talk in terms of psychobiology. Evaluation of personality factors in these terms not only recognizes the factors contributed by the underlying cerebral structures and patterns but also considers the general body action and psychologic training.

There are of course certain areas of the brain in which special functions are concentrated, as for example the motor speech area. Also it is known that the hypothalamic area is the important center that controls many vegetative functions. The tha-

lamic areas are concerned with feeling tone or the affective component of action. Not only does a man who gets angry have increased secretion of epinephrine, increased blood sugar and many other physiologic changes, but also it must be emphasized that the psychologic conditioning that induces the anger is part of the individual's reaction pattern. Anger therefore has psychologic and biologic components.

The following references are recommended to elucidate this psychobiologic point of view:

TREATMENT OF INTRACRANIAL SUBARACHNOID HEMORRHAGE

To the Editor:—Is a physician justified in treating a case of hemorrhage from an aneurysm at the circle of Willis by repeated spinal drainage when there are signs of increasing spinal fluid pressure? Kindly give references, if any, advocating this method of treatment.

Ernest E. Thompson, M.D., Lisbon, N. Y.

ANSWER.—Repeated daily lumbar puncture with the slow removal of from 15 to 25 cc. of cerebrospinal fluid is a safe and commonly used procedure in cases of intracranial subarachnoid bleeding, regardless of its origin. Such a withdrawal may be done with increasing fluid pressure, but it should always be done slowly and with manometer control. Intravenous dehydrating agents, such as sucrose, may accompany the puncture treatment, and for reduction of the pressure it is the method of choice, since the spinal puncture should be primarily for the purpose of freeing the cerebrospinal fluid of red blood cells, so that as complete absorption as possible of the continuously formed cerebrospinal fluid may occur without the obliteration of the absorptive mechanism—the arachnoidal villi. Such aneurysms have been successfully treated surgically by direct intracranial attack or by ligation of the carotid. Two recent articles by McDonald and Korb shed light on the subject:

- McDonald, C. A., and Korb, Milton: The Circle of Willis: Its Angles and Its Aneurysms, *Rhode Island M. J.* 23:145 (June) 1940.

POLLENS IN PUERTO RICO

To the Editor:—Are there the same allergens in Puerto Rico as we have here in the United States? More specifically, a patient intends moving to this island in the near future as a member of the engineering staff at the United States Army. He is severely allergic to grasses and the ragweeds and has been controlled with success by perennial therapy. Before he leaves he would like to know if he must continue this therapy for prophylactic reasons, since he intends spending the entire summer and fall in this place. Are there grasses and weeds there similar to ours in the Eastern states or are they different?

Manahiem Siegal, M.D., Brooklyn, N. Y.

ANSWER.—The patient will not encounter ragweed pollen in Puerto Rico. According to the best information available he will not encounter pollen of any related plant, so it would not seem necessary to continue desensitization against ragweed. He is probably receiving desensitization treatment with a standard grass mixture containing the pollens of sweet vernal grass, blue grass, orchard grass, timothy and redtop. None of these grasses are found in Puerto Rico. However, Bermuda grass is present in Puerto Rico as well as other parts of the West Indies. It is the grass which is usually used for lawns or golf courses and is well known as a serious cause of allergy. Those who are sensitive to the common meadow grasses of the Northern states are usually sensitive to Bermuda grass. The amount of pollen in the air in Puerto Rico from Bermuda grass and other native grasses is probably less than the amount in the air in the Northern and Eastern states during the grass season, but the Puerto Rican pollinating season lasts throughout the year. No pollen statistics are available. It would not seem advisable to omit desensitization against grass even though it cannot be

guaranteed that the kind of grass pollen which the patient is now receiving will protect him against grass pollens he will encounter in Puerto Rico. The patient might well be tested with Bermuda grass pollen. If he is strongly sensitive, this fact should be taken into consideration in deciding on appropriate protective treatment.

INTERRUPTION AND RESUMPTION OF PERTUSSIS VACCINATION

To the Editor:—A child aged 20 months received a first dose (1 cc.) of Sauer's D. S. pertussis vaccine. An intercurrent infection of the upper part of the respiratory tract has prevented me from continuing with the next vaccination. The child is now in its third week of the current illness, and I have decided to discontinue the pertussis vaccination entirely for the present. Is there any danger of a severe reaction in this child if and when this immunization procedure is resumed? When will it be safe to start it again? Should the vaccination be started anew as if the child had never received the first dose?

E. L. Straub, M.D., Philadelphia.

ANSWER.—Whenever the immunization procedure has been interrupted for more than a month it is advisable to give the entire series of three injections. Authorized Haemophilus pertussis vaccine (Sauer) contains no trace of animal protein. It does not sensitize the infant, and there is no danger of a severe reaction. The preferred concentration of authorized H. pertussis vaccine is the new 15,000 million bacilli per cubic centimeter. It causes fewer reactions than the other concentrations. The dose with the least reactions is 1, 2 and 4 cc.; the best interval between the three injections is three weeks. Syringe and needle should be sterilized by heat and the vial cap and the patient's arm sterilized with alcohol on sterile cotton.

CONTINUED ADMINISTRATION OF MAGNESIUM SULFATE

To the Editor:—I gave magnesium sulfate 20 grain (1.3 Gm.) enteric coated tablets before meals to a patient with severe psoriasis over the entire body (diagnosis by a dermatologist) coming on soon after cholecystectomy five years ago, and the condition cleared within two weeks. The skin remains clear as long as this is taken but soon after it is discontinued itching, heat and redness appear but again clear as soon as magnesium sulfate is renewed. The question is What is the harmful effect of this treatment long continued, as seems needed in the case, and what will be the probable first untoward symptom? What might be the effect of adding one-half grain (0.03 Gm.) of sodium succinate to each 10 grains (0.65 Gm.) of magnesium sulfate?

P. W. Hildebrandt, M.D., Mount Sterling, Ohio.

ANSWER.—The fact that soluble salts of magnesium are poorly absorbed in the intestine is one reason that they are satisfactory in large concentrations as cathartics. Elimination of any absorbed magnesium salts begins almost immediately through the kidneys, resulting in diuresis if the amounts of the salt are sufficiently high. The U. S. P. dose of magnesium sulfate is 15 Gm. In this instance the patient received only 1.3 Gm., enteric coated. There should be little unfavorable reaction in taking this amount of magnesium sulfate over a period of time, provided there is no extensive kidney disease. Possibly a slight colitis might be anticipated. There seems to be no reason why one should add 0.03 Gm. (one-half grain) of sodium succinate to each 0.65 Gm. (10 grains) of magnesium sulfate; it would seem to be an irrational mixture.

SWALLOWING FLIES

To the Editor:—Will you inform me what poisons, if any, may be liberated by green bottle flies or blow flies if they are swallowed?

Charles H. Lupton, M.D., Norfolk, Va.

To the Editor:—Please give me an opinion on the possibility of the inadvertent ingestion of house flies causing severe illness and in pregnancy causing miscarriage.

W. N. Jenkins, M.D., Port Gibson, Miss.

ANSWER.—Blowflies breed in decaying animal matter and feed on various types of organic debris. They are, therefore, more or less laden with germs of various kinds. Some of these organisms are inimical to man and may cause digestive disturbances or the onset of diseases such as dysentery or typhoid. There are no true poisons or toxins emitted by blowflies or contained in their bodies. There are instances in which blowflies have been swallowed without producing any ill effects. P. F. Fattig, of Emory University, reports having twenty-five different people drink carbonated water in which from one to several green bottle flies had been soaked for several days. No ill effects were observed by any of these persons.

The swallowing of houseflies would not necessarily result in any ill effects. All varieties feed on excrement and other waste matter and may therefore contain pathogenic germs which could cause disease. The knowledge that a fly had been swallowed might, in a sensitive person, produce vomiting and perhaps more serious reactions.

PREGNANCY AFTER NEPHRECTOMY FOR TUBERCULOSIS

To the Editor:—A white woman aged 30, a primipara, had her last menstrual period Oct. 26, 1940. Her past history discloses that she had a nephrectomy on the right side in 1930 because of tuberculosis of the right kidney and of the bladder. Since the operation she has been in perfect health, with no urinary complaints. She has gained 20 pounds (9 Kg.) and is now seven weeks pregnant. The catheterized specimen of urine shows specific gravity 1.020, acid reaction, 3 to 4 red blood cells per high power field, occasional white blood cells, a slight trace of albumin and no casts. The Wassermann reaction is negative. The hemoglobin is 70 per cent, the red cell count 3,420,000 and the white blood cell count 11,300 with 65 per cent polymorphonuclear leukocytes and 35 per cent small leukocytes. The sedimentation rate is within normal limits. There is no evidence of pulmonary tuberculosis. Are the presence of red blood cells in her urine and the fact that she has had a nephrectomy any indication for a therapeutic abortion? Should the patient be given any specific medication or diet?

M.D., Pennsylvania.

ANSWER.—A few red blood corpuscles in the urine are not of great significance, but in a case such as this it is necessary to determine positively whether the remaining kidney is or is not healthy.

If a capable genito-urologist says the kidney is tuberculous, abortion is indicated. If it is healthy the pregnancy may be allowed to proceed, with of course great watchfulness.

POSSIBLE AGE OF CONCEPTION

To the Editor:—An attorney asked me if it is true that a 12 year old girl can or will become pregnant the first time she has intercourse. He stated that two members of my profession have told him it is not possible for a girl to become pregnant on the first intercourse. I have never heard of such a claim; however, I would appreciate your statement as this may have some legal bearing. The 12 year old girl is pregnant.

M.D., Kansas.

ANSWER.—A 12 year old girl can become pregnant at first coitus. The state of development of the sex organs and not the age will determine the possibility of conception. Pregnancy is theoretically impossible prior to puberty. Puberty is heralded by the onset of the menses, which may occur normally as early as the age of 9 or 10 or be delayed until 15 or 16. The age of puberty varies according to race, climate, hereditary background and social status. After puberty there occurs a period of development which has been designated as adolescence, during which the reproductive organs develop their capacity for reproduction. In this period follicular growth occurs in the ovaries, but follicles fail to rupture. Usually adolescence is a period of physiologic infertility. The period of adolescence in human beings may last two or three years. Maturity is reached when ovulation begins, after which conception is possible.

PREGNANCY IN POSTENCEPHALITIC PARKINSONISM

To the Editor:—Is there any legitimate medical indication for a therapeutic abortion in a woman aged 36 with one normal delivery seventeen years ago who has at the present time an advanced degree of postencephalitic parkinsonism which she has had for the past fifteen years? She has recently had oculo-gyric crises and is eight weeks pregnant with about grade 2 nausea and vomiting. I have never seen or heard of a case at pregnancy in parkinsonism, and I am interested to know if there is any danger in allowing her to go to term. Tincture of stramonium and bulgarian belladonna medications control her symptoms but little.

M.D., Utah.

ANSWER.—In view of the long duration of the chronic encephalitis it would probably be safe to let the pregnancy take its course. However, if the vomiting should become more severe or other complications set in, one would be justified in considering the induction of labor at an earlier stage than would be justified if no such nervous disease existed.

BOWING OF LEGS IN INFANCY

To the Editor:—A child aged 16 months has had the best of care and is normal in all respects except that his legs are quite bowed. What is the prognosis and treatment?

M.D., Maine.

ANSWER.—Bowing of the legs in infancy is usually the result of mild rickets, which at times occurs despite careful dietary management. No treatment of a mild or moderate curvature at this age is necessary, as the normal process of bone growth usually straightens the limbs within a period of one or two years.

STEREOPSIS AND GLASSES

To the Editor:—I have been told that a man wearing glasses does not see the proper images when viewing roentgenograms in the stereoscope. Are persons without glasses better able to view stereoscopic films according to the laws of optics?

Everett W. Gaikema, M.D., Grand Rapids, Mich.

ANSWER.—Glasses are not a handicap to viewing stereoscopic roentgenograms. As a matter of fact, any one wearing glasses who has even a moderate degree of astigmatism has sharper vision, and therefore even more accurate stereopsis, than one with a refractive error who does not wear glasses, particularly if this refractive error is astigmatic. Stereopsis depends on binocular visual training early in life. If one has developed this sense one will retain it, unless the visual acuity in one eye is reduced below 20/50.

TESTING STOOLS FOR BLOOD AFTER IRON AND COPPER ADMINISTRATION

To the Editor:—Does a patient taking 10 units of liver extract intramuscularly per week and daily doses of copper and iron give a stool positive for blood to the benzidine test in the absence of conditions giving rise to bleeding in the gastrointestinal tract?

Harold J. Rothenberg, M.D., Chicago.

ANSWER.—The use of intramuscular liver extract does not produce a positive benzidine reaction in the stools. Iron given orally, however, does affect the benzidine reaction in the stools in such a way that it is practically indistinguishable from the test for blood. In cases in which it is necessary to determine chemical blood in the stools, the guaiac test should be used. In the presence of iron, this test may give a temporary purplish blue, but this reaction is quite different from the sustained deep blue that is obtained with blood.

TOXIC SYMPTOMS FROM INSECTICIDE

To the Editor:—Recently a flour mill employee became ill following the use of an insecticide. His symptoms were fatigue, headache and pains in abdomen, back and flexor muscles of arms and legs. He had occasional vomiting; the blood pressure was 96 systolic, 60 diastolic, the pulse 82. There was moderate cyanosis of the lips and nail beds. Tenderness was present in the lumbar region. Otherwise the examination was negative. He had been using "Dr. Lobell's Mill Insecticide," manufactured by the Huntington Laboratories of Huntington, Ind. The only known ingredient is pyrethrum. Do you have a formula for this insecticide? Could the patient's condition have been the result of using it?

J. R. Cummings, M.D., Flemingsburg, Ky.

ANSWER.—Dr. Lobell's Mill Insecticide is said to consist of pyrethrum extract dissolved in a mixture of about 90 per cent by volume of odorless kerosene and about 10 per cent by volume of carbon tetrachloride. It is entirely possible for the symptoms described to be due to exposure to this mixture, particularly in view of the presence of the pyrethrum and carbon tetrachloride.

SODIUM HYPOCHLORITE FOOTBATH FOR RINGWORM

To the Editor:—When I tried to buy the 20 per cent solution of sodium hypochlorite mentioned in *Queries and Minor Notes* (Footbath Solutions for Ringworm, *The Journal*, April 20, 1940, p. 1577) I was told that such a solution was not manufactured and besides was unstable unless sodium hydroxide was added; this, however, would make the solution irritating to the skin.

B. S. Stell, M.D., Angola, N. Y.

ANSWER.—Sodium hypochlorite, 20 per cent solution, is unstable in open or improperly sealed containers. It can be purchased from a number of chemical companies in chemical carboys in 20 per cent strength. All that is necessary is to dilute this solution 20 to 1 with water for use in footbaths. This solution should then be changed every two days.

THUMB SUCKING

To the Editor:—The reply to W. E. Oldham's query on thumb sucking (*Queries and Minor Notes*, Dec. 28, 1940, p. 2301) would not be endorsed by psychiatrists or by most pediatricians. The use of mechanical restraints should be reserved for the most carefully selected cases. I myself doubt that they should ever be employed. In any consideration of thumb sucking there are two important factors, both of which were ignored in the reply: 1. Thumb sucking is a normal activity of most young infants, a legitimate method of obtaining satisfaction and a means of learning the uses of their senses. In most cases the practice diminishes as other methods of obtaining satisfaction are mastered. 2. When the practice is prolonged beyond the period of infancy and excessively indulged in, it must be considered as a signal that all is not well with the infant's world. It is the responsibility of the physician not to stop the habit but to correct the factors responsible for its continuation.

Gustave F. Weinfeld, M.D., Highland Park, Ill.

HANS ZINSSER AND HIS STUDIES ON TYPHUS FEVER

PETER K. OLITSKY, M.D.
NEW YORK

All science and philosophy and every form of human speech is about objects capable of being perceived by the speaker and the hearer; . . . when our thought pretends to deal with the Subject it is really only dealing with an Object under a false name. The only proposition about the Subject, namely, "I am," cannot be used in the same sense by any two of us, and, therefore, it can never become science at all.—James Clerk Maxwell.¹

I. INTRODUCTION

At this time the recent tragic death of Zinsser should make us pause: to count our great loss; to pay our respects and esteem to his memory, and to recall his great and many contributions to science and, this evening, to the knowledge of typhus fever. Although I also at one time labored in this field, I am keenly aware of my deficiencies in trying to set forth an appraisal of his work on typhus fever, and I seek the pardon in advance of those who were more closely bound to Zinsser in his work and consequently more capable of this task.²

Again, I recall that about seventeen years ago, when he left Columbia University to undertake the direction of the Department of Bacteriology at Harvard Medical School, he asked me to accompany him as his associate—an opportunity which had to be passed over at that time. Indeed, often have I sought his advice on problems that were perplexing me and I was always made to feel that he could be depended on for firm support.

II. ZINSSER'S GENERAL CONTRIBUTIONS TO LITERATURE

Of Zinsser's scientific volumes, on bacteriology and on immunity, little need be said since they have passed through edition after edition and are used as standard textbooks.

Apart from his writings on these subjects, he has contributed to the field of general literature during a period covering almost the last two decades of his life. His contributions, which have been praised with unusual fervor by literary critics who have reviewed them, consisted of essays (chiefly on medical problems), poetry and two volumes: the first, published in 1935, *Rats, Lice and History*, is a remarkable "biography" or

"life history" of typhus fever. In this effort to make scientific work intelligible to the lay reader, he has succeeded to an extraordinary degree. The second appeared shortly before his death and is *As I Remember Him: The Biography of R. S. Fishbein* has placed it in the same rank with the great medical biographies of history: Pasteur by Vallery-Radot, Horsley by Paget and Osler by Cushing. In a review of this book, Dr. Canby of Yale refers to Zinsser as "the complete human being."

The rubric culled from Clerk Maxwell which adorns this paper implies that only a personal estimation can be given in describing Zinsser the man. My opinion, however, must be universally shared, for he stands completely revealed by his literary works. In them one finds a portrait of a philosopher and humanist, tender hearted with his fellows, capable of great self sacrifice, with remarkable courage in face of suffering and even of death. This picture is drawn in gay colors and with bright wit. An enduring tribute has been paid him by one of his young associates (speaking for his colleagues as well): "He helped me most when I needed help most." How well he fits into the description set forth by Rivers in the last lines of his *Lane Lectures on Viruses*, of a useful laboratory worker: a patient, hard-working, imaginative and generous being!'

III. HISTORICAL BACKGROUND OF TYPHUS RESEARCH

Strong² enumerates one hundred and seventy-six scientific papers written by Zinsser for current journals. Those which concern us most on this occasion and which are outstanding as a series of consecutive contributions are the ones dealing with typhus fever, typhus-like diseases and their causative agents, the Rickettsiae.

He entered into the field of these problems first in 1915 when he went to Serbia as a member of the American Red Cross Sanitary Commission, on the Typhus Commission as organized by Dr. Richard P. Strong. As he admits, this effort served for orientation on the problem: "I gathered a great deal of information about the clinical (and pathological) aspects of the disease, did a great many autopsies, and learned the things that one can learn about typhus by living in an epidemic region. But scientific studies were hampered, not by any lack of opportunity or equipment, but rather by the fact that in typhus investigations at that time there was much underbrush to be cleared away. Before the true causes of the disease were uncovered, almost every known micro-organism had, at some time or other, been implicated." What he saw then in Serbia impressed him profoundly and led him to confess "I would never aspire to administrative power or prominence so long as I could remain close, heart and hands, to the problem of disease."

² Sigma Xi Lecture, read Feb. 12, 1941, before the University of Cincinnati, Cincinnati.

¹ From the essay *Psychophysik*, submitted to the Eranos Club and published in *The Life of James Clerk Maxwell*, by Lewis Campbell and William Garnett, London, Macmillan & Co., 1882, p. 463.

² For a penetrating study and a sympathetic eulogy of Zinsser by one of his colleagues, see Strong, R. P.: *Science* 92:276, 1940.

It was during the last ten years of his life, from 1930 on, that he and his associates, among the latter notably Castaneda, his "faithful collaborator," engaged in an energetic and fruitful research on the epidemiology, immunology, diagnosis and classification of the rickettsial diseases. From 1915 to 1930 research on such diseases was rapidly expanding, and a number of solid bases had been constructed on which he could build enduring structures. There were at least two reasons for the rapid advances which were then made; one the prodigious numbers of victims of the disease during the World War and the postwar period, and the other the discovery by Nicolle, Conseil and Conr in 1911 that guinea pigs were susceptible to experimental typhus infection. Theretofore only man and monkey had been found susceptible; progress under such conditions would necessarily be slow.

When the "underbrush" was cleared away at the end of that period, what was left was a substantial heap of facts. The insect vector of typhus fever was definitely established to be the body louse by Nicolle, Comte and Conseil in 1909, and thereafter it was shown that a hundredth part of one infected louse could induce disease in the guinea pig, and that a single infected louse sufficed to convey typhus to man. In other words, since 1 cc. or more of patients' blood is an infective dose for guinea pigs, it was apparent that the causal agent multiplied within the insect. Moreover, the mode of infection of man or lower animals by lice was by means of a bite through skin infected by the insects' excreta, since the infective agent was located in louse feces but not in their salivary glands.

Then also the exciting cause of typhus fever was set on a firm foundation. In 1916 da Rocha-Lima found in typhus-infected lice enormous numbers of minute micro-organisms packed tightly within the cells of the gut. He saw them as a new genus which he named *Rickettsia*, thus honoring the memory of Ricketts, who in 1906-1909 first called attention to them, having seen them in stained film preparations of the blood of man, monkey and guinea pig and in ticks infected with Rocky Mountain spotted fever; and (with Wilder) in the blood of man and in the lining cells of the gut of lice infected with Mexican typhus fever. The species name, *proWazeki*, was given in honor of von Prowazek a co-worker of da Rocha-Lima and, like Ricketts, a victim of the disease he had been studying. Da Rocha-Lima's finding was soon confirmed by others, but the relation of these micro-organisms to the etiology of typhus was for a time obscured by reports of similar structures that were seen extracellularly or in the lumen of the gut of non-typhus-infected lice. However, work in 1917 to 1922 by da Rocha-Lima, by Arkwright and by Wolbach and their respective collaborators fully proved the identity of *Rickettsiae* with the causal agent of typhus. Wolbach, Todd and Palfrey found them in the tissues of patients with Mexican (1920) and European (1922) typhus fever. Then a number of different species of this new genus were observed in insects implicated in other maladies such as trench fever (*Rickettsia pediculi*, *seu wolhynica*, *seu quintana*) and Rocky Mountain spotted fever (*Dermacentor rickettsii*, Wolbach, 1917); also in a number of different species of arthropods, notably by Cowdry in 1923-1925. Among the discoveries of the latter was *Rickettsia ruminantium*, the cause of heartwater fever in cattle, sheep and goats through a bont tick vector *Amblyomma hebraeum*

(Cowdry, 1925). Indeed, as early as 1924 Hertig and Wolbach collected data on forty-two species occurring in various arthropod hosts.

The rickettsial species were determined in rapid succession during the ensuing years as the etiologic agents of a number of other diseases. Apart from typhus in all of its forms, to be described, and Rocky Mountain spotted fever, these maladies comprised the tsutsugamushi fever group, which includes Sumatra mite fever and rural (or scrub) typhus of Malaya; the spotted fever group containing the Minnesota variant of Rocky Mountain spotted fever, São Paulo typhus, *fièvre boutonneuse*, African tick fevers, Kenya fever and the recently described American and Australian *Q* fever (*Rickettsia burneti*).

At present *Rickettsiae* can be defined as minute pleomorphic, gram-negative, bacilloid structures which cannot be stained satisfactorily by means of ordinary dyes and cannot be cultivated outside the body except in the presence of living tissue cells. They are contained within the bodies of arthropods, which in turn convey them to mammalian hosts, sometimes through an intermediary such as a rodent. In addition, infection by them is associated with development of a positive Weil-Felix reaction, to be described, except in the case of infected guinea pigs, when it is difficult to demonstrate this reaction, and the pathogenic forms always develop intracellularly, in the cytoplasm for typhus *Rickettsiae* and in the cytoplasm and nucleus for Rocky Mountain spotted fever (Pinkerton and Hass in 1929-1932). There is an exception to this definition: *Rickettsia melophagi*, found in sheep-lice and nonpathogenic, is cultivable in ordinary mediums and its proper classification is still debatable.

Before 1916 there was no diagnostic test available for recognition of typhus (or of rickettsial) infections. In that year Weil and Felix discovered that a positive clumping reaction occurs when serum of a typhus patient is added to an emulsion of a common nonpathogenic bacterium, proteus bacillus, its O variant of strain X 19 or X 2 (later also X K). Although the latter bacilli are not the causal agent of the disease, the reaction is of inestimable value to the clinician and epidemiologist because of its reliability and its specificity in indicating rickettsial infection—even the type depending on whether the X 19 or X 2 or X K strains are reactive.

During this postwar period the pathology of the natural as well as the experimental disease was determined. Spielmeyer in 1919 and Wolbach, Todd and Palfrey in 1922, among others, showed that the lesions in man and in lower animals are practically identical and that typhus fever is primarily a disease of the smaller blood vessels, chiefly those of the skin, the brain and the skeletal muscles and, to a lesser extent, of the viscera. *Rickettsiae* can be found in the vascular endothelium, which is swollen and proliferated, resulting in thrombus formation. Aggregations of monocytes and of lymphoid and plasma cells about the vessels, also of polymorphonuclear and mast cells, serve to give the appearance of distinctive "nodules," which stand out with special clarity in the brain. In this tissue the infiltration is not only by the hematogenous elements but also by neuroglia cells.

It was revealed in the two decades preceding 1930 that active as well as passive immunity can be produced both in man and in experimental animals. Sporadic attempts were made to apply the principles of active immunization through the use of small doses of the liv-

ing infective agent; but this proved dangerous. On the other hand, passive immunization through the use of immune serum was found to be impracticable not only for prevention but also for treatment. Mechanical delousing, in a variety of ways, was the only recourse then available to limit the spread of the disease during epidemics, and, to protect small numbers of individuals against typhus, Weigl's vaccine consisting of suspensions of the excised gut of lice that had been infected rectally with *Rickettsiae* was employed. The suspension of killed micro-organisms was first prepared in 1920 as a vaccine, on the basis of prior observations that killed infected lice could induce the Weil-Felix reaction in rabbits and resistance to reinfection in guinea pigs.

The discovery in 1919 by Nicolle of clinically inapparent infections in laboratory animals given European typhus material was of great significance. As Nicolle defined the condition, the animal exhibits, after a definite period of incubation, an acute stage of silent infection (interpreted as multiplication of *Rickettsiae*), progression of the infection, followed by regression and return to normal, except that the host now shows a positive Weil-Felix reaction and resistance to reinfection. No clinical signs are observable. Such types of inapparent infection occur as a general rule in the rat and rabbit, the white mouse, and sometimes in the donkey. Moreover, differences were noted in the reaction of the guinea pig to European typhus on the one hand and to tabardillo, the Mexican form, and endemic Southeast United States typhus on the other by Neill in 1917 and by Mooser and by Maxcy in 1929 and were chiefly in relation to the extensive orchitis and tunica vaginalis inflammation exhibited by the latter forms of the disease. In 1926 Maxcy made the significant observation that, in cases occurring in Southeastern United States, louse transmission could be definitely excluded. Then Mooser in 1928-1929 disclosed that injection into the rat of the strain existing in Mexico induced a febrile response corresponding to inflammation of the tunica in the cells of which there were large numbers of *Rickettsiae*, the same reaction having been obtained by Maxcy in 1929 with material deriving from endemic typhus in the region of Southeastern United States. Again, the louse as a vector was excluded in Brill's disease—a form of endemic typhus existing in cities in Northeastern United States and arising especially among emigrants from typhus areas of Europe and shown to be related to Old World typhus. While at the outset all these forms were considered as one disease, typhus fever, now there was question about that unity: Old World and New World; louse borne and not louse borne; endemic or sporadic and epidemic typhus were new designations, and the need for classification arose.

IV. HIS ACTIVE WORK ON TYPHUS FEVER

Thus sketched briefly, with only some of the main lines drawn, was the picture of typhus fever as it appeared to Zinsser and his associates when they began in 1930 to work actively on the subject. His colleagues, besides Castaneda, were at one time or another Batchelder, Enders, FitzPatrick, Macchiavello, Mooser, Plotz, Schoenbach, Seastone, Wei and Zia.

Zinsser's interest in creating order out of the mass of accumulated evidence was expressed in the following classification of the typhus group of diseases, which was evolved from the work of others, his own confirmation of their experiments, and from his and his associates' studies.

General Characteristics of the Typhus Group.—The relation of one to another of the typhus diseases is close, and cross immunity, with certain exceptions to be noted, exists within this group but not with other rickettsial maladies. *Rickettsiae* are present in the cytoplasm but not in the nucleus. The pathologic changes in all are connected with the vascular system, as already described, but the necrotic lesions of other rickettsial disorders are lacking here. Nodular reactions occur in the brain in the experimental diseases in guinea pigs. Under epidemic conditions the diseases are spread through conveyance of the infective agent from louse to man and from man to louse. The Weil-Felix reaction of OX 19 type is elicited by these diseases, and active immunity is brought about by one against the other in the experimental infection of monkeys and guinea pigs. This group immunity is probably also developed in man. The two chief forms are the classic and the murine typhus.

Classic typhus fever, which is also called historical, European or epidemic typhus, occurs as a rule in Europe and central and north Africa and now and again arises concomitantly with the murine form in Mexico, South America, South Africa and Asia. The source of the infection is man or typhus-infected human strain of lice, and the insect vector is again the louse. It is characterized in the experimental guinea pig by either an absence of the Neill-Mooser orchitic reaction or by the occurrence of the latter irregularly (in about 25 per cent of infected animals) with slight and early lesions associated with sparse numbers of *Rickettsiae* in the tunica vaginalis. Only an inapparent infection can be produced in rats, and serial transmissions fail in mice. In rats which are treated by roentgen rays (a method devised by Zinsser and Castaneda in 1932 for production of large quantities of murine typhus *Rickettsiae*) no such increase in numbers of micro-organisms as is found following inoculation of murine typhus *Rickettsiae* is observed. While active cross immunity of classic and murine typhus exists, passive immunity tests reveal that an antimurine serum neutralizes classic typhus *Rickettsiae* only irregularly and, furthermore, injection of murine vaccine induces again only irregular resistance to reinfection with European typhus material. Castaneda has recently found, however, that only large doses of formalized rat lung *Rickettsiae* can induce a regular immune response against the classic typhus agent. In addition, vaccines of the latter prepared by Weigl's method show overlapping serum reactions, but not identity, with the murine strain prepared from rats treated with roentgen rays.

Murine typhus fever, also called New World or endemic typhus, has been found to arise in Mexico (tabardillo), in Southeastern United States (Maxcy's disease), in France (ship fever of Toulon), as urban typhus of Malaya and as Manchurian typhus. It has also been found in Syria, Greece and Africa, in China and Indo-China, and possibly in the Philippines and South America. The reservoir of the infective agent is rats, possibly also mice, and infection is conveyed from rat to rat by rat fleas (*Xenopsylla cheopis*—shown by Dyer and his associates in 1931) or by rat lice (*Polyplax spinulosus*—a discovery made by Mooser, Castaneda and Zinsser in 1931). It was Dyer and his associates who first disclosed the presence of the infective agent in rats trapped in a typhus focus in Baltimore and Savannah in 1931, and shortly thereafter Mooser, Castaneda and Zinsser, during an epidemic originating in the Belem prison in Mexico City, also found the

typhus agent in rats trapped within the prison. From rat to man the vectors are fleas, especially the cheopis species, and from man to man, *Pediculus humanus*. It is characterized in the experimental disease in guinea pigs by the Neill-Mooser orchitic reaction associated with many, sometimes prodigious numbers of Rickettsiae in the tunica vaginalis. The murine type infection induces in rats a febrile, often fatal disease accompanied by numerous Rickettsiae in the tunica. In roentgen ray treated rats there is a peritoneal accumulation of the micro-organisms. They can be propagated indefinitely in serial passages in white mice. Active and passive immunity against homologous murine strains exist. The historical and murine types of infection follow the same clinical course, except that the latter, as an endemic malady, can be milder in its manifestations and have a lower mortality rate. On the other hand, European typhus can also exhibit in its endemic form the same mildness, but the murine disease can develop into expanded epidemics of fulminating infection with a high mortality rate and then be similar in effect to epidemics of Old World typhus.

There is now left for consideration another form of endemic typhus, namely Brill's disease. The malady was first shown to be a form of typhus by Anderson and Goldberger in 1912. In 1933-1934 Zinsser found from a study of the records of 538 cases treated in Boston and New York City from 1910 to 1933, and from observations with Castaneda on three strains of the infective agent deriving from Brill's disease, that this infection constituted at least one of the sources of classic typhus fever in the United States. In this study the strains acted in prolonged series of guinea pig passages precisely like Old World typhus, and the detailed records of the 538 patients revealed that almost all of them had emigrated from typhus regions of Europe (chiefly from Russia). Furthermore, from an analysis of his statistical material Zinsser showed that Brill's disease is a manifestation of a recrudescence of an infection acquired abroad. He deduced that a small number of individuals who have had classic typhus years ago can remain inapparent carriers of the disease and a second attack of clinically apparent infection results when their state of immunity is somehow disturbed. In other words, for this endemic form of typhus rats need not be the reservoirs of the infective agent, but man himself becomes the carrier and the source of propagation of the disease.

In this connection it should be mentioned that Mooser, also Castaneda and Zinsser in 1930, passed murine (Mexican) strains of typhus through lice by the Weigl method, i. e. by means of rectal inoculation. From the results of these experiments, Zinsser infers that, since the louse infection is in most respects no different from similar infection with the European virus, the louse should therefore be considered as capable of epidemic transmission of murine as of European typhus. Furthermore, strains deriving from patients in the course of prolonged epidemics in Mexico and passed through the cycle of man-louse-man can temporarily be modified in the direction of the characteristics of European typhus. Zinsser suggested the interesting problem of noting what might happen if the European strain was passed through rats and fleas for a number of generations.

Another problem for which solution was sought in Zinsser's laboratory concerned the diagnostic reaction of rickettsial diseases, the Weil-Felix test. Theories

have been offered from time to time to explain the mechanism of this reaction, and Zinsser attempted to investigate the validity of two of the theories. One idea was that the Rickettsiae and the proteus bacilli are expressions of phases in the cycle of an ultra-microscopic virus. He believed that there was no evidence deduced to show such relationship and furthermore, with Batchelder in 1930, proved that the murine strain was not filtrable and that Rickettsiae by themselves could be identified with the infective agent. The other theory held that, in view of the positive Weil-Felix reaction, the infective agent of typhus can be identified as the proteus bacilli. With Castaneda in 1930 Zinsser demonstrated when using washed murine Rickettsiae that the etiologic agent of tabardillo was the rickettsial body as such, which in turn could not be considered as a true bacterium since it rigidly depended for multiplication on the survival of susceptible cells, whether insect or mammalian. Castaneda and Zia in 1933-1935 went further in an attempt to define the mechanism of the Weil-Felix reaction and showed that proteus X and the murine Rickettsiae contain a common antigenic factor, and from both micro-organisms a soluble-specific material, probably a polysaccharide, can be extracted, which is precipitable by prepared murine antisera and by human typhus serum.

In respect to other serologic antibodies in typhus serum, Zinsser and Castaneda stated in 1932 that the serum secured from patients or from experimental animals recovered from European or murine typhus infection contains agglutinins for murine Rickettsiae. In addition, Castaneda in 1934-1936 found precipitins and opsonins for these micro-organisms. The fact that the serum of man convalescent from murine or classic typhus and of animals recovered from either infection exhibit opsonins for the murine strains shows how close both types of typhus are. Castaneda also reported the presence of complement-fixing antibodies for them but not for the proteus X 19 bacillus or its soluble-specific substance.

The next problem which Zinsser attempted to solve was that of prevention of typhus fever by means of active and passive immunization.

In the earlier trials with passive immunization for preventive, and the use of immune serum for curative purposes, begun in 1893, human convalescent serum was used; later, to 1930, attempts were made to immunize large animals, horses or donkeys, with active typhus material. The results in general were not satisfactory.

It also appears from tests carried out by Zinsser and Batchelder in 1930 that serum from convalescent guinea pigs and from recovered typhus patients loses its content of protective antibodies if it is collected later than three weeks after defervescence. This would serve again to limit its usefulness. Zinsser inferred from the results of these experiments that the prolonged immunity existing after an attack of typhus would depend more on the resistance acquired by the tissues of the body than on circulating antibodies. Failure to obtain an effective animal antiserum was ascribed to insufficient dosage of Rickettsiae employed as antigen. In 1932-1934 Zinsser and Castaneda made use of the large numbers of murine Rickettsiae that could be obtained from rats treated by roentgen rays, as will be described, and injected horses repeatedly over several months with such material after formolization. In the end the serum showed a Weil-Felix

reaction of 1:640 and could protect guinea pigs against infection by the homologous strain, but only partial protection could be obtained against the European strain. The antimurine horse serum was used in the field in Mexico and in Tunis and Rumania. In Mexico a fair degree of success in preventive and therapeutic effect was noted, although a sufficient statistical sample for analysis is still lacking, and in the Old World it proved inadequate, as might be expected from the results of the guinea pig tests just mentioned.

In the field of active immunization, Zinsser foresaw the necessity of using killed *Rickettsiae* as the immunizing agent. The use of active blood or tissues for immunization has often been tried since 1916, but the danger of inducing thereby an attack of typhus fever could never be completely removed. No satisfactory process could be obtained by him by which virulent typhus material could be so delicately adjusted that its immunizing properties might be retained and its disease-producing power eliminated.

That resistance might be achieved by the use of dead micro-organisms was indicated from the experiments of Spencer and Parker on Rocky Mountain spotted fever, first reported in 1925. They employed the ground viscera of infected ticks, the *Rickettsiae* in which were killed by phenol. Such vaccine proved successful in preventing or moderating attacks of spotted fever. The only available effective method of immunization against typhus in use to 1930 and later was that of Weigl, as previously described; but it was cumbersome and not practical for mass inoculations, since the contents of 50 to 100 lice sufficed for the immunization of only one person and the inoculated insects had to be fed for a week or more on immune individuals to obtain the blood necessary for a good yield of micro-organisms. A simple and reliable method was therefore desirable, especially for interepidemic control of typhus fever.

A high concentration of the infective agent in an antigen was considered by Zinsser, as by others also, a matter of first importance to produce stanch immunity. If he could reduce the resistance of an inoculated animal, he might obtain a rich harvest of micro-organisms. Accordingly the rat was chosen as the experimental animal, and several ways of decreasing its natural resistance to murine *Rickettsiae* were devised: by deficient diet, by benzene poisoning and by exposure to roentgen rays. In the end irradiation proved most efficacious. The murine micro-organisms injected intraperitoneally in rats which were powerfully irradiated in advance resulted in a few days in a yield of as much as 15 cc. from each animal of thick suspensions of *Rickettsiae*. Such material, formalized, induced a high degree of resistance as well as of antibody titer, as has already been mentioned. The method has been used in its original form and with certain modifications by Castaneda in Mexico and by Veintemillas in Bolivia, but since the European typhus micro-organisms, contrary to the murine strain, fail to multiply in such prepared rats, the procedure is not applicable to the prevention of classic typhus fever.

Other ways of increasing the yield of *Rickettsiae* were then investigated, and the choice fell on tissue cultures. Nigg and Landsteiner had already shown in 1930-1931 that growth can be obtained and kept virulent by inoculating normal tunica vaginalis or other tissues of guinea pigs and placing them in a tube containing Tyrode's solution and guinea pig serum, and

Kligler and Aschner in 1934 demonstrated that such formalized cultures can induce an immune response in animals, provided a sufficient dosage is used. These findings were confirmed by Zinsser and Macchiavello in 1936, who also substituted mouse embryo tissue for guinea pig tunica with success. Still another method was followed by Zia in Zinsser's laboratory, namely cultivation on the chorioallantoic membranes of developing chick embryos. Both murine and European typhus micro-organisms were successfully grown in this way.

The yield of micro-organisms by these procedures was still not as high as was desired for the purpose of practical mass immunizations, so another was sought. In 1939 Zinsser, FitzPatrick and Wei announced the preparation of so-called agar-tissue culture medium, which is a test tube medium made up of agar in Tyrode serum (horse, beef) on the surface of which is gently laid minced infected tunica. Later it was found that cultures begun in tunica tissue could be transferred to mouse or chick embryo tissue, and the latter could be employed as inoculum on the agar slanted medium. It may be said at this point that this method also proved satisfactory for the cultivation of rickettsial organisms other than those of typhus and, in addition, of certain viruses (FitzPatrick, 1938-1940). However, in spite of favorable reports of the immunizing capacity of agar-tissue culture vaccines (e. g. Zia, Pang and Wu in 1940) both in animals and in man—in the latter judged by the production of a positive Weil-Felix reaction—this method was further modified to obtain a still heavier growth of *Rickettsiae* for the preparation of a more potent vaccine.

The final modification came about through the employment of the yolk sac technic for the production of enormous numbers of *Rickettsiae*. The method was first mentioned as practical for cultivation of large quantities of the European typhus micro-organism by Barykine and his collaborators in 1936. It was developed to a high degree of efficacy and usefulness not only for different strains of *Rickettsiae* but also for other infective agents as well in 1938-1940 by Cox—formerly my associate for several years. The technic is simple, yet ingenious, and consists of the inoculation of suspensions of micro-organisms through the air-sac end into the yolk of a five or six day incubated fertile hen's egg. Cox reported that yolk sac suspensions of spotted fever and endemic typhus are, as a rule, from one hundred to one thousand times more infective than mammalian tissues or other tissues of the developing chick embryo. Consistently good immunizing vaccines have been prepared from the infected yolk sac material (phenolized and formalized) not only for European and endemic typhus but also for Rocky Mountain spotted fever. From a practical point of view the method is valuable since, if all the embryonic tissue of two infected eggs is used, as much as 550 cc. of vaccine can be produced, or, if a still more potent vaccine made from yolk sac alone is desired, then fourteen inoculated eggs suffice to make 85 to 100 cc.

Now to obtain the largest numbers of *Rickettsiae* by the simplest means, for practical immunization, Zinsser, Plotz and Enders recently, just before Zinsser's death, combined the agar method and the Cox egg technic in a special way. That is, minced embryonic tissue or macerated yolk sac removed from eggs on the fourth day after infection is used to inoculate large quantities of normal minced chick tissue from 10 day old embryos. The tissue thus infected is distributed in large amounts

on the surface of the agar placed in large flasks. It is estimated that 1 liter of vaccine sufficient to immunize three hundred persons can be produced in a week by one bacteriologist with two assistants.³

Apart from the vaccine of Cox and of Zinsser, Plotz and Enders, there is still a third, now being produced in Mexico by Castaneda: one that is made up of rat lung infected with the murine strain and which has been shown to be actively immunizing. Since *Rickettsiae* of European typhus do not multiply to any satisfactory extent in rats, the latter vaccine is limited in its use, although Castaneda states that sufficiently large amounts give an immune response against classic typhus fever. Now (1940), however, Durand and Giroud have prepared a formolized mouse-lung vaccine against this latter disease, especially in its experimental form.

The stage is now set for a trial of the immunizing materials in the field, and it is understood that tests of the yolk sac and of the combined agar-tissue culture-yolk sac preparations have already been undertaken in certain parts of Europe. In the background of the scene is the present war, accompanied by winter and epidemic typhus fever, so that the issue between the inoculations and their preventive effects may be defined. An expectant world awaits hopefully the outcome.

V. HIS ACHIEVEMENT

I have attempted to follow the course of Zinsser's work along the path of his researches on typhus fever during the last decade. It was no easy task, primarily because of the extent of his own labors and of those of his associates. In my search through the literature I have perhaps overlooked some references or have been compelled by limitation of time to omit others. However, I believe I shall have succeeded in my efforts if I have shown how Zinsser and his associates helped to bring about an orderly classification of the typhus group of rickettsial diseases and how he, with patient persistence and with steadfastness of aim, strove toward that goal which becomes clear to one who studies the record: the prevention of the disease. To this end he devoted himself "heart and hands." The tragedy is in this: he was not spared to see his desires fulfilled, but his work has helped to lead us to a high level of hope in the ultimate success of the prevention of typhus fever.⁴

Sixty-Sixth Street and York Avenue.

3. In this and in Cox's yolk sac methods, the growth of *Rickettsiae* is checked by morphologic examination. For this purpose the staining procedure of Dr. Attilio Macchiavello, developed in Zinsser's laboratory, is used. This is a rapid, superior stain not only for these but for other micro-organisms and for protozoa.

4. For references the reader is referred to the articles by S. B. Wolbach, Henry Pinkerton, J. E. Gordon and Hans Zinsser in *Virus and Rickettsial Diseases*, Cambridge, Mass., Harvard University Press, 1940, pp. 789-907.

Tuberculosis in Young Women.—As long as reliable mortality statistics for tuberculosis have been known, young women have always been more prone to die of tuberculosis than have their young brothers or older sisters. While the general death rate from tuberculosis has steadily fallen, the death rate among young women has also decreased, but at a slower rate. The fact remains that tuberculosis is prevalent enough, particularly among young women, to warrant, in the opinion of many authorities, a tuberculin test on all pregnant women. Treatment of tuberculosis has advanced so rapidly in recent years that, with early recognition of the condition in pregnancy, it is possible in many cases to bring the baby through safely with no danger to the mother. —National Council for Mothers and Babies, quoted in National Tuberculosis Association Clip Sheet, February 1941.

PELLAGRA AND THE PUBLIC HEALTH

A DIETARY SURVEY OF KENTUCKY MOUNTAIN FOLK IN PELLAGROUS AND IN NON-PELLAGROUS COMMUNITIES

JOHN H. KOOSER, M.D.

HYDEN, KY.

AND

M. A. BLANKENHORN, M.D.

CINCINNATI

Certain facts about pellagra are now clearly established. There is no longer any doubt as to the fact of cure and none about the method. As far as each person with the disease is concerned, the cause is faulty diet; cure is accomplished by correcting the diet or by the use of nicotinic acid in addition to diet.¹

Simple as these procedures may be, there continues to be a considerable amount of pellagra in certain regions, either because of the relapse of former patients or because of the appearance of new ones. The addition of small amounts of nicotinic acid to an unimproved diet has not been found to restore complete health. Where the most extensive trials have been made with nicotinic acid, physicians are unwilling to rely on this alone because of the appearance of other deficiencies, viz., beriberi and riboflavin deficiency.²

The complete eradication of pellagra is intimately bound up with so many factors which determine the scale of living that merely prescribing nicotinic acid or recommending a good diet is not effective.³

In any given community where pellagra has been endemic, questions of food habits, food supply, living habits and money are all involved in the control of pellagra.⁴ With so many things to improve at about the same time, one wonders where to begin. A general survey in a community that has gone through the process of overcoming pellagra might indicate the successful remedy, if all pertinent conditions, both before and after the bringing of the disease under control, could be known. To our knowledge, no such before and after studies have been made and reported from the United States—none, especially, since the discovery of the beneficial effects of nicotinic acid in the treatment of pellagra. However, we have had occasion to observe two adjacent mountain areas in Kentucky; one where pellagra continues to be endemic and another where pellagra has been endemic but is now rare. A dietary survey of these two areas is the basis of this study—as a substitute for the before and after studies just mentioned.

From the Department of Internal Medicine, University of Cincinnati College of Medicine, and the Frontier Nursing Service, Inc., Wendover, Ky.

Dr. D. D. Turner and the public health nurses Mrs. T. Baker and Mrs. Z. Hale, of the Perry County Health Department, and the staff of the Frontier Nursing Service assisted in conducting this survey. The results of the survey were tabulated by Miss G. Weeks, statistician of the Frontier Nursing Service, Wendover, Ky.

The two areas have a number of things in common. They have the same geographic location, the hills of southeastern Kentucky. They have for the most part a similar population, native white Americans resembling each other in speech, habits and modes of living. The one community is rural, with the chief occupation farming, while in the other the people reside in small urban communities, so-called coal camps. The medical facilities available to the coal camps consist of the camp doctor and the public health department. The rural group is cared for almost entirely by the Frontier Nursing Service.

The region in which pellagra is endemic is located in Perry County, where a pellagra clinic⁵ has been in progress for the past twenty-four months.³ Since most of the attendants at the clinic are from the families of miners, there is an apparent relation between the coal-mining industry and the disease. To date the records indicate that there is a direct association between the low periods of coal operations and increases in the incidence of pellagra. One camp, which was not operating, had more patients than the other camps, which were working part time.

The inoperative camp was selected for investigation as an example of an endemic area. It is impossible to state the exact incidence of pellagra in the camp, because

there has been no physician stationed there since the mine closed. We do know, without any effort at case finding, that 13 pellagrins attend the treatment clinic from the camp—that is, 13 among 493, or 2.6 per cent.

The nonendemic area is that in which the Frontier Nursing Service operates. At the time of our survey there was no patient in it known to have pellagra. A diligent search for pellagra has revealed 2 cases in the past three years, with a total of 4 cases during the resident period (eight years) of one of us in this area. Despite the fact that it is impossible to procure information about the incidence of disease or even a reliable death rate, we have learned from former physicians in this area that pellagra had been prevalent from 1914 to 1931. This opinion is shared by Dr. R. L. Collins, a consultant at the pellagra clinic in Perry County and formerly the resident physician of the Frontier Nursing Service.

The questionnaire which was used in making the survey was arranged to show the foods consumed per day per week. The families interviewed were asked to indicate the frequency with which they consumed available and desirable foods during the week of the survey. The rate of consumption was recorded to show whether the given items were eaten daily, every other day or less often during the week. This method was

5. The nicotinic acid used in the clinic at the present time is furnished by the Winthrop Chemical Company, New York.

chosen because it was impossible to obtain accurate weights and measures of the food consumed. Since we know that families of restricted means tend to minimize the fact that they have little to eat, information was also obtained to show the sources of the food. We had to secure data pertaining to acres under culti-

vation, crops, livestock, gardens, purchasing habits and family income. The survey was conducted during February, March, April and May of 1939 (rural, February, March and April; coal camp, April and May). The late winter and spring months were selected because that period conforms to the low diet season of the year. This applies particularly to the rural area, since there is likely to be a shortage of the fall foods laid by, a scarcity of fresh foods and little opportunity for cash income from labor. In the coal camp there had been a prolonged low diet season for the past eighteen months prior to the survey, since the mine had not operated for that period of time.

In the rural area 330 families (24 per cent) were questioned from an approximate total of 1,400 families who are registered with the Frontier Nursing Service. Thirteen district nurses, each of whom cares for about 100 families, were given a set of instructions with the questionnaires and asked to fill in the schedules of

the first 25 families visited in their regular work. The village in this area, one of 313 inhabitants, was excluded because the population is not entirely rural. In the mining area two nurses from the Perry County Health Department were given similar forms for the survey of the entire coal camp of 93 families. The nurses who conducted the surveys were familiar figures in the respective areas and completely en rapport with the families.

The general information obtained is given in table 1. The relative value of cash income is obvious from this

table. In the coal camp the chief source was unemployment insurance. The majority of the families (66 per cent) subsisted on this income with meager sources of noncash income. In the rural area the chief source of cash income was government work agencies, which gave assistance to 49 per cent of the families. Although there were more families in the rural group than in the coal camp without cash incomes, these families were able to till a little land and to keep some livestock. While these assets are negligible as sources of cash income, they are valuable as food assets.

Data on home production and preparation of certain food supplies are given in table 2.

The food habits of the two groups are shown in the chart, which indicates the daily-weekly rate of foods consumed. While these data pertain only to the week prior to the interview, they may be viewed as a cross section of the respective diets for the given season. The economic level of the two groups would hardly permit any appreciable degree of variation. In general, the farmer eats more home-produced foods, while the miner consumes more store foods. The fairly uniform consumption of fat pork, beans and corn meal is indicative of dietary habits common to both areas. It was

Data on comparative diets, showing percentages of families having the food indicated. The black columns indicate consumption one to three days a week; the white columns, consumption four to seven days a week.

found that 90 per cent of the families in the rural area had pork, 46 per cent having both lean and fat, 34 per cent having fat only and 10 per cent lean only. This compares with 87 per cent of the families in the coal camp who had pork, 19 per cent having lean and fat, 62 per cent fat only and 6 per cent lean only. The prohibitive cost of beef accounts for the infrequent consumption of this food in both areas. There is a marked difference in the consumption of milk and eggs. The principal type of milk used in the rural area is fresh cow's milk, with an average daily yield for the milking period (nine months) of 4 to 6 quarts. In the mining area canned milk is most often used, principally in infant feeding. As a source of food for the entire family, the amount of canned milk consumed is negligible as compared with the amount of fresh milk available and used in the rural area. (This statement has been substantiated by interviews with local merchants.) The amount of eggs used depends more on the home supply; hence the farmer with a few hens will have more eggs to use than the miner who must buy eggs. The greatest variations in the diets were found in comparing the consumption of fresh milk and eggs (table 3).

Pellagra appears to be endemic in the coal camp because the majority of the families there do not have pellagra-preventive foods, such as fresh milk and eggs.

Conversely, the absence of pellagra in the rural area can be explained because the diet of the people there contains these items.

An explanation as to why the rural area no longer shows endemic pellagra is more difficult to achieve. This is especially so since there have been an increase in the population, a decrease in timber values and in the productivity of the soil and unusually long periods of drought affecting the crops. However, with the advent of the Frontier Nursing Service in this community there have been general changes which may have contributed to the present condition. This organization has an active obstetric-public health program which takes into account the interrelation of health, food and disease. There has been a decrease in the incidence of infectious diseases, in the general debility caused by intestinal parasites and in advanced malnutrition caused by faulty feeding. As regards maternal health, antepartum training teaches the mother to use a limited dietary to its fullest extent. The child welfare program is conducted in accordance with accepted pediatric principles. Rural preventive pediatrics is necessarily a slow process, but the effectiveness of such a program is reflected in the increasing demands made on the staff in behalf of babies and children. Parents now solicit information about adequate feeding, immunizations and the proper growth of their children. In individual families food emergencies have been met by the Frontier Nursing Service. The organization has also helped in procuring outside assistance when food emergencies have affected the entire population.

The nutritional advantages of families with incomes exceeding \$500 per year have been reported by Stiebeling and Phipard.⁶ It is significant that the diets of the lowest income groups studied by them contained but the minimum requirements for health. They pointed out, moreover, that purchasing habits vary with the purchaser's knowledge of foods. Since the mining group in our study earns less than \$500 annually, the presence of pellagra is not surprising. However, with the rural group—a similar low income group but one without pellagra—other factors, such as food values and health, become significant. The staff of the Frontier Nursing Service in the rural area studied has been instrumental in effecting a more desirable state of health, no small part of the improvement having been due to the staff's continued emphasis on foods. It is likely that a greater discrimination in the use of foods available for consumption has been of importance in the decrease in the incidence of pellagra in this area.

In our study, the role of vegetables and green which may be produced from a garden was not determined for the diet survey was done at a time (early spring) when neither group had garden produce, either fresh or canned.

SUMMARY AND CONCLUSIONS

For the purpose of understanding how a community gets rid of pellagra, we have studied, by means of a food survey, two adjacent neighborhoods in the mountain counties of Kentucky and have considered many of the complex factors that determine the diets of the people. As to economic status and food habits these two groups are very similar; but the one which got rid of pellagra has gardens, cows and chickens, and the one which still suffers pellagra has only insignificant gardens and the local grocery stores as sources of food.

6. Stiebeling, Hazel K., and Phipard, Esther F.: Diets of Families of Employed Wage Earners and Clerical Workers in Cities, Circular 507, United States Department of Agriculture, Home Economics Bureau, January 1939.

There is not much difference in consumption of the pellagra-producing diet—i. e., both groups eat corn meal and fat pork, in about equal amounts. In the consumption of pellagra-preventing foods there is a significant difference, in that the group now free of pellagra eats more fresh milk, lean pork, eggs and chickens.

The change of dietary practice that apparently has prevented pellagra has come about mainly as a result of a long campaign of instruction in the health-sparing value of foods, and not by any economic betterment.

THEOPHYLLINE MONO-ETHANOLAMINE

A CRITICAL STUDY OF ITS USE IN THE TREATMENT OF ASTHMA AND OTHER ALLERGIES

R. W. LAMSON, M.D.

AND

L. C. BACON, M.D.

LOS ANGELES

The introduction of a new drug or reemphasis of an old one in the therapy of asthma or other allergic conditions carries with it a grave responsibility. It is unfortunate, and often costly to the patient, to create false hopes regarding a remedy which has only a limited application or which may be actually dangerous to some of these sufferers. A large number of our patients have commented as follows: "I have tried everything that has been recommended to me, and I have spent hundreds of dollars but obtained little or no relief." Another trend of their comments is to the effect that the first two or three doses of many preparations afford magical relief, after which the beneficial response gradually or precipitously disappears. They designate this as "wearing out" the medicine, a condition probably differing somewhat from the typical development of tolerance that occurs only after long use of the remedy.

These limitations and responsibilities have been our guide in this study, which has extended over a period of from twenty to twenty-four months. We hope that this has been sufficiently long to temper our enthusiasm with a healthy skepticism and to negative the factor of temporary relief just mentioned.

Drugs of the xanthine series, especially caffeine, have long been recommended for use in conditions such as "heart disease, dropsy, migraine and opium poisoning."¹ Preparations of caffeine have been found useful as cardiac and cerebral stimulants as well as for cardiac dyspnea. Its effectiveness is by no means limited to the last mentioned condition as it may be equally beneficial in a patient with typical allergic asthma. Not a few patients have discovered that a cup of hot black coffee may afford relief from asthma although sympathomimetic drugs may have failed. When a larger dose of caffeine is required, the citrated form, or the alkaloid, has been used. Occasionally a patient may require hypodermic medication with caffeine with sodium benzoate from 0.24 Gm. to 0.5 Gm. (3¾ to 7½ grains). This has been effective in some cases that were temporarily "epinephrine fast." A well known pharmacologist² suggested that theophylline would

undoubtedly be more satisfactory than caffeine. His timely suggestion furnished the first stimulus which led to our present study.

A second step was the introduction of theophylline mono-ethanolamine (theamin, Lilly) which provided a stable, highly soluble compound for oral or parenteral use. That our study represents a new use for this drug is shown by the following list of therapeutic indications given in a circular published by Eli Lilly & Co.:³

(1) Diuretic action; (2) myocardial stimulation; (3) dilating action on coronary vessels, giving rise to improved circulation in the heart muscle, and (4) relief of pain in angina pectoris, coronary thrombosis and similar conditions.

Theophylline is conspicuously absent from the lists of agents to be employed in asthma as published in many current textbooks on allergy, as well as in those of pharmacology. The recent medical literature likewise contains few references which bear directly on our problem. A portion of an article by Greene and his associates⁴ dealt with the use of a theophylline compound in the treatment of asthma. Apparently eleven patients had true allergic asthma and possibly the remaining five represented a different type of paroxysmal dyspnea. While the dose used by these workers and the method of administration (intravenously) are not at all comparable to our protocol, it is of interest to note the marked effectiveness of theophylline. Their results demonstrate its value in at least two types of asthma. They throw some light on the mechanism, as they demonstrated that subjective relief may be obtained with little or no immediate improvement in vital capacity.

Brown⁵ used successfully an identical dose (0.48 Gm.) in a case of acute circulatory failure which was rapidly approaching a fatal termination. Subsequently, this was used to control the patient's asthma when epinephrine failed to do so. The author makes a timely suggestion that half this quantity be used when given to a patient for the initial dose. We would extend the reduction to a still smaller fraction of the original dose.

A brief review of the pharmacology of theophylline (1-3 dimethylxanthine) and related drugs seems to be indicated if one is to evaluate our results. It is said to (1) stimulate the psychic areas, and the respiratory, vasomotor and vagus centers, (2) increase ease of muscular contraction, (3) lead to vasodilatation by a direct action on the vessels (this combines with the cardiac stimulation to quicken the circulation) and (4) lead to diuresis from the interaction of several factors. Sollmann⁶ reviews in considerable detail several articles relative to the action of caffeine on respiration. There is some evidence that it may relax bronchial spasm, although the major emphasis is on the central action "by stimulating the respiratory center to greater effort." Little mention is made of theophylline in this connection, but in general its action seems to be quite similar to caffeine and probably is more intense. Among the unpleasant side actions of effective doses of caffeine and of theophylline are mentioned palpitation, insomnia, nausea, vomiting, headache, vertigo and restlessness. The latter drug is said to be more active than caffeine or theobromine in producing a diuresis. The blood

flow and the filtration pressure in the renal vessels are improved by these drugs. The response is modified in degree by the amount of filtrable liquid in the body; hence diuresis is less evident in the normal than in the edematous person.

METHODS

The patients used for this study are drawn from two distinct groups. One group (112 patients) has a high ratio of Jews, of Latins from the Old and especially from the New World, of Negroes and of several other racial types. Their mental, physical and economic levels are relatively low. Preexisting pathologic changes, often not directly concerned with their clinical allergy, present a definite handicap to the complete control of their symptoms. Pseudo-allergy is more common than true allergy. The other group (forty-one patients) is practically the opposite type. The presenting complaints are often the only deviation from a physical norm. Their ability to cooperate in the evaluation of therapeutic agents is much higher. A greater proportion of this group is sensitive and probably a correspondingly large number are therefore true allergic individuals.

From each group only the more severely afflicted were selected for our series. No one who obtained satisfactory relief from specific or other antigens, from sympathomimetic or other palliative drugs, was included in our series. Those patients with less severe clinical problems do not, of course, represent a critical test of the action of any drug. In view of the previous emphasis on the action of theophylline on the circulation, some might assume that beneficial results in asthma are through this mechanism. We have considerable evidence, namely age "scatter," in the two series which tends to refute this theory. Until recently all patients under 12 years of age were ineligible for the county hospital clinic; circulatory dysfunctions are, of course, much more frequent in older persons. In spite of this atypical preponderance of those in the older age group in the clinic, and the opposite trend in our private patients, there is little difference in the average age in the various subdivisions of these two groups.

We have defined the present illness or duration of symptoms to be the total time which has elapsed since the first attack. During this interval some have had symptoms rather infrequently while others, namely the greater proportion of the clinic patients, have had some symptoms practically every day unless effectively treated. One might assert that the total duration is the factor which determines the degree of damage to the circulatory apparatus. This in turn might be a function in the effectiveness of theophylline compounds. We believe that the data presented in the accompanying table will help to answer these and many other obvious questions.

In the management of any allergic or other chronic condition, the patient's physical, medical and economic interests are best served by adherence to the following pharmacologic axiom: Always employ the smallest effective dose of the least potent agent that will accomplish the desired results and repeat only when the symptoms and safety factors justify such repetition. Few would consider the use of maximum doses of an opiate to control the pain in an early malignant condition. They would, quite properly, insist on a trial of less drastic analgesics and reserve the opiates for the late and more severe manifestations. We believe that

allergic patients should likewise be treated conservatively. All too frequently the physician who sees a patient with asthma, even though it is of recent origin, orders a syringe and needle and starts the patient on a regimen of self medication with epinephrine. One may prescribe maximum doses of some other drug or another physician may advise the use of mixtures containing two, four or more drugs, any one of which, if given alone, would control symptoms. Such a mixture may be "worn out" by the patient as rapidly as would any single ingredient of it, but now all contained therein have lost their effectiveness. When a single tablet or capsule contains the maximum safe dose, it may have advantages from the standpoint of the manufacturer, as the patient's first concern is prompt relief. Undoubtedly such an amount also requires less effort on the part of the physician, as it is easier to prescribe a single unit than to teach the patient to employ from one to several smaller doses.

The recent history of ephedrine is interesting in this connection. The earlier workers advised the use of 50 mg. (three-fourths grain), repeated every four to six hours. Rather dramatic results were obtained at first. The reported failure to develop a tolerance to the drug was undoubtedly due to the fact that each dose contained several times the amount needed (at first) for clinical relief. Tolerance was developing, and in some quite rapidly, but was not evident as long as one effective unit remained. Unpleasant side effects prevented any increase in the original quantity. We believe that as large a dose as 50 mg. is rarely required, nor should its use be permitted. The routine ingestion of this at any stated interval is likewise open to criticism until such a schedule can be shown to be indispensable. The introduction of 8 mg. (one-eighth grain) doses of ephedrine, especially when this is combined with a sedative such as 16 mg. (one-fourth grain) of amytal, marked a distinct advance in therapy. If one has been correctly advised how to use these smaller doses, as good results, with almost no unpleasant side effects, may be obtained with one or two such tablets as with from six to three times this amount of ephedrine. If tolerance to these small doses should develop, one has considerable flexibility before the upper and safe limits are reached. In effect, the patient thus titrates the dose he needs at the time; if the dose is only 8 mg. he does not take two or five additional, but unnecessary, doses, as he would if the units were 25 mg. (three-eighths grain) or the large one, namely 50 mg. One of us (L.) contributed much of the original data which demonstrated the practicability and real need, even in the adult, for these smaller doses.

A few trials with stock doses of theophylline monoethanolamine 0.1 and 0.2 Gm. (1½ and 3 grains) suggested that the problem of dosage with it was a counterpart of what we have described for ephedrine. The manufacturer was most willing to cooperate and soon provided us with 32 mg. (one-half grain) and 65 mg. (1 grain) capsules. The smaller are especially valuable for children and probably will be equally effective in those adults who have comparatively mild and readily controlled symptoms. It should again be emphasized that none of the latter were included in our series.

The method of giving the drug was identical with that described for ephedrine. A 65 mg. capsule should be taken to anticipate and prevent or abort

symptoms. If in from twenty to forty-five minutes the desired result was not obtained, the dose was repeated and the titration continued to a maximum of six capsules. If, for example, four doses were taken in sequence on each of several trials with an interval of three or four hours after each titration, the scheme was modified as follows: Each series was begun with two capsules (0.13 Gm., or 2 grains); in a few cases a third capsule was needed within an hour, and in a rare instance a fourth was required after a similar interval. It is not uncommon to find that the dosage during the daytime is no more than a third or a quarter of that required at night. We have tabulated this factor and, more important yet, the average total dosage for periods of twenty-four hours. We found with theophylline mono-ethanolamine, as we had with ephedrine, that a reduction of from 60 to 80 per cent had been effected without sacrifice of clinical relief. This alone would be sufficient to justify the method used. To it one may add an equally important factor, namely the lessening of malaise, nervousness, lassitude and anorexia, which almost inevitably accompany the use of maximum doses of many drugs. These benefits—individually, and doubly so when considered together—make it mandatory to give no more medication than is necessary.

It may be contended that we are too academic. Why not use a stock item such as a 0.2 Gm. capsule? It is safe and will produce the clinical effect in a large number of those who would obtain relief by any scheme of titrating the dose. We asked ourselves that question and the patients supplied the answer. 1. Many found the first untoward symptoms from these larger doses a deterrent, and after such an experience they would reject a valuable aid because of these side effects. 2. A few might employ a dose of 0.2 Gm. every six hours, a total of four doses 0.8 Gm. (12 grains) each twenty-four hours without side effects. 3. When a smaller unit 65 mg. is used and is effective, the interval between these smaller doses may be as long as between the larger ones. This has been demonstrated to be true in many cases, and the total would then be only 0.26 Gm. (4 grains) in twenty-four hours. The significance of this small dose compared with a total three times as great needs no further emphasis. 4. If the patient obtained relief from doses of 65 mg. during the daytime (possibly taking one at 6 a. m., 12 noon and 6 p. m.) but required 0.13 Gm. or even a maximum of 0.2 Gm. for each of the night doses, the total would not exceed 0.4 Gm. (6 grains), 50 per cent only of what would be ingested were the 0.2 Gm. capsules used each time. This difference begins to assume still more convincing proportions when it is realized that this is a reduction of 12 Gm. (180 grains), or two-fifths ounce in a month. The advantage of a 65 mg. unit over the stock 0.1 Gm. capsule can likewise be shown to be in favor of the smaller doses. If 65 mg. is not sufficient but twice the amount is adequate, one would be forced to give 0.2 Gm. to obtain this amount if each unit contained 0.1 Gm.

RESULTS

In the table we have summarized the entire series of clinic patients and forty-one from private practice. These patients have been grouped on the basis of the amount of the drug required at each dose to control or prevent symptoms. Under such subheadings we have arranged chronologically, according to their age,

the female and the male patients. In the column adjacent to the age there is indicated the duration in years during which the patient has had intermittent or constant paroxysmal dyspnea. For each group the average age and the average duration have been determined, and the total percentage of those obtaining relief by the dose in question is indicated. In considering the figures for the county hospital patients, it must be kept in mind that until recently no person under 12 years of age was admitted to the clinic; hence the distribution in which a majority fall in the older age groups may be atypical. The close agreement in the average age of the patients, whether male or female and regardless of the series to which they belong, is of interest. If we had somewhat larger samplings in a few of the groups, the agreement might have been still closer.

Those patients included under the heading of "no relief" would undoubtedly be excluded from most series. A small portion of these had taken the maximum dose and then failed to obtain relief. Some had taken only 65 mg. and if the results were to them unsatisfactory they refused to cooperate further. In a few this dose had been used a number of times yet the patient had reported "no relief," although subsequently a long remission followed. In others a few unpleasant side effects deterred them from further trial. They preferred to resort to the more undesirable method, namely hypodermic medication with epinephrine. Those in whom maximum doses by mouth failed to give relief should not yet be classified under "failures" of the drug. It would be most desirable to employ intravenous therapy with much smaller doses. In a few instances such apparently refractory patients have been given the drug by this method. A solution containing approximately 25 mg. per cubic centimeter was employed; from 2 to 5 cc. has in every instance tried given prompt relief. We have attempted for months to get in contact with some of the remaining patients who had failed to obtain relief by the oral medication in order to determine whether they possessed actual refractoriness to this agent. We have no direct evidence to explain the relief from minute doses given intravenously when much larger ones by mouth, even though repeated every four to six hours during the day, have failed. The clinic series had only sufficient patients in the "no relief" group to justify summarizing the average age, duration, and the like as we had done for the other subdivisions. These data correspond rather closely to those for the patients included under the column showing relief from 4 grains. We feel quite certain that the number in whom the drug seemed to be unsatisfactory could be further reduced were it possible to get in touch with the patients more readily and to teach them to use this remedy correctly.

It is of interest to note that a significant number of patients, even though they are in the older age groups, have had their symptoms over a long period, which represents a major portion of their life. This seems especially true in the case of women. In summarizing the effectiveness as given in the table, it deserves special comment that approximately 77 per cent of the clinic patients obtained definite or complete relief from no more than 0.26 Gm. (4 grains). In a majority of these the number of doses was not in excess of from 0.13 to 0.26 Gm. in twenty-four hours and frequently when 0.26 Gm. was needed the total amount used might be no greater than would be the case had the smaller doses

been used. The latter, although effective at the time, might be required twice as often in order to maintain control. In the private patients approximately 88 per cent obtained relief from 0.2 Gm. or less. These differences, in favor of the latter series, are due in no small measure to the physical, mental and other differences pointed out earlier in the article, and in addition we have had considerably more personal contact with the private than with the clinic patients. All results, even in the latter group, were obtained by one or the other of us after many personal interviews. The period of observation extended over months to a year or more. In absolutely no instance in either series was any one other than one of us a party to obtaining these data. The patients were not aware of the nature of the remedy they were taking. They were not told it was a "new cure" nor were they in any way prejudiced as to the results that might be obtained. These factors are too often neglected, as they are most time consuming when large groups of patients are to be studied.

POSSIBLE MECHANISM OF ACTION

Many theories can be advanced to explain the action of drugs of the dimethylxanthine series. We have touched on some of these, and if the circulatory factor were the correct explanation we would anticipate that few such persons would fall in the group of true allergic patients. Since one of the criteria of the latter is the presence of skin test sensitiveness, we have indicated for each of the groups the ratio of sensitivity to stock allergens in those tested. In the larger series eleven of the total 112 patients were not tested at all or the tests were never completed. In many instances we exclude tests, as the evidence seems to point to some diagnosis other than true allergic asthma. Of the 101 tested, thirty-one patients (30.7 per cent) were found to be sensitive. In the series of private patients, seven of the total forty-one were not tested. Of the thirty-four patients studied, twenty-nine (85.3 per cent) were sensitive to stock allergens. In the private series, but not in the clinic group, those failing to react to the stock allergens were tested to their own house dusts. This method added three patients (8.8 per cent) of those tested to the sensitive group. Thus the result is that thirty-two of the thirty-four patients (94.1 per cent) were sensitive to stock or environmental allergens. In comparing this with the percentage of 30.7 for the clinic patients, one must deduct approximately 9 per cent from the private series for those who were dust sensitive—a factor which we were unable to determine for the clinic patients. One must keep in mind also that the clinic group represents the pseudo-allergic rather than the true allergic individual. Previous compilations of the percentage of sensitive patients at the clinic have never revealed more than 33 per cent in that category. The difference in these two series is not due to the differences in the allergen used, as they were identical. The reactions are evaluated in the same manner in the two groups. Such a wide variation between two series in the same community and under study by the same workers should serve to temper one's enthusiasm for the superiority of one's own particular method of preparation of allergens and the like. Variation in clinical sampling may account for wide discrepancies in results.

Let us return to a consideration of the relationship between the amount of drug required for relief and

the percentage of those sensitive. In the clinic all dosage groups except the third showed a higher percentage of sensitivity than the average (30.4 per cent) for the 101 patients tested. This would seem to be some evidence against a typical circulatory dysfunction being the primary etiologic factor.

A relatively small proportion of the total clientele at the allergy clinic of the county hospital are Negroes, yet this series includes seven of that race. Each is a female and is between 19 and 39 years of age. The youngest obtained relief from 0.13 Gm., and she is the only one who is sensitive. The oldest required 0.2 Gm. per dose. The five remaining are grouped in the "4 grain" (0.26 Gm.) group and represent 38.4 per cent of the total of thirteen females. This concentration of Negroes in one group is of considerable interest and may represent only a chance occurrence in sampling.

CONDITIONS OTHER THAN ALLERGY

We previously referred to the presence of complicating pathologic conditions, particularly in the clinic group. We have summarized these factors and here present a brief analysis of our data. Serologic or other evidence of syphilis in the clinic is rather uncommon, yet six (one Negro) of the total of 112 patients in this series were so classified. None had clinical syphilis and in only one did that condition appear to be even a secondary cause of the allergic symptoms. Five patients obtained relief from doses of 0.13 Gm. and one required 0.26 Gm.

Hypertension seems but rarely to be a sequela of bronchial asthma, although it may often be the cause of paroxysmal dyspnea indistinguishable from the other type of asthma. Since it is one of several circulatory abnormalities, it deserves special consideration. We included in this category only those patients with a constant systolic reading of 160 mm. of mercury or above over periods of from several weeks to months. Nine patients, seven of whom were 50 years of age or more, had hypertension. The one known to have had it the longest—and incidentally the oldest patient—obtained relief from 65 mg. of theophylline monoethanolamine. These patients were almost equally divided between the 1, 2 and 4 grain (0.065, 0.13 and 0.26 Gm.) and the "no relief" groups, the odd patient being in the second group. Such a distribution does not help to explain the mechanism of the action of this drug.

Although extensive pulmonary fibrosis is a definite handicap to any therapeutic agent, two patients with "miners' asthma" obtained relief with 0.26 Gm. or with 0.4 Gm. doses. Several additional patients had been miners of hard rock but unless x-ray examination of the chest substantiated a diagnosis of silicosis they were not so classified.

The relationship of blood eosinophilia to true allergy is still a moot question. We could not however ignore this factor, since a majority of the clinic patients had had a differential white blood count. Seven patients had one or more counts of from 6 to 15 per cent (average 10 per cent) of eosinophils. These patients were almost equally distributed over the several dosage groups. We have been unable to correlate these examples of increased blood eosinophilia with any factor which would be of value in differential diagnosis, in relationship to sensitivity, to severity of symptoms or to prognosis.

UNTOWARD EFFECTS INCONSPICUOUS

Some of the possible side effects were mentioned in discussing the pharmacology of the xanthine series. When a patient first employs a new drug, the secondary reactions may be more pronounced than at any subsequent use. The beneficial response may be decided, even though transient. In most instances in this series complaints followed only the first few doses. Occasionally the smallest as well as the largest quantity seemed to produce these sequelae. Disturbances of the gastrointestinal tract were the most common symptoms. These ranged from a sensation of gnawing in the epigastrium to nausea and occasionally to vomiting. The use of small amounts of food at the time the capsule is taken is usually sufficient to control this discomfort. Ten patients complained of nervousness and, if the medication was taken at night, insomnia resulted. These conditions are much less common than they are with effective doses of ephedrine. Tachycardia with or without other manifestations occurred in a few cases. The diuretic effect has been inconspicuous, only four patients having experienced sufficient discomfort to report it to us. In one of those it was severe enough to limit the use of the remedy. In passing and to correlate with the infrequent complaint of diuresis, one should note that no patient in either the clinic or the private series presented peripheral edema or other evidence of fluid retention. Several elderly men in the clinic group who had been unable to take ephedrine obtained relief with theophylline mono-ethanolamine and without disturbances of urinary function. One man was unable to take either drug in effective doses.

As a rule the sequelae soon cease to appear, and children as well as the least robust of the adults take the remedy without untoward symptoms. We have again interviewed a majority of the entire series because our first results were so favorable, and especially when compared to the effects of ephedrine. Our original impression has not been changed and the infrequency of these sequelae is in part due to the comparatively small doses we have employed.

UNEXPECTED THERAPEUTIC BENEFIT

As we interviewed these patients we tabulated all data which they supplied without regard to whether it referred to relief from paroxysmal dyspnea. It soon became evident that there were beneficial side effects not directly related to the control of asthma. Several reported a definite decrease in lassitude and fatigue, and shortly several reported a gain in weight which had not followed the use of other drugs. This could not be ascribed to a complete remission, as they were obliged to use theophylline mono-ethanolamine each day. One of these patients, a woman aged 47, had had severe vasomotor rhinitis, paroxysmal dyspnea and generalized eczema during the past forty-four years. These symptoms had been so severe for the past five or six years as to produce complete disability. Not only did she obtain relief from the respiratory symptoms but there was a definite improvement in her skin. Coincident with these beneficial results and the gain of weight she has returned to part time employment. Others volunteered the information that there was marked improvement in their nasal condition. This did not necessarily parallel the effect on the lower respiratory tract.

These incidental observations led us to make a few preliminary observations. The following comments are not presented as a completed study but merely to record some very definite trends. Conclusions should be withheld until further data have been accumulated. Detailed case histories would seem superfluous; hence we are presenting only salient points: A white girl aged 15 years had been under pollen treatment in our office for three or more years. There had been no complaints except acute and chronic nasal symptoms, and these had improved somewhat. Small doses of ephedrine (tablets of ephedrine and amytal previously mentioned) had helped somewhat but the marked nasal obstruction persisted. Radical antral surgery was done during the summer of 1939 with some temporary benefit. She was given theophylline mono-ethanolamine and for the past four months had obtained much relief with a 0.1 Gm. dose each morning and evening. On a few occasions it has been necessary to use a third capsule in the twenty-four hour period. This drug has controlled her nasal symptoms more effectively than all previous therapy combined.

Following such encouraging results, we recently have tried the drug on several additional private patients who complained of severe vasomotor rhinitis with or without paroxysmal dyspnea. One of these patients, a white man aged 24, a medical student, is definitely sensitive to practically every pollen to which he has been tested. Pollen therapy has been quite effective in controlling nasal and chest symptoms but the former were still troublesome. Theophylline mono-ethanolamine in doses of 0.13 Gm. not only relieved the chest symptoms but was so effective as practically to reverse the nasal symptomatology. He complained that his nose was too dry. A classmate of his aged 26 who had experienced only nasal symptoms was under pollen treatment with partial relief. Nasal symptoms became especially acute with the sudden onset of hot weather. A 0.2 Gm. capsule each morning and evening prevented symptoms. They were not aware of the nature of the remedy or of what results to expect; hence the observations are practically unbiased.

Urticaria (with or without angioneurotic edema) is one of the most baffling conditions for which the allergist is consulted. He is expected to find a specific etiology when in all probability one rarely exists. If the indications for dietary restrictions are conspicuous, they would have been followed without the patient's consulting him. The allergic approach has not yielded satisfactory results. Many forms of therapy have been tried and none have survived the test of time. Even epinephrine is not always a panacea. Because of the multiplicity of agents that have been recommended for therapy, the allergist hesitates to add another to the list of "sure cures." Five patients, three females and two males, with urticaria and angioneurotic edema have been treated with theophylline mono-ethanolamine. A dose of 65 mg. and occasionally from 0.13 to 0.2 Gm. from two to four times in the twenty-four hour period has been more satisfactory than ephedrine and amytal tablets or than epinephrine 1:1,000 from 0.3 cc. to 0.6 cc. taken at intervals of from two to four hours throughout the day and night. We have had insufficient time to study a larger series, but these results have never been duplicated by any other therapeutic agent.

UNTOWARD EFFECTS INCONSPICUOUS

Some of the possible side effects were mentioned in discussing the pharmacology of the xanthine series. When a patient first employs a new drug, the secondary reactions may be more pronounced than at any subsequent use. The beneficial response may be decided, even though transient. Urticaria (with or without angioneurotic edema) is one of the most baffling conditions for which the allergist is consulted. He is expected to find a specific etiology when in all probability one rarely exists. If the indications for dietary restrictions are conspicuous, they would have been followed without the patient's consulting him. The allergic approach has not yielded satisfactory results. Many forms of therapy have been tried and none have survived the test of time. Even epinephrine is not always a panacea. Because of the multiplicity of agents that have been recommended for therapy, the allergist hesitates to add another to the list of "sure cures." Five patients, three females and two males, with urticaria and angioneurotic edema have been treated with theophylline mono-ethanolamine. A dose of 65 mg. and occasionally from 0.13 to 0.2 Gm. from two to four times in the twenty-four hour period has been more satisfactory than ephedrine and amylal tablets or than epinephrine 1:1,000 from 0.3 cc. to 0.6 cc. taken at intervals of from two to four hours throughout the day and night. We have had insufficient time to study a larger series, but these results have never been duplicated by any other therapeutic agent.

SUMMARY AND CONCLUSIONS

1. The value of theophylline in certain types of edema as a myocardial stimulant and in dilating coronary vessels is widely accepted. It has found but infrequent use in paroxysmal dyspnea. Its combination with mono-ethanolamine provides a satisfactory agent (theophylline mono-ethanolamine) for oral or intravenous use.

2. A total of 153 patients has been treated. These patients come from two sources and are composed of individuals of widely varying types. Those from the Los Angeles County General Hospital (112 patients) experience the more severe asthma. A higher ratio of them are nonsensitive and present other conditions typical of the nonallergic patient. The smaller group (forty-one patients) is a counterpart of the first and a large proportion represent the uncomplicated allergic problem. Each patient was included because of refractoriness to conventional therapy. The striking differences in physical, clinical and other characteristics help to explain the variations presented in the table and in subsequent discussions.

3. The maximum quantity of drug administered by mouth represents little more than the minimum recommended for its action on the heart and circulation. The minimum doses, found effective in a majority of our patients, are smaller than any previously available on the market. Amounts so small as from one tenth to one fifth of the conventional dose for intravenous use may be effective even though symptoms are most severe.

4. Each patient titrated the required dose and the amounts tabulated for each represent the upper limits. This effective quantity may need no increase after long periods—even a year or more—of use.

5. Approximately 10 per cent of the patients are classified as obtaining "no relief." Several of these did not complete the trials, others failed to return for observation and a few reached our maximum doses of 0.4 Gm. without benefit. A sampling of the latter furnished evidence of the efficacy of smaller (from 40 mg. to 80 mg.) doses given intravenously. Many of those classified as obtaining "no relief" are not, therefore, truly refractory to the drug.

6. Untoward reactions were inconspicuous and tended to be limited to the first few doses. Approximately 15 per cent mentioned transient nervousness or gastrointestinal symptoms. A small amount of food taken with the drug kept the latter at a minimum.

7. Unexpected beneficial side effects were observed. A few trials indicated that these represented real trends rather than coincidental results. Nasal symptoms, with or without asthma, and such refractory conditions as urticaria and angioneurotic edema have been controlled by this drug. These are preliminary impressions and may not necessarily represent final conclusions.

8. In every instance patients have been kept in ignorance of the type of drug and of its potential response. All observations, an average of at least five interviews per patient, were made and recorded only by the authors.

9. Because of the evident usefulness of theophylline mono-ethanolamine in small doses by mouth—and of smaller amounts intravenously—and the slow development of tolerance even to the smaller quantities, we anticipate that this drug will be a valuable adjunct if not a substitute for ephedrine in the treatment of asthma.

THE EFFECTIVENESS OF THE XANTHINE DRUGS IN THE TREATMENT OF ANGINA PECTORIS

I. AMINOPHYLLINE

GEORGE V. LE ROY, M.D.

Instructor, Department of Medicine, Northwestern University Medical School; Cardiologist, Municipal Social Hygiene Clinic

CHICAGO

There is abundant experimental proof that the xanthines theobromine and theophylline, as well as other members of the series, are potent vasodilators of the coronary arteries. These drugs have been shown to possess this property in human¹ and canine² heart-lung preparations: in the intact anesthetized dog by measuring the outflow from the coronary sinus,³ and in the intact anesthetized and trained conscious dog by using a thermostromuhr⁴ on one or another of the coronary arteries. Levy and his associates⁵ have demonstrated this property of the xanthines inferentially and reported the favorable influence of these drugs on patients with attacks of angina pectoris induced by breathing an atmosphere containing only 10 per cent oxygen. In a recent report Gilbert, Fenn and LeRoy⁶ have confirmed this observation. Experiments soon to be published by Gilbert and me demonstrate that the mortality after experimental occlusion of the coronary arteries is 25 per cent in dogs receiving these drugs and 75 per cent in the untreated controls. Theobromine and theophylline are not known to exert any other action on the heart and its blood vessels than to cause an increase in the volume of the coronary blood flow. Any improvement in cardiac function after the use of these drugs is believed to be secondary to this action. The increased blood flow is thought by most investigators to be due to vasodilatation, the result of a direct action of these xanthine drugs on the vessel wall.

There is a considerable difference of opinion among the more articulate internists, and for any report that appears confirming the value of these drugs an article may be found denying that they have any activity.⁷ The standard textbooks, too, do not agree in their estimates of the worth of these preparations. For these reasons it is felt that a suitably controlled series of patients in whom the effectiveness of one of the xanthines was studied should be reported.

This study was undertaken as part of an attempt to discover new members of the xanthine family of greater value, if possible, than the familiar preparations of theophylline and theobromine. For this purpose it was necessary to have a group of patients whose conditions and characteristics were intimately known to me. Throughout the investigation, which is still in progress so far as the new drugs are concerned, the

new compounds were compared with a well known drug. In this instance the known drug was aminophylline (theophylline with ethylene diamine, U. S. P.). Animal experiments on the new xanthine drugs are described elsewhere.⁸ Subsequent reports on the clinical efficacy of these new drugs will follow the present paper, which deals solely with the activity of aminophylline.

THE CLINICAL MATERIAL

The 68 patients considered in this report were all seen by me in the cardiac clinic of the Municipal Social Hygiene Clinic of Chicago. Most of the patients attending this clinic have positive serologic reactions for syphilis, although the majority in the cardiac clinic do not have syphilitic heart disease. In the last thirty months I have observed about 1,600 patients with some sort of cardiovascular disease, and among this number the condition of 110 patients has been diagnosed as angina pectoris. The 68 patients discussed here were selected for this report because during the period of study none of them showed other symptoms of cardiac disease severe enough to warrant the use of other cardiac drugs. Table 1 summarizes the data on sex, age and color of the group. Table 2 is a presentation of the etiologic type of heart disease that was presumed to cause the angina pectoris. Table 3 shows the length of time that the patients were under observation. It should be emphasized that only 50 per cent of the subjects had syphilitic heart disease. The etiologic diagnoses were based on careful consideration of the clinical status, the teleroentgenogram of the chest and the electrocardiogram. Two meter roentgenograms of the chest were made of 80 per cent of the patients. The size of the heart—the cardiothoracic ratio—was from 40 to 50 per cent in 27 per cent of the group, from 50 to 60 per cent in 52 per cent and more than 60 per cent in 21 per cent of the patients. Electrocardiograms were obtained on 85 per cent of the subjects. These were considered normal—that is, showing no more than slurring of the QRS complex or left axis deviation—in only 13 per cent. The commonest abnormality of the remainder was low voltage or inversion of the T waves. Socially, the clientele of this clinic is composed mainly of persons on relief, WPA workers, demimondaines and persons in the very low income groups. The majority, thus, could not afford to pay for medical care and

deserted the clinic only when they were too sick to walk in or when they were hospitalized by a county physician.

DIAGNOSTIC CRITERIA

Angina pectoris was the unqualified diagnosis for all persons who complained that discomfort—as actual pain or a sense of tightness or constriction in the thoracic region (dolor pectoris)—was experienced (a) on exertion, (b) with emotional excitement, (c) after meals when excited or on exertion or when the food was particularly indigestible, (d) particularly with exertion in cold weather and (e) as an accompaniment of nocturnal dyspnea. The diagnosis was considered more probable if the pain was clearly associated with sensations of fear or terror (angor animi). As a matter of fact, it is my custom to diagnose angina pectoris in patients who experience only this sense of fear or terror, although no such patient is included in this study. It is curious how frequently angor animi is neglected in discussions of angina pectoris, since it is apparent that often the pain is not very severe and that the pain alone probably would not impel the patient to seek medical advice.

Patients are often ashamed of the terror that accompanies anginal pain, and unless the mode of questioning is sympathetic the patient may not choose to discuss it. The location of the pain was not felt to be important as a criterion. In general, the diagnosis of angina pectoris was entertained when the pain was substernal, precordial or in the back. Whether the pain radiated to the abdomen, the neck or the right or the left arm was not considered a requisite for the diagnosis, although the last-mentioned radiation is the most typical. The quality of the pain, of course, varied greatly in each subject and from time to time in a given subject. In my practice any sensation that evoked the complaint “it hurts” was called pain. Many of the patients described the most excruciating sensations, but in the majority the discomfort was of less degree, and in many a sensation of tightness or constriction was the most frequent complaint. The duration of the pain was important as a diagnostic criterion. It was felt that pain lasting for hours or fleeting, lancinating pains, even if typically located, did not merit the designation of angina pectoris. The possibility that much of the pain under consideration might be aortic pain arose constantly and was dealt with with difficulty. Throughout the period of the study a serious effort was continually made to challenge the diagnosis of

angina pectoris, and many patients were thus eliminated. The ones described here were resistant to this criticism throughout. The reader may well question why, of the 110 patients with a diagnosis of angina pectoris, but 68 were chosen for inclusion in this study. The reasons are simple: Many of the 42 not included reported to the clinic too irregularly to be of use in a study of this nature, or they were alcohol addicts, or they were not under observation long enough for fair trial periods with active drugs and placebos. Furthermore, this study is but one part of a larger study, and the patients included here are those who have

received or will receive the new drugs. During the period of time covered by this report, however, they were given only the active drug aminophylline.

DRUGS EMPLOYED

The dispensary of the clinic originally contained no drugs for the treatment of angina pectoris. For the purpose of this investigation aminophylline⁹ was

supplied in special 0.2 Gm. (3 grain) sugar-coated tablets. A stock of like-appearing placebos was available. Several experimental batches of the newly devised xanthenes were similarly prepared and were used concurrently. The results of their administration will be described subsequently. These drugs were dispensed in envelopes and were always designated by number. Care was taken not to discuss with the patient the nature of the drug used. It was felt to be good practice to lead the patient to believe that all the drugs were good. For the management of congestive heart failure and fibrillation digitalis, salyrgan and 50 per cent solution of ammonium nitrate were at hand. A few sedative mixtures, the elixirs of phenobarbital and/or sodium bromide could be dispensed. Thus if a patient's symptoms or complaints could not be controlled with any of these drugs he drifted off to another clinic. It is worth mentioning that there were few who could not be adequately controlled.

METHOD OF THE STUDY AND RESULTS

The primary purpose of this cardiac clinic is therapeutic in the dual sense of rendering the patient either fit enough for antisyphilitic therapy or well enough to continue his ordinary activities. For this reason no rigid schedule of courses of active drug and placebo was adhered to. Nor was the dosage of the drug predetermined and strictly followed. The usual dose of aminophylline was 0.2 Gm. three times a day. If this amount did not control the discomfort 0.2 Gm. four or even five times a day was ordered. When 0.2 Gm. three times daily was satisfactory, a period of decreased dosage was ordered. It should be mentioned parenthetically that less than 10 per cent of the patients required more than 0.6 Gm. daily and that at one time or another about 20 per cent were comfortable with 0.4 Gm. daily. The subjects of the experiment were given sedatives, placebos or aminophylline as the initial therapy, the choice of medication depending on several factors: the severity of the symptoms, their duration and the amount of psychic distress that appeared to exist. Placebos and sedatives were seldom administered for a period longer than two weeks unless they were definitely beneficial; in such cases the diagnosis was scrutinized critically and all medication stopped to await a recurrence, if any, of the symptoms. The active

drug, on the other hand, was given for from four to ten weeks, the period of administration depending on the severity of the disorder, the efficacy of the drug and similar factors. Subsequently it, too, was discontinued or replaced by placebos or sedatives or by one of the experimental products as the patient's condition warranted.

In the remarks to follow concerning results, the unqualified word benefit is used to indicate that during the period of the use of the drug, or placebo, the subject experienced definite relief. This may have amounted to complete freedom from pain, but usually the patient reported a distinct lessening in the severity and frequency of the attacks. Only an occasional patient while taking aminophylline was unable to provoke anginal pain by any exertion of which he was capable. The usual result was that the amount of exertion or excitement that would invariably provoke pain before the use of the drug no longer did so, although stronger stimuli were able to cause attacks. Apparently unprovoked attacks—as at rest—were much less frequent while aminophylline was being taken. Moreover, when an attack did occur it was milder, there was less terror and it passed away more quickly. It is important to emphasize the fact that although complete freedom from anginal pain may be an ideal goal it is not a practical one. It is obvious that no therapy of any kind can possibly alter the amount of atheromatous change that exists in the coronary vessels or the amount of aortitis around their orifices. Any patient with angina pectoris due to coronary sclerosis unquestionably has a maximal possible coronary blood flow which may be achieved by complete relaxation of all peripheral resistance. It is fair to assume that this amount is smaller by a varying degree than the maximal possible flow through healthy, nonsclerotic coronary arteries. Thus any patient with angina treated by any satisfactory means may still experience pain with sufficient provocation. The important question in judging the efficacy of therapy is simple: Does the pain come as soon, or as severely, when the patient is taking the drug as when he is not taking it? Failure to appreciate this pathologic fact may seriously color judgment of a drug's use-

TABLE 4.—Summary of Results

fulness, particularly if the critic of the drug considers it worthless unless complete freedom from pain is achieved.

The word relapse indicates, in a patient who has experienced benefit from an active drug, that the substitution of a placebo, a sedative (or, as in the studies to be reported, a less active drug), a reduction of the dose of the active drug or the discontinuation of therapy was followed by a return of symptoms. To put it more generally, the patient became uncomfortable. Usually this was serious enough so that the patient came to the clinic requesting some of the "other medicine" or

⁹ The xanthenes and the placebos were supplied by G. D. Searle & Co.

insisted that he had been given the wrong drug because the expected benefit failed to occur.

For ease of comprehension the results of this study of aminophylline are compiled in table 4.

One fourth of the patients were given initially a course of sedatives consisting of 0.06 Gm. of phenobarbital or 1.2 Gm. of sodium bromide daily. Of this group—designated in table 4 as initial sedative course—3 patients, or 18 per cent, reported benefit. This poor result from sedatives was not unexpected and may be attributed to the rigid effort made to exclude non-anginous patients from the series.

One fifth of the patients were given a course of placebos initially, and this group is designated as initial placebo course. Of these, 2, or 17 per cent, reported benefit. Here again the comment made about the non-success of sedatives applies. As a matter of fact, it is my custom to reconsider with great care any patient who reports a striking initial improvement in angina pectoris from sedatives or placebos. The condition of many patients with supposed angina who experienced such benefit was rediagnosed, and subsequent observation over a long period confirmed the correctness of the change.

The remainder of the 68 patients received aminophylline initially, in doses of 0.2 Gm. three times a day. Some of these were given an enteric coated tablet with no significant difference in the final result. This group, designated initial aminophylline course, reported benefit in 79 per cent. The 24 patients who had been given placebos or sedatives initially were then given aminophylline in the usual dose. Of this group, designated secondary aminophylline course, 18, or 75 per cent, experienced benefit. Of the 6 not benefited, 2 subsequently became more comfortable by taking from 0.8 to 1 Gm. daily. The difference between the results of the administration of the active drug and a placebo or a sedative in the initial course is striking and is, I think, significant of the effectiveness of aminophylline.

Depending on individual circumstances, the active drug was then given for varying lengths of time, usually for from four to ten weeks. In most instances after this period placebos were given, administration of the drug was stopped or an experimental product was substituted. At some time or another, placebos were given subsequently to 52 of the patients. This group, labeled later placebo course, reported a relapse in 72 per cent. Forty-three patients stopped taking drugs altogether for periods up to three months. Of this group, designated no therapy, 74 per cent experienced a relapse within three months.

After a relapse due to cessation of therapy had occurred or after a placebo had failed to give benefit, aminophylline was usually given. There were one hundred and forty-two instances in which this was done in the group labeled later aminophylline course. Of this group, 116, or 81 per cent, reported benefit. Thirteen of the patients who had had a relapse because of cessation of therapy were given placebos when they returned to the clinic for help. Of this group—called secondary placebo course—only 3, or 23 per cent, reported benefit.

SUMMARY

In a series of 68 patients with angina pectoris sedatives or placebos given initially or placebos given after a relapse were of benefit to 18, 17 and 20 per cent of the patients respectively. Aminophylline given initially, after the placebo course or after a relapse was reported as beneficial by 79, 75 and 81 per cent of the patients

respectively. Of the patients who had benefited from aminophylline, substitution of placebos or no drug at all provoked a relapse in 72 and 74 per cent respectively.

COMMENT

The results just described are better than those usually reported in studies of the treatment of angina pectoris with the purine drugs. There are probably several reasons for this which should be mentioned:

1. The group studied was homogeneous. In 50 per cent of the patients (i. e., those with syphilitic heart disease) the pathologic processes responsible for the bouts of coronary insufficiency could be visualized as involving only the proximal portions of the coronary arteries. Under these circumstances a lessening of the peripheral resistance in the coronary circuit by arteriolar vasodilatation should be not only possible but also efficacious.

2. The age distribution of the patients was favorable (table 1). Thirty-nine, or 57 per cent, of the subjects were less than 50, and only 5 were older than 60. Thus the group might be expected to contain relatively few of the type of patient with intense diffuse coronary sclerosis whose angina pectoris is known to be helped little by any medication.

3. Many of the patients were receiving their first medication for angina pectoris, and in the whole group only about one fourth had suffered from angina for longer than six months. Ten of the patients were taking tablets of glyceryl trinitrate when first seen. In all 10 the number of tablets required was greatly reduced by the use of aminophylline, and only 2 patients still take them. Neither one uses more than two or three tablets a week when he is taking the active drug.

4. It is believed that this study is both coherent and consistent because one observer made all the examinations and diagnoses and saw the patients continuously for the entire period. No injustice is intended when it is suggested that the poor results with xanthines reported by other workers may well be due to the fact that the patients were attended in hospital or medical school dispensaries with shifting personnel whose diagnostic acuity and criteria varied. It is certainly true that a clinic for persons with diabetes, for example, managed by a constantly changing staff varying in interest and experience will be less successful than a one man clinic. The same is undoubtedly true of a clinic for patients with angina pectoris. In this connection should be mentioned the psychologic attitude of the clinician toward the drugs in question. It is just as unfair in seeking a patient's evaluation of a drug to lead him to expect poor results as to lead him to anticipate good ones. I attempted to be as non-committal as possible, but discerning patients may well have seen my enthusiasm for these particular xanthine drugs.

5. Finally, the amount of aminophylline administered was, I believe, considerably greater than the doses usually prescribed. No patient was ordered to take less than 0.2 Gm. three times a day unless it was found that the smaller dose was as efficient as the larger one. Furthermore, there was no hesitation in ordering daily doses of 0.8 or 1 Gm. when a beneficial result did not occur.

CONCLUSION

Sixty-eight patients with angina pectoris were given aminophylline or placebos in varying amounts over a period of two years. In general, aminophylline bene-

fited 75 per cent of the sufferers. Placebos and sedative drugs were reported beneficial by about 20 per cent of the group. When patients who had been benefited by the use of aminophylline were given placebos or stopped taking the drug, about 80 per cent experienced a return of symptoms within less than three months.

PRIMARY VIRUS PNEUMONITIS WITH CYTOPLASMIC INCLUSION BODIES

STUDY OF AN EPIDEMIC INVOLVING
THIRTY-TWO INFANTS, WITH
NINE DEATHS

JOHN M. ADAMS, M.D.
MINNEAPOLIS

The present report deals with a hitherto undescribed form of epidemic pulmonary disease occurring in newborn infants. Its peculiar symptomatology and pathology, as well as its epidemic character, clearly indicate the virus nature of its etiology. Characteristic cytoplasmic inclusion bodies were found in the bronchial epithelium in all fatal cases.

An increasing number of reports on the subject of atypical pneumonia or virus pneumonitis in man has occurred in the literature during recent years.¹ That of Goodpasture and his co-workers² alone, however, deals with virus disease of the lungs in infancy. These authors reported finding intranuclear inclusion bodies in the bronchial epithelial cells in 3 cases of postmeasles pneumonia and in 1 case of postpertussis pneumonia. The differences between these cases and those reported in the present paper are detailed under the heading Differential Diagnosis.

The 32 cases reported here occurred in rapid succession during the three winter months January, February and March 1937. Because of the epidemic nature of this outbreak of infection in the newborn nursery, the assistance of the Minnesota State Board of Health was enlisted for a thorough bacteriologic and epidemiologic study of the problem. Nine, or 28 per cent, of the affected infants died. Routine postmortem examinations were carried out in the department of pathology

of the university. Since the clinical features simulated those of epidemic influenza, fresh frozen specimens of lung tissue were sent to Dr. Thomas Francis Jr., of the Rockefeller Foundation, International Health Division, to determine the possible presence of the virus of that disease.

CLINICAL FEATURES

The characteristic clinical signs of the disease were cough, dyspnea, cyanosis and low grade fever. The relative frequency of these signs is shown graphically in figure 1. As indicated, the uniformity of the clinical picture in all cases observed was a striking feature of the epidemic. The temperature response varied considerably but was only moderate to low in the majority of the patients. With the exception of a few cases, the exact time of onset of the disease was difficult to determine. Sneezing and cough were the initial symptoms. At this early stage little if any elevation of temperature was noted. In a few instances cyanosis and respiratory distress were the presenting signs of illness. Listlessness and apathy were prominent symptoms. The cyanosis in many cases was extreme, involving the whole body of the infant. Comparatively long periods of apnea and associated bradycardia accompanied cyanotic attacks in the most severe cases.

Early in the clinical course fine rales could usually be heard over the chest, indicating involvement of the smaller bronchiolar system. The changes found on auscultation, however, were not as obvious as the other symptoms and signs would suggest. Evidence of dullness indicating consolidation was rarely found. It was practically impossible to determine by physical examination whether or not bronchiolitis or bronchopneumonia was present. Nevertheless, roentgen examination of the lungs confirmed the presence of bronchopneumonia in nearly all cases studied roentgenologically.

In those cases which terminated fatally death occurred soon after the establishment of fever. This was especially true among the 4 premature infants. Biphasic fever curves were observed in several instances (fig. 2). The febrile course lasted for as long as three to four weeks in some of the infants who survived. Cough likewise tended to persist. The average duration of illness was seven and six-tenths days in the fatal cases and fifteen and one-tenth days in those which survived. Recovery was complete without complications in the latter.

In order to illustrate more clearly the important features of the symptomatology, the record of 1 case is presented briefly:

CASE 12.—J. L. O., aged 3 weeks, was admitted to the University Hospitals from the Salvation Army Booth Memorial Hospital, St. Paul, on February 18 with an illness of two days' duration. The presenting symptoms were listlessness, cough and frequent attacks of cyanosis. There was a large amount of mucus in the nose and throat. Respiration was labored, with noticeable retraction of the intercostal spaces and sternum. Fine rales were heard throughout the chest; no evidence of consolidation was present on physical examination. The white blood cell count was 8,300 per cubic millimeter, with polymorphonuclear leukocytes constituting 32 per

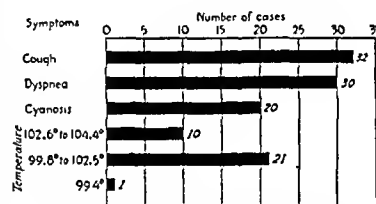

Fig. 1.—Graphic representation of the striking symptoms. A composite graph of temperature records is shown.

The photomicrographs were made by H. M. Morris, M.P.A. Presented before the Minnesota Pathological Society, Nov. 19, 1940. From the Department of Pediatrics, University of Minnesota Medical School.

cent and lymphocytes 68 per cent. A roentgenogram of the chest showed an increase in markings on the lung along the right border of the heart. The observations were interpreted as consistent with bronchopneumonia of the lower field of the right lung. The febrile course is shown in figure 3, the highest reading for the day being the one recorded on the graph. The course was stormy for several days and was marked by frequent attacks of deep cyanosis, necessitating the administration of epinephrine and alpha-lobeline repeatedly. Three small transfusions were given. Oxygen and steam were administered constantly. The cyanotic attacks continued until February 29, but the general condition gradually improved. The patient was discharged on March 11, still coughing. A roentgenogram of the lungs on March 6 was interpreted as still showing areas of increased density in the region of the lower and upper lobes of the right lung, representing areas of pneumonic consolidation (fig. 4).

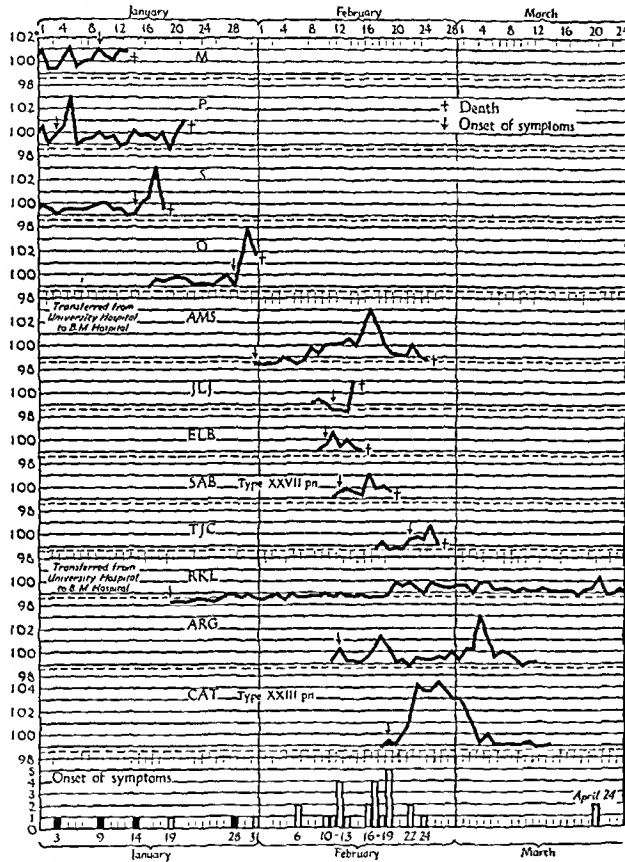

Fig. 2.—Temperature charts of the 4 premature and the 5 full term infants dying of the disease. The charts of 3 additional patients who survived are shown. Note biphasic temperature reactions in several instances. At the bottom of the figure is charted the day of onset of symptoms, the solid blocks indicating the premature infants, the light blocks the full term infants.

Roentgenograms of the lungs are shown from cases 13 and 32 in figures 5 and 6.

The complications observed in the series of 32 cases were 5 cases of otitis media and 1 of staphylococcal empyema. At necropsy 1 patient was found to have a congenital cardiac anomaly.

BACTERIOLOGIC CHANGES

The laboratory staff of the state board of health made cultures of material from the entire group of infants and from the mothers, nurses and attendants at the Booth Memorial Hospital on three different occasions, February 23, March 5 and April 27. Pneumococcus type XXIII was found in 4 cases and pneumococcus type XXVII in 3 cases. Mixed organisms consisting

mainly of gram-positive diplococci, streptococci and staphylococci were found in the cultures taken of material from the pharynx in nearly all cases studied. In addition to the aforementioned organisms, type XVII and type XVIII pneumococci were found respectively in the throats of two nurses, neither of whom was ill. Several cultures were taken of the blood of patients transferred to the University Hospitals. All were reported as sterile. Dr. Francis³ reported that his laboratory was unsuccessful in isolating a virus from the fresh lung material sent to him at the time of autopsy. In a recent communication he stated that the serum of the ferrets which were inoculated failed to show any antibodies capable of neutralizing influenza virus.

EPIDEMIOLOGY

The epidemic nature of the disease, the uniformity of symptoms and the common pathologic changes (including occurrence of cytoplasmic inclusion bodies in the bronchial epithelium) found in all 9 fatal cases strongly suggest that a single etiologic agent was responsible for the epidemic.

The characteristic contagiousness of virus disease, as well as the definite species and tissue specificity, is well illustrated by this outbreak. In the present epidemic a definite predilection for premature and young infants was evident. At no time was a mother, nurse or other attendant ill, although intimate contact existed at the onset of the epidemic at the Booth Memorial Hospital. The particular virus here involved seems to be adapted to epithelial tissues, especially those of the lungs in premature and full term infants.

The epidemic began in the premature nursery of the University Hospitals, where a most rigid technic is employed. The pediatric staff was unable to discover a break in the technic sufficient to explain the transfer of the disease to the newborn nursery of Booth Memorial Hospital. However, at the height of the disease at the University Hospitals, 2 infants (8 and 21) were transferred at different dates from the newborn nursery to the Booth Memorial Hospital. Both infants were noted to be coughing on admission to the latter. Isolation of all newly admitted patients is always maintained for a period of at least a week. In spite of this precaution, however, 2 more infants were noted to be coughing six days after the last admission. Approximately six days after the onset of illness in these 2 infants 7 more infants were noted to be ill. The height of the epidemic occurred five to seven days later, when 10 additional infants became ill. A curve of the occurrence of onset would appear to have its peaks approximately six days apart. (Note chart at bottom of fig. 2.) From these data, it would appear that the incubation period of this disease is about six to eight days. Further observations will need to be made, however, before this can be established with certainty.

The infants at the Booth Memorial Hospital were kept in small individual cribs separated by a distance of 3 to 6 feet. Three large wards were involved. A common room was used for bathing and feeding the babies, although separate equipment was used for each child. In nearly all cases the mother lived in the hospital and cared for her own child. Nevertheless, a graduate nurse was in charge at all times. All the infants were immediately isolated with the onset of the first symptoms, and special care was given by graduate nurses. Whenever possible, the most severely ill were transferred to the University Hospitals.

3. Francis, Thomas, Jr.: Personal communication to the author.

Two babies died at the Booth Memorial Hospital before transfer could be made, and 1 died shortly after admission to the pediatric service of the University Hospitals. These cases illustrate the severity of the disease and the rapidity with which it spread. The peak of the epidemic subsided in February, as will be noted in figure 2, but only after every infant at the Booth Memorial Hospital at that time had acquired the disease. The duration of the symptoms in a few cases was prolonged, as already indicated. This long course in some of the cases probably accounted for the occurrence of the disease in the 2 infants who were born in March and acquired the disease on April 24.

PATHOLOGY⁴

Gross Changes.—Although a brief account of the observations at autopsy accompanies each case report, a composite picture of the changes encountered is presented. The pleural cavities were clear in all cases except for the presence of unilateral empyema in 1 case complicated by a secondary staphylococcal infection. The lung tissue was congested with scattered nodular areas of pneumonic consolidation, many of which were hemorrhagic. Thick, turbid exudate was expressed from the bronchi. Cut sections frequently revealed hemorrhagic areas, and exudate could be expressed from the small bronchioles as well as from the bronchi. Hemorrhage occurred in the medulla of the adrenal glands in a number of the cases.

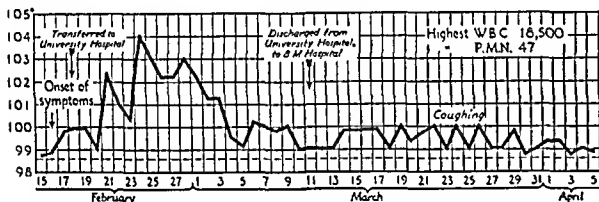

Fig. 3.—Temperature chart of J. L. O. (case 12) the highest reading for each twenty-four hour interval being recorded.

Microscopic Changes.—The bronchi showed necrosis and ulceration of the epithelium with cellular material and debris filling the lumen, composed preponderantly of sloughed epithelial cells rather than of the usual leukocytes. Patches of peribronchial infiltration filled largely with mononuclear cells were numerous. Atelectasis of intervening areas was a prominent feature of the picture. Polymorphonuclear leukocytes, lymphocytes and large mononuclear phagocytic cells were found in the alveolar spaces (figs. 7 and 8).

In addition to these changes, subsequent microscopic study revealed the presence of characteristic cytoplasmic inclusion bodies in the bronchial epithelial cells in all 9 cases (figs. 9 to 12).

No inclusion bodies were seen in the cells of the peribronchial mucous glands, although the adjacent columnar epithelium of the bronchus was found to contain many. In 5 cases the inclusions were found in the cells within the alveolar spaces (figs. 13 and 14).

The characteristic cytoplasmic inclusion bodies were found in epithelial cells only. Their locations are given in table 1. The cells containing the bodies occasionally appeared slightly larger than normal. However, most of them were found in the intact cells of normal size in the bronchial epithelium. The cytoplasm of the cells was sometimes vacuolated, and the body was often

found near the nucleus. With the hematoxylin and eosin stain the ground substance of the inclusions was homogeneous, staining bright red or acidophilic. There was a clear halo about the body in many places. Small vacuoles could be made out within the ground substance of some of the bodies.

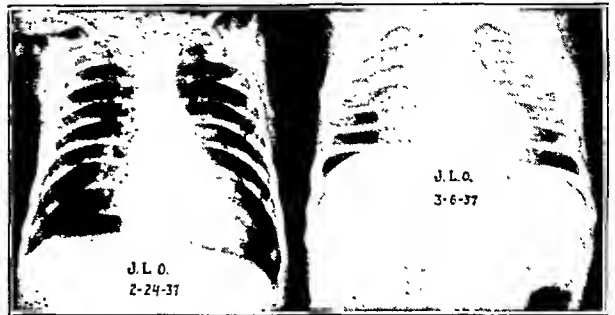

Fig. 4.—Chest of J. L. O., showing changes as seen on February 24 and March 6, interpreted as patchy bronchopneumonia.

The size of the bodies varied from 3 to 6 microns in diameter, and they were often elliptic. In most instances only one body was found in a cell. (Figures 10 to 15 are illustrations of the inclusion bodies.)

The ease with which the inclusion bodies could be found tended to vary inversely with the length of time that the patient lived. In patients dying shortly after the onset of symptoms, the inclusions were most numerous and evidence of inflammatory reaction least. When secondary bacterial invasion had made much headway, as in the case of A. M. S. (case 8), who lived twenty-five days and in whom multiple pulmonary abscesses were found at autopsy, the bodies were found only after a long search. Among the premature infants, 3 of whom died rather suddenly, the inclusion bodies were found with relative ease. This was true also of J. L. J. (case 6), who died a few hours after admission to the University Hospitals.

A careful search of the epithelial structures of the kidneys and livers of all infants who died failed to reveal the presence of inclusion bodies. Cytoplasmic bodies resembling the inclusions found in the bronchial epithelium were seen in large granular cells in the medulla and zona reticularis of the adrenal glands in several cases (fig. 15).

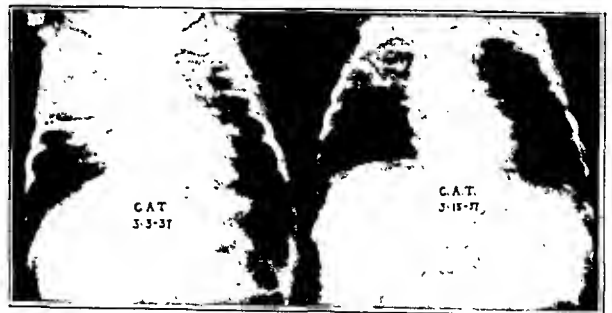

Fig. 5.—Chest of C. A. T. (case 13), showing pneumonia of the upper lobe of the right lung; the slow resolution will be noted.

The prominent pathologic features were ulceration and sloughing of the bronchial epithelium, with a rather high degree of atelectasis in all cases. The edema, hemorrhage and swelling of the surrounding parenchymal tissues seemed to cause a collapse of the bronchiolar system. The mucous exudate was copious and

4. Biologic studies of the living virus, as well as further pathologic and comparative studies of the inclusion bodies, will be reported by Dr. R. G. Green, Dr. C. A. Evans and me in the near future.

widespread throughout the bronchial system and contained some pus cells, but for the most part it seemed to be epithelial slough and amorphous material. Cytoplasmic inclusion bodies with definite characteristics were found in the bronchial epithelium in all cases, and in a few instances in the alveolar epithelium as well.

DIFFERENTIAL DIAGNOSIS

There are two disease pictures, most probably due to viruses, from which the present group of cases should be differentiated. The characteristic features of differentiation are listed in table 2. The first condition is so-called inclusion disease. The second is a form of secondary virus pneumonia described by Goodpasture and his co-workers.² "Inclusion disease," which has no distinctive clinical or pathologic features, has been found at necropsy in association with a wide variety of diseases largely confined to the period of infancy. The only pathologic change is noted in the large macrophage wandering cells which have been found to contain intranuclear and cytoplasmic inclusion bodies. Farber and Wolbach³ in a recent review noted these cells to be within the epithelium-lined spaces. They were found in the salivary ducts, the bile ducts, the

renal tubules, the acini of the thyroid gland and the ducts of the pancreas, as well as in the epithelial structures of the lung. "No distinctive pathologic process was found in these organs, the large cells often being found in otherwise normal appearing areas."

In 1939 Goodpasture, Auerbach, Swanson and Cotter² described characteristic intra-

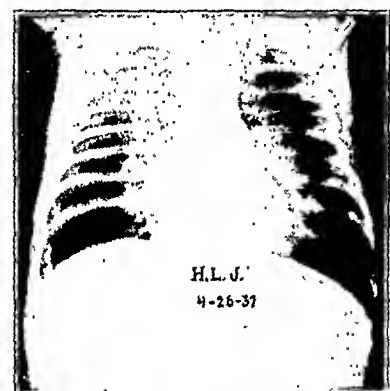

Fig. 6.—Chest of H. L. J. (case 32), showing typical changes of patchy bronchopneumonia.

nuclear inclusion bodies occurring almost exclusively in epithelial cells of the lungs in infants dying from pneumonia secondary to whooping cough and measles. Five cases occurred sporadically between 1931 and 1938. Associated with the intranuclear inclusions there was a characteristic necrosis and ulceration of the bronchial mucosa.

The differential points in the epidemic disease herewith described are (1) the clinical picture of primary pneumonitis, (2) its occurrence in epidemic form, (3) the presence of characteristic cytoplasmic inclusion bodies in the bronchial epithelial cells in 100 per cent of the infants dying from the disease and (4) the definite and distinctive pathologic picture.

As far as I have been able to ascertain, this syndrome has not been described heretofore.

REPORT OF CASES

The following brief reports concern 9 fatal cases and 6 cases in which recovery occurred. Because of their similarity to the latter, 17 other cases in which recovery occurred are not included.

CASE 1.—M., a baby boy, was admitted to the University Hospitals November 15 because of premature birth. The weight

was 1,060 Gm. and the temperature 98.6 F. The highest body weight was 2,290 Gm., attained on the fifty-seventh day of life. The patient's course was uneventful until January 8, at which time coughing and sneezing were first noted. On January 9 he had frequent attacks of cyanosis. These continued along with cough and respiratory difficulty until January 13, at which time the baby died, in spite of the administration of oxygen and other forms of therapy.

Fig. 7.—Section showing destruction and slough of lining epithelium of a bronchus (case 1). Slightly reduced from a photomicrograph with a magnification of 65 diameters.

Autopsy.—The lungs weighed 40 Gm. Their posterior portions were moderately atelectatic. On section they showed congestion and contained numerous raised or nodular areas. The smaller bronchi were found partially obstructed by turbid mucoid material. Microscopically this was found to consist largely of desquamated epithelial cells, mononuclear leukocytes, red blood cells and amorphous material. However, the most striking feature of the microscopic picture was the occurrence of characteristic cytoplasmic inclusion bodies in the epithelial cells of the bronchi. Some of the cells within the alveolar spaces likewise showed these bodies.

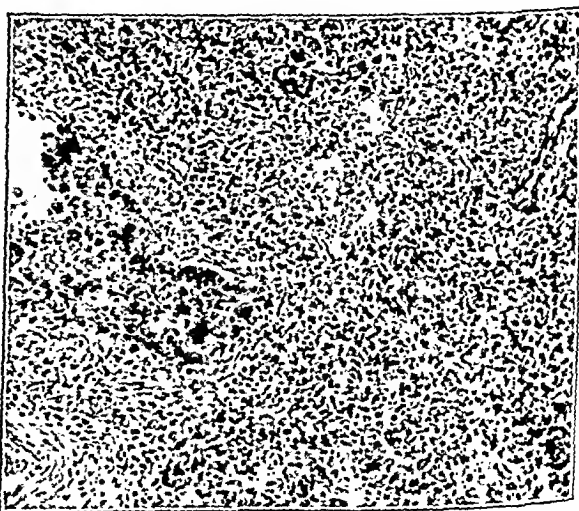

Fig. 8.—Section showing atelectasis, scattered hemorrhage and collapse of a small bronchiole with epithelial exudate filling lumen (case 6). Slightly reduced from a photomicrograph with a magnification of 270 diameters.

CASE 2.—P., a baby girl, was born on December 12 and weighed 750 Gm. Her general condition after birth was critical for a few days, with a temperature ranging from 99.4 F. to 101 F. Thereafter, however, her course was satisfactory until the time of her final illness. The highest weight attained was 1,350 Gm. On January 3 her color was more dusky than usual.

5. Farber, S., and Wolbach, S. B.: Intranuclear and Cytoplasmic Inclusions ("Protozoan-Like Bodies") in the Salivary Glands and Other Organs of Infants, *Am. J. Path.* 5: 123 (March) 1932.

Two days later her temperature was elevated to 103 F. but returned to normal the next day. During the following two weeks mild attacks of cyanosis recurred at intervals. On January 20 cyanotic spells became frequent and severe. During the next two days periods of apnea were observed, and respirations became decidedly irregular. Administration of oxygen, blood transfusions and other forms of treatment were without permanent benefit. The infant died on January 22. (The temperature record is given in figure 2.)

Autopsy.—The right lung weighed 20.6 Gm. and the left 14.8 Gm. There were scattered areas of atelectasis in both lungs, most noticeable in the left. There was no gross evidence of bronchopneumonia. A subarachnoid hemorrhage was found in the left occipital lobe measuring 2.5 cm. in diameter. No abnormalities of the brain substance were noted. Microscopic examination of the lungs revealed many alveoli with thickened walls. The blood capillaries were engorged. Alveoli occasionally contained epithelial cells, polymorphonuclear leukocytes and cellular debris. There were areas of atelectasis with little associated reaction. The most important pathologic changes occurred in the bronchi, which showed areas of necrosis and sloughing of the epithelium. Cytoplasmic inclusion bodies were numerous in the detached, as well as in the intact, bronchial epithelial cells. A few were also found in alveolar cells.

CASE 3.—S., a baby boy, was born at the University Hospitals December 14 and weighed 1,750 Gm. On January 14 sneezing

Fig. 9.—Section showing three cytoplasmic inclusion bodies in the bronchial epithelium (case 3); $\times 1,800$.

and cyanotic spells were noted. On January 15 the highest rectal temperature recorded was 100.2 F. There were several cyanotic attacks on this day. On January 16 cyanosis became severe and dyspnea was more apparent. Continuous administration of oxygen and frequent injections of epinephrine and alpha-lobeline, together with whole blood given intramuscularly, were the treatments employed. The temperature rose to 103 F. on the next day. The infant died on January 18. (Figure 2 records the temperature curve.)

Autopsy.—Grossly there was a slight degree of pulmonary atelectasis. The lungs weighed 54 Gm. On section there were numerous small irregular nodular areas scattered throughout both lungs. Microscopic examination revealed that some of the bronchi contained mucus and a few to a moderate number of leukocytes. In general, however, there was no definite bronchial obstruction. Atelectasis was patchy in distribution. No pneumonic exudate of the usual type was observed. However, the epithelial cells of the bronchi were found to contain many cytoplasmic inclusion bodies.

CASE 4.—O., a baby boy, born December 12, weighed 1,830 Gm. At birth a loud systolic murmur was heard over the precordium and cyanosis was present. On January 30 he was ready for discharge, weighing 2,575 Gm. On February 1 he began to sneeze and cough. The cough gradually increased

in severity. The temperature on the following day rose to 102 F. and on February 3 reached 104 F. At this time roentgenologic examination of the chest showed evidence of early bronchopneumonia. The infant died on February 4. Shortly before death serosanguineous material oozed from the nares and mouth. (Figure 2 records the temperature curve.)

Autopsy.—The right lung weighed 40 Gm. and the left 36 Gm. The right apex was the site of pneumonic infiltration. The

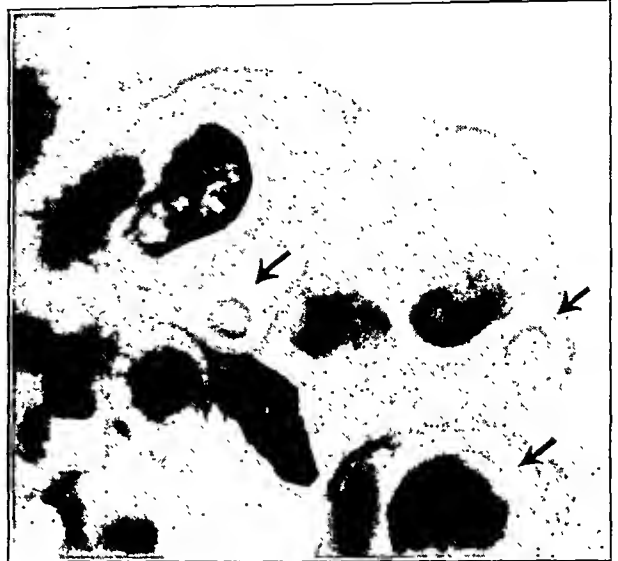

Fig. 10.—Section showing three cytoplasmic inclusion bodies in bronchial epithelial cells. Note small vacuoles in the body on the right and halo about inclusion bodies (case 2); $\times 1,800$.

entire lower lobe of the left lung was likewise consolidated, with dark red patches showing through the pleura. The bronchial epithelium was necrotic and sloughing. Collapse of the small bronchioles with a mononuclear reaction and hemorrhage was present. Further microscopic study revealed cytoplasmic

Fig. 11.—Section showing cytoplasmic inclusion body in the bronchial epithelium. This cell is in the base of an invaginated portion of the bronchus next to the mucous glands. Note mucus in the lumen (case 6); $\times 1,800$.

inclusion bodies in the bronchial and alveolar epithelial cells. The adrenal glands weighed 7.5 Gm. and showed medullary hemorrhages.

CASE 5.—S. A. B., a full term baby girl, was born January 11 at the Booth Memorial Hospital. The course was uneventful until February 12, at which time apathy, anorexia and attacks

of coughing, associated with dyspnea and cyanosis, were noted. She was transferred to the University Hospitals on February 16. Examination revealed her to be acutely ill, with a dusky color. Coughing occurred frequently. The nose was filled with a ropy, mucopurulent exudate. The pharynx was red. The respirations were dyspneic. Deep retraction of the sternum and intercostal spaces occurred with each inspiration. Fine rales

that the vocal cords were in a position of abduction until an effort was made for inspiration, when the glottis opened adequately. When respirations became more regular there was a good airway in the larynx and the cords remained abducted. Oxygen and steam were administered continuously and dextrose was given intravenously. In spite of such treatment, death occurred nine hours after admission. (The temperature record is charted in figure 2.)

Autopsy.—The right lung weighed 45 Gm. and the left 30 Gm. There was posterior hypostatic pneumonia of both lungs. Microscopic examination of the lungs showed areas of extensive peribronchiolar infiltration, predominantly mononuclear. The alveoli in certain areas contained phagocytes in which droplets of fat could be detected. The bronchioles were partially filled with cellular exudate. There were no areas of pneumonic consolidation found. Further microscopic study revealed characteristic cytoplasmic inclusion bodies in the bronchial epithelium and also in the alveolar cells.

CASE 7.—E. L. B., a full term baby girl, born November 13 at the Booth Memorial Hospital, weighed 7 pounds and 15½ ounces (3,615 Gm.) at birth. Physical examination revealed her to be cyanotic, with a loud to and fro cardiac murmur heard over the entire precordium. The patient gained weight and the cyanosis persisted. A roentgenogram and an electrocardiogram confirmed the impression of congenital heart disease. The present illness began on February 11 with coughing. On February 12 cyanosis was increased, with severe coughing and listlessness. Dyspnea also accompanied this picture. The patient died on February 16, having had little deviation in temperature. (The temperature record is charted in figure 2.)

Autopsy.—The heart showed enlargement of the right auricle with an incomplete septal formation of auricles and ventricles. The right lung weighed 39.4 Gm. and the left 51 Gm. They appeared red and congested. On section extensive bronchopneumonia could be demonstrated. The adrenal glands weighed 3 Gm. each and showed medullary hemorrhages. Microscopic examination of the lungs revealed engorgement of blood vessels and multiple areas of bronchitis with peribronchial infiltration by lymphocytes, mononuclear cells and polymorphonuclear leukocytes. Extensive atelectasis was present. The bronchi in places were filled chiefly with a mononuclear exudate mixed

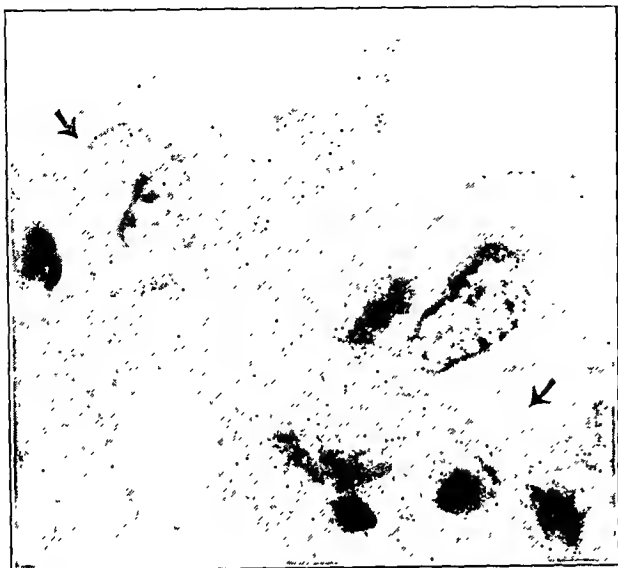

Fig. 12.—Section showing cytoplasmic inclusion bodies in bronchial epithelium (case 2). Note vacuoles in the larger body; $\times 1,800$.

were heard over both pulmonic fields, but no other evidence of consolidation was found on physical examination. The hemoglobin content of the blood was 90 per cent; the total leukocyte count was 6,400 per cubic millimeter, with 77 per cent neutrophils, 20 per cent lymphocytes and 3 per cent monocytes. Roentgenograms of the lungs revealed slight densities in the upper lobe of the right lung suggestive of patchy bronchopneumonia. The child was treated with oxygen, mild sedatives and steam inhalation. Attacks of cyanosis became more frequent and severe. The white blood cell count on the third day in the hospital rose to 15,000, with 69 per cent neutrophils, 28 per cent lymphocytes and 3 per cent monocytes. Death occurred during an attack of cyanosis on February 20, the fifth hospital day. (Figure 2 charts the temperature record.)

Autopsy.—The right lung weighed 60 Gm. and the left 45 Gm. Both lungs, especially in the lower lobes, showed numerous hemorrhagic consolidated areas up to 6 mm. in diameter. The bronchi contained a small amount of colorless mucous material. Microscopic examination of the lung disclosed scattered areas of hemorrhage and atelectasis. Necrosis of bronchial epithelial cells evidenced by sloughing with but a single layer of cells remaining stood out as a prominent change. The epithelial cells of the bronchi showed cytoplasmic inclusion bodies. Pneumococcus typing by the Minnesota State Board of Health yielded pneumococcus type XXVII, obtained from a culture taken post mortem of material from the lungs.

CASE 6.—J. L. J., a full term baby boy, was born at the Booth Memorial Hospital on December 31. His course was uneventful until February 12, when coughing was first noted. Shortly thereafter respiration became difficult, as considerable amounts of mucoid exudate accumulated in the air passages. He was transferred to the University Hospitals on February 15. Cough was now intense and dyspnea evidenced by noticeable retraction of the sternum, costal margins and intercostal spaces. Severe attacks of cyanosis were associated with periods of apnea broken by sudden, deep respirations. The pulse was irregular. Many fine, sticky rales were heard over the upper lobes of both lungs, but there was no impairment of the percussion note over such areas. Roentgenograms of the lungs, however, disclosed increased density and mottling involving the upper lobes of both lungs. From a laryngoscopic examination made during an attack of respiratory difficulty it was observed

Fig. 13.—Section of lung, showing alveolar cell with an inclusion body in the cytoplasm (case 8); $\times 1,800$.

with a few necrotic epithelial cells. The intact as well as sloughing bronchial epithelial cells contained many cytoplasmic inclusion bodies.

CASE 8.—A. M. S., a baby girl born at the University Hospitals January 21, was slightly immature and weighed 2,400 Gm. She was discharged from the University Hospitals on January 31, weighing 2,140 Gm., and was admitted to the Booth Memorial Hospital. At the time of admission the child was

listless and was coughing. Her cough continued, and on February 10 the temperature was 100 F. She was transferred back to the University Hospitals on February 17. For twenty-four hours prior to admission the child's condition was poor, characterized by increasing cough and cyanosis associated with prolonged periods of apnea. Physical examination revealed her to be small, flaccid and listless. There was no dullness over

Fig. 14.—Section of lung, showing an alveolar cell with inclusion body in the cytoplasm. Note halo about body (case 8); $\times 1,800$.

the pulmonic fields but there were questionable diminished breath sounds and fine rales on the right side. Leukocytes numbered 5,700 with 6 per cent neutrophils, 91 per cent lymphocytes and 3 per cent monocytes. A roentgenogram of the lungs showed some mottling and increased density throughout the right side suggestive of patches of bronchopneumonia. The child was given blood transfusions on three occasions and fluid subcutaneously. The white blood cell count rose to 36,000 with 35 per cent neutrophils, 64 per cent lymphocytes and 1 per cent monocytes. A roentgenogram of the lungs on the day prior to her death disclosed a homogeneous shadow obliterating the lower two thirds of the right pulmonic field. This was interpreted as consistent with consolidation and possibly a small amount of fluid and either small abscesses within the lung or small air pockets in the pleural space. There was some suggestion of atelectasis. The child's cyanosis and respiratory irregularity increased progressively during the last three days of life. (The temperature record is charted in figure 2.)

Autopsy.—The pleural cavity showed multiple fibrinous adhesions on the right side, with about 20 cc. of purulent fluid in the posterior cavity in the right side of the chest. The right lung weighed 55 Gm. and the left 30 Gm. The right lung was grossly consolidated and adherent throughout. The left lung showed a few ecchymotic areas. The liver weighed 200 Gm. and extended 5.5 cm. below the right costal margin. The kidneys were pale and showed ecchymotic areas; on section small hemorrhagic areas were seen in the cortex. Microscopic examination of the lungs showed the pleura covered with a fibropurulent exudate. There was evidence of severe bronchopneumonia with predominant mononuclear infiltration. Some areas showed more destruction than others, with the formation of abscesses. Microscopic study (by oil immersion) of the pulmonary tissues revealed characteristic cytoplasmic inclusion bodies in the bronchial epithelial and alveolar cells.

CASE 9.—J. D. O., a full term baby boy, was born December 31 at the Booth Memorial Hospital. The child's course was normal until February 12, at which time he was listless and coughed. On February 16 he was transferred to the University Hospitals with a history of cough for four days. Apathy, anorexia and increasing dyspnea were accompanied by mild cyanosis. Examination revealed him to be acutely ill with

respiratory difficulty, subcostal and sternal retraction and slight cyanosis. Many fine, sticky rales were heard throughout both lungs and sounded close to the surface. Examination of the blood showed hemoglobin 81 per cent, leukocytes 10,000, neutrophils 25 per cent, lymphocytes 71 per cent, eosinophils 3 per cent and basophils 1 per cent. Pneumococcus type XXVII was isolated from the sputum. Roentgenograms showed an area of increased density in the upper portion of each lung. A low grade temperature characterized the child's course in the hospital. On two or three occasions only did it rise as high as 100.8 F. Further roentgenograms of the lungs on February 27 were interpreted as demonstrating bilateral bronchopneumonia. The child was treated with three small blood transfusions, fluids given subcutaneously and oxygen. The attacks of cyanosis and cough gradually subsided, and the patient was discharged in good condition on March 9.

CASE 10.—A. R. G., a full term baby boy, was born at the Booth Memorial Hospital January 5. The clinical course was uneventful until the present illness, which began four days prior to admission to the University Hospitals on February 16. This period was characterized by cough, listlessness and apathy with anorexia. Two days before admission there had been increasing dyspnea with severe cough. Periods of cyanosis associated with dyspnea developed. Physical examination disclosed him to be acutely ill and apathetic, with a harsh, deep cough. No definite dullness to percussion was elicited but fine, sticky rales were heard close to the surface. Cyanosis was slight. Examination of the blood showed hemoglobin 80 per cent, leukocytes 7,400, neutrophils 33 per cent, lymphocytes 66 per cent and basophils 1 per cent. Roentgen studies of the lungs revealed a slight evidence of bronchopneumonia. Treatment consisted of oxygen given by nasal catheter, blood transfusions and fluid given subcutaneously. The patient was discharged to the Booth Memorial Hospital, where further examinations on April 2 and April 24 revealed him to be normal. (The temperature record is charted in figure 2.)

CASE 11.—J. R. D., a full term baby girl, born at the Booth Memorial Hospital on January 5, had an uneventful infancy until February 12, when she began to cough. The patient was transferred to the University Hospitals with a history of cough, dry and hacking, of five days' duration. On the day of

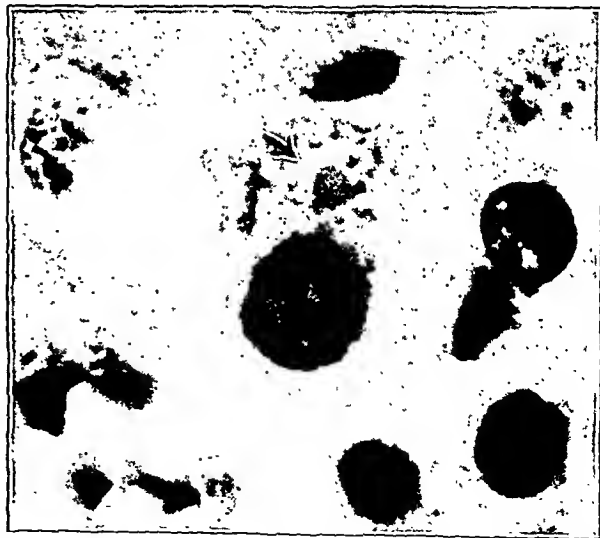

Fig. 15.—Section of adrenal medulla, showing large cell with inclusion-like body in the cytoplasm (case 2); $\times 1,800$.

admission cyanosis developed. Physical examination disclosed her to be slightly cyanotic, with dyspnea and noticeable retraction of the intercostal spaces and the sternum. Wet, sticky rales could be heard at the end of inspiration. Examination of the blood showed hemoglobin 90 per cent, leukocytes 15,400, neutrophils 50 per cent and lymphocytes 50 per cent. Roentgen study of the lungs showed no changes except for areas of increased density along the right border of the mediastinum. The roent-

gen appearance was suggestive of rather advanced emphysema together with probable bronchopneumonia at the medial portion of the right lung. On February 27 the leukocyte count reached 29,000, and on March 8 it dropped to 15,000. Type XXVII pneumococcus was isolated. Streptococci were also present in large numbers. Subsequent roentgen studies on February 24 and March 1 showed approximately the same conditions in the lungs. The child's course in the hospital was prolonged. Little fever was present during the first five days. The temperature then ranged between 100 and 101 F. for a period of ten days. The cough increased and the cyanosis became more severe. Oxygen was administered through a nasal catheter. The patient received one transfusion and was discharged on March 9. Subsequent examination on April 2 showed her to be normal.

CASE 13.—C. A. T., a full term baby girl, was born November 21 at the Booth Memorial Hospital. Her infancy was uneventful until February 19, at the age of 11 weeks, when cough, anorexia, listlessness and apathy developed. On February 22 the temperature was 102 F. Rales were heard on both sides, and noticeable retraction of the sternum and intercostal spaces was observed. Severe cough and cyanosis were present. On February 23 the temperature reached 104 F. On February 27 the patient was transferred to the University Hospitals. Listlessness, pallor, sweating of the forehead and cyanosis were observed. Percussion over the upper lobe of the right lung was dull (fig. 6). Breath sounds were diminished, and many fine rales were present. Examination of the blood showed leukocytes 10,800, neutrophils 40 per cent, lymphocytes 56 per cent, monocytes 3 per cent and eosinophils 1 per cent. The leukocyte count on March 3 was 19,650 with 71 per cent neutrophils. Sputum aspirated from the esophagus contained type XXIII pneumococci. Roentgenograms on February 27 revealed an area of increased density of the upper portion of the right lung and also some increase of the markings at the base of it. On March 2 a roentgenogram showed some extension of this pneumonic process. On March 11 and 19 some resolution was evident (fig. 5). (The temperature record is charted in figure 2.)

CASE 14.—T. J. C., a full term baby boy, born December 24 at the Booth Memorial Hospital, was normal until February 22. On that date a slight nasal discharge and cough were noted. However, feedings were taken well. The next day at 3:15 a. m. the baby was observed by the nurse to be cyanotic and dyspneic. A few minutes later he died. (The temperature record is charted in figure 2.)

Autopsy.—The right lung weighed 100 Gm. and the left 110 Gm. A small amount of pus was expressed from the bronchi. There were scattered red areas throughout the parenchyma of

Cough was severe; cyanosis was not observed but some respiratory difficulty was present. The temperature rose to 101.2 F. on the second day. The infant was transferred to the University Hospitals on April 26. Physical examination revealed rales over both pulmonary fields. Roentgen examination of the lungs revealed patchy areas of increased density extending out from

TABLE 2.—Comparison of Inclusion Disease, Virus Pneumonia of Goodpasture and Present Cases

Diseases involved	Inclusion Disease	Virus Pneumonia of Goodpasture	Present Cases
	Congenital syphilis, miliary tuberculosis, pneumonia (Strep.), meningococcal meningitis, keratomalacia, erythroblastosis, hernia, pneumonia	Whooping cough and measles with secondary pneumonia following	Primary pneumonitis (epidemic)
Organs involved	Salivary glands (common), kidneys (common), liver, lungs, adrenals, thyroid, others	Lungs	Lungs
Clinical and pathologic association	None; no distinctive features, symptoms or disease changes	Pneumonia following measles and whooping cough with pathologic changes of a severe character	Distinctive symptomatology and clinical disease picture of primary pneumonitis with pathologic changes of a severe character
Inclusions	Intranuclear and cytoplasmic	Intranuclear	Cytoplasmic
Cells affected	Large macrophage wandering cells in veins and ducts of epithelial tissues and mesothelial tissues	Epithelial cells of trachea, bronchi, mucous glands and alveolar epithelium	Epithelial cells of bronchial tree and alveoli

both hilar regions (fig. 6). The white blood cell count was 10,300, with polymorphonuclears 40 per cent, lymphocytes 57 per cent, monocytes 1 per cent, eosinophils 1 per cent and basophils 1 per cent. The patient was discharged to the Booth Memorial Hospital on May 3. Physical examination there on June 2 gave negative results.

COMMENT

The now widely accepted concept of Green regarding the nature of viruses is that they are highly specialized, incomplete microbes originating from protozoa and bacteria. They are fundamentally biologic units. Without biologic studies of the living virus one is able to postulate little regarding the life history of this particular organism. Green⁶ stated that "adaptations of viruses to types of cells supersede adaptations to anatomic locations in the individual host and, within certain limits, even supersede adaptations to the species of animal invaded." What other species of animals may be involved in the life history of the virus with which we are now dealing remains for future determination. According to Green, the rigid prerequisites for the survival of a virus are twofold: "First, certain habits must be of such frequency as to insure transfer from one host to another, thereby perpetuating the species; second, fortuitous activities that hinder the transfer to a new host must not be so frequent as to result in failure of host to host transfer and thus destroy the continuity of reproduction." With this idea in mind it may be assumed that there must have been outbreaks of this disease in the past, and one can fully expect to find more in the future.

the lungs. Microscopic examination of the lungs revealed scattered areas of congestion and edema; the alveolar septums were infiltrated with mononuclear and polymorphonuclear cells. Patches of monocyte infiltration were common. The small bronchioles in places were filled with epithelial cells; the bronchi contained pus cells and amorphous debris. Cytoplasmic inclusion bodies were found in the bronchial epithelium.

CASE 32.—H. L. J., a full term baby boy, was born March 16. The present illness started on April 23 at the age of 5 weeks.

6. Biologic studies of the virus from recent cases of the disease reported here are in progress.
7. Green, R. G.: The Biology of Animal Viruses, in Virechet, M. B.: Chemistry and Medicine, Minneapolis, University of Minnesota Press, 1940.

The contagiousness evident in this group of cases and the specificity manifested for young infants are epidemiologic features commonly seen in epidemic diarrhea of the newborn. The latter disease is now recognized as a clinical entity of unknown etiology and is by far the most common epidemic disease of this period of life. Frant⁸ pointed out that data from extensive bacteriologic studies in cases of epidemic diarrhea of the newborn have revealed no definite results and further suggested that the general discrepant character of the data strongly indicates that a virus is responsible for this disease.

It has been established by Rivers and other workers in the virus field that "inclusion bodies constitute the visible manifestations of a series of activities taking place in living and frequently in growing cells under the stimulation and degrading influences of certain viruses." The specific or distinctive differences in inclusions, according to Rivers, "may be dependent on the species of host, the type of cell and its portion affected, and the nature of the stimulus in the form of virus or its activity." Goodpasture has stated that cytoplasmic inclusions are often more characteristic of the specific virus involved than are intranuclear bodies, and in certain instances they are pathognomonic of the infecting agent. The type of cell involved, the effect of the agent concerned on that cell, as well as the distribution and the general character of the lesion, are most important in the diagnosis of virus disease.² A comparative study of inclusions in distemper by Green and Evans⁹ illustrates these features most clearly. They showed that the distribution of inclusion bodies indicates that the virus of epizootic fox encephalitis attacks primarily endothelium and that the virus of canine distemper attacks epithelium primarily. In the pathologic material from all 9 fatal cases reported here, only cytoplasmic inclusions were found in the bronchial epithelial cells.

Pulmonary disease in premature and full term infants presents a problem peculiar to the anatomy and physiology of the lungs at this age. The atelectasis and emphysema so commonly accompanying pneumonitis in the first few weeks of life are expressions of the infantile pulmonary immaturity. Pulmonary congestion is an important factor in the pathogenesis of pneumonitis in infancy. The most common illnesses of childhood predisposing to pneumonia are, according to Trask,¹⁰ the common cold, grip, influenza and measles. Edema and congestion of tissues are well known early signs in these diseases. It is noteworthy that all of them are now considered to be due to viruses. Inflammation in the form of cellular exudation, as pointed out by Rivers,¹¹ is a secondary phenomenon in most virus diseases, the primary changes being either degenerative or proliferative.

Congestion was an early occurrence in the cases described. Sneezing and cough were the first symptoms. A copious discharge, ropy in character, was present in most instances. Auscultation of the chest in the early stages revealed diffusely scattered rales. The

cyanosis and respiratory distress, which in some cases were the first symptoms, also indicated that acute pulmonary congestion was present in the patients. In patients dying early from the disease there was pathologic evidence that congestion played a major role in determining the lethal outcome. Microscopic examination of the peribronchial areas showed congestion and partial collapse of the bronchiolar system. The smaller air passages were in places filled with desquamated epithelium. Associated with these changes was fairly widespread atelectasis with little evidence of inflammatory reaction.

This pathologic picture, as well as the characteristic clinical features, suggests that in these peculiarly susceptible infant hosts the virus was the sole agent responsible for the severe illness and even for death in all fatal cases except 1. This conviction is further borne out by the fact that the mortality was 100 per cent in the premature infants affected.

Several recent reports of "atypical pneumonia" referred to in the introduction indicate that the recognition of viruses as possible causes of pulmonary disease is no longer limited to epidemic influenza. Much further study and classification of such disease is obviously needed at the present time. Francis¹² has stated that "differential diagnosis of the diseases caused by them (the viruses) must rest on clinical epidemiology in which clinical features are viewed in the light of established etiology." The ubiquity of the viruses must put physicians on guard for similar outbreaks of infection of the respiratory tract in infants.

SUMMARY AND CONCLUSIONS

1. Cough, dyspnea and cyanosis were the prominent clinical signs of a hitherto undescribed form of primary, epidemic, virus pneumonitis in 32 cases here reported. These were out of proportion to the physical abnormalities in the chest, which consisted principally of fine rales. Biphasic temperature curves were recorded in many cases.

2. Death occurred in all 4 of the premature infants affected and in 5 of the full term infants, resulting in a total mortality of 28 per cent.

3. The distinguishing pathologic changes in the lungs were edema, hemorrhage, atelectasis, mononuclear infiltration and necrosis and sloughing of the bronchial epithelium.

4. Characteristic cytoplasmic inclusion bodies were found in the bronchial epithelial cells of all infants dying from the disease.

5. Influenza was ruled out as the cause of this epidemic by the fact that ferrets inoculated with fresh material failed to generate an influenza-neutralizing antibody. Inclusion bodies have never been found in influenza.

6. Bacteriologic studies revealed that 4 infants had type XXIII and 3 infants type XXVII pneumococci. None of these died, with the exception of 1 in whom type XXVII pneumococcus was found at autopsy.

7. The virus nature of this epidemic pulmonary disease is indicated by its high degree of contagiousness, by its distinctive symptomatology and pathology and by the failure of our laboratories to identify a causative bacterium.

SKIN PEELING AND SCARIFICATION

IN THE TREATMENT OF PITTED SCARS, PIGMENTATIONS AND CERTAIN FACIAL BLEMISHES

JOSEPH J. ELLER, M.D.

AND

SHIRLEY WOLFF

NEW YORK

Cosmetic defects such as pitted scars and unsightly pigmentations may affect the mental well-being and the economic opportunities of a person. The removal or improvement of cosmetic defects is always a problem.

Fig. 1.—Patient was 31 years of age and suffered from a severe pustular acne for ten years, which resulted in deep pitted scars. Patient was otherwise in good health.

We here describe procedures which we have found efficient in obliterating or lessening such disfigurements.

The so-called skin peeling procedure is used in the treatment of chloasma, marked freckling, excessive oiliness, recalcitrant cases of acne vulgaris, rosacea, and to improve the tone of the skin. It is also beneficial after scarification for the improvement of pitted scars from acne vulgaris, smallpox and chickenpox.

The term "skin peeling" connotes an artificially produced exfoliation of the corneous layer, sometimes extending beyond, caused by various chemical or physical measures.

Normally there is a continuous desquamation of the outermost cells of the corneous layer of the epidermis as part of the process of the physiologic life and death of the epithelial cells. These cells originally derived from the basal or germinal cell layer of the epidermis, gradually move upward, lose their nucleus, become keratinized when they reach the corneous layer, and eventually exfoliate. The application of chemicals for peeling accelerates this process. Preceding the acute exfoliation of the corneous layer produced by chemical applications,

the skin undergoes an inflammatory process with edema. When the inflammation and edema subside, the corneous layer becomes crinkled and parchment-like and then is shed.

The skin peeling process rarely extends beyond the outermost or the corneous layer of the epidermis, and even with the most drastic treatment the lower part of the epidermis rarely exfoliates and the dermis or true skin is not peeled. If the basal cell layer of the epidermis were peeled, there would be bleeding from the blood vessels in the papillae and the possibility of scarring.

A definite improvement in the appearance of the skin after a peeling treatment is apparent. In some conditions it is temporary, in others it is more lasting. The actual peeling is not in itself wholly responsible for the improvement. An explanation might be the increase in the metabolism of the tissues locally, resulting from the intense inflammation and edema caused by the treatment. The astringent effect of the chemicals on the oil and sweat glands may also play a role.¹ This may be the explanation for the improvement frequently observed in cases of indolent acne.

Many methods are used to produce peeling of the skin. Early records show that the Egyptians, Assyrians and Babylonians rubbed pumice on the skin to cause exfoliation of the corneous layer—a method which is in use even today. Exposure to natural or artificial

Fig. 2.—Same patient as in figure 1. The patient's skin was deeply scarified and peeled three times during a period of four months.

sunlight may cause an intense erythema followed by exfoliation. The following chemicals are used for skin peeling: salicylic acid, acetone, resorcinol, solution of formaldehyde, phenol, betanaphthol, glacial acetic acid, mercurial salts, sulfur and solid carbon dioxide. Most of these ingredients can be absorbed through the skin

1. It is well known that many chemicals readily penetrate the skin, reaching the oil and sweat glands.

into the circulation, with the possibility of toxic manifestations occurring in susceptible persons. Before any of the peeling chemicals are applied, the possibility of kidney disease should be eliminated, as this would be a contraindication to their use.

The use of phenol as an exfoliating agent should be confined to selected cases. It can be used with good

toxic manifestations. Repeated peelings of the skin with phenol may damage the fibrous and elastic tissue. Mercurial salts and betanaphthol must also be used with caution.

Chemicals in different concentrations may be used, depending on the rapidity and severity of reaction and the extent of peeling desired. There are some persons

Fig. 3.—Patient was 19 years of age and suffered from a recalcitrant pustular acne for some years, which resulted in numerous pitted scars.

who may have an idiosyncrasy for any one or a combination of these chemicals. If there is a history of an untoward reaction to any one of them, its use should be avoided. In doubtful cases a patch test may be done. However, a negative test may not preclude the

Fig. 4.—Same patient as in figure 3, two years later. This patient's skin was scarified and peeled four times over a period of a year.

possibility of a local sensitivity, especially if the test is made on an area other than the one to be treated.

Chemical peeling agents may be used in the form of pastes or lotions, as given in the accompanying formulas. Certain ones will produce a mild inflammatory reaction with delayed and gradual exfoliation, others an acute severe reaction with rapid exfoliation.

Preliminary to any of the procedures or formulas to be used, the skin should be prepared by a thorough cleansing and degreasing. This may be done in the following manner: The skin should be thoroughly cleansed with soap and water, followed by the application of hot towels for about fifteen minutes, after which any comedones or milia present should be removed.

Fig. 5.—Severe case of chloasma on the face of a woman aged 43.

The skin is then cleansed with ether in order to remove any remaining grit or oil. Sedatives may be given to make the patient more comfortable.

After the peeling chemicals, powdered talcum may be applied to keep the skin as dry as possible until

exfoliation occurs. Water or emollients should not be used until the exfoliating layer has been or is being cast off.

PASTES

A mild reaction with delayed peeling (from two to four weeks) may be produced by the application of any one of the pastes given in table 1.

Formulas for pastes to induce an intense inflammatory reaction with rapid peeling are given in table 2.

In order to avoid any untoward reactions, pastes 4, 5, 6 and 7 should at first be applied for only twenty minutes to one hour or longer in order to ascertain as far as possible any hypersensitivity. This test will also help to determine the duration and the frequency of subsequent applications. The paste should be applied about 1 mm. thick as evenly as possible over the face,

with care to avoid the eyelids and the vermillion border of the lips. Ordinarily these pastes are left on for about twelve hours, but the time may be shortened or lengthened, depending on the reaction desired. After each application the paste is removed with benzine or ether, and powdered talcum or lotio alba may then be applied. Usually pastes 4, 5, 6 and 7 will produce a severe inflammatory reaction with edema after an application of twelve hours. However, the desired reac-

tion may not occur until the treatment is repeated on two or three successive days. When the edema begins to subside, the skin assumes a reddish brown, dusky hue. As it further subsides, the skin becomes parchment-like or mummified, shortly after which numerous fissures develop and exfoliation occurs. As already

Fig. 6.—Same patient as in figure 5, showing removal of pigmentation following a skin peeling. There has been no recurrence of the pigmentation in over four years.

mentioned, emollients or water are not to be used until exfoliation is well under way or completed.

Many prefer to use the peeling agents in solutions rather than in pastes. The solutions are more easily applied. The intensity of the reaction in the skin and the depth of peeling desired can be controlled by varying the concentrations of the solutions and the number and intervals of their applications.

LOTIONS

The solution given in table 3 is applied over the entire face with a cotton applicator every 10 minutes for 5 to 8 applications. The edges of the eyelids and the lips must be avoided. As the fumes may irritate the eyes, castor oil should be dropped into them preceding the applications and, if necessary, repeated

Fig. 7.—Extensive freckling of the face of a woman aged 37.

during the treatments. The pain may be lessened by drying with a fan. After the third application, the lotion may be rubbed in until the skin becomes whitish. Only a freshly mixed solution should be used, and a new cotton applicator for each painting. During the period of applications, the patient should drink five or

six glasses of water. After the sixth application, swelling usually occurs. This increases for about three days, the skin assuming a darkish hue. In order to keep the face dry, the patient is instructed to apply powdered talcum two or three times daily. On the fourth or fifth day the edema subsides, the skin becomes parchment-like or mummified and fissured, and on the sixth or seventh day exfoliation occurs.

In tables 4 and 5 are additional formulas for peeling lotions.

Phenol lotions are used when an intense reaction and deep peeling are desired. The number of applications will be determined by the sensitivity of the skin, and it is advisable at first to apply one coat only, to note the reaction. The number of applications should be limited to four and may be given over a period of an hour.

PEELING BY CRYOTHERAPY

Cryotherapy, or the use of carbon dioxide snow slush, has proved most efficient in the treatment of recalcitrant cases of acne vulgaris and its scars, rosacea and superficial telangiectasia. It can also be used to advantage in any condition of the skin in which a mild astringent action and peeling are desired.

The carbon dioxide slush is prepared as follows: One hundred and fifty Gm. of solid carbon dioxide (dry ice) is hammered into a fine powder, which is then placed in a mortar and thoroughly mixed with about 10 Gm. of precipitated sulfur. Sufficient acetone is added to this mixture, with constant stirring, until a slush the consistency of soft "water ice" is obtained. A gauze tampon is dipped into the slush and immediately rubbed on the skin. Sufficient rubbing with pressure is done to cause a mild blanching of the skin. This may be repeated several times during one session, depending on the severity of the reaction and the depth of peeling desired. These treatments may be given

Fig. 8.—Same patient as in figure 7, showing removal of freckles following peeling treatments with a lotion containing salicylic acid and resorcinol.

several times weekly over a period of months. This mixture is also efficacious without the sulfur, especially in the absence of acne or rosacea. When giving these treatments, one should carefully protect the eyes by means of a shield. In order to avoid burns of the skin, no solid ice particles should be present in the slush.

Another method of applying the carbon dioxide slush is to place the finely ground dry ice and the sulfur in a

gauze bag into which the acetone sufficient to make the consistency of hard water ice is dropped. The bag is then applied directly to the skin with a rubbing motion. The fingers of the operator are protected by a thick rubber ring through which the upper part of the bag is pulled through and held.

After the evaporation of the solid carbon dioxide and acetone on the skin, the sulfur residue may be allowed to remain for about three hours, after which it may be washed off with soap and water. The following day there is a mild erythema and peeling of the skin.

SCARIFICATION

Scarification is a method of treatment which will in many cases improve the appearance of pitted scars, especially the superficial ones. For the deeper scars, repeated scarification is necessary. This is best done with a scalpel having a sharp thin blade. Various instruments with multiple blades have been recommended with the claim that the incisions are more uniformly

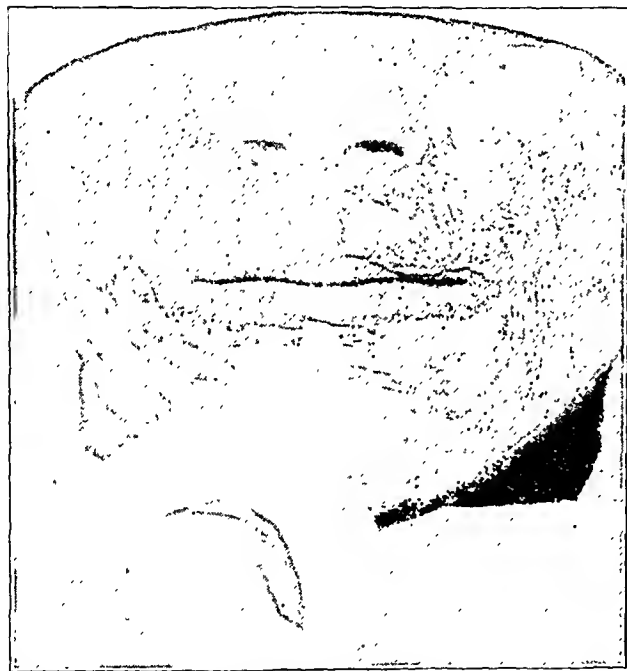

Fig. 9.—Carbon dioxide slush (containing sulfur) applied in a case of acne pitted scars. A gauze covered applicator is dipped into the slush and immediately applied to the skin by rubbing with a circular motion, using slight pressure.

spaced and that the time required is shortened. We favor the use of the single blade, since it enables the operator to be in full control of each incision. The scars are crisscrossed with multiple closely made incisions into the cutis, varying in depth according to the scar. Bleeding occurs when the papillae have been penetrated. Strict aseptic precautions must be followed to prevent infection. Healing takes place by first intention in about a week.

Unusually deep or cuplike scars may be improved considerably by shaving off the upper layers of the skin as in taking an epidermic skin graft. This removes the upper edges of the scars, thereby lessening the depths of their concavities. Cuplike scars may also be improved by bevelling off their edges by electrodesiccation.

The skin peeling procedures may follow the treatments any time after healing takes place.

CUTANEOUS AND CONJUNCTIVAL MANIFESTATIONS OF SULFATHIAZOLE INTOXICATION

ITALO F. VOLINI, M.D.

Professor and Chairman of the Department of Medicine, Loyola University School of Medicine; Attending Physician and Chairman of the Pneumonia Committee, Cook County Hospital

ROBERT O. LEVITT, M.D.

AND

HUGH B. O'NEIL, M.D.

Resident Physicians, Pneumonia Service, Cook County Hospital
CHICAGO

The introduction of the newer chemotherapeutic drugs has produced several clinical patterns of toxic manifestations. These effects are encountered in several organs and tissues of the body. One of the most common of these is the untoward reaction encountered in the skin. Indeed, if the nausea and vomiting induced by sulfapyridine are eliminated from consideration, cutaneous rashes are probably the most frequent toxic reaction.

Attention has been directed repeatedly to these cutaneous manifestations with the use of sulfanilamide and sulfapyridine. Experience indicates the former as the more frequent offender in this regard. For example, the types of rashes encountered are indicated by such varied descriptions as erythematous, morbilliform, maculopapular, erythema multiforme, vesicular, bullous, urticarial, exfoliative and purpuric. On the other hand, rashes produced by sulfapyridine have been infrequent. The morbilliform eruption is most commonly encountered on sulfanilamide administration. Nevertheless, specific rashes probably cannot be ascribed to the specific sulfanilamide drug. There may be an exception to this statement because we have encountered a nodular type of rash only with the use of sulfathiazole.

Sulfathiazole, 2-sulfanilamidothiazole, has been recently introduced as an addition to the chemotherapeutic armamentarium. The advantages of this synthetic derivative of sulfanilamide over sulfapyridine are definite and have been described in detail by several investigators. However, Long and his associates¹ have stressed the frequency with which cutaneous rashes are encountered, reaching the astonishing incidence of 12.8 per cent in a group of 78 cases. Flippin and his associates² gave an incidence of 4 per cent of 100 patients treated. The following report deals with 7 patients suffering a rash while on sulfathiazole medication, an incidence of 3.9 per cent in a group of 180 patients. The untoward reactions otherwise encountered in this series have been surprisingly small: nausea and vomiting in 3.8 per cent and drug fever in 1.2 per cent, both thus surpassed by the incidence of cutaneous rashes. A summary of the series appears in the accompanying table.

The average dose of sulfathiazole employed in the series of 180 patients was 26 Gm. The average dose

Read before the Chicago Society of Internal Medicine, Nov. 25, 1940.

given patients in whom rashes developed was 34 Gm. While the rash occurs most frequently and with greater severity after the use of large total doses, it must be stated that 2 patients showed cutaneous eruptions after only 6 Gm. was employed. One of these patients, however, had received 12 Gm. six days before. The patients who died were given doses of 30, 51 and 75 Gm.

Fig. 1.—Nodular rash of lower extremities, arm and abdomen.

respectively. All suffered from severe pneumonic disease, which was the cause of death. One patient with a maculopapular rash survived although receiving a total dose of 59 Gm.

In 4 patients the manifestations appeared after five days of use of the drug, namely after five, five, ten and

P. H.	39	2d day	20	2.8	Urticarial	Recovery

* Had received 12 Gm. of the drug over a period of three days, six days previously.

fourteen days respectively. The remaining patients had onset after two and three days. One person showed a maculopapular rash after twenty-four hours on resumption of the drug when it had been discontinued for six days after three days of medication. This suggests sensitization induced by the resumption of interrupted medication. Three patients over 50 in whom cutaneous manifestations developed died, all showing the severe, nodular form of rash. This correlation of age with a high percentage of mortality is definite with pneumococcal infections of the lung, although some toxemia is probably added by the drug intoxication. The average blood sulfathiazole concentration in the patients with eruptions was 4.2 mg. per hundred cubic centimeters, with a range from 2.5 to 7.1 mg. Determinations were made at the appearance of the rash, when the drug was usually discontinued. This blood concentration average

is about the same as that encountered in the entire series, a level of accepted therapeutic effectiveness. Thus no conclusions can be drawn as to the relation between the concentration of the drug in the blood and the development of the rash.

The variety of rashes encountered in this series was as follows: one urticarial, three maculopapular and three definitely nodular, one of the last-mentioned being complicated by a purpuric lesion. The chronologic sequence apparently is first macular, then papular and finally nodular, depending on the total amount of the drug administered, the continued use of the drug and, perhaps an additional factor, the age of the patient. Increasing age probably renders the patient more susceptible to cutaneous complications, especially the severer forms. The first two stages, macules and papules, may appear almost simultaneously and are not distinctive. The nodular form, however, has presented a rash which we have not encountered previously in any other disease or condition.

The nodules appeared first on the extremities, the extensor surfaces of the hands and arms and the flexor surfaces of the thigh. The lesions usually occur bilaterally but not symmetrically. Initially the nodules are discrete but spread rapidly and may involve the entire body. They may remain discrete or fuse and become confluent. These nodules are distinctly elevated above the general level of the skin and vary in diameter from 1 to 10 mm. The color is usually dark reddish. Figures 1 and 2 illustrate this type of eruption. Histologic evidence was obtained from biopsy specimens (figs. 4 and 5). The biopsy report was as follows:

Biopsy of the skin revealed hyperkeratosis with an almost complete absence of the keratohyaline layer of epithelial cells. The granular layer revealed a moderate intra-epithelial edema with elongation of the nuclei perpendicular to the surface of the skin both in the granular layer and particularly in the stratum germi-

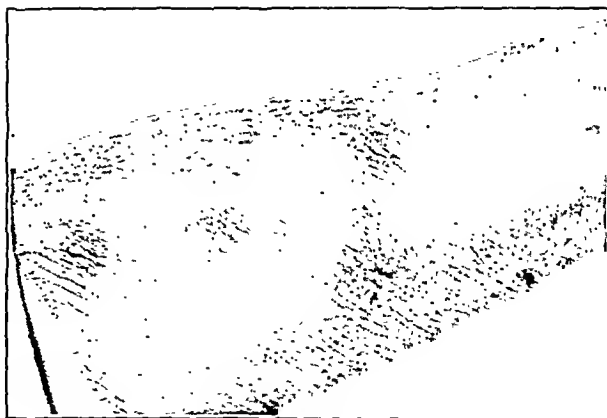

Fig. 2.—Nodular rash with erythema.

nativum. The papillary layer of the dermis was edematous and contained a fine fibrillary network. The reticular layer of the dermis was unchanged.

This report is characteristic of several biopsies.

COMMENT

The evidence thus presented illustrates the pronounced frequency of cutaneous manifestations of medication with sulfathiazole. Attention must be called

to the frequent involvement of the conjunctiva. This was noted in association with 4 of the 7 cases of rash. Only 1 case of severe conjunctivitis unassociated with cutaneous eruption was encountered. The conjunctivitis was frequently severe, with a bright red injection of the palpebral and bulbar conjunctiva, with edema of the eyelids and a seropurulent discharge. Some photo-

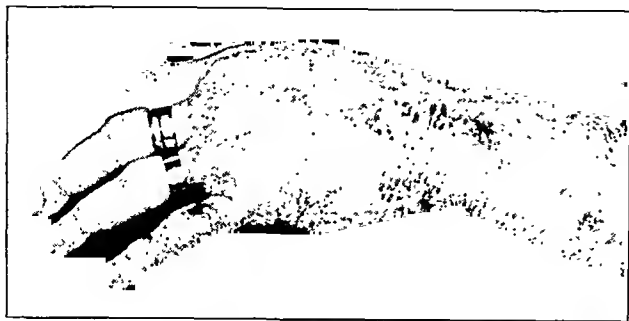

Fig. 3.—Nodular rash with purpuric base.

phobia was present. The conjunctivitis cleared rapidly, and no permanent changes have been noted. The brief reports of the following 2 cases illustrate the data described.

REPORT OF CASES

CASE 1.—W. E., a white man aged 64, was admitted April 17, 1940 with pneumonia of the middle lobe of the right lung and type III pneumococcus in the sputum, but a sterile blood culture. The patient was given sulfathiazole by mouth, receiving an initial dose of 4 Gm. followed by 1 Gm. every four hours. The temperature dropped to normal by lysis on the fourth day. On the fifth day it was elevated to 103 F., and an eruption appeared on the skin of the arms and legs. Originally maculopapular, it rapidly became nodular and spread to involve the entire surface of the body except the face. The level of sulfathiazole in the blood at this time was 7.1 mg. per hundred cubic centimeters. Fifty-one Gm. of the drug had been given. The drug was discontinued. The patient died forty-eight hours later.

CASE 2.—A. H., a white woman aged 69, was admitted on April 30, 1940 with type II lobar pneumonia and a sterile blood

Fig. 4.—Section of nodular rash. Reduced from a photomicrograph with a magnification of 130 diameters.

culture. On the fourth day of medication with sulfathiazole severe conjunctivitis with edema of the eyelids was noted. The following day maculopapular lesions appeared on the extensor surfaces of both forearms (fig. 3), the dorsa of both hands and the flexor surfaces of the thighs. The lesions were deep red and elevated above the general level of the skin, varied between 0.5 and 5 mm. in diameter and felt edematous. Many were poorly demarcated and on the dorsa of the hands became

confluent and hemorrhagic. The level of sulfathiazole in the blood was 5.5 mg. per hundred cubic centimeters. Administration of the drug was stopped, a total of 30 Gm. having been given. Eighteen hours later the blood sulfathiazole level was 4.7 mg. and that of the urine 227 mg. per hundred cubic centimeters. The lesions disappeared almost entirely in forty-eight hours. However, there was no response to supportive therapy, and the patient died two days later, four days after cessation of treatment with sulfathiazole.

SUMMARY AND CONCLUSIONS

1. Cutaneous eruptions and conjunctivitis are frequently encountered on medication with sulfathiazole.
2. The rashes encountered are urticarial, erythematous, macular, papular, nodular and purpuric.
3. Of these, the nodular is the most distinctive, definitely different from any nodular lesion previously encountered.

Fig. 5.—Section of nodular rash. Reduced from a photomicrograph with a magnification of 325 diameters.

4. The nodular lesion probably represents the advanced stage of toxic rash developing on continued medication. It has been the most serious lesion, having been associated with a fatal outcome in a high percentage of cases.

5. There is no definite correlation between the level of the drug in the blood and development of the rash. The total dosage shows a closer relationship. Sensitization may follow resumption of interrupted medication.

6. Most rashes develop on the fifth day or later with sulfathiazole administration.

7. Conjunctivitis is a frequent accompaniment of the rash, although it may appear as an isolated phenomenon.

8. Cessation of administration of the drug is immediately indicated and may prevent further toxic developments.

Clinical Notes, Suggestions and New Instruments

METHOD FOR OBTAINING RAPID BACTERIAL GROWTH IN CULTURES FROM PATIENTS UNDER TREAT- MENT WITH SULFONAMIDES

CHARLES A. JANEWAY, M.D.

Associate in Medicine, Peter Bent Brigham Hospital; Instructor in Medicine and Bacteriology and Immunology, Harvard Medical School

WITH THE TECHNICAL ASSISTANCE OF ANNE SHWACHMAN, B.S.
BOSTON

Since the introduction of the sulfonamide drugs for the therapy of bacterial infections, it has often been difficult to obtain positive cultures from patients under treatment. In most cases this is because the bacteria have actually disappeared from the lesion or the blood stream. In other cases, however, when the patient is obviously ill and not responding satisfactorily to treatment, cultures may grow out slowly if at all. Occasionally a patient is seen at home by a physician without facilities for taking cultures, who makes the diagnosis and puts the patient on chemotherapy. If the response is unsatisfactory, the patient is sent to the hospital, where, because of the presence of sulfonamide in the body fluids, it becomes exceedingly difficult to make an accurate bacteriologic diagnosis and hence to institute proper therapy.

We have encountered several such cases recently. One patient with purulent meningitis had been heavily treated with sulfanilamide at home without any clinical improvement. Cultures of the spinal fluid, made at the time of admission, were still sterile when he died three days later, although *Staphylococcus aureus* eventually grew out in large numbers. In subacute bacterial endocarditis, blood cultures have become sterile or the number of colonies has been sharply reduced soon after the institution of sulfapyridine therapy, although eventually fever and positive blood cultures have returned.

Experimental investigations of the bacteriostatic action of these drugs have convinced us that negative cultures in certain cases in which sulfonamide derivatives have been employed are false results. It has been shown that organisms grown in sulfanilamide for four or five hours and then transferred to fresh mediums that contain sulfanilamide are much more inhibited than are ordinary organisms.¹ Furthermore, it has been shown that the bacteriostatic effectiveness of these drugs in cultures of susceptible organisms is more dependent on the size of the inoculum than on the concentration of the drug.² If 10 cc. of blood is withdrawn from a patient with a blood level of 10 mg. per hundred cubic centimeters of sulfanilamide and injected into a flask containing 100 cc. of sterile broth, the sulfanilamide concentration in the flask will be 1 mg. per hundred cubic centimeters. This is ample to inhibit the growth of the small number of organisms present in the blood, particularly when they are already under the influence of sulfanilamide. Similar results may be obtained with cultures of other body fluids, and growth may either be completely inhibited or only delayed.

Recent work of Stamp³ and Green⁴ in England, and MacLeod⁵ in this country has shown that there are certain

substances, "inhibitors," capable of nullifying the bacteriostatic action of the sulfonamides. These are present in autolyzed tissue and culture filtrates of sulfonamide-resistant organisms, thus explaining the poor bacteriostatic action of the drugs in pus and certain batches of broth. One such substance which has been definitely identified is para-amino benzoic acid,⁶ which is a readily obtainable, comparatively cheap chemical compound.

It was felt that the addition of para-amino benzoic acid to routine culture mediums might make it possible to obtain rapid growth in cultures from patients under treatment when organisms were present. This has turned out to be the case. This chemical can be added to the beef heart infusion which forms the base of all our standard mediums at the time when the peptone and salt are added, and it will withstand autoclaving at 15 pounds pressure for twenty minutes. All our ordinary mediums are made up containing this compound in a final concentration of 5 mg. per hundred cubic centimeters. Experiments have shown that 1 mg. per hundred cubic centimeters would inhibit the bacteriostatic action of as much as .50 mg. per hundred cubic centimeters of sulfanilamide under favorable circumstances, but that 5 to 10 mg. per hundred cubic centimeters of para-amino benzoic acid was likewise effective and not inhibitory to growth. Therefore, in order to take care of the high drug concentrations present in urine, 5 mg. per hundred cubic centimeters was arbitrarily chosen for our routine concentration.

Number of Colonies per Cubic Centimeter of Blood as Determined by Plates Poured with 1 Cc. of Citrated Blood and 10 Cc. of 0.2 per Cent Dextrose Beef Heart Infusion Agar

	Date	Days of Incubation									
		1	2	3	4	5	6	7	8	9	10
A. B.	11/13/40	A	0	1	6	7	7	13	13	13	
		B	0	0	0	0	0	0	0	0	
	11/26/40	A	0	3	5	12	14	15	17	17	17
		B	0	0	0	0	0	0	0	0	0
E. B.	11/12/40	A	5	15	15	15	15	15			
		B	0	3	5	5	5	5			
	11/26/40	A	14	16	16	16	20	..	22	22	
		B	0	3	4	5	5	..	5	5	

A contains 1 mg. per hundred cubic centimeters of para-amino benzoic acid; B contains no para-amino benzoic acid.

Further experiments showed that para-amino benzoic acid was not inhibitory to any of the common pathogenic organisms. Various strains of *Staphylococcus aureus*, *Streptococcus viridans*, *Streptococcus haemolyticus*, *pneumococcus*, *gonococcus*, *typhoid bacillus*, *colon bacillus* and *Aerobacter aerogenes* were tested. In every case rapid growth was obtained in the presence of 1 mg. per hundred cubic centimeters of para-amino benzoic acid. Whenever the bacteriostatic effect of 10 mg. per hundred cubic centimeters of one of the sulfonamides could be demonstrated, this concentration of para-amino benzoic acid was sufficient to nullify it. Although careful quantitative tests were not performed, this drug seemed to be about as effective against the bacteriostatic action of sulfapyridine and sulfathiazole as of sulfanilamide.

Blood cultures were taken from two patients with subacute bacterial endocarditis who had been under treatment with sulfapyridine for over a month and inoculated into mediums with and without para-amino benzoic acid. In these two patients positive cultures were obtained in either medium, but the organisms grew much faster in the presence of para-amino benzoic acid, and the number of colonies was always greater in the plates containing it.

The tabulated counts of the number of colonies of *Streptococcus viridans* noted in pour plates from the blood of these patients illustrates this graphically.

SUMMARY

We recommend the addition of para-amino benzoic acid to a final concentration of 5 mg. per hundred centimeters to all routine culture mediums. It will make cultures from patients under treatment with the sulfonamide drugs mean what they should—i. e. the presence or absence of viable organisms. By way of caution, it must be noted that the body fluids may frequently be sterilized by sulfonamide therapy and then later become positive again when the patient relapses. During the remission, positive cultures could be obtained only from the local focus, and no amount of para-amino benzoic acid would make the cultures of the body fluids positive.

LEGAL RESPONSIBILITY FOR MEDICAL MALPRACTICE

I. THE LEGAL MATRIX OF MEDICAL MALPRACTICE

HUBERT WINSTON SMITH, A.B., M.B.A., LL.B.

Member of the Bar of the United States Supreme Court

BOSTON

FOREWORD

Within the last thirty years the practice of medicine has become an enormously more complex undertaking, and during that period the increase in legal problems relating to medical practice has tended to parallel the general enlargement of the field. Prior to 1910, the patient-physician relationship was a relatively simple one. Since then, the legal aspects of this relationship have been complicated by many changes, including the practice of dividing the responsibility for the diagnosis or the care of patients with other physicians, with technicians or with nurses; the advent of group practice, of health insurance and of contract practice; the growing number of circumstances in which the physician examines but does not treat, as in the examination of insured persons, of employees, of school children, of claimants of pensions, of claimants of damages for personal injury and of persons accused of crimes; the increase in the number of physicians employed on a part or full time basis, and the increase in the number of patients cared for through charity or by public funds.

Mr. Smith has attempted to define the fundamental principles on which the legal status of the varied problems of medical malpractice must be determined. He has given the physician a rationale by which he may reason, rather than a mere catalogue of legal decisions. By so doing he has rendered a great service to the physician who wishes to have a clear understanding of the legality of his professional activities.

ALAN RICHARDS MORITZ, M.D.

"Law is a seamless web," said Maitland the legal historian. To the uninitiated, this attribute makes of the law a perplexing mystery. He seizes avidly on a single thread, only to find that he has many tangled skeins within his grasp. Each thread is too interwoven in the complete fabric to have much meaning alone. To trace the many patterns and to put the threads in their true relations is an arduous task for even the most experienced lawyer.

Yet, curiously, the pattern of legal responsibility for medical malpractice has received scant scrutiny by law-

yers. They see it too infrequently in their practice. Physicians, on the other hand, are active changers of the status quo in respect to valuable property, the health of patients. They therefore carry a constant risk of responsibility for negligent injury, which makes it wise for them to know the pattern well.

This conviction has moved me to seek the meaning of the figures in the design, with the hope that I may (1) introduce the physician to the legal tradition and its relation to his profession, (2) present to him a concept, in miniature, of modern law in action, and (3) clarify the first principles which determine legal liability for so-called medical malpractice.

The well informed physician, perhaps, will want to add this information about malpractice to his general knowledge, without regard to any question of personal peril. I hope it will be possible to instruct him who is curious without causing the feeble pulse and the ashen pallor of profound shock. It is time to dispel the notion that a bizarre body of law makes a physician almost automatically liable once he is brought to court. This is not true. The present study is intended to be a "transfusion," rather than a letting, of blood; its aim is to strengthen confidence rather than to dissipate the feeling of security. The thoughts imparted may seem alien at first, but once received they become the property of the donee, who may put them into useful circulation in other spheres. There is no doubt that the law relating to the practice of medicine has long been the potential property of the physician, and he may perfect his title by reducing the subject matter to possession. The courts have held repeatedly, in actions for negligent medical conduct, that standards of "due care" are to be fixed not by court or jury but by testimony of qualified physicians. The conscientious practitioner of medicine usually does not believe that justice would be served by making his profession immune from the civil responsibility for negligent conduct which attaches without discrimination to the practitioner of law, to the architect, to the public accountant and indeed to every member of society. His true concern is that legal liabilities shall be fixed only on actual negligence competently proved, that realities rather than "apparent" truth shall be made the basis of every verdict, and this is a concern jointly shared with him by every right thinking lawyer.

Having had considerable contact with physicians, I feel warranted in saying: Do not order major operations for removal of moles! Do not diagnose without seeing the patient. Do not carp at law and lawyers, condemn courts or weigh policies of law without knowing what that law really is. A random or fragmentary impression is inadequate. The practicing lawyer knows that two inquiries must be kept separated in his mind; the actual and the ideal. What is the actual state of the law? This inquiry is of practical importance, for it governs current transactions. What would be an ideal state of the law? This question has pertinence in organizing influences to bring about needed change through appropriate legislation. But the latter inquiry proceeds blindly if not guided by a sound conception of what the law already is and wherein it may fall short. When sectioning a nerve to stop pain, the surgeon relies on his knowledge of anatomy to help him avoid cutting the nerves supplying important muscles. It would be inconceivable for a surgeon to undertake an operation without first trying to localize the lesion. The same critical point of view should be carried over in consider-

These articles were written pursuant to the Henry Jackson Cabot Fellowship in Medicine at Harvard Medical School, 1939-1940.

Alan R. Moritz, M.D., professor of legal medicine, Harvard Medical School, gave support to these studies; Mr. Livingston Hall, professor of criminal law, Harvard Law School, gave suggestions in reading the manuscript and contributed to certain sections touching on responsibility in criminal law; Prof. Roscoe Pound, Harvard Law School, gave suggestions on Roman and comparative law, and Anton-Hermann Chroust, S.J.D., gave assistance with the material on the law of France and Germany.

ing proposed radical operations on the body of the law. The first requisite must be to localize the lesions and to learn more about the patient.

EVOLUTION OF THE LAW OF MEDICAL RESPONSIBILITY¹

LAW OF THE BABYLONIANS

Though the dwellers on the Euphrates knew nothing of the ruptured appendix or of how pernicious anemia can be held in check by liver therapy, a physician who caused an ill result was held liable, without further proof of fault. His responsibility, at least in respect to affirmative conduct, approached that of a guarantor. It was as though society hoped to squeeze some superhuman effort from the physician to cover the gaps in existing knowledge.

The Code of Hammurabi² (enacted about 2030 B. C.) declared:

215. If a doctor has treated a man for a severe wound with a bronze lancet, and has cured the man, or has opened an abscess of the eye for a gentleman with the bronze lancet and has cured the eye of the gentleman, he shall take ten shekels of silver.

216. If he (the patient) be the son of a poor man, he shall take five shekels of silver.

217. If he be a gentleman's servant, the master of the servant shall give two shekels of silver to the doctor.

218. If the doctor has treated a gentleman for a severe wound with a lancet of bronze and has caused the gentleman to die, or has opened the abscess of the eye for a gentleman with the bronze lancet and has caused the loss of the gentleman's eye, one shall cut off his hands.

219. If the doctor has treated the severe wound of a slave of a poor man with a bronze lancet and has caused his death, he shall render slave for slave.

220. If he has opened his abscess with a bronze lancet and has made him lose his eye, he shall pay money, half his price.

221. If a doctor has cured the shattered limb of a gentleman or has cured the diseased bowel, the patient shall give five shekels of silver to the doctor.

222. If it is the son of a poor man he shall give three shekels of silver.

223. If a gentleman's servant, the master of the slave shall give two shekels of silver to the doctor.

Thus, the physician was entitled to no compensation in the event that his attempted cure failed. By force of positive law, a "no cure, no pay" proviso was read into his every undertaking. Furthermore, if his well intended ministrations caused death of the patient or loss of an eye, severe punishment, retributory in character, was visited on him. It is interesting to note that no mention is made of punishing the physician whose dereliction consisted of an error of omission, of mere "watchful waiting" as contrasted with the affirmative act of the surgeon. Shall this be taken as evidence that some means was considered necessary to check the enthusiasm of the overzealous surgeon? The explanation more likely lies in the fact that the Babylonian law seemed to make causation the sole test of liability.

1. Mr. Justice Holmes, late of the United States Supreme Court, has said: "It is something to show that the consistency of a system requires a particular result, but it is not all. The life of the law has not been logic: it has been experience. The felt necessities of the time, the prevalent moral and political theories, intuitions of public policy, avowed or unconscious, even the prejudices which judges share with their fellow-men, have had a good deal more to do than the syllogism in determining the rules by which men should be governed. The law embodies the story of a nation's development through many centuries, and it cannot be dealt with as if it contained only the axioms and corollaries of a book of mathematics. In order to know what it is, we must know what it has been, and what it tends to become" (The Common Law, Boston, Little, Brown & Co., 1881).

2. Thatcher, O. J.: The Library of Original Sources, Chicago. University Research Extension, vol. 1, p. 439.

Causation was recognized only when the evil result followed a positive act (the "misfeasance" of the modern common law). It is a more refined thought that mere failure to act can constitute proximate causation, a concept that goes with a more advanced system of jurisprudence.

One also notes with interest that a class or "caste" distinction was applied to patients under the physician's care. When his dereliction affected only a slave, the redress lay not in penal retribution ("cut off his hands") but in compensation ("a slave for a slave").

LAW OF THE EGYPTIANS

In respect to the legal responsibility of the Egyptian physician, de Pastoret,³ in his "Histoire de la législation," has said:

General rules had been established for the treatment of patients. These were the result of carefully made observations which were guarded by the priests in books that were so respected that they were solemnly carried in the processions taking place on days of public fête. An absolute prohibition did not exist preventing the physician from applying a new truth, but if far from obtaining the salutary effects that he expected to procure he caused the death of his patient, he was obliged to pay his tribute for the misfortune or the boldness of having sacrificed the life of a citizen, by being beheaded. On the other hand, he was never liable to a patient confided to his care when he followed the rules laid down in the Sacred Books.

In the writings of Diodorus Siculus⁴ one finds this ruling set out:

For the physicians have a public stipend, and make use of receipts prescribed by the law, made up by the ancient physicians. And if they cannot cure the patient by them, they are never blamed. But if they use other medicines, they are to suffer death, inasmuch as the lawgiver appointed such receipts for cure as were approved by the most learned doctors, such as by long experience had been found effectual.

Society thus continued to demand a legal accountability based on causation, but the physician could gain protection by conforming his practice to established standards. Here was the first departure from the harsh rule of the old law that a physician must act at his peril. A new sanction had been substituted by which professional prudence was preserved to society, and society, in turn, gave up its old insistence on absolute liability. It may seem a poor bargain that made the physician conform to settled standards in order to gain this exemption, but one can imagine that the whole device was designed to keep medicine in contact with the priests and that the guarded precepts were administered with benevolence. In understanding how society in its regulation of the practice of medicine has merely traded sanctions without ever foregoing them completely, evolution of legal thought must be taken into account, but also one consideration which even yet motivates certain legal doctrines: the apprehension that in a particular case a particular physician may put aside the safe and conservative course to embark on experimentation for which consent has not been obtained. To this day, detached plaudits are given to the innovator in medical science, but the individual member of society shrinks from becoming a guinea pig except on his own heroic decision.

4. Diodorus Siculus: Bibliotheca historica (The historical library of Diodorus the Sicilian, 15 books), translated by George Booth, London, Awnsham & J. Churchill, 1709, book 1, chapter 6.

LAW OF THE GREEKS

It is not easy to ascertain the exact law of the Greeks, but de Pastoret has affirmed the existence of principles of medical liability in it. Plutarch⁵ also indicated the recognition of such liability, in relating the story of Glaucus, a physician of Ephesus, who left his patient to go to the theater. Freed of restraining influences the patient dined excessively and died, and Alexander condemned the physician to be put to the cross for dereliction of professional duty.

EARLY ROMAN LAW

To the legal mind, the fabled grandeur of Rome rests most securely on the influential body of thought known as Roman jurisprudence. Negligent conduct as a criterion of legal liability first emerged in this system. In particular, the *lex Aquilia* repealed in part every prior statute which dealt with illegal damage, whether contained in the Twelve Tables or in other enactments. The date of appearance of the *lex Aquilia* is usually given as 287 or 286 B. C., but Girard expressed the belief that it can be placed only vaguely between the time of the Twelve Tables and the end of the seventh century.⁶

The Romans distinguished "*dolus*" (malice) from "*culpa*" (fault or negligence) and made the latter sufficient to maintain an action under the *lex Aquilia*. It is true that the proceeding tended to be of a penal or a criminal nature; yet, in addition, damages could be assessed on the "*delict*" to compensate the aggrieved party for the injury inflicted by the wrongdoer. When the defendant by his own person had acted directly on the plaintiff, the remedy lay under the *lex Aquilia*. If he had brought about the injury indirectly, the action, instead, was one in *factum*.

Under this law "*imperitia*" (inexpertness?)⁷ of the surgeon is treated as *culpa* (negligence).

In the Roman Digest jurists set out the *lex Aquilia*, and from this work a few sections pertinent to this study are reproduced:

6. Celsus says that it makes a great deal of difference whether the party kills or furnishes the cause of death; one who furnishes the cause of death not being liable under the *lex Aquilia*, but to an action in *factum*; and in this connection he mentions the case of a man giving another poison by way of medicine, who, he says, furnished the cause of death, just like one who puts a sword in the hand of a lunatic; this latter, he says, like the first, not being liable under the *lex Aquilia*, but to an action in *factum*.

7. But where a man throws some one off a bridge, whether the latter is killed by the shock itself, is at once drowned, or is overpowered by the force of the current and so dies from exhaustion, the offender is liable under the *lex Aquilia*, just as he would be if he had dashed a boy's head against a stone. Proculus says that, if a surgeon operates on a slave unskillfully, there is a good right of action, either on the contract or under the *lex Aquilia*.

8. The law is the same where a doctor makes a wrong use of a drug; it must be added that where a man operates properly, but omits further treatment, he will not get off free but is held to be guilty of negligence (*culpa*). 1. Again, where a mule-driver, owing to want of experience, is not able to hold up his mules, so as to prevent them from rushing ahead, if the

mules run over some one else's slave, the driver is commonly said to be liable on the ground of negligence. The same rule applies where he is unable to hold up the mules because he is not strong enough; and it cannot be held unjust that want of strength should be counted against a man on the question whether he was negligent, because people have no business undertaking tasks in which they know or ought to know that their want of strength will be a source of peril to others. The law is the same in the case of a man who from want of experience or want of strength should be unable to keep in a horse on which he is riding.

9. Again where a midwife gives a drug to a woman, who dies in consequence, Labeo makes this distinction: If she administered the drug with her own hands, she must be held to have killed the woman; but if she gave it to the woman for her to take it herself, there must be an action allowed in *factum*: and this is a sound opinion, as in the latter case the midwife furnished the cause of death rather than killed. 1. Where a man, either by force or suasion, administers a drug to any person, either as a draught or by injection, or where he rubs him with some poisonous preparation, he is liable under the *lex Aquilia*, just as the midwife is who administers a drug.⁸

I shall not digress here to discuss distinctions drawn between injuries to the body of a free man and those to the body of a slave. The *lex Aquilia* dealt with injuries to a man's slaves, but the freeman was able to seek analogous remedies. That the liability for damage occasioned by negligence was of general application is apparent from the "*Pandects of Justinian*."⁹ One reads:

If you give a cup to a jeweller to be filigreed and he breaks it through lack of adequate knowledge or experience, he is liable for wrongful damage; but if he breaks it not from lack of skill but because it was badly cracked, he may have a defense. Hence, most artisans who receive things of this kind stipulate that they will not do the task at their risk, which prevents an action on the contract or under this statute.²

From what has preceded it will be seen that:

1. Under Roman law, the physician incurred a legal liability when he was guilty of *culpa* (culpable conduct), or negligence.

2. This negligence could consist of: (1) an affirmative act ("*misfeasance*" of modern common law) or (2) a mere omission ("*nonfeasance*" of modern common law), which arose from (1) sheer ignorance due to lack of adequate training or experience (*imperitia*), (2) lack of skill in the particular undertaking, or (3) failure to attend or to care for the patient after a properly performed operation. In all cases, damage had to flow from the *delict* if it was to constitute legal injury.

3. If the physician caused injury by an intended direct contact, unconsented to by the patient, he could be held liable for *dolus* (equivalent to "*battery*" of modern law, a tort consisting of any unconsented touching of another, as when a surgeon performs an operation for which consent has not been obtained).

4. The action under the *lex Aquilia* for wrongful damage was dual in character: (1) it had penal aspects (punishment: an attribute of criminal law), and (2) it afforded reparation for the injury (compensation: an attribute of civil law).

5. The law had now advanced to the essential premise of modern jurisprudence: no responsibility for medical practice exists without proof of fault.

How often were these principles of medical liability actually applied? One cannot be certain but may infer infrequently from the violent indignation with which

5. Plutarch: *Lives of Illustrious Men*, translated by J. Dryden; revised by A. H. Clough, New York, the Modern Library, Inc., 1932, p. 851.

6. Justinian: *Imperatoris Justiniani institutionum*, translated by J. B. Moyle, ed. 4, London, Oxford University Press, 1906, vol. 2.

7. "*Imperitia*" in Roman law has often been translated as "*inexpert*" or "*unskillful*." Anton-Hermann Chroust, S.J.D., has expressed the belief that "*imperitia*" is more properly translated as "*ignorant, lacking in adequate knowledge, training or experience*," than as mere lack of skill.

8. Justinian: *Lex Aquilia*, Digest IX, 2, translated by C. H. Monro, London, Cambridge University Press, 1898.

9. Justinian: *Lex Aquilia*, p. 27.

Pliny¹⁰ (23 to 79 A. D.) asserted that in Rome a physician enjoyed the most complete impunity. He wrote:

... And then, besides there is no law in existence whereby to punish the ignorance of physicians, no instance before us of capital punishment inflicted. It is at the expense of our perils that they learn, and they experimentalize by putting us to death, a physician being the only person that can kill another with sovereign impunity. Nay, even more than this, all the blame is thrown upon the sick man only; he is accused of disobedience forthwith, and it is the person who is dead and gone that is put upon his trial.¹⁰

MODERN ROMAN LAW

By the "modern Roman law" I refer to the original Roman law as introduced into continental Europe around 1200 A. D., together with its elaboration and interpretations. Blended with a certain amount of indigenous law, it formed a basis of judicial decision in France and Germany and in other central European countries until the recent advent of the modern codes. This reversion to the Roman law enabled jurists of the middle ages to avail themselves of legal reason dating back to Justinian. They conformed their rich heritage to the needs of their own age by processes of judicial extension and amputation.

Under this law there were definite principles regulating the so-called free intellectual professions. The professional man, bound by contract to perform,¹¹ was responsible not only for malice (intentional injury) but for negligence and for lack of that knowledge and ability which the person employing his services rightfully could presuppose him to have. One reads:

Whoever employs the services of a person who makes a profession of the possession of an art or science, may, disregarding particular circumstances, presuppose that this person has such knowledge and abilities as one might acquire in such art or science by usual industry and conscientious application. There is no right to presuppose particular gifts or the endowments of genius.¹²

This mutual contractual relation concerning the use and the services was not altered by the fact that the person rendering the services had received from the state to this end an approbation, concession or employment, such as was granted the advocate, the notary public, the physician and the teacher.¹³

Thus, the later Roman law makes even clearer the proposition that fault is the test of liability, and it lays down a standard. The measure of care and skill which the member of the public can rightfully expect is to be fixed not by the special talents of genius but by the more modest level of attainment of the average practitioner. It has been the conscious policy of the modern law of torts¹⁴ to encourage initiative by saying to the actor: Your responsibility shall be fixed at the lowest standard compatible with a fair protection of the person acted on.

10. Pliny the Elder: *The Natural History of Pliny*, translated by J. Bostock and H. T. Riley, London, G. Bohn, 1856, book 22, chapter 7.

11. Contract in Roman law differs from the Anglo-American conception of contract in dispensing with the necessity for a consideration. By Roman law, the mere assumption of performance under mutual agreement, even when nothing is to be paid for the service, constitutes a contract. Under Anglo-American law, an agreement not supported by a consideration is a "nudum pactum" and unenforceable.

12. Windscheid, Bernhard: *Lehrbuch des Pandektenrechts*, ed. 6, Frankfurt on the Main, Rütten & Loening, 1887, vol. 2.

13. In accord is the modern Anglo-American law. A municipal government, without its consent, cannot be sued for injury negligently inflicted by a physician in its employ. But this immunity of the government to suit does not extend to the physician, who remains subject to personal liability for his torts. Windscheid.¹²

14. Torts: such invasion by one person of the rights of property or personality of another as the law will recognize as redressible wrongs without a showing of any contract relations between the actor and the person acted on.

COMPARATIVE MODERN LAW

THE LAW OF GERMANY

To round out the survey of the legal evolution of medical responsibility, one should look at the present doctrines of countries other than the United States. The most cursory inspection shows that they bear a striking resemblance to those of Anglo-American law. This resemblance is of peculiar interest when one considers that the Continental "codes" are not altogether a continuation of old legal traditions but include some points of departure from them.

Under the new German law, resting on the civil code of 1900, one finds that:

Where a performance is based on a contract, the general success of which is uncertain, as for instance in the case of a dangerous operation, then we have to assume in a case of doubt that only the first success, namely, only the operation as such, but not its successful outcome, is contained in the contractual promise.¹⁵

With regard to a physician's liability for operating on an unconscious patient without his consent,¹⁶ one reads:

No doctor is liable for battery and assault, if this act is done in the well understood interest of the injured or in conformity with his real will or that which rightfully could be presupposed under the circumstances as his real will.¹⁷

A physician who by his lack of skill in the application of a medical treatment causes the death of a patient not only is liable for breach of contract but is liable in tort. (Paragraph 823, section 1, of the B. C. G. [German Civil Code] applies.)

On March 14, 1911 the Supreme Court of Germany decided a case of alleged negligence committed by a physician. In treating an inflammation of lymph glands in the neck, he used an electric needle to puncture the skin and inflicted a deep burn, which left a deforming scar.¹⁸ The court's decision was as follows:

The Supreme Court finds that, in spite of the contention of the defendant, he is not only liable for breach of contract but also liable in tort. The defendant is guilty of a violation of the principles of medical science in that he applied in the treatment of a harmless ailment of the plaintiff an inadequate method. In other words, he carried out the chosen method in a faulty manner, in spite of the fact that he should have known better if he had taken into consideration every fact. By acting thus negligently, the defendant not only committed a breach of contract but also a tort. He should have known that through this deep burn he would cause a scar and produce unnecessary pain as well as a deformity of plaintiff.

The Court holds, furthermore, that the doctor, by virtue of his profession, is under an obligation to avoid fault in the application of treatment as well as infraction of the rules of medical science while treating patients. It makes no difference whether a contractual relationship between doctor and patient be presupposed or not. He is liable for tort under paragraph 823, sec. 1, of the German Civil Code. If he, in violation of his professional duties, illegally violates life, limb or health, he is liable to the injured person for damages, especially for immaterial damages arising from pain, suffering, etc.

Any illegality or liability on the part of the doctor under 823 is excluded only if the patient or his legal representative has consented to the operation. See "Decisions in Civil Litiga-

15. Enneccerus, L.; Kipp, T., and Wolff, M.: *Lehrbuch des bürgerlichen Rechts*, Marburg, C. K. Braun, 1923, ed. 20, vol. 1, p. 444.

16. Note that, under the German practice, litigants' names are omitted by customary policy, the court's interest being only in the technical aspects of the law as a scientific problem and not in the personalities of the litigants.

17. Enneccerus, Kipp and Wolff: *Lehrbuch des bürgerlichen Rechts*, p. 654.

tions of the Supreme Court of Germany," vol. 62, p. 431 and "Sceuffert's Archiv," vol. 62, p. 450. But to an unnecessary and painful treatment and the deformity resulting therefrom, the plaintiff and its parents did not agree.

THE LAW OF FRANCE

In the "*Traité des obligations en général*," published in 1931, the French law is laid down with clarity, thus:

The responsibility of a doctor toward his client comprises certain factors. The doctor enters into a contractual obligation concerning means but not the final result. He is therefore not responsible if his patient does not get well. He promised only attentive care and the patient must prove the fault of the doctor. He also has equally to prove the causal relationship between the fault and the damaging act.¹⁹

The following exception is made: If the physician has promised to visit a sick man and omits such a visit, he is absolutely responsible for damage arising therefrom. But the patient must prove the causal relation between the absence and the damage, and the physician may justify himself by establishing that it was impossible for him to come.

As to what concerns the treatment, the physician is responsible for his lack of prudence and for his negligent actions. But it seems that, to make out a case of negligence, an act must be involved which a person exercising his profession with due care and skill would not have committed. Important in this connection also is the fact that the general status of development of medical science at the time of the act is to be taken into consideration. But the physician who tries what is considered medically impossible at the time and place and employs a method which would be used in a similar disease, thereby displaying an initiative which might be successful, does by no means automatically incur responsibility.

There is a scientific domain in which the judge has no right to interfere. As the Court of Cassation (highest appeal court of France) said:

It is up to the wisdom of a judge not to enter too keenly into the examination of medical theories and methods and to pretend to discuss questions of pure science. The problem is one of general rules, of good sense and of wisdom to which one has to conform above all in the exercise of every profession, and under this heading the doctors are subjected to the general application of law ("*au droit commun*").²⁰

In the "*Traité pratique de droit civil français*," published in 1930, a further statement of present French law is found:

The doctor who has accepted the care of a patient is responsible under contract if he neglects to give him his attention at a wished time, or abandons him during the treatment without being compelled to do so by a major (irresistible) force or by the behavior of the patient himself.

He is also responsible, in conformity with the general application of the civil law, for all the damage caused by his lack of prudence or his negligence in diagnosing the malady, in applying treatment, or in performing an operation. As to the claim that doctors should only be responsible for gross negligence, the Court of Cassation has always refused to lay down such a particular basis for the liability of a doctor.²¹

Liability does not follow mere mistakes, one reads:

... but this "exemption" does not apply if the mistake for which the doctor is reproached results from negligent application of the treatment or from negligent execution of an operation, particularly if such conduct is called negligent by common medical consent. The same is true if a material error

exists in the writing out of a prescription; in the administering of one medicament in the place of another; in case the doctor leaves a compress or instrument behind in the wound; if he hands out a certificate after an insufficient physical examination or without an examination; where he fails to tell a nursing mother that the nursing committed to her care is infected with a contagious disease; where he approaches with a thermocautery a skin still moist with alcohol. Without doubt, the most diligent person is susceptible to an unfortunate omission, but, even so, since every one is liable under such circumstances, there is no reason why a doctor should enjoy a lesser degree of responsibility.²²

LAW OF JAPAN

Japan did not experience a gradual development of its present social and judicial institutions. She passed suddenly from a state of medieval feudalism to a régime of representative government. Her imitation of the industrial system of Western civilization ushered in a new and more complex social order.²³ To meet this situation, the Japanese civil code was enacted in 1891. Under its tort provisions (articles 709 to 724), a physician's legal responsibility approximates that which he carries under the modern law of other countries.²⁴

LAW OF ENGLAND

As will later appear, the common law of England must be recognized as the remote ancestor of the present American law of malpractice. From time to time, reference will be made to important decisions of the English and the Dominion courts, but for the moment it will suffice to say that subsequent judicial evolution of the subject has in main been parallel to that of the American law.

LAW OF THE UNITED STATES

Elucidation of this law will be the chief concern of later phases of the present study. At this juncture it may fairly be said that, owing to abundant litigation in America, the courts have evolved the modern law of the subject with greater refinement than has any other system of jurisprudence. Taking from the English common law the premise that a physician may not be held a guarantor but is answerable only for fault, the courts have introduced many special doctrines. Among these, "freedom of choice among contending methods," "lessened duty of care in emergencies," "schools of practice," "error of judgment" and rigid requirements of proof of the "delict" represent gracious gestures of the law to reduce the legal responsibility of the physician to a minimum.

Both English and American law draws a sharp distinction between civil and criminal responsibilities. The two cannot be asserted in the same proceeding, and while ordinary negligence proved by a preponderance of the evidence will sustain a civil suit for compensatory damages, a criminal conviction must rest on gross negligence of a much more opprobrious character proved beyond a reasonable doubt.

SUMMARY

It has been shown that in the Babylonian law the physician was held liable as a guarantor, irrespective of fault, and his failure was visited with criminal penalties. The Egyptian law continued his strict liability but gave him exemption if he conformed to the preserved precedents of the priests. The Greek law

made no notable advance but affirmed the existence of legal liability. The Romans, under the *lex Aquilia* and analogous remedies, made *culpa* (fault) and *dolus* (malice) the bases of medical liability. The doctrine of negligence, which was unknown to earlier systems of jurisprudence, emerged. Both penal and civil remedies were granted in respect to the delict in a single action. These more liberal rules of medical responsibility were preserved and elaborated by the modern Roman law. They were carried forward into current European law by the modern codes of Germany and France. Similar provisions appear in the modern law of Japan by virtue of the new civil code, enacted in 1891. The English common law arose as an indigenous system by fusion of diverse legal elements. It was in no sense a direct product of the Roman law. It has never been codified. Yet it, too, eventually settled on similar principles of torts as the proper measure of the physician's legal responsibility. It gave an action of "trespass" for battery (intended touching of another for which consent has not been obtained) and an action of "trespass on the case" for negligence (unintended consequential injury).

Soon after the Revolutionary War or at some later date, almost all the states of the Union provided by constitution or statute that the English common law should be taken as a basis of decision, subject to modification to meet conditions of the new world. American courts thus received the English tradition, elaborated it and developed new doctrines reducing the responsibility of the physician to the minimum consistent with fair protection of the patient. Both countries parted company with the Roman law in refusing to permit the trial of civil and criminal proceedings in a single action.

In early law, society used penal sanctions as its chief method of regulating the medical profession. Today, "medical practice acts," flowing from the legislative function, set up licensing standards capable of testing knowledge but not care or skill. Criminal charges for malpractice are now only occasionally brought by the state. At present, it is the civil action against the licensed physician for some dereliction in point of care or skill which is becoming of preponderating importance. The civil action for damages enforces only incidentally the standards of medical practice. Its prime object is to afford compensation under the law of torts to the patient injured by some dereliction of his physician. Usually, but not always, this dereliction consists of negligence rather than of some other variety of improper conduct.

One may thus say that the principle of medical responsibility goes back to antiquity in unbroken continuity, that it meets a universal demand put forward in all societies and all countries and that its evolutionary trend has been from absolute liability to limited liability conditioned on fault. The responsibility of the physician has been lightened by special doctrines evolved in American courts. These make just concessions to the exigencies of medical practice and to the fact that medicine is often the exercise of an art guided by judgment rather than an infallible science. The trend has also been from penal sanctions (criminal punishment) to civil compensation. During these successive epochs the law has applied the same, or even more rigorous, doctrines of liability to the members of other classes of society.

OVARIAN TUMORS OF ENDOCRINE NATURE

EMIL NOVAK, M.D.

BALTIMORE

This special article is published under the auspices of the Council on Pharmacy and Chemistry. It is one of a series which will be published in book form as the second edition of "Glandular Physiology and Therapy." The opinions expressed in this article are those of the author and do not necessarily represent the official views of the Council.—Ed.

Not so many years ago the general concept of tumors was that they are collections of cells which have cut themselves off from all functional activity, living in a purely parasitic way. It is known now that this is not invariably true and that a considerable degree of functional activity may be retained by the cells of certain tumors, especially those of highly differentiated type. In the case of neoplasms of the endocrine glands such a persistence of function has long been recognized, probably because its manifestations are more striking, involving tissues and functions far removed from the tumor site itself. Many examples of functional endocrine tumors are now adducible as producing well established clinical syndromes. Among these may be mentioned adenoma of the eosinophilic, basophilic or chromophobic cells of the anterior lobe of the pituitary and certain tumors of the thyroid, parathyroid and adrenal (both cortex and medulla) glands and of the gonads, both male and female.

This article will concern itself only with certain functioning tumors of the ovary, long recognized as one of the endocrine glands of the body. The two ovarian hormones are estrogen and progesterone, produced by the follicle and the corpus luteum, respectively. Of these, estrogen may be considered the more fundamental, since it is responsible for the characteristic female secondary sex characters in addition to its role in menstruation and in pregnancy. Progesterone, on the other hand, plays an important role in the pregestational portion of the cycle and in gestation itself. The fact, therefore, that certain ovarian tumors are characterized by estrogenic activity would at once suggest an origin from some phase of follicle development, as is indeed the case. The occasional cases in which progesterone effects are produced by ovarian tumors would in the same way suggest the lutein cell as the source of the hormone, as it normally is, in the ovary at least. In addition to these, however, it will be seen that certain alien cells which may occur in the ovary may give rise to still other hormones, such as the androgenic principles and thyroxine.

The ovarian tumors which have been shown to possess endocrine activity are (1) granulosa cell carcinoma, (2) thecoma, (3) luteoma, (4) arrhenoblastoma, (5) adrenal ovarian tumors and (6) the so-called struma ovarii or thyroid tumor of the ovary. All of these, with the exception of the last two, are looked on as of dysontogenetic origin, arising from abnormalities in the early stages of gonadogenesis. For an appreciation of their endocrine effects, and even more for the interpretation of their varied histologic structure, some understanding of these early stages in the development of the ovary is absolutely essential. This subject can be set forth here in only the briefest fashion and with full appre-

ciation of the fact that on certain points there is still considerable difference of opinion among embryologists.

At a very early embryonic phase there develops on the anterior or ventral surface of the wolffian body a grouping of cells which constitutes the anlage of the sex gland, testis or ovary, as the case may be. The first point to stress is that in this early, or undifferentiated, stage it is impossible to determine whether this nucleus of cells will differentiate as testis or as ovary. Incidentally, tumors may arise in later life from cells which in this undifferentiated phase are cut off from the germinal stream, as it were, while the surrounding cells undergo their later differentiation into ovarian or testicular structures. These tumors constitute the group designated as seminoma when in the testis and as dysgerminoma when in the ovary. The histologic structure of the male and female tumors is identical. As would be expected from their origin, they have no endocrine effect whatever.

At a later stage the cells in the gonadal area become differentiated and arranged in cords of zigzag appearance which converge toward the hilus, where in the male they link up with mesonephric structures to complete the testicular scaffolding. The cords become canalized to form the seminiferous tubules, and the wolffian duct itself becomes the vas deferens. From the standpoint of the female, with which this article is more directly concerned, it is important to remember that the same cordlike differentiation occurs as in the male, though there is no link-up with mesonephric structures and the whole process is evanescent.

Over the fossil remains of this male type of differentiation, to put it figuratively, there then occurs a second differentiative process, the cells of the mesenchyme differentiating into cells of either granulosa or thecal type and arranging themselves in clusters about the germ cells to form the primitive follicles. In this typically female phase, however, cells may be left behind, especially in the region of the rete ovarii, which have persisted from the earlier male type of differentiation and which may therefore retain a potentiality to develop along masculine lines. It is from such male-directed cells in the ovarian medulla that, according to Meyer,¹ the masculinizing tumor, or arrhenoblastoma, has its origin. His explanation has been generally accepted, and it gives at least a satisfactory working theory of the histogenesis of these tumors. It is quite possible, however, that the real explanation goes deeper than this, for comparatively little is as yet known of the mechanism of sex differentiation. Especially suggestive is the close embryologic relationship of the ovarian medulla and the adrenal cortex, and the fact that the biologic effects of certain adrenal cortical lesions are so similar to those of arrhenoblastoma.

Robert Meyer,¹ to whom is due so much in the classification of these dysontogenetic tumors of the ovary, ascribes the origin of the second, or feminizing, group, the granulosa cell carcinoma, to masses of redundant granulosa cells or granulosa cell rests (granulosaballen) left over in the differentiative processes of early follicle formation. The evidence of recent years, however, indicates that this view must be modified. While it was formerly held that the follicular epithelium is derived from invagination of the germinal epithelium, the work of Fischel, Politzer and others has shown quite clearly that both granulosa and thecal elements are formed by

differentiation of ovarian mesenchyme in situ, and these embryologic researches are borne out by studies on the experimental production of such tumors with roentgen rays.² In other words, from the ovarian mesenchyme tumors may develop which morphologically are made up of either granulosa or thecal cells or of a mixture of the two. If a generic name were to be coined for this entire feminizing group, a good one would seem to be "feminizing ovarian mesenchymoma." Granulosa cell carcinoma and thecoma therefore have a common origin, and while they show certain structural differences, they produce similar feminizing effects and should therefore not be as sharply separated as they have been by some authors.

In certain granulosa or thecal tumors, either partial or complete luteinization has been noted. The folliculome lipidique described in 1910 by Lecène belongs to this group, and a considerable number of tumors of this group have been described. When the lutein transformation is complete, the tumor becomes a luteoma, and the majority of tumors coming under the latter designation are probably derived in this way. With lutein transformation of the granulosa or thecal cells, progesterone effects on the uterine mucosa may be noted. There are, however, many exceptions to this rule, and, although knowledge on this point is still very incomplete, it would seem that morphologic and functional lutein changes are not always parallel.

The subject of luteoma is further confused by the fact that masculinizing effects have been reported in association with certain tumors of this histologic group. The chief difficulty in the interpretation of such tumors has been to distinguish them from those of adrenal origin. Schiller³ believes that, with the exception of a very few cases, the adrenal origin is the correct explanation for this masculinizing group, and with this view I agree.⁴ Finally, in the group of ovarian tumors in which an origin from adrenal ovarian rests seems indubitable a masculinizing syndrome is produced which is practically identical with that brought about by arrhenoblastoma.⁵

It is obvious that knowledge of the histogenesis of the dysontogenetic functioning tumors of the ovary is still very incomplete, and hence it is not surprising that in certain cases there is difficulty, with difference of opinion as to the proper pathologic classification. A discussion of the gross and microscopic pathologic observations is beyond the scope of the present paper but may be found in many readily available papers, such as those of Schiller,⁶ Novak and Brawner,⁷ Novak,⁸ Norris,⁹ and Melnick and Kanter.⁹

CLINICAL CHARACTERISTICS OF GRANULOSA CELL CARCINOMA AND THECOMA

Granulosa cell carcinoma and thecoma may occur at any age, and the endocrine effects produced by them vary chiefly according to the age of the patient. They

are not by any means uncommon, making up something like 10 per cent of all solid malignant tumors of the ovary. In the Laboratory of Gynecological Pathology of the Johns Hopkins Hospital we now have more than 80 specimens of this group. The endocrine effects are dependent on the production of estrogen by the tumor cells, as has been shown by hormone assays and by the demonstration of the estrous effects produced by injection or implantation of the tumor tissue in castrated animals.

Effects in Children.—A considerable group of granulosa cell tumors has been reported in children.¹⁰ It is known that the development of secondary sex changes at puberty, as well as the initiation of the menstrual function, is due to the awakening of estrogenic function at that phase. The estrogenic function of a granulosa cell tumor which develops in infancy or childhood, therefore, brings about an abnormally early appearance of these puberal phenomena, constituting one group of cases, though numerically not the largest, of precocious puberty and precocious menstruation. The breasts become hypertrophic, more or less regular menstruation is initiated, genital and axillary hair growth appears, and the external genitalia assume the puberal type, with also hypertrophy of the uterus.

With removal of the tumor, these symptoms regress completely, a crucial demonstration of the causative role of the tumor hormones in their production. Indeed, in at least one recorded case in which such regression occurred a second reappearance of the precocious symptoms was found to be due to a recurrence of the tumor in the other ovary. Removal of the recurrent growth was followed by disappearance of the abnormal symptoms.

Effects During the Reproductive Epoch.—As might be expected, the effects of granulosa cell growths during reproductive life are far less striking than when they are projected against the bare estrogenic background of childhood. During menstrual life large amounts of estrogen are present in the circulation, and the secondary sex characters have long been present. The tumor, therefore, produces only a quantitative increase of estrogen, a "hyperestrogenism" like that found in many cases of functional bleeding and in at least some cases of amenorrhea. Menstruation may therefore be normal or excessive, or it may be absent for long periods.

Effects in Postmenopausal Life.—When such a tumor develops late in life, periodic uterine bleeding is usually observed and is interpreted by the patient as menstruation, though it is not associated with ovulation. The normal senile uterus is often hypertrophied to a size like that observed in reproductive life, and the endometrium often shows marked hyperplasia. Breast changes are not seen, presumably because of incapacity of the senile breast to respond to estrogenic stimulation as does the immature breast of the young child. Removal of the tumor not only brings about cessation of menstruation but may even be followed by vasomotor disturbances like those seen at the normal menopause (Novak; Dworzak; Schulze).

CLINICAL CHARACTERISTICS OF ARRHENO- BLASTOMA

The masculinizing group of tumors is far less common than the feminizing, the total of reported cases being not over 60. As with other tumors of the dysonto-

genetic variety, there can be no question that the rarity is not as great as published figures would indicate, for the reason that many pathologists and clinicians have not yet familiarized themselves with the characteristics of these neoplasms, so that the tumors often pass unrecognized.

Arrhenoblastoma occurs usually in young women and produces a train of symptoms characterized first by certain defeminization phenomena, followed by others which are definitely masculinizing. The history of a case of my own may be considered typical of the group. A woman of 35, previously of normal feminine type and with previously normal menstruation, had ceased menstruating eleven months before she was seen. There had been one full term pregnancy seven years previously. Shortly after the onset of her amenorrhea the breasts had begun to regress and at the time of examination were quite flat. She had lost slightly in weight, and her contour had lost the typical feminine curves. None of the thus far enumerated symptoms can be considered masculinizing. They are, however, to be interpreted as defeminizing, subtracting something from the characteristic feminine make-up.

Some months after the onset of amenorrhea, the patient noticed a rather heavy growth of downy hair over the face, extremities and abdomen, and this hypertrichosis had gradually increased. The previously high-pitched voice became deep and rough, and the patient had, in fact, been treated for many months for a supposed laryngitis. Still later the clitoris had become moderately enlarged. Pelvic examination revealed a rounded solid movable tumor about the size of a golf ball in the right ovary. Such a finding, plus the train of symptoms noted, left little doubt as to the diagnosis of arrhenoblastoma, which proved correct.

The removal of an arrhenoblastoma is followed by reappearance of menstruation, almost always about one month after operation. Other feminine characteristics, such as breast development and body contour, are soon restored. The positive masculinization phenomena are much slower to disappear, and regression is often incomplete. Hypertrichosis in some cases, as in the one described, may disappear within a few months, but the disappearance of the hair may be much slower and very incomplete. The same thing applies to the voice changes and the hypertrophy of the clitoris. If the latter is extreme, amputation may be necessary.

It should be remembered that mildly intersexual conditions of congenital origin are very common in women and that in such women simple ovarian tumors may develop in later life, possibly leading to an incorrect suspicion of arrhenoblastoma. With the latter, however, the abnormal sex phenomena occur characteristically in women who previously have been normal in this respect. The clinical test of the causal role of the tumor is the regression of the symptoms after removal of the growth. As with granulosa cell carcinoma, a double check has been possible in at least one case, in which such regression followed removal of an arrhenoblastoma, with reappearance of symptoms some years later because of a recurrence of tumor on the other side, and again disappearance of symptoms after removal of the second tumor.

ADRENAL TUMOR OF THE OVARY

The very rare adrenal tumor of the ovary is worth at least brief mention, if for no other reason than that it can produce a clinical syndrome identical with

¹⁰ Novak, Emil: Granulosa Cell Ovarian Tumors as Cause of Precocious Puberty, *Am. J. Obst. & Gynec.* 26: 505 (Oct.) 1933.

that of arrhenoblastoma. Only a small group of tumors of this type have been reported, apparently rising from adrenal tissue rests in ovaries.¹¹ Mention has already been made of the intimate embryologic relation between the anlagen of the adrenal cortex and the ovarian medulla, so that it is not surprising that certain adrenal tumors produce sex effects exactly similar to those of arrhenoblastoma. As already mentioned, it seems probable that most of the tumors reported as luteoma producing masculinization phenomena have probably been of adrenal origin.

THYROID TUMOR OF THE OVARY (STRUMA OVARII)

A rather rare type of ovarian tumor is the so-called struma ovarii, made up entirely or in part of thyroid tissue.¹² Such neoplasms are looked on as teratomas in which thyroid tissue has overridden and perhaps blotted out other teratomatous elements. The thyroid tissue in such tumors is quite typical histologically, and in some cases studies of the iodine content have added further confirmation on this point. Finally, in a few recorded cases the thyroid tissue of the tumor was apparently functionally active, producing clinical evidences of hyperthyroidism.¹³

HUMAN CONVALESCENT POLIOMYELITIS SERUM AND HUMAN CONVALESCENT MUMPS SERUM

Preliminary Report of the Council

HUMAN CONVALESCENT SERUMS ARE PREPARED BY A NUMBER OF SERUM CENTERS, SOME OF WHICH OPERATE UNDER LICENSE OF THE U. S. PUBLIC HEALTH SERVICE. THE SAMUEL DEUTSCH CONVALESCENT SERUM CENTER, MICHAEL REESE HOSPITAL, CHICAGO, IS THE ONLY CENTER WHICH HAS PRESENTED FOR THE COUNCIL'S CONSIDERATION HUMAN CONVALESCENT POLIOMYELITIS SERUM AND HUMAN CONVALESCENT MUMPS SERUM. THE FOLLOWING PRELIMINARY REPORT INDICATING THE PRESENT STATUS OF THESE TWO SERUMS HAS BEEN PREPARED AND PUBLICATION AUTHORIZED BY THE COUNCIL.

OFFICE OF THE SECRETARY.

HUMAN CONVALESCENT POLIOMYELITIS SERUM

Of the many methods that have been tested to prevent and to treat anterior poliomyelitis there are included the antistreptococcic serum of Rosenow,¹ the chemicals tried by Schultz,² including alum, tannic acid, picric acid, neutral acriflavine, zinc sulfate, vitamin B compounds, viosterol, sodium sulfanilsulfonate and sulfapyridine (the first five appearing effective prophylactically in monkeys when applied to the olfactory mucosa), roentgenotherapy,³ malarial therapy⁴ and potassium

chlorate.⁵ However, not one has seemed to find the favor accorded to human convalescent serum by other investigators except in the hands of the individual investigators responsible for the suggested treatment.

According to McKinnon,⁶ previous to 1927-1928 the use of convalescent serum in the treatment of preparalytic poliomyelitis was based on the demonstration in 1910 of neutralizing bodies in the serum of monkeys and individuals recovered from the disease, a report in the same year by Flexner and Lewis on the prevention of paralysis in monkeys by the intraspinal injection of serum within twenty-four hours after the inoculation, and other similar reports. However, other workers often failed to support the previous observations and it was not until 1927-1928 that a renewed interest in the use of serum was manifested. During that time there appeared independent reports, clinical and experimental, from widely separated places, which seemed to indicate that the serum was worthy of consideration. But inconsistencies in duplicating previous results were again observed and many clinicians and laboratory investigators were skeptical about the therapeutic value of convalescent poliomyelitis serum. Because of this skepticism, investigations using controls were conducted in the Eastern states. Some patients were given serum, others were given only routine treatment. An analysis of the results failed to show any decrease in paralysis or fatality in the serum treated cases, and yet many physicians, because of their observations, were convinced that the serum had some value. Apart from the ardent supporters of serum therapy, the common attitude among the less conservative physicians was probably hypothetically expressed as "Serum may not be of any value but neither is it likely to cause harm. Since we have no other agent, what have we to lose by trying this type of therapy?"

Aycock⁷ and Fischer⁸ were of the opinion that the end results of the serum treated cases were no better than those of the control cases. However, it was felt that this was not a contraindication to further trials with serum and they emphasized the need for further investigation with an adequate arrangement for controls. Analyzing all their available data failed to give a satisfactory answer to the problem, and the reports that subsequently appeared were both favorable and unfavorable for the use of convalescent human serum in the treatment of anterior poliomyelitis.

Levinson and his co-workers⁹ have reported favorably in several instances on serum therapy while working at the Samuel Deutsch Convalescent Serum Center, and in a review of previous literature¹⁰ they pointed out that many investigators had found serum therapy to be of definite benefit in the preparalytic stage. With a group of 130 patients diagnosed as having anterior poliomyelitis and treated with serum, they obtained a mortality rate of less than half the mortality observed for the patients in the same city who received no serum. Unfortunately there were no controls in their own investigation for accurate comparison. They also reported that a frequent prompt decrease in temperature and other symptoms occurred and the resulting paralysis was lessened in severity following serum therapy. A later publication by Levinson¹¹ further pointed out the low mortality rate that appears to follow the use of serum. In discussing this paper,¹² one clinician reported two cases from his own experience which appeared to be outstanding in response to serum therapy. A still later publication¹² reported that less

than 2 per cent of some 200 consecutive patients with poliomyelitis treated with convalescent serum had residual paralysis. This was compared with the 20 per cent found among untreated patients. The success apparently depended on early diagnosis and early serum administration in large doses (from 100 to 200 cc. intravenously as an initial dose) and close observation of the patient with repeated administration of serum every twelve hours until the disease was arrested. The average dose at the Samuel Deutsch Convalescent Serum Center is reported to be from 250 to 300 cc., but some patients have received as high as 1,000 cc. of serum.

In 1937 Jackson,¹³ while emphasizing the value of serum, stressed the importance of early administration in adequate quantity. However, he admitted that the observations were open to criticism because of limitations of diagnosis in early cases. Personal opinion and observations seem to influence most of the literature and yet each author almost invariably admits that any good results can be subjected to criticism. Most of the fault appears to be in doubtful diagnosis, inadequate controls and misinterpretation of observations. Another factor that may play an important part is the possible variation in strains in different outbreaks. Often the serum may have been unjustly condemned by those who are certain that serum therapy has no value in the treatment of anterior poliomyelitis; and just as often the serum has possibly been overestimated by the more highly optimistic investigators. Its true value can be determined only by impartial investigators using a system of controls that is above scientific criticism. The same attitude was voiced by Park and by Kramer in 1932.

Rosenholtz¹⁴ studied the effect of human poliomyelitis convalescent serum in the preparalytic stage, being most interested in the mortality, amount of paralysis or muscle weakness during the acute stage, and residual paralysis. In his statistical analysis of several thousand cases, with most attention being paid to those with adequate controls, there appeared to be no evidence of value for the serum. Gershenfeld¹⁵ also reported that a review of available evidence indicated serum to be of little if any value in the treatment of acute poliomyelitis.

Another factor which has caused some doubts concerning the value of serum is the fact that the port of entry of infection is still in dispute. Some investigators have attributed outbreaks to be due to contaminated water, others to milk, others to direct contact. However, it is felt that the consensus places the nasal passages and olfactory nerve endings as the usual path by which the infection invades the nervous system. Kempf and his co-workers¹⁶ found only a small percentage of circulating antibody present in the spinal cord, an observation which suggested to them that antiserum is of little value if the virus spreads by a mode other than the blood serum. They had felt that to be effective antiserum must be able to penetrate into the nervous tissue when the virus is present.

In the hands of some investigators serum therapy appears to be of considerable value while in others it appears to be of no value. In view of the conflicting evidence the Council decided to postpone consideration of human convalescent poliomyelitis serum until further controlled evidence is available.

HUMAN CONVALESCENT MUMPS SERUM

As in the case of poliomyelitis, confusion appears to exist on the value of convalescent mumps serum in the prophylaxis of and in the treatment of mumps. The reasons for the differences in results and opinions are often not readily apparent. One factor may possibly have been the size of the dose, as it has been shown at the Samuel Deutsch Convalescent Serum Center that 10 cc. of serum appeared to afford no protection while 20 cc. (the one recommended by this center) apparently resulted in a lower incidence of disease following exposure.

Among the reports favoring the use of mumps serum are those by de Lavergne,¹⁷ who presented a series of 113 serum-treated cases in which orchitis developed in only five instances as compared to 107 controls, in which orchitis occurred in twenty-five; Teissier,¹⁸ who found orchitis developing in 8.1 per cent of 172 patients treated with serum and in 23.3 per cent of 174 non-serum treated cases; Barenberg,¹⁹ who reported 15 per cent of fifty-five exposed and serum treated children developing the disease as compared to 39 per cent of 125 controls, and Hinckley,²⁰ who found that complications developed in 13 per cent of a serum treated group of twenty-three cases, compared with 40 per cent in non-serum treated fifty-five cases. Other investigators²¹ have reported a decreased incidence in serum treated patients as compared with control patients but the dosage was often so small (from 2 to 5 cc. in some instances), when compared with the recommended higher dosages, that some skepticism has been felt regarding their results because of (a) the possibility of lack of true exposure to an infection and (b) the lack of adequate controls.

Contrary to the authors of the foregoing favorable reports, Toomey²² stated that there was no good reason to immunize passively, with human convalescent serums, individuals exposed to mumps.

Experimentally the virus has been injected into monkeys in an attempt to produce mumps and to determine the extent of experimental immunity produced. However, Johnson and Goodpasture²³ found difficulty in inducing infection except by intraparotid inoculation and attempts to confer passive immunity usually failed. Bloch²⁴ obtained no evidence for the presence of any considerable amount of antiviral substance in either serum or saliva and agreed with Johnson and Goodpasture that a more delicate test is needed for the study of immunity to mumps.

Human convalescent mumps serum appears to be of therapeutic value in the hands of some investigators to induce some degree of passive immunity, while in others the results are less certain. Confirmatory experimental evidence on animals is lacking. In view of the lack of confirmatory evidence, the Council voted to issue the foregoing preliminary report.

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLE HAS BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

SATURDAY, MARCH 8, 1941

MORTALITY OF HUSBANDS AND WIVES

From modern studies, especially those of Pearson in England, it has been known that there is a certain positive correlation in the length of life of husbands and wives. For single causes of death it has been proved for tuberculosis by several investigators that there occurs a definite association between husband and wife in incidence and mortality from this disease. Now Antonio Ciocco¹ has reached some new results by applying modern statistical methods to death records of marital groups.

Ciocco obtained the material for his study from the death records of white persons filed in the Washington County (Md.) Health Department during the period 1898 to 1938. The records of married men have been matched with those of widows and vice versa. Thus the records of 2,578 couples have been collected, or 45 per cent of what it could theoretically have been possible to discover. Among the 2,578 couples, the husband and wife of 7 died simultaneously or within twenty-four hours from homicide, suicide, accidents or similar causes. These have been excluded from the further study, and the material is constituted by the death records of 2,571 white couples.

The material originates from official vital statistics of all the dead white persons of the community, and intentional selection has not been made relative to the two main variables dealt with in the investigation, viz. age at death and cause of death. The careful analysis of the material reveals first that there is a high positive correlation in the length of life of the spouses. There is evident a strong tendency for marital partners to have the same duration of life.

The author next arranged the observed number of husbands and wives in a contingency type of table according to the stated specific causes of death of each couple and calculated the number of deaths expected, assuming random matings in relation to cause of death.

1. Ciocco, Antonio: On the Mortality in Husbands and Wives, Human Biology 12: 508 (Dec.) 1940.

These data reveal that when a husband or wife died of tuberculosis the relative number of their spouses who also died from this cause is three times as high as that of the spouses of other persons. Influenza and pneumonia as a cause of death occur almost twice as often in the group of marital partners who have died from this cause as among the spouses of those who have not. This ratio was 1.5 in the case of cancer and 1.2 in the case of heart diseases.

The author also set up a control sample which is of an entirely different nature from the calculated expected deaths. For each husband whose death preceded that of his wife, another widow was sought in the files of unmatched widows having as characteristics the age at death within ± 5 years that of the wife and the time of death within ± 5 years of that of the wife. In the same manner a control widower was selected for each wife whose death preceded that of the husband. The results obtained in these control, nonmarital, couples for tuberculosis, influenza and pneumonia, cancer and heart diseases are shown in the tabulated summary and compared with the marital

Number of Couples in Which the Man and the Woman Died from the Same Cause

Cause of Death	A	B	C
	Observed Number of Husbands and Wives	Expected Number of Husbands and Wives	Control (Non-marital) Couples
Tuberculosis (all forms).....	20	7.4	9
Influenza and pneumonia (all forms)	27	15.5	19
Cancer and other malignant tumors	29	19.9	19
Heart diseases	184	162.6	166

couples both of whom have died from one of these causes and with the number expected assuming random mating.

This impressive table reveals an almost perfect agreement between the control group (C) and the calculated data (B). Within the limits of that comparison the calculated numbers actually represent the expectations, assuming random matings.

The results of Ciocco's investigations demonstrate not only the existence of a high correlation in the length of life of husbands and wives but also a distinct tendency for marital partners to die from the same cause when one of the mates dies from tuberculosis, influenza and pneumonia, cancer or heart disease. For a chronic infectious disease such as tuberculosis, this kind of association is easily explainable and has also been found by former investigators. It is somewhat more difficult to explain for an acute infectious disease like influenza and pneumonia, considering that the deaths of husband and wife were not simultaneous. In heart diseases, which are of course not a clinical entity, the association could be due to another chronic infection, rheumatic heart disease. However, such a direct transmission, according to our present knowledge, can hardly explain the marital association noted for cancer.

NECROBIOSIS LIPOIDICA DIABETICORUM

An apparently new dermatosis, necrobiosis lipoidica diabeticorum, was first described in 1929 by Oppenheim.¹ A diabetic patient had cutaneous lesions—flat, red papules with a yellowish center—distributed over the legs. Biopsy revealed necrobiotic areas in the corium in which the elastic fibers were absent and the collagen fibers swollen. Oppenheim named the disorder “dermatitis atrophicans lipoides diabetica.” A similar lesion was observed by Urbach² in 1932 in a woman who had diabetes. The lesions, chiefly below the knees, consisted of hard flat papules, bluish violet at the border and yellow in the center. Microscopic examination revealed changes in the vessels of the corium with local necrotic areas in which fatty substances were deposited. Urbach considered the condition to be a local tissue necrobiosis caused by toxins due to diabetes mellitus and followed by infiltration with lipoids present in excess in the circulating blood of patients with diabetes. He accordingly named the lesion “necrobiosis lipoidica diabeticorum.” Balbi reported a case in 1933, and Zeisler and Caro³ reported the first two cases in the United States in 1934.

Now Hildebrand and her associates⁴ have reported 8 cases observed at the Mayo Clinic and 76 instances collected from medical periodicals. Among 2,000 cases of diabetes admitted to the Mayo Clinic from 1936 to 1940, only 8 instances of this dermatosis occurred. Diabetes was present in more than 87.2 per cent of the reported cases. In 55.6 per cent diabetes was diagnosed from one to ten years prior to the appearance of the cutaneous lesions, while in 17 per cent the lesions appeared prior to the diagnosis of diabetes. In 70 per cent the diabetes was moderately severe or severe. All cases have been treated with insulin during the greater part of their course, although in the majority of the cases the course of the disease has been poorly controlled. Some have thought that insulin may have a role in the development of these lesions. Thus Michelson reported a case in which lesions developed at the sites of injection of insulin. However, as Hildebrand points out, in 8 cases the lesions developed before diabetes and in 8 cases there was no diabetes. Of the 78 cases reported in the literature 47 occurred in women and of the 8 cases of the Mayo Clinic 7 were in women. The condition was seen predominantly in younger diabetic patients, those between the ages of 10 and 40.

The common site of occurrence is one or both legs below the knee. The individual lesion is a small round or oval reddish papule, which enlarges gradually and becomes a plaque with a red or violet border and yellowish center.

The microscopic changes are pathognomonic and consist primarily, according to Zeisler and Caro, of a vascularitis with perivascular lymphocytic infiltration and extensive necrobiotic areas in the corium containing swollen collagen fibers which are infiltrated by droplets of lipoids. These lipoids stain reddish brown with sudan III and do not show double refraction with the polariscope. Most authors believe that these lipoids are composed of phospholipids and free cholesterol. Two hypotheses have been advanced to explain the pathogenesis of this condition. One attempts to explain it on the basis of damage to the small blood vessels of the corium by circulating toxins with subsequent thrombosis, necrosis and secondary imbibition of fat particles. The other hypothesis attributes the cutaneous lesions to changes in the general metabolism of fat. However, Hildebrand and her co-workers indicate that in their series the average value for cholesterol was found to differ but little from the average mean normal value and that the blood lipoids in the 8 cases gave values practically identical with average mean normal values. Thus the pathogenesis of this condition is still obscure.

The diagnosis of the lesion, especially in a subject with diabetes mellitus, presents little difficulty. It is differentiated from xanthoma, which it resembles, by the absence of true foam cells, and from amyloidosis, scleroderma and similar dermatoses by the characteristic gross and microscopic appearances. The lesion is chronic and is resistant to treatment with insulin and low fat diet and to roentgen or ultraviolet irradiation.

SUDDEN DEATH

For medicolegal and clinical purposes, sudden death may be defined as the termination of life which comes quickly under circumstances when its immediate arrival is unexpected. Sudden death may be further differentiated, as suggested by Moritz,¹ into (1) instantaneous death, (2) unexpected syncope with deepening unconsciousness terminating in death, and (3) rapidly fatal illness with early prostration not initiated by loss of consciousness. The causes of sudden death are varied. In most instances vascular accidents are responsible, the term “vascular” being employed to include the heart as a modified blood vessel. These accidents in order of their frequency are (1) sudden stopping of the heart, (2) hemorrhage, (3) arterial embolism and thrombosis. Hemorrhage may prove instantaneously or rapidly fatal because of (1) loss of blood, (2) the effects of pressure on a vital organ, as in bleeding into the pericardium, (3) the damage to tissue from bleeding into its substance, as in the case of hemorrhage into the brain or into both adrenal glands. Emboli come as a rule from thrombi in the systemic veins or thrombi in the cham-

bers of the heart. Sudden death follows the occlusion of the trunk or of both branches of the pulmonary artery and sometimes also when only one main branch is occluded.

Statistical studies by Hamman² reveal that 91 per cent of sudden deaths from natural causes are due to disease of the cardiovascular system and that 65 per cent of all cases are due to sudden heart failure, 21 per cent to hemorrhage, and 5 per cent to arterial embolism and thrombosis. Of the deaths from sudden heart failure, 65 per cent are due to disease of the coronary arteries; 21 per cent occur with valvular heart disease, 10 per cent with myocardial disease and 3 per cent with cardiac hypertrophy. Syphilis of the aorta is a frequent cause of sudden death. It occurred in his statistics in about 20 per cent of all cases due to natural causes. Thus it appears that heart failure is the cause of sudden death nearly three times as often as hemorrhage and embolism combined. Death from sudden stopping of the heart is more often instantaneous than death from hemorrhage or cerebral embolism. If an adult in perfect health suddenly falls dead, the chances are overwhelmingly in favor of coronary occlusion. Coronary arteriosclerosis with or without thrombosis is the commonest cause of sudden death. Other diseases of the heart responsible are syphilitic aortitis, especially when the aortic valve or the coronary ostiums are involved, congenital anomalies and hypertensive, degenerative or inflammatory lesions. These may lower the threshold to such a degree as to predispose the heart to sudden stoppage.

In the majority of cases of instantaneous death, according to Weiss,³ postmortem examinations fail to reveal the cause. Weiss is much impressed by the close similarity and interrelation between the mechanism of instantaneous death and that of syncope. Frequently instantaneous death is merely fatal syncope. In cardiac syncope increased sensitivity of the myocardium and nerve structures within the heart, caused by ischemia and infection, plays an important part. In the presence of ischemic myocardium and hyperactive reflexes, fright or other emotional stress may induce cardiac arrhythmia, syncope and death.

In the absence of a structural defect, instantaneous death may be considered logically as due to inhibition of cardiac action on a physiologic basis. Two physiologic mechanisms within the heart have so far been established as capable of accounting for a sudden cessation of the circulation leading either to temporary syncope or to death. One is the temporary cardiac or ventricular standstill observed in the syncope of Adams-Stokes syndrome. The other mechanism is ventricular fibrillation. This is an irreversible phenomenon which termi-

nates in death. Hoffa and Ludwig demonstrated in 1850 that electrical stimulation of the mammalian heart leads to ventricular fibrillation and death. McWilliam in 1888 advanced the theory that sudden death in man could be due to ventricular fibrillation. Hering observed that ventricular fibrillation in animals is an irreversible process invariably terminating in death. Ventricular fibrillation may be induced experimentally in animals by electrical, mechanical or chemical stimulation and by ligation of the coronary artery. The latter phenomenon suggests that the mechanism of death in coronary artery disease is by ventricular fibrillation. Contrary to Allbutt's belief that death in angina pectoris is due to overstimulation of the vagus resulting in a standstill of the entire heart, the preponderance of evidence indicates that fatal cardiac syncope is usually due to ventricular fibrillation.

The exact nature of ventricular fibrillation is not clear. Recent physiologic studies have demonstrated that sympathetic nerve stimulation acts through the chemical mediation of an epinephrine-like substance. Apparently epinephrine is capable of initiating a new focus of rhythmicity. Observations on experimentally induced ventricular fibrillation in animals indicate that epinephrine is an important exciting agent in the development of fibrillation in a ventricular myocardium sensitized by various methods such as poisoning with chloroform, barium chloride and benzene, reduction of the blood supply or application of electrical stimuli. Nathanson⁴ suggested that the tendency to ventricular fibrillation may be lessened by the application of drugs which counteract the effect of epinephrine on the ventricles. He induced cardiac standstill in susceptible human beings by reflex vagus stimulation and by sympathetic stimulation with epinephrine administered intravenously. The prefibrillation rhythm induced by intravenous injections of epinephrine was controlled by the oral administration of quinidine or of acetyl-beta-methylcholine chloride. Borg⁵ attempted to modify the incidence of sudden death in his hospital service by administering quinidine sulfate to patients liable to sudden death. A comparison of the incidence of sudden death of patients admitted in the course of three years shows that in 1934 and 1935 the number amounted to twenty-three each year, whereas during the year 1936, when the drug was given, there was not one death among patients with congestive heart failure who had received the drug. The desirability of the continued use of quinidine in an attempt to prevent sudden death is still open to discussion. True, known well controlled studies do not point to danger, and Borg's study does not indicate that this exists. However, more evidence should be available before a definite opinion is reached.

Current Comment

BRINKLEY ON THE BRINK? IV

THE JOURNAL on February 8 called attention to a news release which stated that Dr. John R. Brinkley had been adjudged bankrupt. *Broadcasting* for February 10 refers to this incident as follows:

Almost coincident with the disclosure that the Mexican Government will not re-license Dr. John R. Brinkley's 180,000-watt XERA, at Villa Acuna, Mexico, came the action Jan. 31 of the Federal District Court at San Antonio, adjudging the medico-broadcaster a bankrupt. . . . Following the conclusion of the North American Engineering Conference in Washington, Jan. 30, to perfect the continental allocations under the Havana Treaty, it was learned authoritatively that no provision had been made for the continuation of XERA when the treaty becomes effective March 29.

ACUTE SUBDELTOID BURSTITIS

A clinical picture characterized by sudden onset of agonizing pain and stiffness in the shoulder was described as early as 1872 by Duplay under the name of periarthritis humeroscapularis. He had correctly recognized the subdeltoid bursa as the seat of the lesion. Codman in 1904 called attention to the role of the tendons of the short rotators in the production of many lesions giving rise to painful shoulder. He stressed in particular the importance of rupture of the tendon of the supraspinatus muscle in the production of subdeltoid bursitis. With the advent of x-rays, calcified deposits were demonstrated in the substance of the tendons of the short rotators. As the result of observations in cadavers (Meyer) and in operations, the following concept has been evolved: Repeated minor traumas produce minute tears in the substance of the tendons. These tears, because of poor circulation in a tendon, result in areas of local necrosis with formation of calcium deposits. At some time an area of calcification, usually in the tendon of the supraspinatus muscle, becomes the seat of an acute inflammatory process which produces tension in the unyielding fibers of the tendon. The acute inflammation extends to the overlying bursa. The resulting clinical picture is characterized by acute agonizing pain in the shoulder and exquisite tenderness over the great tuberosity and the insertion of the deltoid muscle. Any attempt at abduction increases the pain. X-ray examination usually discloses a relatively large calcified deposit. The acute stage subsides in one or two weeks with disappearance of the muscle spasm and pain and gradual return of motion. In cases in which complete recovery occurs, Codman believes, the soft calcified deposit has spontaneously ruptured into the bursa, whence it has been absorbed. Thus it appears that relief from pain and return to normal shoulder function depend on the relief of tension in the calcified area. This was readily accomplished by exploration of the bursa and incision of the calcified deposit in the supraspinatus tendon. The operation may be performed under general, local or brachial plexus block anesthesia. Haggart and Allen¹ obtained good results by injection

of about 20 cc. of a 2 per cent procaine hydrochloride solution into the bursa and into the capsule of the shoulder joint. They believed that the relief of symptoms following this procedure was due to a more rapid removal of the calcified deposit due to improvement in the local circulation. They add, however, that injection of the tendon provides for rupture of some of the calcified material into the bursa, a point which Codman stressed as probably the means by which nature gives relief. Patterson and Darrach² obtained apparently as good results in the treatment of sixty-three patients with acute subdeltoid bursitis by introducing two needles into the bursa and forcing saline solution through one needle to flow out the other. They were able in that way to wash out the calcified deposits. Alanson Weeks³ in 1908 aspirated a subdeltoid bursa of a patient with acutely painful shoulder for diagnostic purposes. Although he had aspirated only about 1 cc. of straw-colored fluid, the patient experienced instantaneous relief from pain. Weeks has been able to obtain relief for forty patients by the simple procedure of multiple needling of the bursa whether he was able to withdraw fluid or not. He believes that the relief of symptoms is due to relief of tension effected by puncturing the firm walled sac in numerous places. The method is simple and may be performed under local or gas inhalation anesthesia. According to Weeks, chronic conditions as well will be relieved and the calcium absorbed after the use of this method, unless the salt has organized into bony hardness, in which case surgical removal is justified.

THE CAMPAIGN AGAINST RHEUMATISM IN BRITAIN

The Fourth Annual Report of the Empire Rheumatism Council⁴ covers the period of November 1939 to November 1940. In spite of the extraordinary difficulties encountered, including the bombing of one of the laboratories, substantial progress is reported in plans for a national scheme of treatment. Research in the various institutions sponsored by the council has continued with comparatively few interruptions. Likewise, the treatment centers operating under the auspices of the council have continued to function with only slight disturbances. The council itself and members of its staff have cooperated in numerous ways with work for the defense forces, which, as pointed out in the report, now comprise the whole community, excluding only the totally infirm and the children. Among other difficulties, this has involved an administrative problem in that the physical treatments which are necessary in the treatment of rheumatic diseases are also frequently called for in the rehabilitation of joints, muscles and nerves injured by wounds. The report not only reflects the difficulties encountered with medical research and treatment during wartime but also illustrates the degree to which these difficulties can be overcome.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

THE FLYING CADET CANDIDATE AND THE FAMILY PHYSICIAN

M. MARTYN KAFKA, M.D.

Flight Surgeon, U. S. Army

Scott Field, Illinois

The U. S. Army Air Corps has embarked on a program to increase greatly the number of available aviators. Each corps area has a flying cadet board which passes on the qualifications of the applicant flying cadets. The family physician can in large measure assist in the Air Corps preparedness program by a proper approach and attention to the physical problems of these applicants for the Army Air Corps. Many of the young applicants travel hundreds of miles to army flight surgeons for the required special physical examination. Important problems arise in the course of a pilot's career. High altitude flying, sudden changes in altitude and temperature, all require perfectly healthy young men.

The family physician must realize that when pilots and their crews are flying in extremely high altitudes their safety depends on the maintenance of normal respiratory, cardiovascular and mental processes. Therefore any physical defect which the applicant has may be the cause of his rejection by the flying cadet board.

The family physician can aid the flight surgeon and the flying cadet board by properly preparing the applicant prior to his contemplated trip to take the special physical examination. The family practitioner may overlook the minor defects of a seemingly healthy youth who asks to be examined. Naturally the apparently healthy candidate feels that he is qualified for any type of physical examination, and should he fail he may become discouraged; besides, it has cost him time and money to travel to the examining board, and when a flying cadet candidate is disqualified because of some minor defect the progress of the preparedness program is hampered to some extent.

The family doctor, then, should bear in mind some of the deficiencies which are common disqualifying factors. A general survey is here offered which attempts to outline some of the physical requirements essential to the acceptance of a flying cadet candidate. These applicant cadets are only too often rejected because of minor conditions which originally could have been corrected before they left home.

The minimum vision is 20/20 for a class A pilot. A mild conjunctivitis, hordeolum or scar on the external eyeball not affecting the cornea is not considered disqualifying. Severe myopia, hyperopia or advanced astigmatism are disqualifying. Any decided weakness of the extraocular muscles or phorias are also disqualifying. Failure of the pupils to react to light and in accommodation, or unequal pupils, finding of total color-blindness to the yarn test for a single color such as red, green or blue or the presence of night blindness will be sufficient cause to reject the candidate.

Obstructions of the nose or deformity of the septum which occludes nasal breathing should be corrected before the candidate appears for his examination. Any nasal polyps, sinus infections, chronic hypertrophied infected tonsils, obstruction of the eustachian tubes or any infection of the mouth, gums or teeth should be treated and cured. Acute rhinitis and bronchitis should be treated. No applicant should be allowed to appear before the Flying Cadet Examining Board with a cold, nor should one be permitted to travel a long distance for a physical examination immediately after convalescing from a short or long illness.

I would suggest that, when doubt exists in the family doctor's mind on problems about the eye, ear, nose and throat, a local specialist be consulted and that, if minor defects are found, correction be encouraged. Missing teeth should be replaced. The applicant's hearing should be at least 20/20 tested by the whispered voice. Any benign tumors of the neck, such as cysts or lipomas, should be surgically removed. Irritations of the neck and infections of the skin should be cured. Acne vulgaris should be improved.

Any deformities of the chest such as pigeon chest, rachitic chest or deep funnel chest are considered disqualifying. Lordosis or scoliosis with shoulder deformities are unfavorable. Shortening of the limbs is disqualifying. Extensive psoriasis which is not amenable to treatment is likewise a rejectable factor.

Organic lesions of the heart or any pulmonary diseases of either early or late stages are disqualifying. A pulse rate of 90 beats per minute may be considered normal if the applicant is excitable.

Blood pressure should be checked to see if it is within normal range; about 135 to 140 systolic is a borderline type.

Ringworm on any region of the body as well as any other diffuse cutaneous disease should be cured. Applicants with deformities of the feet are rejectable except for various degrees of flatfoot.

Undernourishment and excessive obesity should be corrected to the ideal type of weight. A fairly good and simple guide for weight calculation is for every applicant who measures 5 feet (152 cm.) to allow 104 pounds (47 Kg.) and for every inch thereafter to add an additional 5 pounds (2.3 Kg.). If for example a candidate aged 22 weighs 170 pounds (77 Kg.) and is 5 feet 6 inches (167.6 cm.) tall, he would be accepted by the Air Corps if he were of an average of 134 pounds (61 Kg.), with a minimum weight of 124 pounds (56 Kg.) and a maximum of 151 pounds (68.5 Kg.). This is calculated by deducting 10 pounds (4.5 Kg.) from average ideal weight or adding from 22 to 30 pounds (10 to 13.6 Kg.) to the ideal average for the maximum weight. Thus any applicant who is overweight or underweight could be treated for correction. The minimum height is 5 feet 4 inches (162.5 cm.) and the maximum height accepted is 6 feet 4 inches (193 cm.). The maximum weight accepted is 200 pounds (91 Kg.).

Those candidates who are under active treatment for gonorrhea should be discouraged from appearing for an examination. Candidates who have had gonorrhea but who have been cured may be considered favorably. Candidates with congenital or acquired syphilis are rejected.

Secondary anemias should be corrected. Any history of nephritis or finding of any persistent degree of albumin, dextrose or casts in the urine is disqualifying.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY SECOND CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Second Corps Area, which comprises the states of New York, New Jersey and Delaware:

BENNETT, William L., 1st Lieut., East Northport, L. I., N. Y., Madison Barracks, N. Y.
BREENBERG, Solomon, Captain, Bayonne, N. J., Fort McClellan, Ala.
BUMP, Samuel C., 1st Lieut., Ridgewood, N. J., Camp Shelby, Miss.
CHARET, Richard, 1st Lieut., Brooklyn, Fort McClellan, Ala.
COLTON, Benjamin, 1st Lieut., Flushing, L. I., N. Y., Carlisle Barracks, Pa.
COOPER, Nathaniel, Captain, Merrick, L. I., N. Y., Carlisle Barracks, Pa.
DEFUSCO, Gaetano, 1st Lieut., Jersey City, N. J., Camp Livingston, La.
D'ELIA, William J., 1st Lieut., Jersey City, N. J., Camp Shelby, Miss.
DE LUCA, Donato, 1st Lieut., Montclair, N. J., Fort Benning, Ga.
EHRlich, Hilbert W., 1st Lieut., New York, Fort McClellan, Ala.
EINHORN, Samuel E., 1st Lieut., Newark, N. J., Camp Livingston, La.
EISENBERG, Nathan P., 1st Lieut., New York, Camp Shelby, Miss.
FENCHEL, Benjamin, 1st Lieut., Newark, N. J., Camp Shelby, Miss.
GERSH, William J., 1st Lieut., Mount Vernon, N. Y., Carlisle Barracks, Pa.
GIANATASIO, Pasquale F., 1st Lieut., New York, Camp Livingston, La.
GOLAN, Myer E., 1st Lieut., New York, Carlisle Barracks, Pa.
GRAVES, Clifford L., 1st Lieut., New York, Carlisle Barracks, Pa.
HAVERTY, Edwin A., 1st Lieut., New York, Trenton, N. J.
HOROWITZ, Max N., 1st Lieut., New York, Fort Hancock, N. J.
KAUFMAN, Philip M., 1st Lieut., Brooklyn, Fort McClellan, Ala.
KNAPP, George M., 1st Lieut., Larchmont, N. Y., Carlisle Barracks, Pa.

THIRD CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Third Corps Area, which comprises the states of Pennsylvania, Virginia, District of Columbia and Maryland:

ABRAMS, Frank, 1st Lieut., Pittsburgh, Fort Belvoir, Va.
ADONIZIO, Anthony Charles, 1st Lieut., Pittston, Pa., Philadelphia QM Depot, Philadelphia.
ALEXANDER, Arthur Sidney, 1st Lieut., Washington, Pa., Fort Belvoir, Va.
ALEXANDER, Charles Palmer, 1st Lieut., Richmond, Va., Langley Field, Va.
ATKINSON, Walter, Captain, Washington, D. C., Fort George G. Meade, Md.
BAILEY, Charles Philamore, 1st Lieut., Upper Darby, Pa., Indiantown Gap, Pa.
BARDONER, John Nicholas, 1st Lieut., McKees Rocks, Pa., Savannah Air Base, Ga.
BARNETT, Luke Joseph, 1st Lieut., Pittsburgh, Savannah Air Base, Ga.
BAUSCHER, Abner Henry, Lieut. Col., Reading, Pa., Indiantown Gap, Pa.
BENZ, Carl Ferdinand, 1st Lieut., Linesville, Pa., Camp Shelby, Miss.
BISHOP, Charles Justus, Captain, Hop Bottom, Pa., Camp Lee, Va.
BLUMBERG, Joe Morris, 1st Lieut., Baltimore, Fort Eustis, Va.
BRALL, Cleo Augustus, 1st Lieut., Washington, D. C., Fort George G. Meade, Md.
BRANT, Glen Zimmerman, 1st Lieut., Berlin, Pa., Camp Lee, Va.
BREHM, William Frederick, Jr., Captain, Franklin, Pa., Indiantown Gap, Pa.
BRESLER, Rubin Ralph, 1st Lieut., Emporium, Pa., Fort Belvoir, Va.
BRONK, Henry Nehemiah, Captain, Jeannette, Pa., Camp Lee, Va.
BROWDIE, Abraham Saul, 1st Lieut., Pittsburgh, Camp Lee, Va.
BRUNACCI, Alfred, Captain, West Pittston, Pa., Camp Pendleton, Va.
BRYCE, Clifford Barton, 1st Lieut., McKeesport, Pa., Savannah Air Base, Ga.
BRYNE, Kenneth Nathan, 1st Lieut., Lexington, Va., Fort Eustis, Va.
CANADA, Charles Crawford, 1st Lieut., East Falls Church, Va., Fort Story, Va.
CLOUD, Milton Harlan, 1st Lieut., Uniontown, Pa., Fort Eustis, Va.
COHEN, Reuben Robert, Captain, Pittsburgh, Savannah Air Base, Ga.

Roentgen ray and laboratory tests are utilized by examining board flight surgeons as a routine.

Since the examination of the flying cadet candidate entails a highly technical procedure, the absence of the deficiencies mentioned would considerably help the examining flight surgeon in the output of acceptable flying cadet material. Aviation medicine today is an attempt to keep pilots well while they are in the air as well as on land.

FOURTH CORPS AREA

The following additional medical reserve officers have been ordered to active duty by the Commanding General, Fourth Corps Area, which comprises the states of Tennessee, North Carolina, South Carolina, Alabama, Georgia, Mississippi, Florida and Louisiana:

AKERS, Noel M., 1st Lieut., McIntyre, Ga., Fort Bragg, N. C.
 ALVERSON, Reginald C., 1st Lieut., Greer, S. C., Fort Bragg, N. C.
 ANDERSON, Charles W., 1st Lieut., Clinton, S. C., Camp Polk, La.
 ASSEY, Philip E., 1st Lieut., Georgetown, S. C., Fort Bragg, N. C.
 ATKINSON, Samuel C., 1st Lieut., Waverly, Ga., Fort Bragg, N. C.
 AUSTIN, Frederick D., Jr., 1st Lieut., Charlotte, N. C., Fort Bragg, N. C.
 BALL, Albert L., 1st Lieut., Memphis, Tenn., Camp Polk, La.
 BARFIELD, William E., 1st Lieut., Jackson, Ga., Fort Bragg, N. C.
 BERGMAN, Sam, 1st Lieut., New Orleans, Camp Polk, La.
 BIRD, Donald P., 1st Lieut., Lakeland, Fla., Camp Polk, La.
 BOOKER, John P., 1st Lieut., Walhalla, S. C., Fort Bragg, N. C.
 BRANTLEY, James W., 1st Lieut., Grandin, Fla., Fort Bragg, N. C.
 BROWN, Randall G., 1st Lieut., Graymont, Ga., Fort Bragg, N. C.
 BURNS, Cornelius B., 1st Lieut., New Orleans, Fort Bragg, N. C.
 CALDER, Alexis B., Captain, Sumter, Miss., Fort Bragg, N. C.
 CAMP, Milton N., 1st Lieut., Fort Lauderdale, Fla., Camp Polk, La.
 CANDLER, Robert W., 1st Lieut., Atlanta, Ga., Camp Polk, La.
 CHASTAIN, Joseph R., 1st Lieut., Buford, Ga., Camp Bragg, N. C.
 CRANE, Wesley T., 1st Lieut., Auburn, Ala., Fort Bragg, N. C.
 DAVIS, Harley F., 1st Lieut., Miami, Fla., Fort Bragg, N. C.
 DAVEY, Walter F., 1st Lieut., Stuart, Fla., Fort Bragg, N. C.
 DAVSON, George R., Captain, Charleston, S. C., Fort Bragg, N. C.
 EDDLEMAN, Thomas S., 1st Lieut., Yazoo City, Miss., Camp Polk, La.
 EDELSON, Edmond K., 1st Lieut., New Orleans, Camp Beauregard, La.
 FARISH, Clarence G., 1st Lieut., Moulton, Ala., Fort Bragg, N. C.
 FILLINGIM, David B., 1st Lieut., Savannah, Ga., Fort Bragg, N. C.
 FISHBEIN, Isadore L., 1st Lieut., Miami Beach, Fla., Fort Bragg, N. C.
 FULENWIDER, John O., Jr., 1st Lieut., Pageland, S. C., Fort Bragg, N. C.
 FULLER, William A., Jr., 1st Lieut., Atlanta, Ga., Camp Polk, La.
 GIBBONS, George E., 1st Lieut., Hampshire, Tenn., Fort Bragg, N. C.
 GLENN, Francis W., 1st Lieut., Miami, Fla., Camp Polk, La.
 GOODWIN, Hugh B., Jr., 1st Lieut., Fort Pierce, Fla., Fort Bragg, N. C.
 HALL, Henry F., Jr., 1st Lieut., Wagener, S. C., Fort Bragg, N. C.
 HERRINGTON, Cecil P., Captain, Alexandria, La., Fort McPherson, S. C.
 HEWES, Archibald C., 1st Lieut., Gulfport, Miss., Camp Polk, La.
 HOLT, Howard P., 1st Lieut., Rodessa, La., Fort Bragg, N. C.
 HOWDON, William M., 1st Lieut., Miami, Fla., Fort Bragg, N. C.
 HOWELL, John B., Jr., 1st Lieut., Canton, Miss., Fort Bragg, N. C.
 HOWELL, Robert S., 1st Lieut., Coral Gables, Fla., Fort Bragg, N. C.
 IVEY, William H., 1st Lieut., Atlanta, Ga., Fort Bragg, N. C.
 JERNIGAN, Henry C., Jr., 1st Lieut., Black Mountain, N. C., Fort Bragg, N. C.

JOHNSON, John R., Major, Jackson, Miss., Camp Polk, La.
 JOHNSON, Wilbur E., 1st Lieut., New Orleans, Fort Bragg, N. C.
 JOYNER, Rayburn N., 1st Lieut., Marianna, Fla., Fort Bragg, N. C.
 KING, Ralph E., 1st Lieut., Winnsboro, La., Fort Bragg, N. C.
 KLINE, Bernard, 1st Lieut., Miami Beach, Fla., Camp Polk, La.
 LAMB, Roland D., 1st Lieut., Columbus, Miss., Fort Bragg, N. C.
 LANCE, Vernal L., 1st Lieut., Blairsville, Ga., Fort Bragg, N. C.
 LARISEY, Carr T., 1st Lieut., Varnville, S. C., Fort Bragg, N. C.
 LEVIN, Jack M., 1st Lieut., Atlanta, Ga., Fort Bragg, N. C.
 MCCURDY, James W., 1st Lieut., Thomaston, Ga., Camp Stewart, Ga.
 MCFARLAND, Osmyn W., 1st Lieut., Baton Rouge, La., Fort Bragg, N. C.
 MARTIN, Robert B., III, 1st Lieut., Shillman, Ga., Fort Oglethorpe, Ga.
 MICKAL, Abe, 1st Lieut., New Orleans, Fort McClellan, Ala.
 MILLER, Cecil E., 1st Lieut., Sarasota, Fla., Camp Stewart, Ga.
 NICHOLSON, James H., Captain, Madison, Ga., Camp Polk, La.
 NOLAN, Lewis E., Captain, St. Petersburg, Fla., Fort Bragg, N. C.
 OLEEN, George G., 1st Lieut., Winston-Salem, N. C., Camp Polk, La.
 PARISH, Frank M., 1st Lieut., Brunswick, Ga., Fort Bragg, N. C.
 PARKER, Charles E., Captain, Montgomery, Ala., Fort Bragg, N. C.
 PARKER, Julian G., 1st Lieut., New Orleans, Camp Polk, La.
 PETERSON, Edward J., 1st Lieut., Birmingham, Ala., Camp Polk, La.
 PHILLIPS, Walter A., 1st Lieut., Arlington, Tenn., Fort Bragg, N. C.
 PHIPPS, Tilden H., 1st Lieut., Tampa, Fla., Fort Bragg, N. C.
 POWELL, Sam M., Jr., 1st Lieut., New Orleans, Fort Bragg, N. C.
 POWELL, William F., 1st Lieut., New Orleans, Camp Polk, La.
 PUTMAN, James H., 1st Lieut., Miami, Fla., Fort Bragg, N. C.
 RAMSAY, Lewis C., 1st Lieut., Memphis, Tenn., Fort McClellan, Ala.
 RAMSEY, Russell W., 1st Lieut., Winter Park, Fla., Fort McClellan, Ala.
 RANEY, Charles J., 1st Lieut., Collinston, La., Fort Bragg, N. C.
 ROBERTS, Thomas L., Jr., 1st Lieut., Miami, Fla., Fort Bragg, N. C.
 ROGERS, Wilbert K., 1st Lieut., Loris, S. C., Fort Bragg, N. C.
 ROSS, Sam H., Jr., 1st Lieut., Seneca, S. C., Fort McClellan, Ala.
 SOX, Carl C., 1st Lieut., Columbia, S. C., Camp Grant, Ill.
 SPARKMAN, Arthur A., Captain, Jackson, Tenn., Fort McClellan, Ala.
 SPRUELL, William H., 1st Lieut., Russellville, Ala., Camp Stewart, Ga.
 STEAD, Vergil G., 1st Lieut., Naples, Fla., Fort Bragg, N. C.
 VAUDRY, James W., 1st Lieut., New Orleans, Fort Oglethorpe, Ga.
 WAGNER, Rudolph T., 1st Lieut., Miami Beach, Fla., Camp Grant, Ill.
 WINSTEAD, Maurice B., 1st Lieut., Washington, N. C., Fort McClellan, Ala.
 ZIMMERMAN, Paul A., 1st Lieut., Miami, Fla., Fort Bragg, N. C.

Orders Revoked

CHRISTIAN, Robert H., 1st Lieut., Baldwin, Miss.
 ELLIOTT, John L., Captain, Savannah, Ga.
 HOCHFELDER, Bernard, 1st Lieut., New Orleans.
 KING, James M., 1st Lieut., Tullahoma, Tenn.
 SAPP, James W., 1st Lieut., Havana, Fla.

SIXTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Sixth Corps Area. The Sixth Corps Area comprises the states of Michigan, Illinois and Wisconsin.

ADLER, Edmund R., 1st Lieut., Chicago, Station Hospital, Fort Sam Houston, Texas.
 BLOOM, Charles R., 1st Lieut., Cicero, Ill., Station Hospital, Fort Sill, Okla.
 BRECK, Merrick Roblee, Captain, Chicago, Station Hospital, Fort Sill, Okla.
 BURKET, Walter Cleveland, Major, Evanston, Ill., Station Hospital, Fort Sill, Okla.
 DASHIELL, Grayson F., 1st Lieut., Chicago, General Hospital, Fort Bliss, Texas.
 GROSSMANN, Erwin E., 1st Lieut., Milwaukee, Station Hospital, Fort Sill, Okla.

HALL, James W., Jr., 1st Lieut., Chicago, General Dispensary, Chicago.
 HAWTHORNE, Roy O., Lieut. Col., Kankakee, Ill., William Beaumont General Hospital, El Paso, Texas.
 IMPASTATO, Frank, 1st Lieut., Chicago, Station Hospital, Fort Sill, Okla.
 LUSTOK, Mischa J., 1st Lieut., Milwaukee, William Beaumont General Hospital, El Paso, Texas.
 PERRY, Alvin L., 1st Lieut., Detroit, William Beaumont General Hospital, El Paso, Texas.
 RANNELLS, Charles H., Jr., 1st Lieut., Evanston, Ill., Station Hospital, Fort Sam Houston, Texas.
 ROOT, Charles T., Captain, Detroit, Medical Laboratory, Fort Sam Houston, Texas.
 SARGENT, William F., 1st Lieut., Salem, Ill., Station Hospital, Fort Sam Houston, Texas.
 WACHS, Leonard V., 1st Lieut., Chicago, Michigan Induction Personnel, Detroit.
 WALD, Sidney I., 1st Lieut., DuQuoin, Ill., Station Hospital, Fort Sam Houston, Texas.

EIGHTH CORPS AREA

The following additional medical reserve officers have been ordered to active duty by the Commanding General, Eighth Corps Area, which comprises the states of Colorado, Arizona, New Mexico, Oklahoma and Texas:

ANDERSON, Leighton L., 1st Lieut., Oklahoma City, Station Hospital, Fort Sill, Okla.

BAKER, Albert B., 1st Lieut., Sterling, Colo., 1st Battalion, 77th Field Artillery, Fort Sill, Okla.
 BARTA, Chester K., 1st Lieut., Dallas, Texas, Station Hospital, Fort Sill, Okla.
 BAZE, Roy Ellis, 1st Lieut., Chickasha, Okla., 45th Division, Fort Sill, Okla.
 BERTRAM, Harold F., 1st Lieut., Oklahoma City, 45th Division, Fort Sill, Okla.

CAUSEY, Paul Spencer, 1st Lieut., Douglas, Ariz., 349th Field Artillery, Fort Sill, Okla.
COLLINS, William A., Jr., 1st Lieut., El Paso, Texas, Station Hospital, Fort Sill, Okla.
COWART, O. H., 1st Lieut., Bristow, Okla., Station Hospital, Fort Sill, Okla.
DUGAN, William D., 1st Lieut., Hotchkiss, Colo., 45th Division, Fort Sill, Okla.
FOLLINGSTAD, Alvin H., Captain, Springer, N. M., 349th Field Artillery, Fort Sill, Okla.
GALLAGHER, Paul, Lieut. Col., El Paso, Texas, Station Hospital, Fort Bliss, Texas.
GALLAHER, Paul C., 1st Lieut., Shawnee, Okla., Station Hospital, Fort Sill, Okla.
GARCIA, Robert E., 1st Lieut., Parker, Ariz., 45th Division, Fort Sill, Okla.
HALL, Henry Lee, 1st Lieut., Denver, 349th Field Artillery, Fort Sill, Okla.
HAMPTON, Daniel E., 1st Lieut., Denver, Recruit Reception Center, Fort Bliss, Texas.
HAMRA, Henry M., 1st Lieut., Phillips, Texas, Station Hospital, Fort Sill, Okla.
HERNDON, James H., 1st Lieut., Dallas, Texas, Station Hospital, Fort Sill, Okla.
HUNTER, Richard O., 1st Lieut., Bartlett, Texas, 45th Division, Fort Sill, Okla.
HUTCHINSON, Ben B., 1st Lieut., Lubbock, Texas, 45th Division, Fort Sill, Okla.
KENNERLY, Thomas P., 1st Lieut., Houston, Texas, Station Hospital, Fort Sam Houston, Texas.
KINSINGER, Ralph R., 1st Lieut., Blackwell, Okla., Station Hospital, Fort Sill, Okla.

MARKEWICH, Jake, 1st Lieut., Beaumont, Texas, 45th Division, Fort Sill, Okla.
MAY, LESTER M., 1st Lieut., San Antonio, Texas, 45th Division, Fort Sill, Okla.
MAYFIELD, Warren T., Captain, Norman, Okla., Fort Bliss, Texas.
MELINDER, Roy J., 1st Lieut., Claremore, Okla., 45th Division, Fort Sill, Okla.
MILLER, Hubert W., 1st Lieut., Artesia, N. M., 349th Field Artillery, Fort Sill, Okla.
MOHLER, Eldon Clyde, 1st Lieut., Ponca City, Okla., 2d Observation Battalion, Fort Sill, Okla.
RICHARDSON, George S., 1st Lieut., Austin, Texas, Fort Bliss, Texas.
SADLER, LeRoy H., 1st Lieut., Oklahoma City, Station Hospital, Fort Sill, Okla.
SCHNITTMAN, Jacob, 1st Lieut., Gould, Okla., 45th Division, Fort Sill, Okla.
SHERE, Norbert L., 1st Lieut., Denver, Station Hospital, Fort Sill, Okla.
SMITH, Thomas E., Captain, Dallas, Texas, Station Hospital, Fort Sam Houston, Texas.
TIPTON, George W., 1st Lieut., Marshall Ford, Texas, 45th Division, Fort Sill, Okla.

Orders Revoked

DAVIS, Frank Milton, Major, San Antonio, Texas.
HODGES, Tom Wiley, 1st Lieut., Boston.
ROBERTSON, David Lyle, 1st Lieut., Wichita Falls, Texas.
ROSS, Lloyd L., 1st Lieut., San Antonio, Texas.
SHOTTS, C. C., 1st Lieut., Pleasanton, Texas.
STANTON, William Paul, 1st Lieut., San Antonio, Texas.

The letter reporting revocation of orders in the case of 1st Lieut. Leon LoBello in THE JOURNAL, February 15, p. 601, was in error. Orders in his case were not revoked.

NAME NINE GENERAL ARMY HOSPITALS

The War Department announced on February 14 that names have been selected for each of the nine Army general hospitals, all of which are under construction or will be started soon in various parts of the United States. The hospitals have been named for former army medical officers who served with distinction in the service of the United States. The new hospitals, the location, and the officer for whom each is named, are as follows:

BARNES GENERAL HOSPITAL, Vancouver Barracks, Wash., Brevet Major General Joseph K. Barnes.
BILLINGS GENERAL HOSPITAL, Fort Benjamin Harrison, Ind., Lieutenant Colonel John Shaw Billings.
HOFF GENERAL HOSPITAL, Santa Barbara, Calif., Colonel John Van Rennselaer Hoff.
LAGARDE GENERAL HOSPITAL, New Orleans, Colonel Louis Aneatole LaGarde.
LAWSON GENERAL HOSPITAL, Atlanta, Ga., Brevet Brigadier General Thomas Edwin Lawson.
LOVELL GENERAL HOSPITAL, Fort Devens, Mass., Surgeon General Joseph Lovell.
O'REILLY GENERAL HOSPITAL, Springfield, Mo., Major General Robert Maitland O'Reilly.
STARK GENERAL HOSPITAL, Charleston, S. C., Colonel Alexander Newton Stark.
TILTON GENERAL HOSPITAL, Fort Dix, N. J., Lieutenant Colonel Henry Remsen Tilton.

PROTECTION OF DEFENSE WORKERS' HEALTH

About one hundred and fifty federal, state and city hygienists attended a national conference of governmental industrial hygienists, February 17, at the U. S. Public Health Service Building, Washington, D. C., for a two days consideration of a program to protect the health of workers in national defense industries. The program was outlined by Dr. C. D. Selby, chairman of the subcommittee on industrial health and medicine for the Federal Security Agency. The need of a \$1,650,000 annual expenditure for this purpose was pointed out, to provide the training of additional personnel, the setting up of training centers at universities, and for intensive training courses in industrial health and hygiene in governmental plants. Some of this money would be spent for the gathering of information by research workers on the prevention and treatment of disease conditions due to environmental factors and for research into harmful properties of many new substances which have come into use in manufacturing munitions.

The boom towns which have sprung up around the plants engaged in national defense work have created many problems in health and hygiene. The program discussed was drawn up by a joint committee from Dr. Selby's subcommittee and from the Council on Industrial Health of the American Medical

Association. The joint committee pointed out the loss of time from illness by workmen, an average it was said of more than eight days a year, much of which is preventable, while the rate for women is still higher. This loss of time amounts to a grand and staggering total of more than one million work years a year.

The conference was addressed also by Dr. Warren F. Draper, now acting surgeon general of the United States Public Health Service, who pointed out that already the division of industrial hygiene has placed four units in the field, each consisting of a physician and an engineer, to work with state industrial hygiene divisions, and that it is planned to add ten or twelve more such mobile units.

HOSPITAL ASSOCIATION TO AID BRITISH HOSPITALS

In view of the fact that 50 per cent of all British hospitals have been damaged in war raids and are in urgent need of assistance, the Greater New York Hospital Association announced on January 17 the organization of its one hundred and two hospitals for the collection of surgical and medical supplies, funds and clothing to aid British hospitals. The hospital association unanimously pledged full cooperation with the British War Relief Society in raising money and supplies and appointed a committee for this purpose, the chairman of which is James U. Norris, superintendent of Woman's Hospital. Each Greater New York Hospital Association member has been asked to set up its own committee for this purpose. The activities suggested by the central committee include the contribution of medical samples received by hospital staff members, collection of all discarded but serviceable surgical equipment, the raising of funds through benefit parties, and knitting by nurses and other women employees.

YELLOW FEVER VACCINE

Secretary of War Stimson has announced that all army troops on duty in tropical stations in the Western Hemisphere or hereafter to be ordered to such stations will be vaccinated against yellow fever. This will include troops stationed in Panama, Puerto Rico and the bases to be established in the Caribbean. About 50,000 men and officers at stations in this area will be vaccinated at once and more later as the garrisons are enlarged. The vaccine used, it is said, was developed in 1936 from attenuated strains of tissue-culture yellow fever virus. Since then nearly 2,000,000 persons in Brazil have been vaccinated. Yellow fever, it is said, has been practically driven out of the Canal Zone, but it continues to be a menace in some parts of Central and South America.

FEBRUARY 19, MORNING

THE COURT:—What shall we begin with?

Mr. Kelleher:—We propose to read now some of the documentary evidence to the jury.

(Counsel discussed further with the Court admission of documents.)

Mr. Kelleher:—I now read from exhibit 248, carbon copy of original letter, over the signature of defendant Cutter, addressed to Dr. J. I. Scarborough, Trinity Hospital, 2000 Main Street, Little Rock, Ark., Sept. 9, 1935:

U. S. EXHIBIT 248

"It has been reported that Trinity Hospital is engaged in contract practice of medicine.

"In order that we may have reliable information on this point, will you be good enough to explain just what is the form of service in which you are engaged? Could you send me samples of your announcements and agreements? Do you employ solicitors to procure clients?

"Very truly yours,"

Exhibit 249 is a letter from J. I. Scarborough to the American Medical Association, Attention: Dr. William D. Cutter, dated Sept. 16, 1935:

U. S. EXHIBIT 249

"Dear Dr. Cutter:

"Replying to your inquiry of the 9th, I wish to confirm the report that Trinity Hospital is engaged in contract practice.

"The attitude of the A. M. A. toward us in this matter has been so arbitrary, unreasonable and unfair that we feel disinclined to discuss the matter further.

"Before going to the trouble to supply you with the information requested may I ask what is the purpose of your inquiry and what use you expect to make of the information, if supplied?

"Please understand that there is nothing in our plan of practice to be concealed and that my remarks are not directed at you personally but at the organization which you represent. In fact I have very pleasant recollections of you back in the old Baltimore days.

"Very truly yours,
J. I. Scarborough."

Exhibit 256 is a carbon copy of an original letter over the signature of the defendant Cutter. It is dated Sept. 23, 1935, addressed to Dr. J. I. Scarborough, Trinity Hospital, 2000 Main Street, Little Rock, Ark.:

U. S. EXHIBIT 256

"Dear Dr. Scarborough:

"Thank you for your letter of September 16. One of the duties assigned to this Council on Medical Education and Hospitals is to maintain a Register of Hospitals accepted by the American Medical Association. I am pleased to send under separate cover a copy of the Register with our compliments.

"I need not tell you the benefits that come to a hospital through recognition in that Register and the favorable publicity which is given since the Register is published in every issue of the American Medical Directory and in the special Hospital Numbers of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION.

"Enclosed is a copy of the 'Essentials of a Registered Hospital' and a copy of the 'Principles of Medical Ethics' to which the 'Essentials' make reference. Our object in writing to you was to extend to you the privilege of speaking for the hospital, and particularly supplying infor-

mation on those points against which some objections have been made and which practices if they do exist and if persisted in would jeopardize the registration of the hospital. "Very truly yours,"

In the margin is a pencil notation reading as follows:

"No reply to 10-7-35. Continue hospital in Register?"

Exhibit 250 is a letter from C. T. Snyder, Superintendent, Trinity Hospital, to American Medical Association, Attention: Medical Directory Department, dated July 7, 1936:

U. S. EXHIBIT 250

"Gentlemen:

"We received our new medical directory today, on our order of August 20, 1935, signed by Dr. M. D. Ogden of our staff, and I find that our hospital is left out of the listing of Little Rock hospitals.

"All information blanks ever received from you have been filled out and returned promptly. We have been listed every year since 1924 and have bought a directory every year. We are interested in knowing the reason for the omission.

"Yours very truly,
Trinity Hospital."

Exhibit 251 is a carbon copy of an original letter written over the signature of the defendant Cutter, dated July 16, 1936, addressed to Miss C. T. Snyder, Superintendent, Trinity Hospital, Little Rock, Ark.:

U. S. EXHIBIT 251

"My dear Miss Synder:

"Your letter of July 7 to the Directory Department has been referred to the Council on Medical Education and Hospitals. This Council prepares the lists of hospitals for the Directory.

"We have, as you say, been pleased to carry the Trinity Hospital in our directory list and register of hospitals for a number of years. However, it became apparent that policies adopted by the hospital made it inconsistent for us to further continue to endorse the institution before our readers. This has reference to methods resorted to in connection with the contract for hospitalization and medical service.

"We had correspondence with Dr. J. I. Scarborough but did not receive any answer to our letter written him on September 23, 1935.

"Very truly yours,"

Exhibit 210 is an original letter from John Walker Moore to the Editor of the American Medical Association, Chicago, Illinois, on the letterhead of the Louisville City Hospital, dated May 14, 1937:

U. S. EXHIBIT 210

"Dear Sir:

"I have a letter from the Trinity Hospital Private Clinic, Little Rock, Ark., asking me to recommend them an internist. In the letter they state that the clinic is owned and operated by Drs. J. I. Scarborough, M. D. Ogden, O. K. Judd and R. B. Moore.

"Will you kindly inform me whether or not this clinic is in good standing.

"Very sincerely yours,
John Walker Moore
Staff Executive."

Exhibit 209 is a carbon copy of an original letter over the signature of defendant Cutter dated May 17, 1937, addressed to Dr. John W. Moore, Louisville City Hospital:

U. S. EXHIBIT 209

"My dear Doctor Moore:

"Trinity Hospital, operated by the physicians mentioned in your letter, is not recognized in the American Medical Association register of hospitals. We also understand that their scheme of contract practice is not in harmony with their local medical organization, the County Medical Society.

"Very truly yours,"

Exhibit 8 is a publication entitled "Proceedings of the House of Delegates of the American Medical Association, the Eighty-Fifth Annual Session held at Cleveland, Ohio, June 11-15, 1934," and on page 35 appears the following headed, "Resolution limiting physicians on staffs of hospitals approved for intern training to members of component county medical societies":

U. S. EXHIBIT 8 (EXCERPT)

"Dr. G. Henry Mundt, Illinois, presented the following resolution, which was referred to the Reference Committee on Medical Education: (45) (46)

"Resolved, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement."

Subsequent portions of the proceedings show that that resolution was adopted by the House of Delegates.

Exhibit 246 is a carbon copy of an original letter over the signature of defendant Cutter dated Dec. 1, 1936, addressed to Dr. Christopher G. Parnall, Medical Director, Rochester General Hospital, Rochester, N. Y.:

U. S. EXHIBIT 246

"Dear Dr. Parnall:

"We wrote you on September 8 calling your attention to a recent resolution passed by the House of Delegates of the American Medical Association, as follows:"

The resolution is then quoted.

"Our analysis of the recently submitted staff list was quoted in the inspection report which was sent you at the same time.

"We are anxious to learn from approved hospitals as to whether they are in general agreement with the principle laid down in this resolution, and would be pleased to have your comments in the matter."

"Very truly yours,"

Exhibit 254 is an original letter from C. G. Parnall to Dr. William D. Cutter, Secretary, American Medical Association, dated Dec. 17, 1936:

U. S. EXHIBIT 254

"Dear Dr. Cutter:

"Relative to the resolution of the House of Delegates favoring a rule by the Council on Medical Education and Hospitals limiting membership on a hospital staff to members in good standing of local county societies, I am in somewhat of a quandary as to just what to say. Personally I feel that members of hospital staffs should be members of their local county societies. However, I do not believe in any inflexible rule setting up such a stand of eligibility.

"I suggested to our Board of Directors a change in the By-Laws relating to staff appointments, requiring that unless otherwise voted by the Medical Board, no physician would be eligible to the Visiting and Associate positions of the staff unless he is a member in good standing of the county medical society. When this proposal was referred to the Medical Board for an opinion, I was rather surprised to find that its members—all members of the county medical society—were unanimously against it. Their feeling was that the county medical society should stand on its own merits and that it should offer enough of itself so that practically every member of a hospital staff would seek membership, and that anything that savored of compulsion would subject Medicine to the same thing that rouses the resentment of doctors to the actions and attitudes of nonmedical organizations.

"It was pointed out that only a small percentage of the staff were not members of the county society and that most of this group were younger men, most of whom will shortly join the county society. I am sending you a list of our staff appointments for the hospital year 1935-36, with the non-members checked. You will note that allowing for duplications, excluding the Honorary and Consulting Divisions, there are 128 members, 118 of whom are members of the county society, leaving 10, or 8%, who are not. Even on the Honorary inactive staff of seven members, all but one being over 75 years of age, there is only one who is not a member of the county society. Of the 22 on the Consulting Staff, the only two who are not members of the county society are the Professor of Bacteriology at the University and a bacteriologist who is not an M.D. Our Staff represents practically one fourth of the active membership of the county society. On its membership are the President of the New York State Medical Society; the President, the President-Elect and the Secretary of the Medical Society of the County of Monroe.

"I personally have been a member of the American Medical Association continuously for over thirty years and two of my sons are members of county societies.

"Under the circumstances, as far as support of organized medicine is concerned, could the House of Delegates very well hold that the Rochester General is an unfit place for the training of interns?"

"With warmest personal regards and wishes for a Merry Christmas and a successful New Year, I am,

"Sincerely yours,

C. G. Parnall."

Exhibit 255 is a carbon copy of an original letter over the signature of defendant Cutter, dated Dec. 21, 1936, addressed to Dr. C. G. Parnall, Medical Director, Rochester General Hospital, Rochester, N. Y.:

U. S. EXHIBIT 255

"My Dear Doctor Parnall:

"In response to your letter of December 17, let me express my appreciation of your information and your comments on the affiliation of your staff members with your medical society.

"The intention behind the resolution referred to was to smoke out from the staff of some hospitals certain men who were regarded as objectionable but whom the hospital felt a delicacy in removing.

"I notice in the figures which you have kindly supplied, that your staff enjoys a very fortunate position with regard to the support of your professional organization, and that apparently any object which the Council might have had in view has already been anticipated.

"Cordially yours,"

Exhibit 30 is a carbon copy of an original letter over the signature of C. M. Peterson of the American Medical Association, dated Dec. 22, 1937, addressed to Mr. Theodore Wiprud, Executive Secretary, Medical Society of Milwaukee, Wisconsin:

U. S. EXHIBIT 30

"Dear Mr. Wiprud:

"Enclosed are the regulations governing internship approval by the Council.

"To this should be attached the following resolution of the House of Delegates of the American Medical Association adopted in Cleveland 1934."

And the resolution which I have read is quoted.

"As far as the language of the resolution is concerned, no distinction is drawn between the full attending staff and other staff divisions. As a matter of actual practice, we carefully check the honorary, consulting, full attending and associate attending staffs in conjunction with our program of inspections. We obtain at the same time a list of all physicians who have courtesy privileges only. We do not check the courtesy list unless we find that all members of the other divisions are in good standing simply because of the magnitude of the task.

"Under this principle we nevertheless call the attention of the authorities and staff of every hospital inspected and we have received favorable replies in practically every instance.

"If we can be of further aid to you in explaining our method of procedure as outlined above, please call upon us.

"Very truly yours,"

Exhibit 145 is an opinion of the Judicial Council of the American Medical Association entitled, "Appeal to the Judicial Council of the American Medical Association of Dr. A. L. Curtin, Dr. H. C. Dallwig, Dr. J. E. Rueth, Dr. Gerald A. Sullivan, Dr. H. F. Walters, from the Decision of the Council of the State Medical Society of Wisconsin affirming the action of the Board of Directors of the Medical Society of Milwaukee County, Wisconsin, expelling the above named doctors from membership."

The opinion is dated Feb. 15, 1938, and the opinion reads as follows:

U. S. EXHIBIT 145

"In 1935, at a meeting of the State Medical Society of Wisconsin, action was taken disapproving the establishment of any plan for the medical care of low income groups by persons not representing the State or County Societies.

"On February 8th, 1936, a special meeting of the Board of Directors of the Medical Society of Milwaukee County was called to discuss a plan for the care of the employees of the International Harvester Company proposed by Drs. Curtin, Rueth and others. Drs. Rueth, Curtin and Dallwig were present. The essential features of the plan as presented by this group were as follows:

"1. Unlimited medical and surgical service for \$1.00 per month for a single man; \$2.00 per month for a man and wife; \$3.00 per month for man, wife and family.

"2. Only diseases excluded from the plan—mental and contagious. Hospitalization not included.

"3. There would be no solicitation of patients.

"4. All physicians who joined the clinic would benefit from any profits.

"5. Patients may select any physician on the staff.

"6. Preventive treatment not included in the plan.

"7. No written contract between patient and clinic. Participants in plan restricted to those with income of \$200.00 or less per month.

"It was stated that plans to remodel proposed offices had been made, a lease had been signed, but no equipment had been purchased.

"Between February 10, 1936, and February 14th, meetings of the Public Policy Committee and the Board of Directors were held and Drs. Curtin, Rueth and Dallwig notified by letter that the plan was disapproved. At the February 14th meeting the Board of Directors directed letters requesting resignation from the society be sent to the doctors proposing the plan. These letters were sent February 18th and were in the form of charges citing nine offenses.

"Late in February, on the advice of counsel the doctors proceeded with their plans and on February 26th announced that the clinic would open for business April 1, 1936. In their letter of announcement they stated that subscribers 'must come of their own free will and without solicitation,' making it very plain that the doctors as physicians were so restricted by the Principles of Medical Ethics.

"March, 1936. About the middle of March the International Harvester Council (an employees' organization) prepared 'Instructions to Patients,' of which the clinic doctors had 1,000 copies printed to be given out in the plant to those subscribing to the plan.

"March 17th the doctors by letter refused to resign from the medical society denying all charges contained in the letter requesting their resignation. March 20th at a special meeting the Board of Directors formally preferred charges and directed that an answer be filed by March 27th. The doctors made answer and a hearing was had March 30th. At this hearing the accused were found guilty and expelled on three counts, viz.:

"1. Violation of Chapter XI, Sec. 3. By-Laws of the State Society (conduct tending to defeat the purposes of the society).

"2. Violation of Chapter III, Art. I, Sec. 4, Principles of Medical Ethics (Solicitation of patients, advertising).

"3. Violation of Chapter III, Art. VI, (Revised) Sec. 3, Principles of Medical Ethics (contract practice contrary to sound public policy).

"Appeal from the action of the Board of Directors of the Medical Society of Milwaukee County to the Council of the State Medical Society of Wisconsin and from the decision of that Council approving the action of the county society to the Judicial Council of the American Medical Association was duly made and heard. The claim was made by the appellants before the Judicial Council that they had not had a fair trial before the Council of the State Medical Society of Wisconsin by reason of the fact that the Executive Secretary of the State Association had furnished legal counsel at the trial of the appellants before the Board of Directors of the Medical Society of Milwaukee County, thus prejudicing the Council of the State Medical Society of Wisconsin against their cause on appeal. The Judicial Council finds no evidence supporting such claim. It believes that such employment was customary and only for the purpose of protection of both sides of controversies by assuring that procedure should be correct and each side protected in its rights. The counsel was discharged on the completion of the trial before the Board of Directors of the county society and had no connection with any further procedures.

"The Judicial Council affirms the action of the Council of the State Medical Society of Wisconsin in respect to the charge of violation of Chapter III, Art. I, Sec. 4, of the Principles of Medical Ethics (solicitation of patients, advertising). The Board of Directors of the county society found these appellants guilty on this charge. The Council of the state society affirmed that decision. The Judicial Council finds no error in the interpretation of the Principles of Medical Ethics by either of these bodies, nor error in procedure.

"The Judicial Council affirms the action of the Council of the State Medical Society of Wisconsin in respect to the charges of violation of Chapter III, Art. VI, (Revised) Sec. 3, Principles of Medical Ethics (contract practice contrary to sound public policy). The appellants claim that at the time charges were preferred against them (March 20, 1936) and they were expelled (March 30, 1936) they were not operating under the plan and engaging in contract practice; that their practice under the plan did not begin until April 1, at which time the clinic was opened; that therefore they were not guilty when and as charged.

"The fact that no medical care had as yet been given at the time charges were preferred is not a reversible error in procedure. The appellants had abundant warning that the plan under which they proposed to operate was disapproved by the Board of Directors of the county society. They officially presented their plan to the board on February 8th, 1936. On February 14th, after disapproval of the plan, and after statements by the appellants to the Board of Directors that they would prosecute the plan even though disapproved, they were officially notified of disapproval and request for their resignation was made which request was refused.

"That at the time charges were preferred against them they had not as yet treated a patient under the plan is inconsequential. Certain preliminary preparations to treat patients necessarily had to be made before giving service but such preparations would not be made unless assurance were had by either written or verbal agreement or understanding which constituted a contract. The appellants were therefore engaged in contract practice from the time the agreement was made notwithstanding the fact that the preparations to treat patients had not been completed.

"The Judicial Council is distinctly of the opinion that practice under the terms and conditions to which these appellants have agreed with the employees of the International Harvester Company constitutes a violation of Chapter III, Art. VI, (Revised) Sec. 3, of the Principles of Medical Ethics (contract practice contrary to sound public policy).

"In respect to the charge that the appellants violated Chapter XI, Sec. 3, By-Laws of the State Medical Society of Wisconsin, the Judicial Council makes no pronouncement. It is not necessary that an accused shall be guilty on all charges made. If the accused is guilty on one or more major charges and no reversible error in the procedure of the trial is found, the Judicial Council will not interfere in the verdict pronounced by the county society and upheld by the state association. These appellants were found guilty by the Board of Directors of the Medical Society of Milwaukee County on two major charges of violation of the Principles of Medical Ethics of the American Medical Association, which action was sustained by the Council of the State Medical Society of Wisconsin. There was no reversible error in the proceedings.

"The actions of the Board of Directors of the Medical Society of Milwaukee County and of the Council of the State Medical Society of Wisconsin is approved."

Exhibit 232 is a carbon copy of an original letter written over the signature of the defendant Cutter and addressed to Dr. E. T. Thompson, Medical Superintendent, Mount Sinai Hospital, Milwaukee, dated July 17, 1936:

U. S. EXHIBIT 232

"Dear Doctor Thompson:

"It has come to our attention, through correspondence with the Medical Society of Milwaukee County, that certain physicians have been expelled from that society through participation in an organization known as

'Milwaukee Medical Center.' It is also reported that certain of these same individuals continue as members of your attending staff with hospital privileges.

"May we call your attention to the recent resolution passed by the House of Delegates of the American Medical Association as follows: "Resolved, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement."

"What possibility, if any, exists for observance of the principle laid down in this resolution?

"Very truly yours,"

Exhibit 233 is an original letter from E. T. Thompson to William D. Cutter, M.D., Secretary, American Medical Association, dated July 30, 1936:

U. S. EXHIBIT 233

"Dear Dr. Cutter:

"This letter will acknowledge with thanks your inquiry of July 17th, 1936 in regard to the controversy between the Milwaukee County Medical Society and the members of the Milwaukee Medical Center.

"Mount Sinai Hospital has been forced, because of fear of itself being involved in legal complications, to take the stand that until this matter is adjudicated it is deemed advisable to take no drastic action.

"With kindest personal regards,

"Very sincerely yours,
E. T. Thompson."

Exhibit 247 is a carbon copy of an original letter written over the signature of defendant Cutter to Dr. Edward T. Thompson, Superintendent, Mount Sinai Hospital, Milwaukee:

"Dear Doctor Thompson:

"Please let me thank you for your letter of July 30. It will be very greatly appreciated if you will let me know whenever any action is taken.

"Cordially yours,"

Exhibit 244 is a carbon copy of a letter written over the signature of defendant Cutter dated Oct. 24, 1936, addressed to Dr. Edward T. Thompson, Superintendent, Mount Sinai Hospital, Milwaukee:

U. S. EXHIBIT 244

"Dear Doctor Thompson:

"This is in continuation of our previous correspondence about qualifications for staff membership in Mount Sinai Hospital. We have been informed that the Council of the Wisconsin State Medical Society has upheld the action of the Milwaukee County Medical Society in expelling certain physicians for unethical behavior.

"How does this action affect Mount Sinai Hospital? Are all members on your staff in good standing with the Milwaukee County Medical Society or eligible for membership in that society?

"Very truly yours,"

Exhibit 245 is an original letter from Edward T. Thompson, M.D., to William D. Cutter, M.D., Secretary of the American Medical Association, Chicago, dated Oct. 30, 1936:

U. S. EXHIBIT 245

"Dear Mr. Cutter:

"I have your letter of October 24th in regard to the action of the Council of the Wisconsin State Medical Society expelling certain physicians from the Milwaukee County Medical Society.

"I beg to inform you that the situation at Mount Sinai Hospital is still in status quo.

"Very truly yours,"

Exhibit 234 is a carbon copy of an original letter over the signature of the defendant Cutter addressed to Dr. Edward T. Thompson, Superintendent, Mount Sinai Hospital, Milwaukee, dated Nov. 27, 1936:

"Dear Doctor Thompson:

"We have now received word from all hospitals in Milwaukee concerning the status of certain physicians who were recently expelled from the Milwaukee County Medical Society.

"This matter will be reviewed by the Council at its next regular meeting in February following which we will be in position to acquaint you with any further action or recommendation.

"However, if any changes occur in the situation at Mount Sinai Hospital we shall be very glad to have you keep us advised.

"Very truly yours,"

Exhibit 216 is an original letter from Edward T. Thompson to William D. Cutter, M.D., American Medical Association, Chicago, dated Oct. 22, 1937:

"Dear Dr. Cutter:

"Considerable time has elapsed since I communicated with you in regard to the status of the men associated with the Milwaukee Health Center. As you will recall, these men were expelled from the County

Medical Society over a year and a half ago and at that time you wrote to me to ascertain the attitude of Mount Sinai Hospital, which letter I answered under date of July 30th, 1936.

"We have heard nothing definite in regard to this matter since that date and we are anxious to know where the matter stands at the present time. Has the action of the County Medical Society been upheld by the American Medical Association? If not, when will action be taken?"

"Mount Sinai Hospital has always been, and I hope will always be, cooperative with organized medicine, and where we can be of assistance to the County Medical Society, we do not hesitate to render such assistance. In fact I have on my desk at the present time a thank you letter from the secretary of the County Medical Society thanking the hospital for its participation in a Preschool Round Up.

"As I explained in previous correspondence, we have withheld decision in regard to physicians from the Milwaukee Health Center pending action by the American Medical Association.

"I hope to be in Chicago on Tuesday, October 26th, and would like to have the opportunity of discussing this matter with you.

"With kindest personal regards, I am

"Very truly yours,

Edward T. Thompson, M.D."

Leading off from the next to the last paragraph of the letter, which reads, "I hope to be in Chicago on Tuesday, October 26th," is a pencil notation reading:

"A. T. doesn't know if he called."

Exhibit 217 is a carbon copy of a letter over the signature of the defendant Cutter addressed to Dr. Edward T. Thompson, Superintendent, Mount Sinai Hospital, North Twelfth Street and West Kilbourn Avenue, Milwaukee, dated Nov. 3, 1937:

U. S. EXHIBIT 217

"Dear Doctor Thompson:

"The matters about which you inquire are still under discussion by the Judicial Council of the American Medical Association. As soon as a decision has been reached, we shall be sure to apprise you of the fact.

"Very truly yours,"

Exhibit 206 is an original letter from Edward T. Thompson, M.D., to William D. Cutter, Secretary, on the letterhead of Mount Sinai Hospital, Milwaukee, dated April 6, 1938:

U. S. EXHIBIT 206

"Dear Dr. Cutter:

"I am writing you to ascertain whether or not there has been any change in the situation concerning compulsory County Medical Society membership on approved voluntary hospital staffs.

"It has been several months since any correspondence has passed between us and since we are vitally interested in this matter, I would appreciate hearing from you in regard to it.

"With kindest personal regards, I am

"Very truly yours,

Edward T. Thompson, M.D."

Exhibit 207 is a carbon copy of an original letter written over the signature of defendant Cutter addressed to Dr. Edward T. Thompson, Superintendent, Mount Sinai Hospital, North Twelfth Street and West Kilbourn Avenue, Milwaukee, dated April 13, 1938:

U. S. EXHIBIT 207

"Dear Doctor Thompson:

"We have recently been informed that the Judicial Council of the American Medical Association has sustained the action of the Milwaukee County Medical Society in the matter of certain physicians recently expelled from society membership.

"Accordingly, we shall be anxious to know what action Mount Sinai Hospital is taking in respect to the resolution of the House of Delegates pertaining to staff appointments in hospitals approved for intern training.

"Very truly yours,"

Exhibit 208 is an original letter from Edward T. Thompson, Superintendent, addressed to the defendant William D. Cutter, dated April 15, 1938:

U. S. EXHIBIT 208

"Dear Dr. Cutter:

"Thank you for your letter of April 13th. I note that you referred to the resolution of the House of Delegates pertaining to staff appointments in hospitals approved for intern training. In checking our correspondence I note under date of July 17th, 1936 you wrote as follows:

"May we call your attention to the recent resolution passed by the House of Delegates of the American Medical Association, as follows:

"Resolved, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Education and Hospitals to take this under advisement."

"We note particularly that this resolution passed by the House of Delegates was referred to the Council on Medical Education and Hospitals. We are wondering whether or not the Council on Medical Education and Hospitals has taken any definite stand in regard to this matter.

"I would appreciate receiving this information as soon as possible in order that I may present the whole matter to the staff this next regular meeting.

"Very truly yours,

Edward T. Thompson, M.D."

Exhibit 211 is a carbon copy of an original letter over the signature of F. H. Arestad, M.D., of the American Medical Association, addressed to Dr. Edward T. Thompson, Superintendent, Mount Sinai Hospital, Milwaukee, dated May 5, 1938:

U. S. EXHIBIT 211

"Dear Doctor Thompson:

"In the absence of Dr. William D. Cutter, I have been requested to reply to your letter of April 15. May I say first of all that the American Medical Association does not have, nor does it assume, legal authority over any hospital and consequently does not presume to dictate how hospitals should conduct their affairs.

"If, however, a hospital desires the endorsement of the Council, it should be willing to comply with the principles which the American Medical Association considers necessary. One of the basic requirements is that the medical staff should be composed of regular physicians properly qualified as to training, licensure and ethical standing.

"When a hospital, therefore, employs physicians expelled from county medical society membership on the basis of unethical conduct it is obvious that the hospital's standing is involved not only from the point of view of intern training but also as regards basic registration. We are anxious, therefore, to be notified of any action taken by your executive board.

"Very truly yours,

F. H. Arestad, M.D."

Exhibit 205 is a carbon copy of an original letter over the signature of defendant Cutter addressed to Dr. Edward T. Thompson, Mount Sinai Hospital, dated July 14, 1938:

U. S. EXHIBIT 205

"My dear Doctor Thompson:

"In view of the fact that we have received no reply to our letter of May 5 and no notification of any action taken with respect to the employment of physicians expelled from the county medical society, we wish to inform you that we are recommending to the Council that Mount Sinai Hospital be removed from the approved intern list and also from the Register of the American Medical Association.

"Very truly yours,"

Exhibit 212 is a carbon copy of an original letter over the signature of the defendant Cutter addressed to Dr. Edward T. Thompson, Medical Superintendent, Mount Sinai Hospital, Milwaukee, dated July 20, 1938:

U. S. EXHIBIT 212

"Dear Doctor Thompson:

"With reference to your recent telephone inquiry we wish to state that in our opinion the action taken by the county medical society in expelling physicians for unethical practice constitutes an equal censure of other doctors participating in the same clinic enterprise.

"Very truly yours,"

Exhibit 213 is an original letter from Edward T. Thompson, M.D., to William D. Cutter, Executive Secretary, American Medical Association, dated July 21, 1938:

U. S. EXHIBIT 213

"Dear Dr. Cutter:

"This will inform you that on recommendation of the Executive Committee of the Staff of Mount Sinai Hospital and ratification by the Board of Directors of the Mount Sinai Hospital, Drs. A. L. Curtin and H. F. Wolters were removed from the active staff of Mount Sinai Hospital and courtesy privileges were withdrawn from these two men, as well as from Drs. Sullivan, Rueth and Dallwig, in accord with your letter dated July 14th, 1938 and telephone conversation held with you on Friday, July 15th, 1938.

"Very sincerely yours,

Edward T. Thompson, M.D."

Exhibit 214 is an original letter from Edward T. Thompson, Superintendent, Mount Sinai Hospital, to the defendant Cutter, dated July 21, 1938:

U. S. EXHIBIT 214

"Dear Dr. Cutter:

"To supplement our letter of July 21st and to conform with your letter of July 20th we wish to inform you that Dr. B. H. Oheremist has been removed from the courtesy staff of Mount Sinai Hospital and courtesy privileges withdrawn.

"Very truly yours,

Edward T. Thompson, M.D."

Mr. Lewin:—I shall read an original letter from M. W. Ireland to defendant Cutter, letter dated March 27, 1937, which bears the stamp "Council on Medical Education and Hospitals." This is Exhibit No. 295:

U. S. EXHIBIT 295

"My dear Cutter:

"The facts below just came to my knowledge and I am going to drop them on your desk. It may be old stuff to you people around headquarters

"The early part of the week a couple of men from the Home Owners' Loan Corporation (H. O. L. C.) visited the Surgeon General of the Army to say that they wanted to obtain the services of a doctor to look out for the health of their personnel, which incidentally is quite large. After the consultation, the Surgeon General asked Colonel Glenn Jones, a retired medical officer, to visit these people. After this visit which lasted for a period of two or three hours, Jones telephoned to the Surgeon General to the effect that this was nothing but an entering wedge to the establishment of state medicine and so far as he could make out the Twentieth Century Finance Corporation of New York City was going to pay the expenses of this so-called medical care for the personnel of the H. O. L. C. Needless to say, Jones and the Surgeon General are dropping it like a hot cake.

"Just treat this information as though it blew in your window as I don't want to be the person to embarrass the Surgeon General if there should be any embarrassment. Some of the prominent doctors in Washington are going to be wised up.

"With best wishes,

"Faithfully yours,
M. W. Ireland."

And a postscript,

"Reynolds has it in the back of his head that maybe the two chaps from the H. O. L. C. thought they were in Parran's office when they were talking to him."

And on the bottom of this letter is this notation in pencil:

"Copy sent to Dr. Woodward and Dr. Leland 3-31-37."

Exhibit 236, which is a carbon copy of an original letter from the defendant Cutter to Dr. Daniel H. Kress, the Medical Director of Washington Sanitarium and Hospital, Takoma Park, Md., dated July 27, 1937:

U. S. EXHIBIT 236

"Dear Doctor Kress:

"The enclosure is a copy of Dr. C. H. Peterson's notes on the present status of intern training at Washington Sanitarium and Hospital, which should be considered in conjunction with previous inspection reports which have been submitted to your institution.

"Your particular attention and that of other members of your staff is called to the recommendations enumerated at the end of the statement. It would be a matter of interest to this office to learn whether you consider these recommendations acceptable and the possibility for their adoption in your educational program. Such a statement would be useful to the Council when it meets in October in order to determine whether internship approval should be continued or not.

"May we also call your attention to a recent resolution adopted by the House of Delegates of the American Medical Association, the language of which is as follows:

"*Resolved*, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement."

"Analysis of the staff is included in the report. What possibility, if any, exists for the observance of this recommendation at Washington Sanitarium and Hospital?

"Very truly yours,"

Exhibit 235, which is an original letter from Dr. Kress, the Medical Director of the Washington Sanitarium and Hospital, back to Dr. Cutter, dated Sept. 28, 1937:

U. S. EXHIBIT 235

"Dear Dr. Cutter:

"The copy of the report of Dr. C. M. Peterson's inspection of the Washington Sanitarium and Hospital has been very carefully gone over by the Staff of this institution. A committee was appointed to consider in detail the recommendations made in the summary of the report and the following plans have been worked out:

"1. In order to provide for more careful supervision of the record work of interns it was decided

(a) that daily the Record Librarian shall check the previous day's admissions for the recording of working impressions and report all delinquencies to the Medical Director to whom each physician shall be directly responsible.

(b) that the following regulation of the Board of Trustees of this institution shall be rigidly adhered to: 'If outside attending physicians do not furnish the complete history of their cases within 48 hours after admission, the intern shall be asked to secure same and to make routine physical examinations—this not to include pelvic examinations.'

(c) that hospital follow-up and instruction in differential diagnosis as it refers to the recorded working impressions shall be a part of the teaching program of each physician to whose service the intern is assigned.

"2 and 3. In order to provide for better instruction in clinical and tissue pathology it was decided and has been arranged that there shall be weekly a clinical pathological conference conducted by Col. J. E. Ash, the pathologist, on Sunday morning from 11:30 to 12:00 o'clock, that the interns shall be required to be present at these conferences and the immediate staff shall be expected to attend.

"4. In order to comply better with the recommendation regarding the definite assignments as listed on the report our rotating schedule creates the following:

a. Surgery—16 weeks, 10 days.

b. Medicine, Pediatrics—12 weeks, 10 days.

c. Obstetrics, Gynecology—4 weeks.

d. Night Duty (Obstetrics, Gynecology, Medicine, Pediatrics, Emergency Surgery) and Clinic—16 weeks, 10 days.

"In regard to the resolution of the House of Delegates of the A. M. A. concerning the limiting of physicians on the staffs of hospitals approved for intern training to members in good standing of their local county medical societies, we would say that each application for staff appointment, which is form 561 of the Physicians' Record Company, calls for the medical societies to which the applicant belongs. Would this meet the requirement of the resolution? I believe that a satisfactory staff analysis could be made from our staff appointment file, for the average physician is quite careful in filling in the information desired on the application. Any recommendation or suggestion in regard to this will be greatly appreciated.

"Sincerely yours,

"D. H. Kress, M.D."

Exhibit 231, which I shall read, is a carbon copy of an original letter from the defendant Cutter back to Dr. Kress, dated Oct. 5, 1937:

U. S. EXHIBIT 231

"Dear Doctor Kress:

"We appreciate having your letter of September 28 which supplements Dr. Peterson's report on Washington Sanitarium Hospital. It is a matter of satisfaction to learn that his suggestions have been found acceptable and certain changes have been made in keeping therewith.

"As far as the resolution of the House of Delegates is concerned, the intention remains that of hospitals' stipulating membership in the county medical society as the basis for the assignment of hospital privileges. The great majority of hospitals with whom we have corresponded on this point have agreed that this is a good basis on which to operate and, in fact, many have anticipated this recommendation by a considerable length of time.

"Very truly yours,"

I shall now read a carbon copy of an original letter (Exhibit 237) from the defendant Cutter to Sister Mary Rodriguez, Registered Nurse, Superintendent of the Georgetown University Hospital, Washington, D. C., dated Aug. 7, 1937:

U. S. EXHIBIT 237

"My dear Sister:

"The enclosure is a copy of Dr. C. M. Peterson's notes on the present status of intern training at Georgetown University Hospital together with comments relating to the application for approval of residencies in surgery. Will you be good enough to submit this statement to officers of the staff who are responsible for the maintenance of the educational services for house officers?

"A number of recommendations are incorporated at the end of the report. It is a matter of interest to this office to learn whether in your opinion these suggestions can be adopted. In consequence, any supplementary information which you care to submit will be appreciated.

"In respect to the residency in surgery, your attention is called to the components which need further attention before full approval can be assigned.

"May we also call attention to a recent resolution adopted by the House of Delegates of the American Medical Association, which is as follows:

"*Resolved*, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement."

"Analysis of the staff is included in the report. What possibility, if any, exists for the observance of this recommendation at Georgetown University Hospital?

"Very truly yours,"

Exhibit 238, which is an original letter from Sister Rodriguez, the Superintendent of Georgetown University Hospital, back to the defendant Cutter, dated Oct. 18, 1937:

U. S. EXHIBIT 238

"My dear Dr. Cutter:

"Your letter of August 7th, together with Dr. Peterson's notes on the present status of intern training in the Georgetown University Hospital, have been presented at the October meeting of the Executive Staff. It gives me pleasure to report as follows:

"All members to the Executive Staffs are nominated and elected annually. The Executive Staff ruled at its last meeting that no physician shall be nominated or elected to any Staff of the hospital unless he is a member of his local Medical Society or the American Medical Association. Members who are already on the Staffs, specified by you as not meeting these requirements, will be notified to qualify within the year.

"I. John R. Cavanagh, B.S., M.D., Associate Clinical Professor of Medicine, was appointed Medical Director of the Dispensary on Sep-

tember 1st, with Frank S. Horvath, M.D., Associate Clinical Professor of Medicine, as Assistant. Dr. Cavanagh has made the following assignments:

- (a) The intern on Medicine I shall be in the clinic on Mondays, Wednesdays, and Fridays for the duration of the clinic period.
 - (b) The intern on Medicine II shall be in the clinic on Tuesdays, Thursdays, and Saturdays for the duration of the clinical period.
 - (c) The surgical intern shall be in the surgical clinic for the duration of the clinical period.
 - (d) The Medical Resident shall be in the clinic at least one day a week, so that he may follow up cases discharged from the hospital.
- "II. The Intern Committee is holding regular meetings and checking the record work of the interns. Residents are assigned one day each week to conduct record conferences with the interns, these conferences to be supervised by the chiefs of the respective departments."

Now, there is a great deal more to that letter, but it does not relate to this case, and I want to know if you care to have it read.

Mr. Leahy:—We should like to have it read.

Mr. Kelleher:—You want it read?

Mr. Leahy:—Yes.

Mr. Levin:—All right:

"III. Vincent J. Dardinski, A.B., M.A., M.D., Ph.D., was appointed full time clinical pathologist and Director of Clinical Pathological Laboratories on September 1st. He is directly in charge of the educational program of the interns. With the assistance of the Professor of Medicine he is holding regularly conducted clinical pathological conferences with the interns each week. We feel that this procedure has already stimulated a greater interest in autopsies and pathological work; besides this the chiefs are holding conferences with the interns three times a week.

"IV. A library has been installed in the interns' suite and is now being equipped with approximately two to five hundred books and current medical journals to be furnished by the Georgetown University School of Medicine. A Journal Club is also being organized and in addition to this the interns have access to the Georgetown University Medical School library from 9 a.m. to 9 p.m., daily. Moreover the interns have available the libraries of the Director of Clinical Pathological Laboratories, and of the Professor of Medicine and of the Professor of Radiology.

"V. (a) The Intern Committee is functioning with renewed activity and since receiving your letter an additional intern has been appointed. It is the plan of the Committee to further increase the Intern Staff as soon as possible.

(b) The additional intern referred to in the preceding paragraph has been assigned to the surgical service; relieving much of the conflict between operating room work and ward rounds. A system of weekly surgical grand rounds is now being instituted.

(c) Arrangements have been made to have physical examinations and chest films done on all interns, including the present group, at the beginning and expiration of their term of service.

(d) Besides the regularly conducted clinical pathological conferences each intern is assigned for a definite period to laboratory work, and instruction is under the supervision of Vincent J. Dardinski, A.B., M.A., M.D., Ph.D., clinical pathologist.

(e) Each intern is now required to submit in writing to the Interns' Committee a detailed by-monthly report of all his services.

(f) Dr. Dardinski (who is in charge of the educational program) has instructed the residents to organize an Interns' Club with the idea of arranging a schedule of speakers and subjects to be presented at regular meetings.

"VI. It is the idea of the Executive Staff, to fully cooperate with all the suggestions made in your report. We fully appreciate the comments which you have so kindly made and are pleased to state that most of them are already in operation.

"Gynecology is conducted in this hospital as a major department under the direction of Professor Leon A. Martel who is certified by the American Board of Obstetrics and Gynecology. There are also two associates; one of whom is certified by The American Board of Obstetrics and Gynecology, and six assistants all of whom are especially qualified in this work. I note that this was not included in Dr. Peterson's report to you.

"Very sincerely yours,

"Sister Mary Rodriguez

"Superintendent."

Exhibit 239, which is a carbon copy of a letter from the defendant Cutter to Sister Margaret, Registered Nurse, Superintendent of Providence Hospital, dated Aug. 21, 1937:

U. S. EXHIBIT 239

"My dear Sister:

"The enclosure is a copy of Dr. C. M. Peterson's notes and recommendations referring to the opportunities available for interns at the Providence Hospital. Please refer this statement to the officers of the staff and members of the executive committee.

"You will recognize that there are several factors that are not in conformity with the Council's regulations governing internship approval. It is a matter of great interest to this office, therefore, to learn whether the recommendations enumerated at the end of the report are acceptable or not. As matters stand now, we believe quite likely that when this statement is submitted to the Council at its regular meeting early in November, internship approval will be withdrawn. Similarly, the application for approval of a residency in surgery is held in abeyance pending adjustment of the present situation.

"We also append for your interest a recent resolution of the House of Delegates of the American Medical Association:"

And then comes the resolution, the Mundt resolution, that has been read before.

"According to our analysis, there are six members of your staff who are not affiliated with any of the constituent societies of the American Medical Association.

"Very truly yours,"

Exhibit 240, which is an original letter from Sister Rosa, the Acting Superintendent of Providence Hospital, back to the defendant William D. Cutter, dated Aug. 27, 1937:

U. S. EXHIBIT 240

"Dear Sir:

"No words can express my distress at the possibility of losing the American Medical Association's approbation of our Intern Training School. As requested, I presented the copy of Dr. Peterson's notes and recommendations to our Staff President, Dr. J. J. Mundell, and the matter will be discussed in detail at a special meeting of the Chiefs of our various Services, to be called next Tuesday.

"I assure you, the recommendations at the end of the Report are acceptable and will be given major consideration. In fact, many points brought into relief during Dr. Peterson's visit last June have been cared for satisfactorily. This is particularly true with regard to the patients' Records which have improved noticeably since July first.

"You will receive, very shortly, notification from our Staff concerning their desire and intention to co-operate wholeheartedly in placing our Internship on a platform that will meet the requirements of the American Medical Association. Nothing will be omitted either by the Staff, the Hospital, or the Superintendent to prevent what would prove a dire catastrophe to Providence Hospital, the loss of its accreditation for Intern Training.

"I trust that when the Association will receive assurance concerning the adjustment of all that is considered inefficient by Dr. Peterson, the approval of a residency in surgery will be granted.

"Lest any discrepancy should occur, please communicate with me freely on the subject of our standing, that proper reformatory measures may be put immediately into execution. Our desire is to give 100 per cent co-operation to the demands of the Association, and I trust that if some of these readjustments take a little time for development, the Association will bear patiently with the unforeseen delay.

"Sincerely yours,

"Sister Rosa

"Acting Superintendent."

Exhibit 230, which is a carbon copy of a letter from the defendant Cutter back to Sister Rosa, dated Sept. 9, 1937:

U. S. EXHIBIT 230

"My dear Sister:

"We acknowledge with thanks your letter of August 27 which expresses in convincing terms your desire to cooperate with this Council in improving intern training at Providence Hospital according to suggestions recently submitted by Dr. C. M. Peterson.

"It will be a matter of great interest to receive the communication from the staff which you mention in your letter.

Exhibit 241, which is a letter from Sister Rosa, the Acting Superintendent, and Dr. Claude C. Caylor, the Secretary, of Providence Hospital, to the defendant William D. Cutter, dated Oct. 12, 1937:

U. S. EXHIBIT 241

"Dear Doctor Cutter:

"We have had several meetings of the Executive Staff of Providence Hospital for the purpose of considering the recommendations in Dr. C. M. Peterson's report of his inspection of our Hospital on June 15, 1937.

"The membership was furnished with copies of this report prior to the meetings in order that each might familiarize himself with its contents.

"The staff agreed that the report was well founded, and unanimously agreed to meet the suggestions of the Council; Committees were appointed for the purpose of planning suitable regulations for interns and in order to obtain more efficient records. These Committees have submitted comprehensive reports.

"In accordance with the recommendations which begin on page 8 of Dr. Peterson's report, the staff has acted as follows:—"

Now I will ask you whether you care to read the whole letter or whether I can read those portions that are relevant to that inquiry.

Mr. Leahy:—No. Read the whole letter, because you emphasize Sister Margaret's letter so much. Perhaps the jury would like to know what it was that she was referring to.

Mr. Levin:—I can't believe they will be interested in this, but maybe they will:

"1. An intern committee has been appointed, the duties of which shall be solely the appointment and supervision of interns. With respect to the physical examination of interns, the staff has voted that appointees be given a physical examination immediately after their acceptance of their appointments, and in addition, that a roentgenological examination be made of their chests immediately before entrance upon their term as interns. There is now being prepared a regular form for recording the detailed work of each intern, which records are to be regularly reviewed by the resident and the intern committee. Meetings of the entire resident staff and the intern committee are to be held twice monthly, and the first of these meetings has

already been held. The Hospital is now attempting to secure an additional intern in order that the services may be so arranged that the entire morning of one intern may be spent with the pathologists in clinical laboratory and histopathological procedures. For the time being, the obstetrical and x-ray services have been combined under one intern. A combined clinical and journal club has been formed. This club is to meet twice monthly and one or more members of the staff are to be invited for the purpose of discussion and instruction. A clinical pathological conference in conjunction with the medical or surgical service is to be held weekly.

"2. The Staff was much chagrined at the first sentence in Dr. Peterson's second recommendation, although it realized the truth of the statement. It was the unanimous opinion of the Staff, that the records form the only index of the work done by the attending, resident and nursing staff, and steps have been taken to provide records that will indicate every step made in arriving at a diagnosis, and the treatment of each patient. A Medical Director, Dr. Valentine M. Hess, has been appointed, who will have supervision generally over the medical conduct of the hospital and of the hospital records. Rules have been drawn providing for physical examination and history taking on all cases within twenty-four hours after admission, in ordinary cases, and in a shorter time in emergency cases. These histories must be inspected by the attending physicians and surgeons who shall make such corrections as they deem necessary. Tentative diagnoses by the interns must be made immediately upon completion of the physical examination and laboratory work, which diagnosis must be confirmed or corrected by the attending physician or surgeon. Progress notes will be made as frequently as the nature of the case requires and will be signed by the responsible individual. Written résumé of consultations will be made and signed by the consultant. X-ray and clinical laboratory records will be duplicates of the bed-side records and the respective laboratories will maintain alphabetical and pathological card indices. For some time past, medical departmental conferences have been held and these conferences will be expanded to include the various hospital services. A Medical Historian has been secured who is experienced, competent and qualified, and whose sole duties are the writing of dictated histories and other chart records before the records are submitted to the record room.

"3. We have found that despite the concerted and tactful attempts on the part of the staff and interns, that the securing of autopsies is extremely difficult. A form has been incorporated in the hospital record for autopsy information. This form will be present in the records of all deceased patients, and if permission for autopsy was not obtained, the reason therefore shall be stated. With reference to coroner's autopsies, it is the policy in the District of Columbia to exclude all except officials from autopsies resulting from murder or other legally culpable deaths. In all other autopsies interns are welcome and may make such records as are necessary to secure a full autopsy report. Our interns will be instructed to attend autopsies of patients on their services when such autopsies are conducted by the coroner or his assistants.

"4. The Medical Library will be improved jointly by the Hospital and Staff, by the securing of recent textbooks and current good medical journals.

"Members of the Staff who did not belong to the Medical Society of the District of Columbia have been contacted and at the present time, all non-members have submitted their applications for membership, so that now, with those exceptions, all members of our Staff are members of the American Medical Association or affiliated with its constituent societies.

"We feel that we have complied with the requirements set forth in Dr. Peterson's report. However, our Medical Director, Dr. Hess will be in Chicago the latter part of this month to attend the meeting of the American College of Surgeons. He would like to call upon you and confer with you regarding what we have done in these matters. If you will be kind enough to let us know when it will be most convenient for you to see him, we are sure that he will arrange his schedule accordingly.

"Yours very truly,
"Sister Rosa
Acting Superintendent
"Claude C. Caylor, M.D.,
Secretary."

Mr. Lewin:—Exhibit 242 is a carbon copy of a letter of the defendant Cutter to Dr. Walter A. Bloedorn, the medical director of George Washington University Hospital, Washington, D. C., Aug. 23, 1937:

U. S. EXHIBIT 242

"Dear Doctor Bloedorn:

"The enclosure is a copy of Dr. C. M. Peterson's report on the present status of intern training at George Washington University Hospital. We should like to have you refer this statement to those of your staff who are interested in and responsible for the internship program.

"On the whole, statements are quite commendatory. However, a number of suggestions are incorporated at the end of the report, and it would be a matter of interest to this office to learn whether these suggestions are acceptable or not. They represent developments which, in our experience, have proved to be of real value elsewhere.

"May we also call attention to a recent resolution adopted by the House of Delegates of the American Medical Association, the language of which is as follows:

"Resolved, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospitals approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local

county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement.

"Analysis of the staff is included in the report. What possibility, if any, exists for the observance of this recommendation at George Washington University Hospital?

"Very truly yours,"

Mr. Lewin:—Exhibit 215 is another letter from the defendant Cutter to Dr. Bloedorn of George Washington University Hospital, dated Oct. 28, 1937:

U. S. EXHIBIT 215

"Dear Doctor Bloedorn:

"May we call to your attention our letter of August 23 which accompanied a copy of Dr. C. M. Peterson's report with suggestions on internships at George Washington University Hospital.

"Can you tell us at the present time whether his suggestions have been incorporated in your internship program?

"Has any action been taken in respect to the resolution of the House of Delegates on the subject of staff membership contained in our letter of August 23?

"Very truly yours,
"William D. Cutter."

Exhibit 243 is an original letter from Dr. Bloedorn, the medical director of George Washington University Hospital here in Washington, back to the defendant Cutter, dated Nov. 4, 1937:

U. S. EXHIBIT 243

"Dear Dr. Cutter:

"Thank you very much for forwarding us a copy of Dr. C. M. Peterson's report on the George Washington University Hospital.

"I am very glad indeed to have his suggestions which, of course, are of real value.

"A Staff Intern Committee has been organized to exercise supervision over the house officers' training. The suggestion of the Journal Club for the house staff has been transmitted to the Intern Committee and arrangements will be made for convenient access to the University Medical Library next door.

"With respect to the resolution of the House of Delegates on the subject of staff membership, we find that only nine members of the total staff are not members of the local Medical Society and that of these nine, six are full time members of the Staff of St. Elizabeths Hospital in the Department of Psychiatry. As we do not have a psychiatric department in the George Washington University Hospital these members are used primarily in a teaching capacity for our medical students who go to St. Elizabeths Hospital, which as you know, is a Psychiatric institution. The problem then is reduced to three members of the clinical staff and I feel that this number will be reduced very shortly.

"Very truly yours,
"W. A. Bloedorn, M.D.,
"Medical Director."

I shall now read Exhibit 223. It is a carbon copy of a letter from the defendant Cutter to Col. P. M. Ashburn, Medical Superintendent, Columbia Hospital for Women, Washington, D. C., Sept. 8, 1937:

U. S. EXHIBIT 223

"Dear Colonel Ashburn:

"The enclosure is a copy of Dr. C. M. Peterson's notes on the present status of your educational service for residents in obstetrics-gynecology. Will you be good enough to transmit this statement to other members of the intern committee and the chiefs of service who are primarily responsible for the quality of experience which your house officers receive.

"A number of recommendations have been attached to the report which, in our experience, have contributed to improving educational standards elsewhere. It is a matter of genuine interest therefore for this office to learn whether these suggestions are acceptable or not, preferably in advance of the next meeting of the Council which will occur early in November. We judge from certain remarks in the report that remedial measures have already been instituted, especially in relation to the record system.

"May we also take this occasion to call your attention to the following resolution:

"Resolved, That it is the opinion of the House of Delegates of the American Medical Association that physicians on the staffs of hospital-approved for intern training by the Council on Medical Education and Hospitals should be limited to members in good standing of their local county medical societies and that the House of Delegates requests the Council on Medical Education and Hospitals to take this under advisement.

"What possibility, if any, exists for observance of this principle in your hospital?

"Very truly yours,"

Exhibit 227 is another letter from Dr. Cutter to Colonel Ashburn, Superintendent of Columbia Hospital for Women, here in Washington, dated Nov. 3, 1937:

U. S. EXHIBIT 227

"Dear Colonel Ashburn:

"In continuation of our previous correspondence, are you in position to report any action taken by your Board on the subjects covered in Dr. C. M. Peterson's report, especially the suggestions attached thereto?"

"This present inquiry also extends to the resolution which was quoted in our letter of September 8 relating to county society membership as a basis for hospital privileges.

"Very truly yours,"

Exhibit 228 is an original letter from Colonel Ashburn, the Superintendent of Columbia Hospital for Women, here in Washington, back to the defendant Cutter, dated Nov. 5, 1937:

U. S. EXHIBIT 228

"My dear Dr. Cutter:

"Referring to your letter of November 3rd, 1937, I am glad to reply that Dr. Peterson's report of inspection of this hospital and the Medical Board's action and recommendation in regard thereto were submitted to the Executive Committee of the Board of Directors at its recent meeting, and both were accepted. The Committee agreed with the Medical Board in promising to put into effect the recommendations as it becomes possible, except that, in view of the hospital's financial condition and the exceptional medical library facilities in Washington, it did not wish to promise to improve the medical library of the hospital to any great extent.

"As for demand that 'physicians on the staffs of hospitals approved for intern training should be limited to members in good standing in their local county medical societies,' it meets with the approval of the Medical Board as regards future appointments. So far as known, all present members of the staff of this hospital, except one, are members of the District Medical Society. The exception is a man of long service at the hospital and of high standing in the profession. His reasons for not belonging to the Society are probably personal and nobody on the Medical Board suggested that any action be taken in his case.

"Very sincerely yours,

"P. M. Ashburn, M.D.,
"Superintendent."

The last letter I shall read at this time is Exhibit 229, which is a carbon copy of a letter from the defendant Cutter back to Colonel Ashburn of the Columbia Hospital for Women, here in Washington, dated Nov. 15, 1937:

U. S. EXHIBIT 229

"Dear Colonel Ashburn:

"Thank you very much for your letter of November 5. This completes our records as far as the recent inspection report is concerned. We shall be glad to turn over the complete file to the Council with favorable recommendations for continued approval of residencies in obstetrics-gynecology.

"Very truly yours,
"William D. Cutter."

I should now like to read to the jury from the minutes of the District Medical Society:

"Minutes of the special meeting of the executive committee of the Medical Society of the District of Columbia, held Tuesday evening, June 1, 1937, 8 P. M.

"Dr. J. Lawn Thompson, Chairman, presiding.

"Present: Drs. C. N. Chipman, A. J. Connelly, David Davis, William T. Gill, Jr., William P. Herbst, Raymond T. Holden, Jr., R. Arthur Hooe, H. C. Macatee, F. X. McGovern, Thomas E. Neill, H. H. Schoenfeld, William M. Sprigg, Earl R. Templeton, C. B. Conklin; and Dr. J. R. Verbycke Jr. and Colonel Glenn I. Jones, by invitation.

"The Chairman, in addressing the meeting, said that the reason for calling the special meeting was on account of certain serious situations that had developed. The Home Owners Loan Corporation, the Veterans' Bureau, the Soil Conservation Department and the Reconstruction Finance Corporation had already undertaken the development of a plan for medical care of their employees."

(Here came a discussion of the reading of the minutes and an agreement on omission of certain portions.)

Mr. Lewin:

"Dr. Thompson called on Dr. J. Russell Verbycke Jr., who had been very much interested in this subject.

"Dr. Verbycke said that he had heard of this plan and he had in his hand a prospectus, marked 'Confidential,' in which details had been very well worked out."

I am omitting the details here.

"He learned that they were opposed to the entire proposition of the prepayment plan.

"The Chairman, Dr. Thompson, stated that we should look to the future; these plans all threaten the coming generation of physicians and their income.

"Dr. H. C. Macatee was called upon by the chairman to state his views. He stated that some two Sundays ago he attended a meeting in Dr. William Gerry Morgan's office at which time consideration was given to this movement. He thought the medical profession had two weapons at hand, one, to forbid consultation with the physicians doing this type of work; the second, would be to withhold approval of any hospital that would take any cases or assist in the movement in any way.

"Dr. R. Arthur Hooe at this time was given the privilege of the floor."

Then, omitting:

"He said, 'Why has this all come about? Because people are not satisfied with what they are getting. Definitely and assuredly it is our fault.' He now made a motion to the effect that there would be a special meeting of the Society called for the coming Friday evening, at which

time the membership would be informed of just what was taking place and they would be asked what they wanted to do in the premises. The motion was seconded."

Then, I omit some discussion.

"Dr. Hooe interrupted to state—"

Mr. Lewin:

"The Secretary stated that Dr. H. R. Brown had called him up, stating that he was going to be out of town for ten days attending a medical meeting. When he returned he would be at the service of the committee. He also stated that another doctor interested in the movement would be available. It was said that Dr. Brown certainly should be invited to a meeting and that information should be obtained."

Now, I will read from "Confidential: For Private Circulation only."

Mr. Lewin:

"A Plan for a Cooperative Medical Service on a Periodic Payment Basis for Federal Employees and their Families in Washington.

"Foreword.

"The problem of medical care and costs has become a serious one. A large proportion of our population does not obtain adequate medical care. . . .

"Hospitalization insurance, of which several types exist in Washington constitute a partial solution of this problem. Thereby, people are enabled to provide in advance against the cost of hospitalization, and by so doing, many of low incomes who might otherwise have to ask for charity, are enabled to obtain hospital care, when they need it, in a self-respecting manner. But this insurance is incomplete for it does not cover physicians', surgeons', and nurses' services and other items of importance in the medical bill. Some arrangement obviously is needed whereby individuals and families may pay a certain fixed charge monthly or annually, and receive in return medical care of whatever type and amount they require.

"Proposed in the following pages is a plan by which the community of Federal Employees and their dependents in Washington may solve this problem—if not completely, at least to the fullest extent possible by voluntary effort. The plan is tentative in nature. It is submitted to serve as a basis for discussion for individuals who may wish to constitute themselves a group to agree upon a particular plan and to take the steps necessary to establish it.

"The aim of this plan,—"

Mr. Magee (interposing):—Are you going to leave out the footnotes?

Mr. Kelleher:—Yes.

Mr. Magee:—I was just asking.

Mr. Kelleher:

"The aim of this plan is to make available to Federal Employees in Washington, and to their families, adequate medical care, both preventive and curative; to provide this care at moderate cost; and to place that cost on a regular budgetable basis within the means of the group to be served. If federal employees are typical of the general population with equivalent incomes, many do not now obtain adequate medical care, especially preventive service and care in chronic conditions, while many others incur disasters each year because of sickness costs. The provision of better care should promote health and well-being and reduce time lost from work because of illness. The plan should be of benefit not only to the employees and their families, but also to the Government they serve."

Mr. Kelleher:—And then I will omit a large portion of it which is intended to outline the "need."

"SCOPE OF THE PLAN

"It is well to emphasize at the outset that the plan here proposed is potentially one of considerable magnitude. There are 119,000 federal employees in Washington. Should 30 per cent avail themselves of the plan, the population served, including dependents, would probably number over 70,000 people. To provide care to this group would require the full-time services of 80 physicians. At a cost of \$25 per person, the annual budget of this enterprise would amount to \$1,750,000."

Mr. Kelleher:—I am going to omit a paragraph here.

"It is estimated that approximately two-thirds of all families of federal employees in Washington have incomes between \$1,500 and \$4,500. The proposed plan, while it would be open to all, is designed primarily for families in this income range and for single employees with incomes over \$1,200

"BENEFITS AND COSTS.

"The level of costs in such a plan as is here proposed must be geared to what the group in question is accustomed to spend.

"Various surveys show that families of the income range in question spend four to five per cent of income, on the average, for medical care. In other words, averaging the years of low cost with the years of high cost, a family with a yearly income of \$1,500 will spend approximately \$67 a year for medical care; a family with an income of \$2,000 will spend approximately \$90 a year; one with an income of \$3,000 will spend approximately \$135. Most federal employees, like most of the general population, do not now receive fully adequate care, preventive and curative. The aim should be not to reduce present expenditures, but to

regularize them and to provide for these expenditures a distinctly better level of medical care than they now purchase. The charges under the proposed plan have been drawn up with these considerations in mind."

Mr. Kelleher:—Now, I am going to omit for the sake of speed a lot of detail about those figures.

"If a representative population enrolls, the amount available for provision of medical care at the specified rates, will be approximately \$25 per person a year. This is more than is available under similar plans elsewhere giving a service of comparable items."

Mr. Kelleher:—And references are made in the appendix to those other plans.

"and should be sufficient to provide an excellent quality of service. The rates proposed will make possible salaries to physicians ranging from \$3,000 per year for the younger men up to \$12,000 for the chief of medical staff. Those salaries will be sufficient to attract and hold first-rate men. The rates are set so as to provide a safe margin of income over outgo, bearing in mind the facts that in all plans of this sort, the expenses are greater during the first few years than afterward, and that it is desirable to accumulate a small reserve to take care of any unusual demands for medical services such as might be caused by an epidemic. After the first three or four years, it should be possible to lower the rates or to expand the services.

"The plan should be cooperative in character, i. e., not for profit. It should be incorporated. A suitable name might be: Federal Employees Cooperative Medical Service, Inc. The organization should be controlled by a board of trustees, the members of which serve without pay. At the beginning, the trustees will be the members of the committee which sponsors the plan and sets it in operation. Once the plan has been firmly established, the Trustees should be elected by the subscribers. Provision should be made for an advisory council representing the medical staff, and for another advisory committee representing the general medical profession of the District.

"The executive head of the organization preferably should be a physician. His function would be to direct the organization as a whole and to serve as chief of medical staff. He would require the assistance of a lay manager who would run the business side of the enterprise. A physician who headed up the organization would need to be primarily an experienced and capable administrator, and a leader capable of inspiring, and supervising the physicians on his staff. Physicians with the proper administrative experience are rare, and the right man will be difficult to find. If the right man cannot be found, the executive head of the organization may properly be a layman, in which case it would be necessary to have a separate chief of medical staff who should, of course, be a physician, and completely responsible for professional procedures and personnel."

Mr. Kelleher:—I will omit some more of that detail and go on to this:

"To provide adequate care it is necessary to have one physician for every 800 to 900 enrolled persons. The smallest number of enrolled persons capable of supporting a well-rounded medical group is approximately 10,000. The medical staff in this case would be composed of, say, 10 physicians on full time and of a number of others (equivalent to 2 full-time men) engaged on a part-time or fee basis. As the number of subscribers increases, it will be possible to add full-time men in the less common specialties, and additional physicians in the more common specialties so that subscribers will have a choice among several men in each important field.

"The pros and cons of provision of service by a staff of salaried physicians have been carefully considered. The disadvantage of salaried service is that it does not permit the patient to go to any physician he may select, but limits his choice to the physicians who are members of the staff. It is believed that this disadvantage is at a minimum in the case of the population of federal employees, since many, being newcomers to the city, have not affiliations of long standing with physicians. In any case, the disadvantage is more apparent than real. Actually, the average layman generally chooses his physician on the basis of hearsay and is not qualified to judge competence. With a salaried staff, the patient receives care from a selected group of physicians, chosen by a chief of staff on the basis of their professional qualifications and competence. Furthermore, only in salaried, group practice, is it possible to have a desirable degree of professional supervision of service and ready consultation of one physician with another. Finally, only on this basis can the economies flowing from organization be achieved.

"The type of practice visualized here should be very attractive professionally to the physicians participating. It means a greater degree of cooperation and team-work among them than is usual in 'solo' practice. They will have readily at their disposal, the aids such as X rays and laboratory, necessary for the proper practice of medicine. They will be able to give their patients service of the type and extent required to achieve an optimum result, irrespective of the financial resources of the patient. The members of the staff will have annual vacation and will be able to get away for postgraduate study. At the salaries proposed, there will be no difficulty in obtaining a staff of absolutely first-rate physicians."

Mr. Kelleher:—Then comes a great many figures.

"To establish the plan the following steps will be necessary:

"(1) A small committee of individuals who are agreed on the necessity and soundness of the plan, and who will undertake to put it into operation, must be formed. These individuals must be willing and able to give considerable time to the purposes in hand.

"(2) A sponsoring committee of 50 or 60 individuals should be formed. These individuals should be of two types: (a) individuals of prestige and standing in the Government Service and (b) individuals who by virtue

of positions as heads of employee organizations or associations are able to lead and influence federal employees.

"(3) A certain sum of money to give initial working capital must be raised either by gifts or loans from a small number of people. The sum must be sufficient to set up an office, pay salaries and defray printing and office expenses during the interval between the launching of the plan and the collection of enrollment fees.

"(4) The plan should be launched and publicly announced at a dinner or other suitable meeting, at which representatives of the press should be in attendance. Immediately thereafter all federal employees should be informed of the plan through meetings and circulars, and should be asked whether they would be willing to participate.

"(5) If the response is favorable, a campaign will start to obtain the necessary capital through advance payment of enrollment fees or subscription to shares. When the required funds are in hand the medical director will be engaged and as soon as he can obtain his staff and make the necessary arrangements, the doors of the medical center will be opened, and the plan will commence to operate.

"It will, of course, be desirable to obtain the fullest possible measure of cooperation from the members of the medical profession in the District of Columbia. After the plan is launched, the Medical Society of the District of Columbia will be invited to appoint a representative to sit with the committee which undertakes to establish the plan. It will also be requested to appoint a committee of several physicians to advise the medical director of the plan on all relevant matters. The intention will be to solicit the advice and cooperation of the local medical society as to work with it to the fullest degree possible.

"The present plan will not supplant or injure the existing Group hospitalization plan. That plan is now serving only a fraction of those who need it. Some individuals will want the complete coverage afforded by the plan here set forth; others will want simply the coverage afforded by Group hospitalization. The city is large enough for both plans, and in the long run, each will aid the other."

Mr. Kelleher:—Then follow a number of appendices containing figures, most of them gathered by the committee on medical care, concerning which we have had testimony. I will not read those appendices.

I shall now read from the minutes of the special meeting of the executive committee of the Medical Society of the District of Columbia, held Monday evening, June 21, 1937, 8 p. m.:

"Dr. William M. Sprigg presiding,

"Present: Drs. Daniel L. Borden, C. N. Chipman, A. J. B. Connolly, William T. Gill Jr., A. C. Gray, William P. Herbst Jr., Raymond T. Holden Jr., R. Arthur Hooe, Joseph Horgan, Oscar B. Hunter, H. C. Macatee, Thomas E. Neill, Sterling Ruffin, William M. Sprigg, Earl R. Templeton, J. Lawn Thompson, C. B. Conklio, and Dr. J. Russell Verbruyke Jr., by invitation."

Mr. Kelleher:—I am omitting the first three paragraphs.

Mr. Magee:—Will you read the paragraph concerning the absence of the chairman and the vice chairman?

Mr. Kelleher:—You may read it.

"In the absence of the chairman and the vice-chairman the secretary announced that the first order of business would be the nomination of a temporary chairman to serve until the chairman appeared.

"Upon motion, duly seconded and adopted, Dr. William M. Sprigg was made temporary chairman."

Mr. Kelleher:—And then omit the following paragraph:

"Dr. Verbruyke at this point read a detailed plan that had been organized by the Subcommittee as an acceptable substitute for the Cooperative Medical Service Plan.

"Dr. Verbruyke stated that he had sent by air mail an outline of the Cooperative Medical Service Plan to Dr. W. C. Woodward and requested that Dr. Woodward meet with him in Washington. Every effort was made by Dr. Woodward to ascertain who was financing the project. He met with little success with his inquiry. It was stated that Dr. H. C. Macatee, at the meeting of the House of Delegates, in Atlantic City, outlined the plan that was all ready for trial in Washington. It seemed as though the attitude was 'we are sorry; we have no solution; you work it out.'"

Mr. Kelleher:—I think we may omit what follows:

"The chairman at this point addressed the meeting. He called attention to the fact that he had one son who had just completed his medical course; another son was just entering the medical school. This represented a tremendous personal investment, the usefulness of which he thought would be greatly curtailed by the installation of any such plan as Mr. Russell contemplated fostering on the medical profession in Washington."

Mr. Kelleher:—And I again omit:

"The secretary made a motion that a special meeting of the executive committee be held on the evening of Wednesday, June 23rd, and that Dr. Henry Rolf Brown be informed that his presence would be welcomed, also the presence of any of his conferees. This motion was seconded, and in the discretion the question of executive session on that evening was brought up."

Mr. Kelleher:—And I omit again:

"Dr. Macatee, in summary, stated that two ways available in combating or controlling any such scheme as recently proposed in Washington might probably be handled (1) through disciplining our own

members who undertook to participate, and (2) the possibility of doing something to recalcitrant hospitals through pressure on their staffs. He mentioned the various cooperative plans that were now in force."

The meeting was then adjourned.

I now read from

"Report of the Committee on Group Medical Service Plan," which is appended to the minutes:

"The inception of Cooperative Medical Service plans with a prepaid payment basis for federal employees and their families in Washington forces the Medical Society to take a definite stand either for or against. This decision must be made upon full consideration of various advantages and disadvantages of this service not to the doctor but to the patient since the medical profession has always stood foursquare for principles looking toward improvement of public health albeit at the expense of diminution of its own income. This unselfish attitude is well exemplified by the untiring efforts expended by the profession in furtherance of the prevention of disease and the concept that it is unethical to patent or use for private gain any new discovery for the alleviation of illness. Quite naturally, however, the organized profession is insisting upon not being forced by misguided or unfair competition to give up any of its rightful prerogatives."

Mr. Kelleher:—And I omit:

"The aim of the Cooperative Medical Service is to supply complete medical care, including professional care and hospitalization to all participants at a cost which all can afford through the distribution of such cost over large groups whereby those who are lucky enough not to need the benefits bear their part of the expense of caring for those who otherwise would be subjected to perhaps an unbearable or impossible burden which is imposed by the highly developed and the necessary expensive modern medicine."

Mr. Kelleher:—I omit the next paragraph.

"The profession of the District of Columbia has gone far toward the solution of the problem by its creation of the Medical-Dental Service Bureau, which permits the budgeting of all expenses incident to an illness after the blow has struck, but evidently it has not gone far enough or the need for some plan such as the Cooperative would not have been felt."

Mr. Kelleher:—I omit the next paragraph.

Mr. Leahy:—What paragraph are you on now?

Mr. Kelleher:—I am at page 2.

"The spread of costs with resultant benefit of adequate care to the hard-hit individual constitutes the one advantage of cooperative medical care and it is unquestionably a large one and worthy of deep consideration."

Mr. Kelleher:—I omit—

Mr. Leahy:—No, read on.

"On the other hand, possible disadvantages, some of which may be said to be even likely under the proposed set-up may be enumerated as follows:

"1. The absence of patient-personal physician relationship so necessary in many conditions.

"2. The inability of the patient to have free choice of physician.

"3. The danger of deterioration of service when competitive factors are removed through salaried personnel.

"4. The danger of relative incompetence of personnel through appointment by favoritism or otherwise rather than on a strictly merit basis.

"5. The inability of the patient to have always the best care for a certain condition if the specialist does not happen to belong to that group.

"6. The usurpation of the time and money of the group by some who think that they are ill or enjoy poor health constantly at the expense of some of the more needy.

"7. Actual statistics prove that group practice costs the individual patient more than private practice.

"8. The possibility that group support will be enthusiastic at the beginning but will wane in time with gradual failures.

"Much can be said for these disadvantages to offset in theory the advantage to the patient of the group plan.

"A review will now be made of the history of some of the similar plans which have already have had a thorough trial.

"For many years Quintas have been operating in Cuba, where for a moderate fee per month all diagnostic, dispensary, hospital and home medical and nursing care have been supplied with reputed satisfaction to both patients and the profession.

"The Union Health Center in New York City has rendered service, since 1913, to its members whose incomes are from \$600 to \$1200 with clinics even in such specialties as allergy, cardiography, et cetera, with apparently a high degree of success.

"There are some 150 group clinics throughout the country which supply prepaid medical care, but the outstanding example is the Ross-Loos Group of Los Angeles, and this organization is admittedly a success both from the standpoint of the patient and the staff.

"Trinity Hospital, in Little Rock, Arkansas, owned by a private group of physicians, gives medical service prepaid to an increasingly large clientele.

"County medical societies have within the past several years inaugurated their own prepaid medical service bureaus in several parts of Washington and Oregon with free choice of physicians. Varying results are recorded.

"In Fulton County, Georgia, 65 per cent of the County Medical Society have placed their names on the roster of their bureau. The

only reported difficulty has been tardiness in paying the professional fees necessitated by lack of capital in the beginning.

"In summary, it may be said that few of the prepaid medical setups have been without criticism but that many desirable features have been supplied and it is generally conceded that people of a class or group, who are unable to take care of themselves individually, have a right to band together if their aims can be accomplished collectively and provided contracts are entered into which are fair to all parties concerned.

"Before dissecting the setup of the proposed Cooperative Medical Service Plan for Federal Employees, it might be well to quote the section of the Principles of Medical Ethics of the American Medical Association which will show where the doctor fits into the picture:"

And the section is quoted as follows:

"Contract practice per se is not unethical. However, certain features or conditions if present make a contract unethical, among which are: 1. When there is solicitation of patients, directly or indirectly. 2. When there is underbidding to secure the contract. 3. When the compensation is inadequate to assure good medical service. 4. When there is interference with reasonable competition in a community. 5. When free choice of a physician is prevented. 6. When the conditions of employment make it impossible to render adequate service to the patients. 7. When the contract because of any of its provisions or practical results is contrary to sound public policy."

"It becomes evident that the plan proposed containing at least 4 of the objections raised by the American Medical Association, and, therefore, being stamped as unethical according to these standards, no member of the Medical Society can have a part in it as at present constituted, and still be a member of the Medical Society or of the American Medical Association.

"The proposal bespeaks the wish that the approval of the Medical Society be accorded and that it have an active part in an advisory capacity. It would not appear that the aims of the groups and the features objectionable to the Medical Society are too divergent to be reconciled.

"1. Under no condition can the Medical Society approve any plan which does not allow free choice of physicians so that it cannot approve of salaried fulltime personnel—Violation of conditions 4 and 5 of A. M. A.

"2. The proposal to set up a local medical center with cooperatively controlled hospital, etc., is unquestionably 'contrary to sound public policy.' Not only would members be denied hospitalization of their own choice but present community hospitals, which have done their part through trying times in taking care of the public, would be pushed to the wall and be reduced to charity institutions or have to entirely disband.

"3. The instructions for launching cooperative medical service groups contains the following significant paragraphs:

"It will of course be desirable to obtain the fullest possible measure of cooperation from the members of the medical profession in the District of Columbia. After the plan is launched, the Medical Society of the District will be invited to appoint a representative to sit with the committee which undertakes to establish the plan. It will also be requested to appoint a committee of several physicians to advise the medical director of the plan on all relevant matters. The intention will be to solicit the advice and cooperation of the local medical society and to work with it to the fullest degree possible."

"Now, the important thing for the Medical Society to insist upon, first and foremost, is that it not be consulted after the plan is launched, but that it be consulted first and have a part in drawing up the charter and by-laws to conform with necessary standards of ethics.

"In fact, we propose that the Medical Society go further than this and that it formulate at this time as nearly an ideal plan as is possible with the endeavor to avoid all the objectionable features.

"Briefly, our plan would contemplate a director, or board of several directors, from the Medical Society, who would serve as a central body to have supervision of the launching and future conduct of all cooperative groups to see that all ethical standards are complied with and to act as the final board of arbiters in all cases of dispute. This central board should be salaried and paid by assessments from the various cooperative groups.

"Groups of 10,000, taken as an arbitrary unit, can be organized more or less after the pattern advised by previous planners, except that the only salaried doctor shall be the medical director of the group who shall control all medical and business activities of the group and who shall act as an admitting officer and advise patients as to their general course of procedure, but who shall not himself administer treatment. Each group shall be self-governing and independent, subject only to the general rules of the central directors. Instead of salaried personnel for diagnosis and treatment the patient shall have free choice of physician from a panel of the medical society members, all of whom shall be eligible to register upon accepting the rules and regulations and a standard fee table, after adoption.

"Many details would have to be worked out in the matter of regulations, et cetera, and the above plan gives the basic set-up only.

"It is moved that the executive committee call a special meeting of the Society for the consideration of the question, with the recommendation that a committee proceed with details of a complete set-up which, after adoption by the Society, shall be publicized and submitted to all interested parties."

Mr. Leavin:

"Minutes of the special meeting of the executive committee of the Medical Society of the District of Columbia, held Thursday evening, June 24, 1937, 8:00 p. m., Library.

"Dr. J. Lawn Thompson, Chairman, presiding.

"Present: Drs. A. B. Bennett, Daniel L. Borden, Charles B. Campbell, C. N. Chipman, A. J. B. Connolly, David Davis, William T. Gill Jr., William P. Herbst Jr., Raymond T. Holden Jr., R. Arthur Hoce, Joseph

Horgan, H. C. Macatee, F. X. McGovern, Thomas E. Neill, Sterling E. Ruffin, H. H. Schoenfeld, William M. Sprigg, Earl R. Templeton, C. B. Conklin, members of the Executive Committee.

"By invitation: Drs. Thomas A. Groover, J. Russell Verhrycke Jr., Daniel F. Lynch (Secretary, D. C. Dental Society); Dr. Henry Rolf Brown, Mr. William F. Penniman, and Mr. Zimmerman."

Mr. Lewin:—Now, here at this joint conference, you would like me to read the entire colloquy, I assume. I can do it. I am not so sure, but probably it is best because both sides were present; it should be read.

"The chairman stated that the purpose of the special committee was to consider the Cooperative Medical Service plan as proposed to provide medical care for federal employees and their families. He called on Dr. Henry R. Brown to outline the procedure.

"Dr. Brown stated that he was not chairman of the committee. He would suggest that Mr. Penniman, who is the president of the organization, be asked to open the question. Dr. Brown added that he would be available to answer any medical questions that might be asked.

"The Chairman, addressing Mr. Penniman: 'Would you be good enough to state your method of procedure as to what your proposition is in regard to the Government employees?'

"Mr. Penniman:—'I am very happy to be here this evening to give you the information that I think you are entitled to, and to correct any misinformation that we have under consideration with the Home Owner's Loan Corporation. I was very much relieved when I said to Dr. Conklin a moment ago that we felt you had come up to prepare the operating room, but I find it is all right.

"The organization of which I am President is known as the Group Health Association. It is a body composed solely and entirely of the employees of the Home Owner's Loan Corporation and the affiliated agencies of the Federal Home Loan Bank Board. In addition to the Home Owner's Loan Corporation, which because of its size many of you gentlemen have heard a good deal about, there are other agencies such as the Federal Home Loan Bank Board, Federal Savings and Loan Association, Federal Savings and Loan Insurance Corporation. There are about 1,700 employees under these 4 agencies in Washington.

"We have from time to time made something of a study of the health conditions of the employees of these agencies of which the Home Owner's Loan Corporation is perhaps the largest. We have found, as a result of this study, that a great many of the employees whose salaries are in the lower brackets have not been able to take advantage of the medical service that they are entitled to or that they should have. We have found that the cost to the corporation as a result of sick leave has been heavy. Looking deeper into that we found a great many of them, young men and young women who have gotten married, that have illness. They are not indigent because they have employment and receive income. That income is about all they have to live off. It was proposed and the subject placed before the employees as to whether or not they should be interested in an organization whereby for a small monthly sum, payable in dues, within their ability to pay they could be provided with full medical services. The answer was very enthusiastic in the affirmative and encouraged us to go ahead with this movement. They have obtained a charter. We have already prepared by-laws, elected a board of trustees and officers. We have selected Dr. Brown as the Medical Director.

"Now it is proposed for this small monthly sum that they are to have everything that we can give them through this association in the way of medical service. The approach to it is on the lines of preventive medicine to the extent that we want these people who are members of this association to take full advantages of the services that it renders. We want them to be in a position to go to the medical center every day, every week, every month, and certainly once a year for physical examination. We believe that by so doing a careful physical checkup that oftentimes those whose salaries are small and with some illness they perhaps would attempt to take care of it themselves. Oftentimes it runs into a situation that becomes serious, we believe. It could have been corrected had they attended.

"We are impressed with this fact—that the advancement in medical research has been as outstanding, no doubt, as in the automotive industry. We know more about the automotive industry, because every magazine, every periodical, and radio broadcast has something to tell us about the advance in the automotive industry. It has been just as great in medical research. The great trouble, gentlemen, is so many people are not taking advantage of it, and they don't take advantage until they are flat or down and have to fall on the doctor. By this preventive approach we are in a position to take care of our people and the efficiency of their work is increasing very materially by being in better health, better state of mind, no bills to worry them at the end of an illness.

"I might say our medical service provides for hospitalization, provides for surgical, provides for obstetrics, provides for all of these services that we can give them within our medical center. It is proposed in our clinic to have modern equipment. It is proposed to have a staff of physicians, technicians of the highest type that can be selected, under the direction of Dr. Brown, to observe in every respect ethical medicine in the highest degree.

"I might say that some thought that this is a governmental institution. It is not a governmental institution at all. It is a private association, composed solely and entirely supported, managed and controlled by the employees themselves. It is localized to the District of Columbia.

"I will be glad to answer any questions."

The Secretary:—"When and where is this clinic going to be erected?"

Mr. Penniman:—"It is not going to be erected at all. We are not contemplating building anything, but it is contemplated to house it in a building centrally located and within easy access of transportation."

Q:—"In a Government building?"

Mr. Penniman:—"Oh, no, the Government has nothing whatsoever to do with this."

Q:—"Have you selected your location?"

Mr. Penniman:—"No, we haven't. We would be glad to have some suggestions."

Q:—"How about your personnel?"

Mr. Penniman:—"We thought we had done a pretty good job when we selected Dr. Brown and we stopped there, because we are laymen. The selection of the staff and technicians we turned over to Dr. Brown. Dr. Brown perhaps can answer that question."

The Chairman:—"We would appreciate it, Dr. Brown, if you would say something about the staff or medical aspect."

Dr. Brown:—"The selection of the personnel is now in order. We are interviewing and we have contacted quite a number of men. No actual selections have yet been made of the medical or technician personnel. We expect to procure the services of men who are qualified in the several fields of medicine; men who have practiced the highest standards of medicine obtainable. We will be highly ethical in our practice in every sense. The equipment is modern equipment for diagnostic purposes and treatment purposes. We will only treat cases that will come to the clinic; hospital cases will be treated at the hospital."

The Secretary:—"Will the staff be full-time salaried men?"

Dr. Brown:—"Full-time salaried men. It is a nonprofit organization, for the benefit of the Association."

The Chairman:—"There are four units in the making—the Home Owner's Loan Corporation, Soil Conservation Service, Reconstruction Finance Corporation and one other."

Dr. Brown:—"We have no connection with any other association."

The Chairman:—"Will it be compulsory for these individuals to join?"

Dr. Brown:—"Entirely voluntary."

Mr. Penniman:—"I would like to state that under our membership plan it is entirely voluntary on the part of the members to come in if they see the benefits of it; to resign any time they want to; to accept the services of our clinic. They may supplement it with their own doctor. They may take a portion of this service and maintain their doctor if they wish, and they may not come in at all."

The Chairman:—"Are these doctors that will be associated with the Association allowed to practice on the outside?"

Dr. Brown:—"Full time. No outside practice."

Dr. T. A. Groover:—"How many do you expect to have on your staff?"

Dr. Brown:—"To start with, four or five; perhaps more, depending on the needs."

Dr. A. B. Bennett:—"The membership can't be more than 1,700?"

Mr. Penniman:—"There is the individual membership for those who are single; family membership, which entitles the member and his already dependent members of his family to the benefits."

Dr. R. Arthur Hooc:—"May I burden you with two or three questions, gentlemen? You referred to the choice of the physicians to render the services and you use the personal pronoun "we." I am wondering from what the president just told us if that is not the "Lindbergh we." Does not that really mean you are choosing, and that you probably speak of it as "we" in personal modesty?"

Dr. Brown answered in the affirmative.

Dr. Hooc:—"Would you tell us, next, for the information of the committee, how you are guided in the choice of those physicians. I am trying to place myself in your position, with the same function to perform and wondering just how I would proceed in spite of the fact that I believe I am fairly well acquainted with the medical profession in the District of Columbia and in a pretty good position to choose from among the profession. Will you tell us how you proceed?"

Dr. Brown:—"By personal interviews with the men and qualifications and evidence that we can point to giving us qualifications, his associations and background. It is an unknown quantity. We tell them we feel you are qualified to perform a certain duty. After I have had you on my staff six weeks I find you are not worth anything at all—if not, out you go."

The Chairman:—"Do they make application or are they requested?"

Dr. Brown:—"I have interviewed quite a number of doctors who have sufficient qualifications to meet our demands."

The Chairman:—"The definite policy eventually would be of a man applying for such a position?"

Dr. Brown:—"There is no objection to a man applying if he could back up his qualification; then we would give it consideration."

Dr. C. N. Chipman:—"You referred to the people coming to the clinic that if you could not take care of them in the clinic you would then send them to the hospital."

Dr. Brown:—"I said that cases that were purely hospital cases would be referred to the hospital; we would only treat in the clinic those who are able to come to the clinic."

Dr. Chipman:—"Isn't it your intention to give complete medical care?"

Dr. Brown:—"Yes, we will give treatment in the homes if they are not able to come to the clinic."

Dr. Chipman:—"It is your intention to give complete medical care?"

Dr. Brown:—"We expect to have our staff give complete medical care."

Dr. Hooc:—"Do you think this corporation could function with any degree of satisfaction?"

Dr. Brown:—"We have the experience of 250 clinics in the United States. We feel we can do what they can do."

Dr. Hooc:—"Do you think this corporation could function to any degree of satisfaction with the hospitalization being left out of the equation?"

Dr. Brown:—"I don't see how we could complete treatment if the patient needed hospitalization and we dropped him there. It should be followed through. I don't think it could be done. The treatment is nothing more or less than a patient coming to your own office. He comes to you and he is well physically and mentally. You go over to the case and you examine him and you dispose of him according to your judgment. If he should go to the hospital you send him. If you can treat him in your office you treat him."

FEBRUARY 19, AFTERNOON

Mr. Lewin:—I will continue reading from the minutes of the special meeting of the executive committee of the District Medical Society held June 24, 1937:

"Dr. Groover:—"Counting the families which you are going to look after, how many individuals did you anticipate?"

"Dr. Brown:—"According to statistics every 100 would have 125 in the family."

"Dr. Groover:—"That is how many you would have?"

"The Chairman:—"It has been rumored that the project has been financed by the Federal Housing."

"Dr. Brown:—"I have had come back to me a great many rumors—one, that this covers proposed state medicine, etc. Those are rumors that gather momentum as they go. You know the old saying 'A lie travels around the world while the truth is putting his boots on.' The medicine that we practice is the same as you in your individual capacities. Three or four doctors work together; you have diagnostic facilities—that is all we propose, nothing more, nothing less."

"Dr. Horgan:—"How has the inauguration of this setup been financed?"

"Dr. Brown:—"I will leave that to the President to answer. I am interested in the medical."

"The Chairman asked *Mr. Zimmerman* if he had anything to add.

"Mr. Zimmerman:—"I am glad to be here and listen to the questions that are asked. They give an accurate and correct picture of what is undertaken."

"The Secretary:—"I would like to ask *Mr. Penniman* a few questions; first I would like to know *Mr. Penniman's* initials; second, if it is not too personal or inquisitive, is he connected with the United States Government?"

"Mr. Penniman:—"My initials are Wm. F. In answer to your second question I am an employee of the Home Owners' Loan Corporation."

"The Secretary:—"Official?"

"Mr. Penniman:—"Yes."

"The Secretary:—"High official?"

"Mr. Penniman:—"I don't know how high you would call me."

"Dr. Groover:—"May I ask a question? What do you estimate that your gross income from contributions would be?"

"Mr. Penniman:—"By contributions, you mean payment of dues. I should say, Doctor, in rough, round figures, around \$50,000."

"Dr. Horgan:—"How old is this?"

"Mr. Penniman:—"It is still on the bottle."

"Dr. Horgan:—"Could you answer the question I asked *Dr. Brown*? How has the inauguration of this undertaking been financed or subsidized?"

"Mr. Penniman:—"In answer to your question—the plan, as I stated a moment ago, is to be supported in the main by the membership dues. It has been fixed at a figure which we believe is within the income of those of the smaller brackets to pay. There is one question in connection with that perhaps you need to know. We have made a study of the situation and find that the cost of the Home Owners' Loan Corporation sick leave has been very expensive for services rendered to the Home Owners' Loan Corporation; in the examination of its employees, that the Home Owners' Loan Corporation may get more efficient work out of these employees; from the constant observation of health conditions among employees generally from which the Home Owners' Loan Corporation will be a direct beneficiary. The Home Owners' Loan Corporation has appropriated a sum, an initial sum for two years to start this."

"Dr. Groover:—"You speak about the lower income brackets. What are your limits as to membership?"

"Mr. Penniman:—"No restrictions at all."

"Dr. Groover:—"You take high or low income employees?"

"Mr. Penniman:—"If they are eligible employees of the corporation they are eligible to join."

"Dr. W. M. Sprigg:—"Is this not for any government employee?"

"Mr. Penniman:—"No, it is positively not. It is confined solely to the employees of this agency."

"The Chairman informed *Dr. Sprigg* (who was not present when the meeting opened) that this was one particular unit represented here tonight, speaking for itself only.

"Mr. Penniman:—"We know nothing about the others. We are not connected with them whatsoever. Speaking of the income brackets, about 80 per cent of the incomes will average \$2,400 and below."

"The Chairman:—"You say these men are full-time men. How are you going to prevent them from practicing outside? In all government departments there are some doctors who practice at night—we call them sundowners."

"Dr. Brown:—"I wish to take exception. Not all government departments. I have been with the Veterans Administration for the last 18 years. I don't know of a man now in the administration who is practicing outside. In our organization if we find a man violating his obligation to us by practicing outside, he will no longer be with us."

"The Chairman:—"That did not obtain in the Veterans Administration?"

"Dr. Brown:—"We have more men in the Veterans Administration than the others combined."

"Dr. Groover:—"Do you make a contract with your beneficiaries?"

"Mr. Penniman:—"Not a contract. It would be an application for membership. That application is passed on by the Board of Trustees just as any other organization. If they are eligible and are entitled to the benefits, they are elected—if not, they are denied."

"Dr. Groover:—"What is your criteria for accepting?"

"Mr. Penniman:—"The criteria in the first group those who are members. Those who are not now members, there is provision in the By-Laws that they cannot become members for 30 days; their dependents cannot become eligible for services for 90 days."

"Q:—"You do not make any guarantee either as to quantity or quality?"

"Dr. Brown:—"We make an agreement that we will give them the very best medical care."

"Dr. Groover:—"That is the contract?"

"Dr. Brown:—"That is the agreement."

"Mr. Penniman:—"It is just like joining a club. If you are not satisfied with the services you resign. If they are not satisfied they are entitled to withdraw at any time."

"Dr. Haac:—"Would you mind telling us, if you will—give us an illustration of what would disqualify new members for the benefits of this plan?"

"Penniman:—"I think one of the things that would disqualify them would be an abuse of the service. Any attempt to try and bring into the Association those who are not eligible would disqualify them and they would be dismissed."

"Dr. Haac:—"Before they are admitted?"

"Mr. Penniman:—"That is after they are in."

"Dr. Haac:—"How about before they are applying?"

"Mr. Penniman:—"I don't know anything that would particularly disqualify them with the exception that on examination it is found that they have tuberculosis, and perhaps have to be confined to a sanatorium—we are not going to take care of these people for the length of time they will be confined. Things are in our by-laws that we do not go into."

"Dr. Haac:—"How about the venereal diseases?"

"Dr. Brown:—"We will treat venereal diseases with an extra charge of 50 cents per treatment."

"The Chairman, Dr. Thompson, inquired as to the medical personnel."

"Dr. Brown:—"The medical personnel will probably be from four to six men."

"The Secretary:—"With those four or six men, would they include the various specialties? I understand you are going to give these people the very best medical care. I would think it would be presumptuous that you would use these six or eight men to take care of the general work."

"Dr. Brown:—"Consultants on the outside would take care of any special work."

"Dr. Conklin:—"Would they be full time?"

"Dr. Brown:—"No."

"Dr. Conklin:—"You would have a contract with the specialist?"

"Dr. Brown:—"Yes."

"Dr. Conklin:—"In all fields?"

"Dr. Brown:—"Per unit basis."

"Dr. Groover:—"You drop a member for nonpayment of dues?"

"Dr. Brown:—"I think those are matters that concern us and not so much the Society. They are our problem and not your problem."

"Dr. Groover:—"It is a problem that will naturally interest us, because if you do that—"

"Dr. Brown (interrupting):—"A person is eligible who keeps his dues up."

"Dr. Groover:—"If he drops out who is going to look after him?"

"Dr. Brown:—"Through the same source as he gets it now."

"Mr. Penniman:—"If he is not able to meet the monthly payments to this corporation he will come to you. He will be just the usual charity case."

"Mr. Zimmerman:—"I think it is fair to say that if you had an employee whose financial condition were such, that an arrangement could be made to carry him along until he could pay."

"Dr. Groover:—"There ought to be. He would automatically be thrown on the medical profession on the outside."

"Mr. Zimmerman:—"If we don't pay dues at the club we don't play golf. It is not the same way here."

"Dr. Brown:—"Every doctor would understand that question perfectly. We would be as human as the average practitioner of medicine."

"Dr. Groover:—"The question has many implications, I will cite some of them, by personal illustration: Some ten years ago I happened to be down in Havana and I went out of a hotel and asked a hackman to take me to the best hospital in Havana. Said he, 'I will take you to the Club Hospital.' He drove me out to the hospital and I was quite impressed. It was a nice hospital. I looked around, visited the x-ray department, etc., and I asked, 'How is this supported?' He said, 'Well, the members of this club pay \$2 a month dues.' I said, 'How many members have you?' He said, 'We have upwards of 50,000 members.' With a little rapid calculation this is \$1,200,000 a year. I thought nothing more about it, but as time went on you see the position we were in. About all the outside doctor would have to do would be to take care of the indigent and the riff-raff and the members who had been dropped by the club. Now that, you see, left them in a plenty bad way. All they had to do was to look after indigent groups. That did not go on. I don't know all of the facts. I have been reliably informed that that very situation was largely instrumental in developing this last revolution they had in Cuba. The doctors who were on the outside were about to starve to death and to use a popular expression, they were on a sit-down strike. Many of them left Cuba and came over to Miami. I merely mention that to recall to your minds that this sort of thing has implications."

"Dr. Brown:—"We have no indigents in employment."

"Dr. Groover:—"Your people may become indigent."

"Dr. Brown:—"Then it becomes the matter of the state."

"Dr. Groover:—"I see, but as a matter of fact the state don't take care of indigents."

"Dr. Brown:—"We are not going to drop a man or let a man suffer for lack of care if he is a member of our group. That is a humanitarian principle that you apply in your own practice."

"The Chairman:—"You spoke about tuberculosis. If an employee had active tuberculosis he would be doubly in need of care. He would not be allowed to work in the Government—he would be dropped from the group."

"Dr. Brown:—"We provide this to the point where it be recommended that be have institutional care."

"Dr. C. N. Chipman:—"It is said you intend to give dental service as well as medical service."

"Dr. Brown:—"We haven't considered that."

"Dr. Hooe:—Have you yet arranged the duration of the hospitalization in your mind—the extent of the time during which your beneficiaries may be hospitalized?"

"Dr. Brown:—Twenty-one days for any one illness, except in contagious diseases.

"Dr. F. X. McGovern:—I gathered from your initial statements that one of the facts that caused you to inaugurate this plan was your sick bill, or health bill, in the Home Owners' Loan Corporation. Have you proven that the sick bill is out of proportion to other departments of the Government?"

"Mr. Penniman:—I could not answer that because I made no check of any other departments of the Government.

"Dr. McGovern:—Notwithstanding in your own organization by comparison, what you have heard of other departments?"

"Mr. Penniman:—No comparison.

"Dr. McGovern:—Because of your particular health bill—

"Mr. Zimmermon (interrupting):—You perhaps realize that the Home Owners' Loan Corporation is somewhat different from other Governmental agencies in that it operates on a reduced amount of lost time because of sickness, physical fitness. The employees show that you get better performance just like any private concern.

"Dr. McGovern:—I hadn't any knowledge that it was any different than other Federal departments.

"Mr. Zimmermon:—We have a different interest in improving operating efficiency.

"Dr. McGovern:—Dr. Brown, in your general statement you brought out the fact that you planned to practice ethical medicine. Just how can you reconcile having staff men with free choice of physicians? How the patient would have free choice of physician, in terms of the ethics of the American Medical Association?"

"Dr. Brown:—The people join with the knowledge of the staff and, of course, there would be no free selection only as it pertains to the staff itself. If they are not satisfied with that staff they are privileged to get any one they please at their own expense. We give them the service—we guarantee the service we have for them.

"Dr. McGovern:—In your setup there is no free choice of physician if they continue to belong?"

"Dr. Brown:—They accept the faculty or staff as is. If they wanted you we could not have you to come in and see them.

"Dr. Groover:—According to rough figures you have an income of \$50,000 a year. With that you propose to hire five or six doctors—full-time. You are proposing to hire technicians to operate the clinic and possibly pay rent, etc., and then provide hospitalization. I don't know why, but that just lets the question that it seems to me you are operating the thing on a rather slim budget to provide the patient with medical care.

"Dr. Brown:—We don't feel that way about it, Doctor. I have recently visited a number of clinics in operation. I have visited within the year the Loos clinic in Los Angeles which has 15,000 members and a staff of 60 men. Have visited other clinics that have a staff of six or seven men, or four or five men. Recently I visited the Milwaukee-Rue clinic which has five men. I visited other clinics in Chicago; in Philadelphia there is also operating successfully a like and similar clinic giving excellent treatment. They are really practicing men who know a lot. It has been demonstrated that they are fully satisfied with the setup.

"Dr. Groover:—Just developing the fact.

"Dr. Conklin:—The Home Owners' Loan Corporation is not just a local affair?"

"Mr. Penniman:—Oh, no. It has branches throughout the country. "Q.—Would you be so good as to state whether you have any control over these branches outside of Washington?"

"Mr. Penniman:—This is the headquarters. It has important offices in every state.

"Dr. Conklin:—It would seem reasonable to you that this clinic to be successful, which I believe it is going to be, that this clinic be instituted in these other areas?"

"Mr. Penniman:—It is not contemplated at all. I would say there is only one factor that would subscribe to it. We have in our regional offices where there is the largest number of employees, what we call a First Aid Room. There is a trained nurse in charge, i. e., to take care of just the emergency cases that develop during the day. Employees are privileged to go into this First Aid Room and get temporary treatment. The only contemplation at this time is to place those infirmaries under the directorship of the Medical Director to the extent that these nurses will have some directing head. We don't want these nurses giving hypodermics when they have no business to—they have no business prescribing medicine. We think they ought to be under the supervision only of a medical director as to the extent of the treatment it calls for.

"Dr. Conklin:—Under whom are these nurses now?"

"Mr. Penniman:—Under the management.

"Dr. Conklin:—Governmental?"

"Mr. Penniman:—Home Owners' Loan Corporation's local management.

"Dr. Conklin:—A Governmental institution. The nurses are definitely governmental employees?"

"Mr. Penniman:—On the payroll of the Home Owners' Loan Corporation.

"Dr. Conklin:—Now then you propose to take them out of the Government?"

"Mr. Penniman:—Leave them in the Government.

"Dr. Conklin:—And then Dr. Brown would have a double function. He would be acting as a governmental official and also supplementing as a head of an institution?"

"Mr. Penniman:—He would not prescribe for any patients.

"Dr. Conklin:—Dr. Brown would not have any government position at all?"

"Mr. Penniman:—He would not be under the Government.

"Dr. Conklin:—Suppose that Dr. Brown, for instance, issues some orders to some of these nurses and they are not just right fundamentally. Now, who would step in and who would have anything to say about Dr. Brown's definitely apparent misdeeds?"

"Mr. Penniman:—The same person that would step in right now, under the direction of laymen, which is a situation we have never liked. Having them only with Dr. Brown as a guide to certain limitations to which he advises—only a matter of advice.

"Dr. Brown:—That would be through the local management?"

"Mr. Penniman:—He tells them what they should not do.

"Dr. Conklin:—Is there nothing extraordinary in your mind about that situation?"

"Mr. Penniman:—It occurs all right.

"Dr. Conklin (continuing):—Dr. Brown, operating an enterprise that is entirely disassociated from the United States Government and yet Dr. Brown does have something to do with the Government in these various places throughout the United States.

"Mr. Penniman:—As I stated this extension of this plan out of these areas is not contemplated at all. They would still continue to operate as they are now operating. Whatever benefits Dr. Brown could give them would be that in any local situation. Any local doctor would be glad to advise the nurse as to the extent of the treatment she should give.

"Dr. Conklin:—No connection with the Public Health Service?"

"Mr. Penniman:—None at all.

"Dr. Groover:—I would like to ask if your organizing committee considered any other form of setup for operating this service which you speak of?"

"Mr. Penniman:—For example, what would you have in mind?"

"Dr. Groover:—For instance, you wouldn't see if you could make any arrangements with the Medical Society to render the service to a group of people?"

"Mr. Penniman:—Would it have been possible if we had contacted the Medical Society whereby the employees could get the benefits of the Medical Society?"

"Dr. Groover:—I think it may be possible.

"Dr. A. B. Bennett pointed out that the employers, under compensation laws, through the Insurance Company pay the doctors per visit, per unit of service. They don't maintain a clinic and use the profession of the city.

"Dr. Groover:—I don't speak for the Medical Society. I don't mean for you to interpret it that way. I think I would be willing, for instance, to bargain with a group on some such basis.

"Dr. Brown:—What is the material difference in the way it is being done?"

"Dr. Groover:—I think I can point that out. The reason I asked that question was the answer 'best medical service.' There is a difference of opinion as to what might be best medical service. The difference is you pay into the concern certain amount of money; the other plan you pay for what you get when you get it.

"Dr. Brown:—Insurance contracts are not always satisfactory. There is a great deal of fault found in the way it is operated. We feel this is a much more satisfactory and more reliable plan.

"Mr. Penniman:—You are familiar with the Group Hospitalization plan, for which I think the members pay 75 cents a month. There is no unit basis.

"Dr. Groover:—I beg to differ. Your contract with Group Hospitalization provides certain specific accommodations for a certain specific time. They have a definite contract—you don't have.

"Mr. Penniman:—The point I was making—you don't use hospitalization until you need it, although you may be paying for several years. Not a unit basis at all. It is really hospital insurance. We would prefer in our Association to look upon it the same way as health insurance.

"Dr. Groover:—That is all right, but isn't this—

"Dr. Brown (interrupting):—A prepayment health insurance plan, nothing more, nothing less.

"Dr. Groover:—The Workmen's Compensation is pretty much the same thing. I have been buying Workmen's Compensation insurance for a number of years, and never got a penny back from it. Isn't that right?"

"The Chairman:—Men with a salary you could pay on a basis of a \$50,000 proposition—

"Dr. Brown:—I could get many competent men around Washington; could get men right here in Washington who are not making a decent living.

"Dr. Conklin:—Why do you think they are not making a decent living?"

"Dr. Brown:—I don't know the reason.

"Dr. Conklin:—Do you think the men of best ability are making a living?"

"Dr. Brown:—I think the men with the best ability are making a good living. Men with equal ability are not simply because they have not got the standing, not here long enough. Development of practice takes a number of years.

"Dr. C. B. Campbell:—What do you propose paying these doctors?"

"Dr. Brown:—That depends on their ability.

"Dr. Campbell:—I have done a little figuring: The Medical Director is to receive \$10,000; five physicians, say 5 @ \$5,000 would be \$25,000; rent \$2,000, which I think is very reasonable, would leave \$13,000. You have hospitalization of the patient, technicians, equipment, secretary, your office force, your overhead, and I was wondering if the Executive Committee or your Committee on Arrangements get any salary.

"Dr. Brown:—No salary.

"Dr. Campbell:—If I was running a store on that overhead I doubt that I would have a profit.

"Dr. Brown:—We don't want a profit.

"Dr. A. B. Bennett:—Is there any way the Medical Society could help?"

"Dr. Brown:—We are anxious to go with the Medical Society. I am anxious to become a member. We will be very glad to have our staff make application and go with your Society in every way we can for the uplift of medicine. If you can help us select personnel we will be glad to take recommendations from this organization, to consider them, and perhaps employ them.

"The Chairman asked if Dr. Daniel F. Lynch, Secretary of Columbia Dental Society, had any questions to ask.

"Dr. Lyuch:—I would like to ask Dr. Brown—in your visit throughout the country, did you find sections on dental diagnosis in connection with these clinics?

"Dr. Brown:—Some of them are partnerships; some on salary, some on commission. We are not at this time considering dental service at all.

"Dr. Hooe:—May I ask Mr. Penniman two brief questions? Do you find, as a result of your study of this plan, are you led to the conclusion that by means of this plan the individual beneficiary is subjected to less expense during any given year than he has been in the past—that it is a financial saving to him?

"Mr. Penniman:—Yes, not only a financial saving to him but gives the member the benefits of a medical service which would cost him a great deal more money if he didn't take advantage of it.

"Dr. Hooe:—Second, and last question. Did we not understand you to say that you have incorporated and that you now have the articles of incorporation in this activity in which you are going to hire certain members of the medical profession to do your medical work?

"Mr. Penniman:—Yes, that is correct. The corporation is chartered to employ the medical physicians.

"Dr. Bennett:—Incorporated to render medical service?

"Mr. Penniman:—Yes.

"Dr. Groover:—Do you operate under any insurance law?

"Mr. Penniman:—What do you mean?

"Dr. Groover:—They have insurance laws in the District of Columbia.

"Mr. Penniman:—Indemnifying the doctors?

"Dr. Groover:—No. Under the District of Columbia Insurance Law all life insurance companies in the insurance business have certain regulations prescribed by Congress. This is a health insurance. For instance, they have Group Hospitalization, Inc., under the District of Columbia Insurance Law.

"Dr. Brown:—It is not a health insurance in that sense. We don't insure the health as your insurance policy covers it. Not an insurance in that sense at all.

"Dr. Groover:—Isn't that sidestepping the question?

"Mr. Penniman:—No. I don't think it is. It does not mean we will pay them for health insurance for benefits. It is preventive medicine.

"Dr. Groover:—Other companies do exactly the same thing. You go down and buy a Health and Accident policy; that company has to be licensed to practice under the law.

"Dr. Thomas E. Neill:—Don't they get around that by deducting sick leave and the salary goes on just the same?

"Dr. Brown:—We go on according to the rules—sick leave and absence leave. May be 30 days, or 15 days, so much according to leave. Annual leave may be applied to sick leave. They are paid for a definite period. In Civil Service they have a definite period for sick leave. If you use that up you can call on your annual leave. If it goes beyond 90 days they are on without pay.

"Dr. W. M. Sprigg:—Suppose you should be stricken with an epidemic and your funds immediately available are used up. Where would you secure funds to carry on? Have you any reserve?

"Mr. Penniman:—There is no reserve. We probably would come to the Medical Society for some help.

"Dr. H. H. Schoenfeld:—The employees are not necessarily Civil Service employees?

"Mr. Penniman:—There is no reason why the Association could not either raise the dues or lower the dues, according to whatever its treasury is. It is a nonprofit organization. The officers and trustees receive no salaries.

"Dr. Sprigg:—Just as we do in hospitals. We have given our services to the indigent for years.

"Dr. Schoenfeld:—The employees of this corporation are not necessarily Civil Service employees?

"Mr. Penniman:—This is a private corporation.

"Q.—It is not a Government department thing?

"Mr. Penniman:—Private institution entirely.

"Dr. Sprigg:—I would like to ask whether the Home Owners' Loan Corporation, in the case of emergency, will come forward and loan you money to carry on?

"Mr. Penniman:—I don't know how we could go to the Government and ask for it.

"Dr. Sprigg:—The Government can do anything in an emergency.

"Mr. Penniman:—We would not refuse.

"Dr. Schoenfeld:—Your corporation can for purposes of study of health, appropriate money to this organization?

"Dr. Sprigg:—The Home Owners' Loan Corporation can appropriate to the organization for services rendered it. The Home Owners' Loan Corporation in the case of emergency can appropriate without any Government supervision?

"Mr. Penniman:—That is right.

"Dr. Conklin:—I think that all of us present tonight appreciate just what these gentlemen have done. They have been kind enough, good enough to come down and meet with us. They have answered all of our questions and haven't denied us at all, no matter what their own personal feelings may have been concerning some of them. We are primarily interested in the patient's welfare. That has been demonstrated time and again in this country and throughout the United States. I am wondering if they would accept the opportunity of a committee of three of the Medical Society to meet with them, with a view to making presentation as clearly as possible of the Medical Society's attitude primarily toward this particular proposition from the viewpoint of the patient, primarily. I wonder if that would be acceptable. I have no authority to say that the Medical Society would appoint such a committee. But if that would be acceptable to the Medical Society do you gentlemen think you would accept a proposition of that kind?

"Dr. Brown:—A further meeting to elucidate certain questions?

"Dr. Conklin:—I am sure there are certain ideas that definitely seem to be fixed. There is a possibility in further conference with three representatives of the Medical Society, who would go down to the Home Owners' Loan Corporation and talk these things over and see whether or

not some alternative proposition will operate that would be acceptable to some 800 practicing physicians here in the District of Columbia. I would think it would be a wonderful thing.

"Dr. Brown:—Our objectives are identical with those you have expressed. We have no objections to meeting any committee of three.

"The Chairman:—To confer with their own committee if they would like to have such a meeting?

"Mr. Penniman:—We have a Board of Trustees.

"The Chairman:—It might not be a bad idea and to have as many men as they want to, to discuss the thing further. There is no question that other units in the Government are going to undertake the same thing.

"Dr. Conklin:—If we may have a definite assurance, tentative acceptance of this plan, I think your coming down has been just a most successful thing with a view to definite harmony. I think that is what we want. We want to see these men and greet these men, and have them certainly not fighting organized medicine, because I think any doctor who attempts to do that is doomed to failure. We want to have this committee of three representatives to meet with you and talk these things over and with a possibility of making some little re-arrangement wherein we can come before our entire membership and present this thing and recommend adoption.

"Dr. Brown:—We are anxious for cooperative intercourse. We would be glad to consider those plans.

"Mr. Penniman:—I want to say—I should have said and would have liked to have said at the outset—reversing the words of Shakespeare: 'I came down with the idea of praising Caesar not burying him.' I have the most profound respect for the medical profession—always have had and always will have. It is the desire of this Association to work to the ultimate end that we may give our employees medical care. I speak not as an official of the Home Owners' Loan Corporation but as one of the employees. Medical Service of the highest type, within their ability to pay and to solicit at every point of view possible the full cooperation of the Medical Society of the District of Columbia. Glad to have it. I would like to make a suggestion—since we have a Board of Trustees consisting of eleven employees of the corporation who have been elected by the employees, that if you would be good enough to drop us a line so that we can put it clearly to the Board, your point of view, I am safe in saying that it would be met with a ready response.

"Dr. Conklin:—You mean the point of view as to this committee of three?

"Mr. Penniman:—Yes.

"At this point Mr. Penniman, Dr. Brown, and Mr. Zimmerman left the meeting.

"The Chairman asked the wish of the committee in the matter.

"Dr. W. M. Sprigg was of the opinion that the committee could do nothing until the Society as a whole authorized it.

"Dr. A. B. Bennett felt that a subcommittee should be appointed to bring about some changes in the arrangements before a Society meeting was called, and the committee should have the plan as near finished as possible.

"Dr. R. Arthur Hooe stated that he agreed with Dr. Bennett, but at the same time the committee was committing itself and definitely taking action on a matter involving public policy. 'While I am not in personal sympathy with it you placed in the Constitution last winter a provision that prohibits a committee of this kind from taking this action.'

"The Chairman brought out the fact the report submitted by Dr. Verbruycke at the last meeting of the Executive Committee was accepted in principle.

"Dr. Hooe said the committee could present that report to the Society and ask it to appoint a committee to confer with a committee of the Group Health Association. But when the Executive Committee appoints a committee to meet with this group to effect a compromise, to iron out the differences, for which the Executive Committee tonight does not stand, Dr. Hooe was of the opinion the committee was therefore taking action on a matter involving public policy. He added, 'You must have a meeting of the Medical Society and present Dr. Verbruycke's plan and what has occurred here tonight and ask it to appoint a committee.'

"The Chairman said he would welcome a motion to the effect that a copy of these minutes be sent to the Active Membership so they would know what was going on. It was his opinion that 90 per cent of the membership knew nothing about this plan.

"Dr. J. Russell Verbruycke made a motion that a copy of the Executive Committee report be sent to the membership for their digest with a notice that the matter will be acted upon at a certain meeting of the Society. He brought out the fact that his report contained the recommendation that a committee be appointed to carry on the work and not just for the purpose of meeting this committee but to get together and try to formulate a plan which will not violate any provisions or principles of the Medical Society. Any final action would be dependent upon both organizations; not only of this organization but that of subsequent organizations which develop. Dr. Verbruycke pointed out that to make his motion parliamentary, it should come from a member of the Executive Committee.

"Dr. H. H. Schoenfeld moved that Dr. Verbruycke's suggestion be adopted. Seconded.

"The Chair pointed out that there were four of these units in the making. He added that Dr. Brown was adverse to meeting with the Executive Committee of the Society, postponing the time set. Just today at 12 o'clock he again called and asked to have the meeting postponed to a later date. The Chairman told Dr. Brown that this could not be done.

"Dr. Sprigg would inquire if the motion would mean that a committee of eleven is to be appointed to meet with the committee of Group Health Association?

"Dr. Schoenfeld said that was not the intention. He said it was his idea in offering the motion suggested by Dr. Verbruycke, that the whole thing should be carried promptly to a special meeting of the Society; therefore the report becomes the report of the Executive Committee of

the Society. Then after the Society has made its determination, the Committee may be set up as indicated. He said he realized that if a committee is appointed after a meeting by the Society, that that committee would come back with a final report that would require another meeting at a later date.

"Dr. Sprigg offered an amendment that the personnel of the committee be not greater than five members.

"Dr. Schoenfeld accepted Dr. Sprigg's amendment.

"Dr. Horgan would inquire if these plans were predicated on the fact that we accept this thing that an organization of our Federal Government is undertaking.

"Dr. Sprigg said that had nothing to do with this committee; that it was purely for the purpose of bringing Dr. Verbyrck's report before the Society, which report has been accepted in principle by the Executive Committee.

"The Secretary said: 'It occurs to me that it might be a better idea to have this committee of five perhaps being constituted by members of the Executive Committee who have been fully cognizant of what has been going on and to not have this committee to be too official as representing the Medical Society. We shouldn't step that far yet. The function of this committee should be largely that of finding points on which we might possibly agree and then finding the points on which we couldn't agree. In other words this committee is to feel out the organization and see where, if any place, they are willing to submit to arbitration or to consider some other scheme than the scheme they have now. If we can get some modification of this scheme it is my personal view that we have done a lot. Endicott-Johnson had this same identical setup in New York State. The New York State Medical Society and Broome County Medical Society fought this thing tooth and nail. The result was that Endicott-Johnson did as they pleased and they give full medical care to the employees and all their families. They know about the Ross-Loos outfit in California. It was bucked by the California State Medical Society. They know about the other organizations throughout the land. Dr. Brown has that information. As I told Mr. Zimmerman the situation in the District of Columbia is different, where if this thing spreads to all government employees, which I have no doubt will be the situation, we can all realize what will happen to the practice of medicine in the District of Columbia. The seriousness of that situation means we should have a committee to go to their committee and feel out the whole thing; sift it out and get information about getting it to the Home Owners' Loan Corporation throughout the states. It is going to be widespread. My idea would be to have this carried on without this committee having any authority to bind the Society—just to find out what they will accept.'

"Dr. Hoee:—Briefly Dr. Conklin's idea would sound all right. I am referring to that part of it relating to the choice of five men of the Executive Committee. Ordinarily that would be all right. I think this whole matter is of extreme importance. I think I see the possibility of its being ironed out if the right five men are chosen and I don't see why, in choosing those men, if there are one or two best suited for that committee—I feel we can ill afford to leave them off that committee because they are not members of the Executive Committee. I refer to Dr. Tom Groover. He ought to be on that committee. His judgment will have weight on that committee. If the Chairman could go out of the Executive Committee and be permitted to choose I would say have Tom Groover on that committee.'

"Dr. Schoenfeld would ask how about Dr. Verbyrck.

"Dr. Hoee:—Had no objections to Dr. Verbyrck serving on the committee.

"The Secretary would suggest that the incoming President appoint an unofficial committee.

"Dr. Hoee did not agree with the suggestion.

"Dr. Thomas E. Neill was of the opinion that a copy of what was learned tonight should be sent to the membership, with a copy of Dr. Verbyrck's report, and the matter should be brought to the floor of the Society. He felt there should be no hurry.

"The Secretary stated the organization was 'ready to shoot.'

"Dr. Neill added, 'They are shooting with their guns half cocked.'

"Dr. H. C. Macatee:—There are certain things that have occurred to me that I would call to your attention. This is something that affects vitally the whole membership of the Medical Society. Certainly no committee of it would undertake to do anything that seemed to commit the Society to any position in regard to it, but I would like to express the opinion that this is not a matter of public policy. If the Medical Society of the Executive Committee were to undertake to recommend that the Medical Society endorse cooperatives of this sort as a social setup in the District of Columbia, that would be a question of public policy. If you consider that this is a question of public policy then under the Constitution we are required to send this report and any action of the Executive Committee to every member of the Medical Society before calling a meeting to consider it. It seems to me that the report and the suggestions contained in it are very tentative offers of a possible organizing interest between two existing corporations. The Medical Society has been chartered over 100 years, and this corporation is incorporated and has a legal status. We can't express any opinion as far as the public policy is concerned. If this proposal is published to the whole membership of the Medical Society it, to a certain extent, becomes a public document. Whether the Medical Society adopts it or not it becomes a public document—it can't be helped. It seems much wiser for the Executive Committee to feel out whether there is any possibility of this corporation even considering a proposal of employing the organized medical profession as its agency for rendering the services as it promises to its people before you go to the Medical Society with anything.'

"Dr. Hoee:—Does that mean that the committee can go to these people but not in any way commit the Society—it can't offer anything? That would appear different.'

"The Chairman:—What is the sense of appointing a committee unless we have something to offer?'

"Dr. Sterling Ruffin:—This committee has a right to further confer along the same lines as we did tonight—not to commit the Society—for the purpose of getting all the facts. We can then bring it before the Society and let the Society take any action it deems proper. We have a perfect right to appoint a committee—suggest the appointment of a committee of five of this committee—with authority to take with them any members outside of the Executive Committee whom they wish; that would bring in Dr. Groover and Dr. Verbyrck, if they wish to have their assistance. There is nothing wrong about that.'

"Dr. Schoenfeld at this point withdrew his motion.

"Dr. Ruffin made a motion that a Subcommittee of five members be appointed from the Executive Committee, with authority to add to the committee any other members of the Society, to confer further with the committee of the Group Health Association for the purpose of getting all of the facts concerning the Cooperative Medical Service Plan. Seconded. Finally adopted.

"Dr. A. B. Bennett pointed out that some hospitals require that the courtesy staff should be members of the American Medical Association. Dr. Brown's cooperation with the Medical would seem important. Dr. Bennett would suggest that these facts be brought to the attention of the rest of the board.

"Dr. Joseph Horgan was of the opinion that they should conform to the Principles of the American Medical Association. The thing that behooves us to attack is the fact that they have admitted they are setting up a corporation with taxpayers' funds to practice medicine. I asked Mr. Peniman with what funds was this thing subsidized; he admitted that it was from the funds of the Home Owners' Loan Corporation, an agency of the Government.'

"Dr. Bennett pointed out that the Home Owners' Loan Corporation does not use taxpayers' money.

"Dr. Horgan added: 'Essentially it is an agency of the Government. Remotely, if not directly, they are using taxpayer's money. If it were not true they would have to carry compensation policies to protect their own employees.' If the Society does not combat this plan there will be set up 'in our midst a Federal Agency unit for the corporate practice of medicine.'

"The Chairman appointed the following committee: Drs. Sterling Ruffin, Thomas A. Groover, H. C. Macatee, Thomas E. Neill and J. R. Verbyrck Jr.

"It was pointed out that Drs. Groover and Verbyrck were not members of the Executive Committee. Dr. Sterling Ruffin asked not to be appointed as he was so much opposed to the plan.

"The Chairman reserved the right to appoint a subcommittee at a later date."

"Adjourned.

"C. B. Conklin,
"Secretary."

"* Dr. Thompson appointed the following subcommittee:

"H. C. Macatee; F. X. McGovern, Chairman; Earl R. Templeton; William P. Herbst Jr. and Coursen B. Conklin."

Mr. Kelleher:—I will now read Exhibit 106, which is an original letter from Dr. William P. Herbst, 1726 I Street, Northwest, Washington, D. C., to Dr. Olin West, Secretary, American Medical Association, Chicago, dated June 25, 1937:

U. S. EXHIBIT 106

"Dear Doctor West:

"I wish to thank you for your very kind letter which I received a short time ago.

"In regard to Sir Henry Brackenbury, I will be as nice to him as I know how and see if I can find out anything that is of any importance.

"We are having a great time locally here at the moment. That Group Health Service affair of the Home Owners' Loan Corporation has already been incorporated and our Executive Committee had a meeting with some of their representatives last night and it certainly looks bad. It was brought out that it is possible for them to borrow money from the Home Owners' Loan Corporation when and if necessary at any time for any purpose in regard to the health problem. It was also brought out that there are about two hundred branches scattered throughout the United States which maintain emergency rooms with a nurse which are directly under the central office here in Washington. Just what is going to come out of the whole affair is impossible to predict at this time but there are going to be some conferences in an attempt to go along with this outfit if it is possible to do so and retain our faces.

"I am on my way up to the A. U. A. in Minneapolis and if I can steal any time on the way up or way back, I shall give you a call and trust that it will be possible to have a little visit with you.

"With very kindest personal regards, I am

"Sincerely,
"William P. Herbst."

Exhibit 135 is an excerpt from the minutes of the Board of Trustees of the American Medical Association for June 29, 1937:

"Home Owners' Loan Corporation; Group Health Association, Inc.; Group Medical Service Plan (p. 294):—

Mr. Leahy:—Will you indicate the pages, please?

Mr. Kelleher:—17 and 18.

"The following paragraph from a communication which Dr. West received from a physician in Washington, D. C., was read:

"The Group Health Service affair of the Home Owners' Loan Corporation has already been incorporated and our Executive Committee had a meeting with some of their representatives last night and it certainly looks bad. It was brought out that it is possible for them to borrow money from the Home Owners' Loan Corporation when and if necessary at any time for any purpose in regard to the health problem. It was also brought

out that there are about two hundred branches scattered throughout the United States which maintain emergency rooms with a nurse which are directly under the central office here in Washington. Just what is going to come out of the whole affair is impossible to predict at this time but there are going to be some conferences in an attempt to go along with this outfit if it is possible to do so and retain our faces.

"Dr. Woodward reported information secured from a Washington physician over the telephone and by letter concerning this matter and there was considerable discussion as to what the action of the American Medical Association should be concerning the activities of the H. O. L. C. and also concerning the proposal of the Medical Society of the District of Columbia to organize its own cooperatives. After the discussion the following actions were taken:

"Dr. Bloss moved that the Editor and the Secretary and General Manager be authorized to proceed to inform the profession of the country as to the efforts of the H. O. L. C. to enter into the practice of medicine and as to the present status of the proposal to organize cooperatives by the Government. Dr. Hayden seconded the motion and it was carried.

"Dr. Hayden moved, and the motion was seconded by Dr. Bloss and carried, that Doctors Woodward and Leland be requested to go to Washington to see what they can learn and to try to advise the Medical Society of the District of Columbia if that Society is willing to accept advice."

Exhibit 177 is an original memorandum written by the defendant W. C. Woodward on June 28, 1937:

U. S. EXHIBIT 177

"About four o'clock p. m., June 28, I talked with Dr. J. Russell Verbyrck Jr., Washington, D. C., relative to certain statements in a letter just received by Dr. West from Dr. Wm. P. Herbst, Washington, concerning the Group Health Association, Inc., organized in Washington under the auspices of the H. O. L. C. I referred particularly to Dr. Herbst's statement that the representatives of the Medical Society of the District of Columbia who met with representatives of the Association planned 'to go along with the Association' if they could do so and save their faces. I suggested to Dr. Verbyrck that I could not see how they could go along with the Association named without violating the principles of medical ethics of the American Medical Association. His answer was in effect that they would try to work out some plan whereby they could do so. Cooperatives, he said, were already with us, and the representatives of the Medical Society of the District of Columbia thought it would be better for the Society to help organized cooperatives on an ethical basis rather than oppose the wishes of the Association named. I asked him what cooperatives he knew of, and he named the Group Health Association, Inc. I called his attention to the fact that that organization was an illegal corporation, if there could be such a thing, in that it was incorporated to engage in the practice of medicine and dentistry. Dr. Verbyrck said that representatives of the Association had said that it was not planning to engage in such practice. I told him that its charter definitely planned that it should do so. He said that representatives of the Association had refused to furnish him with a copy of its articles of incorporation and he was much surprised when I told him that those articles were matters of public record and that I had a copy of them.

"I asked him what Dr. Herbst meant when he said that there were already two hundred emergency rooms with nurses in attendance, under the direction of the central office in Washington. Whether he meant that these two hundred emergency rooms were under the Washington headquarters of the office of the Association organized under the auspices of the H. O. L. C. He said that reference had not been made to the present existence of two hundred such emergency rooms under the Association, but ultimately the Association expected to have that number of rooms throughout the country.

"Dr. Verbyrck said that he had prepared a lengthy report on the situation, which report had been approved by a subcommittee and then by the full executive committee of the Medical Society. He promised to send a copy of that report and to try to get it off by air-mail, special delivery tonight. He said, too, that minutes had been kept of the recent conference with representatives of the Association and that he would send me a copy of those minutes.

"Dr. Verbyrck said that a Mr. Penniman had stated that 'they' had the same right to look after the health of their employees that any private corporation had to look after the health of its employees. I suggested that in my judgment the representative of the Corporation had done some tall bluffing in the conference, but he felt confident that that would not be the case because Mr. Penniman is a high official in the H. O. L. C. and a smart man. I suggested that that very type would do the bluffing. Dr. Verbyrck expressed a wish for cooperation by the American Medical Association, but I had to tell him that we certainly could not cooperate with his group if it did not let us know what was going on. If we had been given notice of the proposed conference with representatives of the H. O. L. C., I might, I told him, have come to Washington to attend.

"W. C. W."

Mr. Kelleher:—Exhibit 198 is a carbon copy of a letter written over the signature of William C. Woodward, dated July 2, 1937:

U. S. EXHIBIT 198

"Dr. C. B. Conklin, Secretary,
"Medical Society of the District of Columbia,
"Washington, D. C.
"Dear Dr. Conklin:

"Did the Medical Society of the District of Columbia at its special meeting on June 30 consider the status of the special medical cooperative established by employees of the Home Owners' Loan Corporation? If so, will you not let me know at once the result of the Society's deliberations? Will you not send me at the same time a copy of the minutes of the meeting at which representatives of the Home Owners'

Loan Corporation medical service association conferred with representatives of the Medical Society regarding the proposed medical service cooperative?

"Yours truly,"

Exhibit 199 is a letter from C. B. Conklin to Dr. William C. Woodward, dated July 6, 1937:

U. S. EXHIBIT 199

"Dear Doctor Woodward:

"At the special meeting of the Society held on June 30 the matter of the medical cooperative for the Home Owners' Loan Corporation was not discussed. Arrangements have been made, as you will see, in the transcript of the minutes of the joint meeting with representatives from the Home Owners' Loan Corporation for a committee from the Society to meet with representatives of the cooperative project at a future date. Dr. F. X. McGovern is the chairman of the committee from this Society.

"Assuring you that it will always give us pleasure to keep your office fully apprised of any future developments, I am

"Sincerely yours,

"C. B. Conklin."

Mr. Levin:—I shall now read from minutes of the meeting of the executive committee of the Medical Society of the District of Columbia held Monday evening, July 12, 1937, at 8 p. m.:

"Present, Drs. Borden, Chipman, Holden, Hoce, Macatee, McGovern, Neill, Reed," spelled R-e-e-d, John A. Reed, E. Hiram Reede, Ruffin, Schreiber, Templeton, Yater, Conklin, and *Preston, *Sprigg and *Wells.

"(*) In attendance after the meeting started."

"Dr. F. X. McGovern, Chairman of the Subcommittee that was appointed to confer with representatives from the Group Health Association, Inc., was recognized. He made a motion that his report be given preference over the other agenda for this meeting, and that it be heard at this time. Duly seconded and adopted.

"For the information of the new members of the Executive Committee, Dr. McGovern outlined the prepayment medical care plan that has been set up by the Home Owners' Loan Corporation, stating that the Executive Committee had appointed a subcommittee to meet with the Committee on Medical Economics to study the prospectus and bring a report back to this committee. A report, which was prepared by Dr. J. Russell Verbyrck, who was then the Chairman of the Committee on Medical Economics, was approved in principle by the Executive Committee at a subsequent meeting. Since that time the subcommittee has met and studied and reviewed supplementary plans by Dr. Verbyrck, which Dr. McGovern offered as a report to the Executive Committee tonight.

"Dr. H. C. Macatee interpolated, for the information of the new members of the Executive Committee, that upon the adoption in principle of the report of the Subcommittee, the Subcommittee was given instructions to negotiate on the basis of that report with the medical service corporation, and this supplementary report is now made to gain alternative instructions.

"(Copy of Dr. Verbyrck's letter, dated July 12, 1937, appended hereto.)

"The Secretary made a motion that this letter be accepted as the report of the Subcommittee and be approved in principle."

That was seconded right there.

Now I turn to that letter which was moved to be the report of this committee:

"July 12, 1937

"Dr. F. X. McGovern, Chairman,

"Special Subcommittee of the Executive Committee on Cooperative Medical Care,

"Dear Dr. McGovern:

"I have no longer any official status, but I am deeply interested in the entire subject, and since I was the author of the original report which has been approved in principle by the Executive Committee, I ask your leave to submit some further thoughts with the hope that they may be of some slight help.

"The present H. O. L. C. corporation is only a minor consideration: (a) Either innumerable others will follow or (b) a large all-embracing organization will succeed all smaller enterprises. The first eventuality is not of great concern to us. Competition will kill them and since they cannot be large enough to supply a proper quality of medical care or hospitalization on their own account subscribers will gradually withdraw. Also the Medical Society by its present control over its members and, through them, of the hospitals can adequately fight (if it is so desired) these small units. (Various methods which are more or less practical will be later detailed.)

"However, if the second eventuality should occur, and one single large cooperative to take in all government employees should be formed, the considerations are entirely different and we must be prepared to admit the following:

"1. With size and a single large cooperative its financial success is assured.

"2. It can secure enough personnel of good quality, even if not the best, either local or imported, to assure its success from the patients' standpoint.

"3. Its own medical center and hospital can be obtained.

"4. It is not unlikely that a responsible organization could borrow all the money needed, even into the millions, through one of the administration agencies, such as P. W. A., just as many other projects have, without such an act making it a federal enterprise.

"The Medical Society must therefore adopt a definite policy toward the cooperative movement as a whole, and at once, without wasting a great deal of time on the H. O. L. C. project. The alternatives of policy are primarily:

"1. Approval of cooperatives as at present outlined.

"2. A laissez-faire attitude of seeing what will happen.

"3. Disapproval and active combat with all measures at our command.

"4. Disapproval of all other plans and the offer of prepaid medicine through the Medical Society (a) either as a Society subsidiary or (b) through a change in the Medical-Dental Service Bureau.

"The first of these, approval, is manifestly an impossibility. The second alternative threatens through inertia more than any other factor.

"Active opposition is possible at present. Whether it is advisable is another matter, unless some substitute plan can be suggested. Failure to place the cooperative on the approved list of the Medical Society would automatically forbid any consultations by members of our Society. Any full-time employees of the corporation could probably easily fail to be put on the courtesy list of the hospitals for one reason or another without the fact of his connection with a cooperative being even mentioned. In fact any combative methods would necessarily have to be camouflaged to the nth degree.

"The original plan submitted to the Executive Committee envisioned the aid of the Medical Society in the formation of the cooperatives along ethical lines and their continuous active supervision, insisting above all upon free choice of physicians. All cooperative corporations would be financially and administratively independent except for the control exercised by the Central Board elected by the Medical Society.

"It would now appear that a better plan might be a much more ambitious one, namely, the formation of our own complete organization for the distribution of prepaid medical care as a distinct unit competitive with any other organization that may be formed.

"This is the plan which Dr. West made it clear he favored as having the greatest chance of success. He made the further suggestion that our own Medical-Dental Service Bureau could be changed to take over the plan. I believe that none of us had previously thought of this solution and I personally believe that it has great possibilities.

"The Bureau has done great work in allowing patients to budget their medical, dental and hospital care. It has also acted as the clearing house for the Central Admitting Bureau partial-pay patients. It has just about broken even on the 10 per cent allowed but it would not have been able to carry on had it not been for the C. A. B. business."

That is Central Admitting Bureau, I suppose.

"The Bureau has about reached its peak of volume of work and it would appear that various factors might even tend to start it on the down grade. Therefore, it would seem that our having a working organization with personnel, quarters, etc., which might with the necessary changes function at any time, is a most fortunate thing.

"Group Hospitalization is also vitally affected by the inception of cooperative medicine.

"May I offer the earnest suggestion to your committee that you request a joint meeting with the Board of the Medical-Dental Service Bureau and the Board of Group Hospitalization, Inc., with a view to discussion of the factors affecting all and the possible formation of definite constructive plans.

"Very truly yours,
"J. Russell Verbrycke Jr."

THE COURT:—That is Exhibit 292.

(Copy of letter, Verbrycke to McGovern, dated 7/12/1937, heretofore marked as Government Exhibit 292 for identification was received in evidence.)

Mr. Kelleher:—Exhibit 292 is a copy of the report which Mr. Lewin has just read, which is from the files of the American Medical Association and bears on it the stamp, "File, Sep. 1, 1937, W. C. W.," and one of the girls in his office testified that it was the stamp placed on the mail received in his office.

I shall now read Exhibit 152, which is an original letter from the defendant Olin West to Dr. J. Russell Verbrycke, dated July 12, 1937:

U. S. EXHIBIT 152

"Dear Doctor Verbrycke:

"Our telephone conversation this morning was not altogether satisfactory for the reason that I could not hear you very well.

"Since the meeting held at the Metropolitan Club in Washington the other evening, I have given a little more thought to the matters that were discussed and have come to the conclusion that I offered one suggestion for the consideration of the Medical Society of the District of Columbia that it was not altogether wise to offer. I stated, in effect, that if I were a member of the committee of the District society, I should want to consider the advisability of organizing a sort of cooperative movement under the auspices of the society to offset the effect of the cooperative movement that is now being promoted by certain agencies in Washington. Having thought the matter over more carefully, I have come to the conclusion that that was a poor suggestion to offer, for the following reasons:

"First, I do not believe that the District society could organize any sort of cooperative scheme without establishing a relatively low income limit for those who might be included among the beneficiaries of the scheme. It is my understanding that the so-called H. O. L. C. cooperative does not intend to establish any particular income limit, but that the higher paid officers among the employees of that corporation are to be included in the cooperative scheme. Certainly the District society could not afford to undertake any sort of plan under which persons enjoying relatively large incomes would be included. Secondly, if the Medical Society of the District of Columbia should attempt to organize

and operate a cooperative movement, it would at once give endorsement to the principle of collective bargaining, which, in my opinion, cannot be properly applied to medical service.

"Since I returned to the office this morning I have talked with Dr. Woodward and with Dr. Leland, both of whom expect to arrive in Washington on Wednesday morning in the hope that they may be able to be helpful in some way to the committee of the District medical society. Dr. Woodward seems to be inclined to believe that the cooperative movement now being promoted in Washington might be successfully opposed on the ground that when it goes into operation it will be a corporation engaging in the practice of medicine. As you know, court decisions in several states have specifically declared the practice of medicine by a corporation to be illegal.

"I was delighted to see you while I was in Washington and to have the privilege of meeting with the members of the group at dinner at the club. I am sorry indeed that I could not offer some suggestion that might be more helpful to your committee, but I hope that Dr. Woodward and Dr. Leland will be able to be of some assistance.

"With most cordial good wishes, I am,

"Very truly yours,
"Olin West."

Mr. Lewin:—Continuing the reading from the minutes of the executive committee of the District Medical Society of July 12, 1937:

"Dr. Hooe"—"He thought the plan discussed with Dr. West offered great possibilities.

"Dr. McGovern, in answer to why the Subcommittee had not met with the Group Health Association representatives up to this time, said that his committee did not feel that it was ready to meet until it had something concrete to offer. He stated that within the past week Dr. Olin West, Secretary of the American Medical Association, was in the city and met with the committee and it was felt that very important information was obtained through this meeting. He added that he had a telegram from Dr. West, stating that Drs. W. C. Woodward and R. G. Leland (the latter Director, Bureau of Medical Economics) of the American Medical Association would be in Washington Wednesday morning of this week."

"Dr. Thomas E. Neill pointed out that the subcommittee was appointed on June 30. The Chairman of the committee as constituted did not accept the appointment and Dr. Neill appointed a new chairman, Dr. McGovern, to take the place of a member who did not want to serve. He was of the opinion that the committee should have something concrete to offer when they meet the representatives of the Group Health Association. He said he gained, personally, a lot of information from the conference held with Dr. West. He felt that the subcommittee should meet with the Board of Trustees of the Health Association and then in the fall, at the first business meeting of the Society, some concrete recommendation could be adopted."

"Dr. A. Arthur Hooe, as Chairman of the Compensation, Contract and Industrial Medicine Committee, would call attention to the fact that by fall this thing (the Group Health Association, Inc.) would be running very smoothly. He felt that there was no time to lose in dealing with the matter. Dr. Hooe was of the opinion that the subcommittee should do its work and do it promptly, and come back with something definite to the Executive Committee to recommend to the Society at a meeting to be held."

"Dr. McGovern added that his committee did not know—"

Mr. Leahy (interposing):—Why not read it all so that they get it?

Mr. Lewin:—I think they will get it.

Mr. Kelleher:—I thought that was agreed.

Mr. Lewin:—I thought we had that arrangement with Mr. Leahy in the interests of everybody, but—

Mr. Leahy:—Well, I know, but you pick these men out as though they were the only ones who talked.

Mr. Lewin:—Oh, no. I am perfectly willing to stipulate.

Mr. Leahy:—It was a running fire of talk from everybody in the committee.

Mr. Lewin:—I am perfectly willing to stipulate.

THE COURT:—Well, you may read it.

Mr. Lewin:

"At this point Dr. Ruffin suggested that, for the benefit of Dr. Sprigg, the portion of the report of the Subcommittee dealing with the recommendations he read. This was done by Dr. McGovern.

"Dr. McGovern added that his committee did not know just what the attitude of the Executive Committee of the Society would be; whether to fight this thing with the weapons at hand or possibly set up an organization to combat it. The committee felt that some definite instructions should be given along that line."

"Dr. Hooe said he was of the opinion—"

Mr. Leahy (interposing):—Why not read what the chairman, now, said?

Mr. Lewin:—Very well. We are just going back on our arrangement we made. I think we were doing very well.

THE COURT:—I think I have indicated I—

Mr. Lewin:—All right; let me read it.

THE COURT:—Provided that while you were reading it he requested you go on and read certain parts.

Mr. Lewin:—All right.

THE COURT:—And you may do so. I think that is the best way.

Mr. Lewin:

"The Chairman said it was his understanding that the subcommittee had the authority to meet with representatives of the Home Owners' Loan Corporation for the purpose of getting from them all of the data they could; not to go to them with any plan or proposition but to get information and to bring it to the Executive Committee and the Society for approval.

"The Secretary, at this point at the request of Dr. McGovern, read 'Suggestions for agenda for joint meeting of the Subcommittee of the Executive Committee of the Society, with the Committee from the H. O. L. C.' (Copy appended hereto.)"

Mr. Leahy:—Is it there, Mr. Lewin?

Mr. Lewin:—"The Chairman"—Yes, sir.

Mr. Leahy:—Leave the copy there so we can see what they were going to talk about.

Mr. Lewin:—Have you got a copy of it?

Mr. Leahy:—No; I just got this photostat.

Mr. Lewin:—Well, I don't believe I will stop to look for that now, if you don't mind.

Mr. Leahy:—All right. I am trying to find it.

Mr. Lewin:—I would like to do your work for you, but—

Mr. Leahy:—Well, this is yours, you know, not mine.

Mr. Lewin:—It isn't mine at all. This is your clients'.

Mr. Leahy:—You are offering this, you know.

Mr. Lewin:—I certainly am offering it.

Mr. Leahy:—Well, then, go ahead and read it.

Mr. Lewin:—Well, that is what I was doing when I was interrupted.

Mr. Leahy:—No; you are just picking out certain parts of it.

Mr. Lewin:—I think your remarks are highly improper.

Mr. Leahy:—If your Honor please, if I stated, of course, that certain portions I wanted read—

Mr. Kelleher:—Under the arrangement we had—

THE COURT:—Just a minute.

Mr. Kelleher:—As you indicated this morning—

Mr. Lewin:—What are you trying to indicate, something unfair in the presentation of this?

Mr. Leahy:—Why argue with me then if under the arrangement I offer it?

THE COURT:—Just a minute, please.

Mr. Leahy:—Very well.

THE COURT:—We are just losing time. This does not get us any place.

Mr. Leahy:—I think if you go right through and read it, if your Honor please—

THE COURT:—While you are reading it, at the time when he indicates parts he wants read they should be read.

Mr. Lewin:—Very well.

THE COURT:—I believe that is best. At least, that was the rule I laid down.

Mr. Lewin:

"The Chairman, for the benefit of the committee, stated that he had information which would indicate that the Ross-Loos Plan, which split the California State Medical Society, was not progressing so well; that the wind was blowing the other way. He was informed that the Ross-Loos Corporation was resorting to other means of business to make up their deficit.

"Dr. Macatee pointed out the fact that the Group Health Association itself was a small group, but there were possibilities of it involving other federal employees.

"Dr. Hooe said he was of the opinion that when this subcommittee goes to the representatives of the Home Owners' Loan Corporation it should carry nothing binding upon the Society. He pointed out that what is done in the Executive Committee is not binding upon the Society. He would suggest that an early meeting of the Society be called to present the proposition. He thought the consensus was that the corporation as it now stands would not be countenanced by the Society. He felt that there were so many substitutes that could be offered and therein lies the one hope for defeating the plan."

I would omit page 4. Do you want it read?

Mr. Leahy:—Yes.

Mr. Lewin:

"The Secretary stated that when the subcommittee goes down to meet the representatives of the Group Health Association there was no one better than Dr. Macatee to be the spokesman and the rest of the committee should be observers.

"Dr. John F. Preston would inquire if there was anything in the setup which would allow the Home Owners' Loan Corporation to put their money in such an enterprise?

"Dr. Macatee said that he was talking to a patient who was an attorney in the corporation and he said it could be done perfectly legal, and if his recollection was correct, that the papers had gone over this attorney's desk. They could do anything not contrary to the law and constitution for the benefit of their employees. In respect to the duties of the Subcommittee, Dr. Macatee pointed out that according to the letter which was addressed to the members of the Group Health Association, that it was clear that at least one medical man had made a contract with the group, and that they are on the verge of going into action. It had been thought by the Subcommittee that we could probably go

before the Trustees and we could ask them what their prospectus meant when it said that they wished to enter into the fullest cooperation with the Medical Society of the District of Columbia, to ask for representation on their board in an advisory capacity, and they wished to do their work in an harmonious way. We thought we might say to the Board of Trustees that the Medical Society had looked upon the organization with some concern and that we wondered if the Trustees sensed the threats involved to the success of their enterprise by the fact that their subscribers would not in the long run have the free choice of physicians. Whether they understood that as soon as some grave medical problem arose among the employees they would not follow the usual human instinct and say 'We don't want these hired men, we want the best'; whether that would not be disruptive of the whole plan. The trustees are laymen. . . . Whether in view of those facts and other facts they might not feel that the principles of organized medicine, that the free choice of physician is essential to the success of any proposition, that that may convey something looking to the entire medical profession of the District of Columbia as a source of the medical and surgical service they may need. If they could consider that we would be glad to take it up with the Medical Society and see what could be worked out. It is for this committee to decide whether it is likely that any good will come from such a meeting."

"The Secretary was of the opinion that the Subcommittee should be sent down to ascertain the facts and have Dr. Macatee speak along the lines which he just did. The lay members of the Board of Trustees would in all probability immediately understand that they haven't anything comparable to what the Medical Society may possibly offer in these few \$3,000 a year men they may be able to pick up outside of the organized medical profession. Further, Mr. Penniman, Mr. Zimmerman and Dr. Brown were given to understand that a committee would be glad to meet with them. He felt it would be undiplomatic to back out now.

"Dr. Ruffin offered an amendment to Dr. Conklin's motion to the effect that the Subcommittee, of which Dr. F. X. McGovern is chairman, be instructed to present arguments along the lines just outlined by Dr. Macatee and bring back a report to the Executive Committee with a view to a meeting being called of the Society at an early date.

"Dr. Hooe suggested to incorporate in the amendment the time for the meeting of the committee and the Society—in the very near future.

"At this point Dr. Conklin and Dr. Ruffin withdrew their motion and amendment.

"Dr. Macatee made a motion to the effect that the supplementary report of the Subcommittee be received and be held on the table for future consideration, after the report of the Subcommittee. Seconded and adopted.

"Dr. Ruffin made a motion that the Subcommittee be instructed to meet with the Home Owners' Loan Corporation representatives, to be addressed by Dr. Macatee along the lines, discuss, and bring a report back as promptly as possible to the Executive Committee with a view to a meeting of the Medical Society. Seconded and carried.

"Dr. Wallace M. Yater would offer an amendment to the effect that the Subcommittee bring back its report after it confers with the H. O. L. C. representatives and also after it has had sufficient conference with Drs. W. C. Woodward and R. G. Leland. In fact Dr. Yater felt that the Subcommittee should confer with Drs. Woodward and Leland before and after they go to the Home Owners' Loan Corporation, to get advice as to how to proceed. No second to this amendment.

"Dr. Ruffin was of the opinion that it could be left to the committee to do this without any specific instructions."

Now, for a long time now we have a lot about Subcommittee on Communicable Diseases. Would you care to have that read to the jury?

Mr. Leahy:—No, no.

Mr. Lewin:—I do want this, page 10, in the middle of the page:

"At this point Dr. F. X. McGovern, Chairman of the Subcommittee of the Executive Committee appointed to prepare an approved list of organizations, groups and individuals, engaged in the practice of medicine within the District of Columbia, in accordance with Chapter IX, Article IV, Section 5 of the Constitution, was recognized. He read the provision of the Constitution, as follows:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group or individual, by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within 10 miles thereof, which has not been approved by the Society."

"The Executive Committee is authorized and directed to prepare an approved list of organizations, groups and individuals, by whatever name called and however organized, engaged in the practice of medicine within the District of Columbia or within 10 miles thereof, and the same shall be kept in the office of the Secretary-Treasurer. Before any such organization, group or individual can be placed on the approved list of the Society, such organization, group or individual, or the member of the Society proposing professional relations therewith, shall submit to the Compensation, Contract and Industrial Medicine Committee such evidence as the Committee or the Society may require showing the character, activities, financial condition and ethical standards of said organization, group or individual, and after considering the same, said committee shall make a report of its investigation and findings to the Executive Committee for such action as it may deem necessary."

"Dr. McGovern stated that he requested the various county medical societies in Virginia and Maryland, within 10 miles of the District of Columbia, to send him a list of their membership. He was not very successful by letter and intended to contact the Secretaries personally. He added that there were a few physicians practicing medicine in the District of Columbia who were not on the rolls of the Society. The Society's office was busy at the present time checking the list of physi-

cians and surgeons as classified in the newest telephone directory and the Commission on Licensure had been approached to obtain a list of all licentiates in the District of Columbia.

"The Chairman, Dr. Sprigg, stated that he requested a list of the licentiates and the Society's office was informed that the records of the Commission on Licensure would be available if the Society could supply clerical help to type the list.

"Dr. McGovern read a proposed list of approved organizations, groups and individuals.

"Dr. Macatee suggested that the words 'employed by' be substituted for the words 'connected with' in item 10. With this change the list was approved, upon motion, duly seconded and adopted, as follows:

"1. All members of the Medical Society of the District of Columbia.

"2. Medical staffs of all hospitals, institutions and clinics, each member of which has been approved by the Medical Society of the District of Columbia.

"3. The United States Government Medical Personnel on duty in the District of Columbia, or within 10 miles thereof, i. e., the United States Army, Navy, Public Health Service, and the Veterans' Administration.

"4. The Health Officer and attached medical personnel.

"5. Membership of the District of Columbia Dental Society.

"6. Membership of the Homeopathic Medical Society.

"7. Members of the Montgomery County (Md.), Prince Georges County (Md.), Fairfax County (Va.), and Arlington County (Va.) Medical Societies, who reside within 10 miles of the District of Columbia.

"8. Members of the Alexandria Medical Society.

"9. The following compensation clinics:

Operated by

Farragut Medical Clinic.....Frank E. Gantz, M.D.

First Aid StationArch L. Riddick, M.D.

Harry M. Lewis Clinic.....Harry M. Lewis, M.D.

Market Compensation Accident Clinic.....M. J. Kossow, M.D.

Northeast Insurance Clinic.....G. Henry Hawson, M.D.

Union Market Workmen's Compensation Clinic.....Maxwell Hurston, M.D.

Washington Industrial Accident Clinic.....Edward Clark Morse, M.D.

Washington Medical Building Workmen's Clinic.....Charles S. White, M.D.

"10. All medical personnel employed by the Federal or Municipal Governments within the District of Columbia or within 10 miles thereof.

"11. Membership of the Medico-Chirurgical Society (colored medical society).

"12. Membership of the Robert T. Freeman Dental Society (colored dental society).

"Dr. Raymond T. Holden Jr. inquired as to the personnel (medical) of the proposed Group Health Association, Inc.

"Dr. Hooe pointed out that it was a separate individual corporation and would have to be approved as a single unit. As a matter of information, Dr. Hooe would inquire if he was right in the assumption that this approved list would not have to be submitted to the Society but from tonight on would be filed in the Secretary's office for reference.

"The Chairman ruled that according to the wording of the Constitutional provision that would be the understanding.

"Dr. Hooe made a motion to the effect that the Secretary of the Society be directed to write a short letter to every member of the Society, calling attention to this Constitutional amendment, quoting it in the letter, and informing them that the approved list (which shall be added in the letter) is now available in the Secretary's Office and is in force; and further that any violation thereof they will be liable for. This letter to be sent registered mail. Seconded.

"The Secretary offered an amendment to the above motion to include that the list as read by Dr. McGovern tonight be enclosed, and not the individual names of physicians. Seconded and accepted.

"In the discussion of the above motion it was pointed out that the cost of registering a letter,"

Mr. Lewin:—I am on page 12. There was mention of the agenda. I think you gentlemen wanted the agenda. I am prepared to read it.

"SUGGESTIONS FOR AGENDA FOR JOINT MEETING OF COMMITTEE REPRESENTING THE EXECUTIVE COMMITTEE OF THE MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA, WITH THE COMMITTEE FROM THE HOME OWNERS' LOAN CORPORATION

"1. Attempt to be made by pointed questions to obtain a copy of written contract between the H. O. L. C. Medical Service and its clients.

"2. The establishment of attitude of H. O. L. C.; should the Medical Society of the District of Columbia offer to furnish in its entirety, through its members, allowing free choice of physician, the entire proposed medical service, regular and consultant.

"3. Would the H. O. L. C. consider giving up its present preparations for giving medical service through full-time \$3,000 per annum doctor employees should the Medical Society advocate the enlargement of the facilities that are already at hand in its Medical-Dental Service Bureau, for the purpose of taking care of large groups of Governmental employees, on a mutually approved prepayment plan?

"GENERAL IMPRESSIONS AS TO PROPER METHODS OF CARRYING ON THE JOINT MEETING

"1. Before the date of the meeting, objectives should be definitely determined and mutually agreed upon by all committee members.

"2. Such propositions as are to be offered, with the thought in mind that they are but tentative and are but 'feelers,' should be done in an orderly manner and by selected spokesmen.

"3. There should be no general speaking by all members of the committee, as this but leads to confusion and to perhaps defeat of the attainment of some definite objectives.

"Finally, the committee should be guided by words of wisdom that were given by Dr. Olin West at a recent meeting, and should be governed by what has actually taken place throughout the states, i. e., in the way of

prepayment plans advocated, installed, and successfully operated by components of state medical organizations. In other words, there should be no denying of what has definitely taken place. The teachings of experience should be weighed against the visionary and impractical promulgating of views and attitudes established by organized medicine, which in many instances constituent bodies have flauntingly discarded. The turning of public opinion against the California State Medical Society in its fight against the Ross-Loos Clinic is well worthy of thought. It would seem that in the Nation's capital that any active campaign by organized medicine for the purpose of denying the present organizers the use of their personnel might have, to say the least, very undesirable implications. The utmost diplomatic handling is required."

Mr. Kelleher:

It is a carbon copy of a letter written by Dr. West to Dr. C. B. Wright, 78 South Ninth Street, Minneapolis, dated July 14, 1937. As his Honor has said, the first three paragraphs deal with matters not relevant to the issues in this case.

"Dear Dr. Wright: I had a long conference with a committee of the Medical Society of the District of Columbia about the cooperative movement that is being promoted by groups of government employees. The District Society is apparently very much agitated about this matter but, as a matter of fact, there was very little that I could offer them in the way of suggestions as to what they might or should do. In accordance with authorization given by the Board of Trustees, I have asked Dr. Woodward and Dr. Leland to go to Washington for the purpose of conferring with the Medical Society of the District of Columbia, and they are to have a conference with official representatives of the Society in Washington today.

"There seems to be a lack of authentic information concerning the exact nature of the cooperative movement. A man in rather high official position in the H. O. L. C. was quoted in Washington as having specifically stated that the H. O. L. C. is not to finance the cooperative movement. Information from other sources, however, is exactly to the contrary. Nobody has as yet been able to get a copy of the contract that may exist between the cooperative organization and the Home Owners' Loan Corporation, nor has any one been able to get a copy of the contract that will be entered into between the cooperative and those who purchase its contract. I was told that 2,000 or more government employees have already signed up as members of the cooperative, and a few minutes later I was told by a Washington physician that employees in certain departments had refused to have anything whatever to do with the movement. It seems almost impossible to get information in Washington that you can tie to. I have never in all my life seen such a situation as now exists. I think Dr. Woodward has about come to the conclusion that the only way to fight the cooperative movement among government employees is to wait until the facts can be definitely discovered and then resort to court procedures in an effort to have the cooperative declared a corporation engaged in the practice of medicine. I am not yet come to any definite conclusion in my own mind as to whether or not this would be a wise procedure."

And the last three paragraphs of the letter deal with other matters.

Exhibit 178 is a telegram from Dr. William C. Woodward to Dr. J. Russell Verbyck Jr., the Farragut Medical Building, Washington, D. C. It is dated July 13, 1937, and reads as follows:

"Leland and I arrive Capital Limited Wednesday stop Leave it to your judgment to arrange a conference at which all essential persons will be present stop It will apparently be necessary for the Society to employ counsel to guide it and presence of that counsel at conference is essential stop If regular counsel is not available his representative or other counsel should be present stop Please arrange so that we can leave Washington not later than Thursday afternoon, July 15 stop Time of conference immaterial to us. We shall be at the Mayflower.

"William C. Woodward."

Mr. Kelleher:—Exhibit 200 is a memorandum from Drs. Woodward and Leland to Dr. West, dated July 16, 1937:

"A prospectus for a plan for a Cooperative Medical Service on a periodic payment basis for Federal employees and their families in Washington was circulated some time ago. The prospectus is not dated and the time of its issue is unknown. It was circulated anonymously. The plan proposed was to make available to Federal employees in Washington, and to their families, adequate medical care, both preventive and curative; to provide this care at moderate cost; and to place that cost on a regular, budgetable basis within the means of the group to be served.

"A certificate of incorporation for the Group Health Association, Inc., was executed February 19, 1937, by W. F. Penniman, R. T. Berry, and Pearl B. Murphy, and subsequently recorded in the office of the Recorder of Deeds of the District of Columbia.

"W. F. Penniman is one of the assistant general managers of the Home Owners' Loan Corporation and has charge of District No. 6. The occupations of R. T. Berry and Pearl B. Murphy are unknown, but it is understood that they are officers or employees of the Home Owners' Loan Corporation.

"An amendment to the articles of incorporation was executed April 21, 1937, for the sole purpose of increasing the number of the Board of Trustees, and the amendment was filed in the office of the Recorder of Deeds of the District of Columbia.

"The Association is organized as a corporation not for profit. Membership is limited to employees of any branch of the United States Government other than officers or enlisted men of the United States Army and Navy. Nothing in the articles of incorporation limits the Association's activities to the District of Columbia.

"Among the purposes of the Association are the following:

"(1) To provide the service of physicians and other medical attention and any and all kinds of medical, surgical, and hospital treatment for the members of the Association and their dependents.

"(2) To furnish all forms of hospital service to members of the Association and their dependents.

"(3) To construct a clinic and medical office building.

"(4) To construct and operate a hospital for members of the Association and their dependents.

"(5) To operate a drug store or pharmacy and to provide drugs and remedies for members of the Association and their dependents.

"(6) To provide nurses for members of the Association and their dependents.

"(7) To give to members of the Association and their dependents all forms of care, treatment, or attention that may be required by the sick or in the prevention of disease.

"The articles of incorporation are silent as to the sources from which the Association is to obtain funds for organization and operation, except in so far as they say that the corporation is to have no capital stock but is to be an association controlled by its members and that all members whose dues have been paid if and when the Association is liquidated shall have the right to share in the distribution of its assets.

"The prospectus referred to above says that the plan should be launched and publicly announced at a dinner or other similar meeting at which representatives of the press should be in attendance, and that immediately thereafter all Federal employees should be informed of the plan through meetings and circulars and should be asked whether they would be willing to participate. If the response was favorable, the campaign was to start to obtain the necessary capital through advance payment of 'enrolment fees.'

"It is understood that a meeting of some kind was held by the organizers of this movement at which, it has been alleged, Secretary of Labor Perkins, Secretary of Agriculture Wallace, and Secretary of the Interior Ickes, and other prominent government officials were present. This however was apparently not the meeting referred to above and, so far as is known, no public announcement has been made of the organization of the Group Health Association.

"It is understood that membership so far has been limited to officers and employees of the Home Owners' Loan Corporation.

"The Home Owners' Loan Corporation, according to an announcement sent out over the signature of Mr. W. F. Penniman, President, and R. T. Berry, Secretary-Treasurer, April 15, 1937, has entered into a contract of some kind with the Group Health Association, Inc. The announcement reads in part:

"Under the terms of the contract between your association and the Home Owners' Loan Corporation, two persons are selected by the Federal Home Loan Bank Board who shall serve on the Board of Trustees."

"The existence of such contract and the control of the Association by the Home Owners' Loan Corporation through the Federal Home Loan Bank Board is shown by an announcement subsequently issued by W. F. Penniman and R. T. Berry, said notice having been issued, it is believed, some time during the first ten days of July, in which it is said:

"The by-laws of the Association have been adopted by the Board of Trustees of the Group Health Association and approved by the Federal Home Loan Bank Board."

"It is understood that the Home Owners' Loan Corporation has aided and is aiding to finance the launching of the Group Health Association, Inc., through a loan or loans, and through a contract or contracts whereby the Association, through its officers will undertake to perform certain services for the Home Owners' Loan Corporation, but the nature of those services is not known. All efforts to procure a copy of the contract agreed upon between the Home Owners' Loan Corporation and the Group Health Association, Inc., have been unsuccessful. It has been stated by Mr. W. F. Penniman, an official of the Home Owners' Loan Corporation, and president of the Group Health Association, Inc., that the Home Owners' Loan Corporation has appropriated an initial sum sufficient to carry on the Association for two years because of some hypothetical benefit the corporation is to obtain from the activities of the association. Furthermore, when asked whether the Home Owners' Loan Corporation could not, for purposes of study of health, appropriate money to the Group Health Association, Incorporated, and whether the corporation could not appropriate for services rendered, or appropriate in case of emergency without any government supervision, Mr. Penniman admitted that that was the case.

"The Group Health Association, Inc., is obnoxious to law for the following reasons:

"(1) It proposes to practice medicine through physicians hired by it, although the Association is not licensed to practice and could not be so licensed.

"(2) It proposes to practice dentistry through dentists hired by it, although it is not licensed to practice dentistry and could not be so licensed.

"(3) It is engaged in the business of insurance, without so far as available records show being qualified to engage in such activities. It is obnoxious to public policy for obvious reasons."

Mr. Lewin:—Exhibit 45 is a mimeographed copy, or a mimeographed letter signed by C. B. Conklin, M.D., Secretary, under the letterhead of the Medical Society of the District of Columbia, dated July 29, 1937, and addressed to "Dear Doctor." It reads:

"It may have come to your attention that there is an organization or organizations that are interested in gaining medical personnel. Your attention is called to Chapter IX, Article IV, Section 5 of the constitution, quoted in full.

"You are particularly urged to submit to the Compensation Contract and Industrial Medicine Committee, pursuant to the constitution, any and all contracts, written or verbal, under which you may contemplate giving your services. Very truly yours, C. B. Conklin."

The second page of this exhibit is a mimeographed letter from C. B. Conklin, Secretary, dated July 29, 1937, under the letterhead of the Medical Society of the District of Columbia. It reads as follows:

"Dear Doctor. Pursuant to action of the Executive Committee, held on the evening of July 12, 1937, and in fulfillment of Chapter IX, Article IV, Section 5 of the constitution, your attention is hereby called to the list of organizations, groups and individuals herewith enclosed. The approved list is on file with the Secretary's office. The amendment is now in force. Any violation thereof will make a member liable according to the provisions of the constitution:

"Chapter IX, Article IV, Sec. 5:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group or individual, by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within 10 miles thereof, which has not been approved by the Society."

"The Executive Committee is authorized and directed to prepare an approved list of organizations, groups and individuals, by whatever name called and however organized, engaged in the practice of medicine within the District of Columbia, or within 10 miles thereof, and the same shall be kept in the office of the Secretary-Treasurer. Before any such organization, group or individual can be placed on the approved list of the Society, such organization, group or individual, or the member of the Society proposing professional relations therewith, shall submit to the Compensation, Contract and Industrial Medicine Committee such evidence as the Committee or the Society may require showing the character, activities, financial condition and ethical standards of said organization, group or individual, and after considering the same, said committee shall make a report of its investigation and findings to the Executive Committee for such action as it may deem necessary."

"Very truly yours,

"C. B. Conklin, M.D."

Mr. Lewin:—And attached to the first page of this Exhibit 45 is a mimeographed copy of a list of approved organizations which has already been read, and which were approved by the committee on July 12, 1937.

Exhibit 201 is a letter from William C. Woodward, Director, to Dr. F. X. McGovern, dated July 26, 1937, and reads as follows:

"Dr. Dr. McGovern. I shall appreciate it very much if you will let me know what the Medical Society of the District of Columbia or your subcommittee has done, and what its present plans are with respect to the Group Health Association, Inc. The situation is one in which the entire medical profession of the United States has a deep interest, and I would like therefore to be kept in as close touch with it as is possible.

"Yours truly,

"William C. Woodward."

Exhibit 179 is a carbon copy of a letter from Dr. Woodward to Dr. McGovern, dated July 17, 1937:

"Dear Dr. McGovern:

"In compliance with your request, I send you herewith (1) the articles of incorporation of the Group Health Association; (2) a copy of the prospectus sent out by the promoters of that association; (3) the notice sent out by William F. Penniman, president of the association, with reference to the first meeting and election of officers, and (4) a report sent out by the same party concerning the activities of the Association.

"I have retained the original certified copy of the articles of incorporation and have made and retained copies of the prospectus, the call for the first meeting, and the subsequent report.

"If there is anything I can do with respect to this matter, please call on me.

"Yours truly,

"Director."

Mr. Lewin:—I shall read from the minutes of the Special Meeting of the Executive Committee of the Medical Society of the District of Columbia, held Tuesday evening, July 27, 1937, at 8 p. m.:

"Dr. William M. Sprigg, Chairman, presiding.

"Present: Drs. C. N. Chipman, A. C. Grey, Raymond T. Holden Jr., R. Arthur Hooe, F. X. McGovern, John F. Preston, John A. Reed, Sterling Ruffin, Henry R. Schreiber and C. B. Conklin. H. C. Macatee."

Now, I am going to pass over the first and second and half of the third page because they deal with other matters than with which we are now concerned.

"Dr. F. X. McGovern, Chairman of the Subcommittee, that had been appointed to make contact with the Home Owners' Loan Corporation Medical Unit, now was called upon to make a report.

"He opened his remarks by stating that pursuant to recommendations made at the last special meeting of the Executive Committee, he had prepared a letter which was sent to Mr. William F. Penniman. In the letter request was made for copies of (1) contract with the Home Owners' Loan Corporation; (2) adopted constitution and by-laws; (3) form or forms of application for membership; and (4) any form of contract or agreement setting forth the service to be rendered to members and their dependents."

"Dr. McGovern stated that Mr. Penniman had not given him a written answer. He had called him up and asked that he have luncheon with him at the Raleigh Hotel. On this occasion he frankly stated that he would give responses to the questions asked in the registered letter that had been received. The copy of the contract asked for, he said, he would have to refuse to exhibit. He thought the Medical Society's asking to see this contract was quite similar to going to Garfinkel's department store and asking them to show the contract they had with some firm with which they were doing business.

"Dr. McGovern then proceeded to read a prepared report, as follows:
"KNOWN FACTS IN RE THE HOME OWNERS' LOAN CORPORATION:

- "1. Corporation—Group Health Association, Inc.
- "2. In Home Owners' Loan Corporation with which it has a contract.
- "3. Mr. W. F. Penniman is president; Mr. R. T. Berry is secretary. Dr. Henry Rolf Brown is Medical Director.
- "4. Instituted presumably to give medical care (complete) to any and all members of the H. O. L. C. who may care to join in.
- "5. Nonprofit, voluntary, prepayment insurance organization.
- "6. Must be in some way related, possibly by contract to Home Loan Bank Board.

"7. President, Mr. Penniman, avoided replying by letter to an official letter from the Society to him.

"8. Mr. Penniman refused to give your committee a list of physicians employed by corporation.

"9. Articles of incorporation so worded that all Federal employees, except Army and Navy may belong.

"10. President, while he states that purpose of the corporation is to provide medical service to low-income individuals, at the same time admits that constitution and by-laws do not establish any income level.

"11. Invites attention to many other similar organizations in existence throughout the country and claims they do the job better than would otherwise be done.

"12. The lay members of the Board of Directors sincerely believe that they are performing a needed, helpful and humanitarian function for their employees, and apparently are firmly convinced that nothing that they are doing is in conflict with the established ethical principles of organized medicine.

"13. Dr. Brown is a physician, recently retired from the Veterans Bureau and is being paid a good (under the circumstances) salary as medical director. Licensed in the District of Columbia, May 21, 1937.

"14. Whereas the officials of the corporation express a desire to cooperate with the Medical Society of the District of Columbia, it is a fact that in the beginning and at all times there has been no real effort made to apprise the Medical Society of the District of Columbia of what they were undertaking. They have not considered (officially) the Medical Society of the District of Columbia during the formative stage of their organization; on the contrary, there seems to have been the desire to keep the matter confidential.

"15. Meetings with officials of the American Medical Association on two separate occasions convince us that the national organization is keenly interested in the whole affair and is solicitous as to how we will consider its relation to us locally and what policy the Medical Society of the District of Columbia will adopt in regard to it.

"16. What might be done:

- "1. Consider it unethical.
- "2. Control our own members in terms of the ethical requirements of our own constitution and by-laws.
- "3. Offer a substitute plan of our own.
- "4. Cope with the situation in the courts in terms of the local Healing Arts Practice Act.

"17. Your committee met with the Board of Directors of Group Health Association, Inc. The attitude of organized medicine in regard to the medical ethics in matters of this kind was fully presented to them. Quotations were read to them from the official code of ethics of the American Medical Association. Other relevant facts were presented. The only reply was made by a Mr. Loomis, member of the Board of Directors, to the effect that he hoped that the Medical Society would see fit to withhold final judgment until Group Health Association, Inc., had been in actual operation a sufficient length of time to practically demonstrate its purpose, its relation to the community and to the medical profession of the District of Columbia."

Mr. Lewin:—I will drop to the bottom of page 6, the next page:

"The secretary explained just what had been suggested by Drs. William C. Woodward and R. G. Leland at the time of their visit. It would seem that Dr. Woodward would advise quo warranto proceedings, which proceedings would require a district attorney or United States Attorney for the District of Columbia, who at least was not hostile, that the suit would be filed in his name. He saw many difficulties in following this up. Dr. Leland had given a sketchy verbal outline of a plan whereby a pool of money could be created and this could be built up by either the people in the lower income brackets or even in the higher brackets, and from this pool the care of the sick could be financed. The secretary stated that the very next morning after the meeting he wrote to Dr. Leland, asking for full details of this plan. Up to date he had received no reply. The secretary opined that the American Medical Association authorities certainly did not have any definite knowledge as to how to proceed in combating the immediate problem that was confronting the Medical Society of the District of Columbia."

Mr. Lewin:—Now, I shall drop down to the middle of page 7:

"A motion was made concerning the registered letter that was to be sent out with Dr. McGovern's committee's list of approved organizations, groups and individuals, engaged in the practice of medicine, to include the phrase 'to each of the hospitals,' in addition to all members. Seconded and adopted."

Mr. Lewin:—Yes, I will.

"Dr. Macatee, in continuing, read an excerpt from the latest issue of the Principles of Medical Ethics of the American Medical Association, having to do with the definition of free choice of physicians, as follows:

"The phrase 'free choice of physicians,' as applied to contract practice, is defined to mean that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patient and physician when no third party has a valid interest or intervenes. The interjection of a third party who has a valid interest or who intervenes does not per se cause a contract to be unethical. A 'valid interest' is one where, by law or necessity, a third party is legally responsible either for cost of care or for indemnity. Intervention is the voluntary assumption of partial or full financial responsibility for medical care. Intervention shall not proscribe endeavor by component or constituent medical society to maintain high quality of service rendered by members serving under approved sickness service agreement between such society and governmental board or bureaus and approved by the respective societies."

"The ambiguity of the situation was immediately apparent.

"Dr. Macatee said that he certainly did not read this at the time of the meeting with the H. O. L. C. unit. He did, however, read on that occasion extensively from the Principles of Medical Ethics under which the medical profession is bound, showing that the project as at present constituted could not be expected to be approved by the Medical Society of the District of Columbia, the local unit of the American Medical Association.

"Dr. Macatee was rather inclined to think that there should be no hasty action taken at this time and that he would recommend that the four possible solutions as prepared by the subcommittee be not read before the Medical Society. He too thought that it might be possible to bring some accord with the Group Health Association."

Mr. Kelleher:—I am now reading from the "Minutes of the Special Meeting of the Medical Society of the District of Columbia," held Thursday evening, July 29, 1937, 8 p. m.:

"Dr. Thomas E. Neill, President, presiding.

"Present: Drs. J. Lawn Thompson, William J. Mallory, O. N. Chipman, F. X. McGovern, James A. Flynn, Prentiss Willson, A. P. Tibbets, John H. Lyons, William P. Herbst, Victor B. Rensch, Victor R. Alfaro, S. B. Muncester, Harry S. Lewis, Oscar Wilkinson, Herman E. Kirtledge, Isadore Lattman, Henry B. Gwynn, Joseph Horgan, J. Russell Verbyrke Jr. and other members to the number of about 150.

"Upon motion, duly seconded, the reading of the minutes of the preceding meetings was dispensed with."

Mr. Kelleher:—"The Executive Committee makes the following recommendations:

"That the chairman of the Executive Committee appoint three of its members to act as a subcommittee, they to add two members of their selection from the Society at large, for the purpose of further studying the Group Health Association, Inc., with a view of bringing back to the Executive Committee a solution concerning what the Society's attitude should be to the above Group Health Association, Inc., and to report to the Executive Committee at the next regular meeting.

"Dr. J. Lawn Thompson made a motion that the report of the Executive Committee be adopted. Seconded.

"Dr. Thompson, in discussion of the recommendation of the Executive Committee was of the opinion that if the report was to be made to the Executive Committee at the next regular meeting, it would probably be too late to do anything, for by that time the Home Owner's Loan Corporation plan will be in full action. He felt that a special meeting should be held in the near future; not only from the medical standpoint, but from the standpoint of the Chamber of Commerce and Board of Trade this should be considered."

I now desire to turn to page 3 and commence with the last paragraph on that page.

Mr. Leahy:—Go ahead.

Mr. Kelleher:

"Dr. McGovern was called upon to discuss the question. He stated that he was the chairman of the subcommittee of the Executive Committee that investigated this matter thus far. He brought out the fact that the purpose of this meeting tonight was to inform the membership of the situation and to familiarize them with the facts obtained to date with an idea of turning it over in the minds of the membership and arriving at some conclusion as to how the Society should act in the matter. He felt that it was apparent from the report that the Group Health Association was not willing to come clean. It was specifically stated that Mr. Penniman, its president, refused to comply in writing to an official communication addressed to him from the Society. In that letter four specific requests were made: that they submit a copy of any contract they may have between the Group Health Association and the Home Owner's Loan Corporation with the Federal Home Loan Bank Board; copy of their constitution and by-laws; and any contract that may be in existence in relation to the members of this corporation; and any other matter that would be of importance to the Medical Society. Dr. McGovern pointed out that the communication was sent by registered mail. Mr. Penniman called him by telephone asking that he have luncheon with him where these matters would be discussed. After consulting with officials of the Society Dr. McGovern accepted the invitation to meet Mr. Penniman at luncheon at the Raleigh Hotel. Dr. McGovern made it emphatic that he was not authorized to commit the Society in any way. Mr. Penniman was willing to give some of the information desired, but when asked for the contract between the Group Health Association and the Federal Home Loan Bank Board, he refused, stating that the Medical Society had no more right to ask for that than they would to go down

to Garfinkel's department store and ask to see a contract that the store had with an express company, for instance. Dr. McGovern felt that it was definite that they had some sort of contract and they are not desirous that anybody should see it. In this connection he would add that the American Medical Association, through Dr. W. C. Woodward, tried diligently, spending a whole day in the building of the Home Owner's Loan Corporation, going from office to office, trying to get a glance at the contract without success. Dr. McGovern felt that the contract itself did not interest the Medical Society as much as it did interest the A. M. A. If there is a connection between the Federal Home Loan Bank Board and the Group Health Association, and the Board is spending money, they are spending taxpayers' money which makes it a national entity. As far as the panel of doctors is concerned, Mr. Penniman said that he did not think it was appropriate for the Medical Society to have a list of the panels of physicians who have already been employed. He added that it is a well known fact that members of the Society have been approached. It also is a well known fact that doctors have been asked to come in from the outside and that Dr. Brown has talked to them.

"Dr. McGovern said that property had already been leased for the housing of the clinic on I Street, between Thirteenth and Fourteenth streets. There was no doubt in his mind that the lay members of the Board of Directors of the Group Health Association are thoroughly convinced that they are doing a splendid thing for their employees. He was further convinced that they are not doing anything that might be considered unethical by them."

And I will omit the balance of that page and go to the bottom of page 5:

"Dr. Prentiss Willson would inquire what information the committee had with respect to hospitalization of the patients who require hospitalization under the Group Health Association.

"Dr. McGovern stated that in the articles of incorporation they are going to give complete medical care and hospitalization. It would not be found out as to how they plan to do that. He pointed out that it is incorporated to include all Federal employees, except Army and Navy. He thought possibly they would have the free use of the local hospitals."

I will omit the next paragraph, which is irrelevant.

"Dr. H. C. Macatee was recognized. He reiterated the plea of the chairman of the Executive Committee that if any members had ideas on this subject, or information about it they should submit it to the committee for investigation. He said he would like to express his personal feeling about this matter, for whatever value it may have. He was of the opinion that the medical society should not take its attitude based on the idea that there are certain scurrilous people who are trying to do a scurrilous thing to the Medical Society and doing it in an underhanded, scheming way. It was his impression, gained from conduct with certain individuals, that they are highly intelligent people who have profoundly studied this subject, who are aware of all the social currents flowing through the country with respect to the relation of the medical profession and the people. They are aware of what has been done elsewhere and the result. 'My feeling is that this is a group of responsible, honest, rather public-spirited people, who are undertaking to do something for the benefit of their associates in office. They are convinced and have secured what they call competent legal advice that they are on secure legal ground. They have by reason of their knowledge of similar projects elsewhere become convinced that wherever such organizations spring up they almost consistently receive the antagonism and the animosity of the local medical profession.' Dr. Macatee added that he was of the opinion that their desire to avoid publicity in this matter was due to their knowledge of that fact. So far as Dr. Henry Rolf Brown was concerned, Dr. Macatee stated that he has had a distinguished service in the Veterans Bureau, where he was highly esteemed. He was retired on account of age and feels that he is not old enough to be put on the shelf. Dr. Brown has been detached from the organized profession for a long time. He, Dr. Macatee, said that he for one did not blame Dr. Brown for taking the position.

"Dr. Macatee, continuing, stated that they had evidently obtained advice from the Twentieth Century Foundation and are perfectly aware that similar organizations, such as the Endicott-Johnson Medical Service, which was fought tooth and nail by the county and New York State Medical Society; also the Ross-Loos Clinic of Los Angeles, which was likewise fought tooth and nail by the California organized medicine to the point that the members of that outfit were expelled from membership and then by court order were reinstated, were in operation. It was because of all these facts that the Executive Committee has recommended that this matter be recommitted for further study as to what will be wise for the membership as well as the public.

"Dr. Macatee added that there is now available a list of corporations and organizations and persons employing physicians in a contractual relationship, prepared under the provisions of the constitution and by-laws. He urged the members to take the list and examine it carefully, and familiarize themselves with its contents."

I now go to the middle of the next page:

"Dr. Hooe said he believed he was in a position to answer Dr. Willson's question concerning hospitalization. He was of the opinion that it was the intention of this corporation for the present to have their beneficiaries hospitalized in the local hospitals and treated by their hired physicians.

"At this point Dr. Sprigg reread the recommendation of the Executive Committee, as amended:

"That the Chairman of the Executive Committee appoint three of its members to act as a subcommittee, that they were to add two members of their selection from the Society at large, for the purpose of further studying the Group Health Association, Inc., with a view of bringing back to the Executive Committee a solution concerning what the Society's attitude would be to the above Group Health Association, Inc., and to report to the Executive Committee, subject to the call of the Chairman.

"Duly seconded and adopted.

"The secretary stated that it was the duty of the Society's office to fulfil instructions from the Executive Committee to supply each member of the Society with a copy of the approved list that had been prepared, pursuant to Chapter IX, Article IV, Section 5, of the Constitution. He pointed out that they were being mailed by registered mail. He announced that any member wishing to secure his list tonight could do so by applying at the Society's office and signing for same, which would aid in the distribution."

Mr. Lewin:—Your Honor, notwithstanding our voices are melodious I think everybody is pretty tired.

THE COURT:—I had intended to go to 4:30, but maybe we had better adjourn.

FEBRUARY 20, MORNING

As the Court opened there was discussion of exhibits, after which letter to Dr. Taylor heretofore identified as U. S. Exhibit 73-A was received in evidence, also letter dated Nov. 25, 1938 from Dr. Anderson to Dr. Coole was marked U. S. Exhibit 151.

Exhibit 186, which is an original letter from John F. Hayes to Dr. William C. Woodward, dated July 31, 1937; the letter is from Washington, D. C., and reads:

U. S. EXHIBIT 186

"Dear Doctor Woodward:

"I attended the special meeting of the District Medical Society on the night of July 29th. This special meeting was called for the purpose of hearing the report of the special subcommittee appointed to secure facts and information regarding the Group Health Association, Inc.

"I am assuming that Dr. F. X. McGovern, Chairman, has sent to you a full and detailed report.

"I do not know that you expect any word from me relating to the meeting. It may be stated, however, that there were present about 150 members of the Society. Dr. Sprigg read a formal and somewhat lifeless report reviewing the facts and information which had been obtained regarding the Group Health Association, Inc. Nearly all of his facts were substantially the facts which you and Dr. Leland had supplied to the group which attended the meeting here about two weeks ago.

"In so far as I could observe, there was no new information in the Sub-Committee's report, except that it did set out the fact that the Committee had by registered letter invited or requested the President of the Group Health Association, Inc. to furnish the Sub-Committee certain information including:

"(1) A copy of its rules and by-laws;

"(2) A list of the physician personnel of the organization;

"(3) A copy of its contract with the Home Owners Loan Corporation.

"President Penniman replied by telephone, inviting the Committee to lunch with him at the Raleigh Hotel. Nothing worthy of review happened at the luncheon, except that Penniman agreed to supply a copy of the rules and by-laws when printed and a list of physicians when the staff had been filled. He refused to supply a copy of the contract on the ground that it was really the property of the Home Owners Loan Corporation, or some such reason.

"There was then about twenty minutes of general discussion by members of the Medical Society, in which Doctors Sprigg, McGovern and Macatee took active part. Doctor McGovern mounted the rostrum and made a very clear, able and comprehensive review of this entire subject and presented his subject in a manner which impressed his hearers and showed the seriousness of the entire movement.

"His remarks had the effect of creating alarm and was just what was needed, because the reading of the Sub-Committee's formal report was lifeless and stilted and made no impression—in my opinion.

"The Medical Society then approved the formal report and—as I understood—instructed the Sub-Committee to investigate further as to methods and means of meeting the situation and report at a future time.

"Nothing whatever was said on the subject of legal proceedings either in the report or in the discussion. Mr. F. A. Fanning, attorney for the Association, was not present. Your name was not mentioned, nor was the name of Dr. Leland mentioned.

"The above are my impressions of the meeting. If I have made any error in the state of facts, please understand that you should be guided by the report of Dr. McGovern, who of course is in position to supply more accurate and more complete information than I.

"Very truly yours,
John F. Hayes."

Mr. Kellcher:—Exhibit 187 is a carbon copy of an original letter from Dr. Woodward to Dr. Conklin, dated Aug. 12, 1937, and reads:

U. S. EXHIBIT 187

"Dear Doctor Conklin:

"Some time ago I wrote to Dr. McGovern, asking him to inform me concerning the results of the special meeting called by the Medical Society of the District of Columbia to consider the activities of the Group Health Association. In the course of a recent visit to Washington, Dr. McGovern told me that he was no longer on the Committee having charge of the matter and that he had referred my letter to you. Will you not let me know what was done by the Society and what the present situation is?

"Yours truly,
Director."

Exhibit 188 is the reply of Dr. Conklin to Dr. Woodward dated Aug. 14, 1937:

U. S. EXHIBIT 188

"Dear Doctor Woodward:

"In reference to your inquiry of August 12, concerning the present status of the Medical Society's deliberations, I would state a Committee at present constituted as follows:

Dr. A. C. Macatee, Chairman
Dr. R. Arthur Hooe
Dr. Thomas A. Groover
Dr. C. B. Conklin

has been organized for the purpose of giving further study of the Group Health Association with view to making recommendation to the Executive Committee as to the Society's attitude in the premises. At the special meeting of the Medical Society to which you make reference and which was attended by some ninety members with Mr. Hayes present, a detailed report was made of the various contracts with the Home Owners' Loan Corporation Group. Various opinions were expressed by individual members ranging from the taking of most drastic measures in the way of boycott, etc., to various conciliatory propositions. Finally, an Executive Committee recommendation was accepted to the effect that the Chairman of the Committee appoint a subcommittee of three members which in turn would select two members from the Society at large. The function of the Committee would be to seek further data and bring a recommendation to the Executive Committee as to plans for a course of action. The aforesaid Committee has had one meeting. An expressed policy is to receive reports from any individual members and to obtain proposed plans from members as to course of procedure.

"It will give me pleasure from time to time to report any developments. In the meantime, the Committee would be very much pleased indeed if the American Medical Association Headquarters would wish to be represented at any of its meetings or would have any proposals to combat the movement, which has implications affecting far greater territory than the District of Columbia.

"Very truly yours,
C. B. Conklin, M.D.
Secretary."

Mr. Kelleher:—Exhibit 181 is a carbon copy of an original letter signed by Dr. Woodward, dated Aug. 21, 1937, and addressed to Mr. John F. Hayes, Washington, D. C., reading as follows:

U. S. EXHIBIT 181

"Dear Mr. Hayes:

"Will you not some time within the coming week learn what you can concerning the activities of the Group Health Association, with particular reference to the establishment of its clinic and the publication of the names of the members of its medical staff. You may recall that the association proposed, according to the newspapers, to open September 1.

"Confidentially, I am preparing an article on the situation and would like to have the latest details.

"Say nothing to Conklin or anyone else about my plans for publication.

"Yours truly,
Director."

Mr. Kelleher:—Exhibit 182 is the reply of John F. Hayes to Dr. Woodward, dated Aug. 24, 1937:

U. S. EXHIBIT 182

"Dear Dr. Woodward:

"I regret that efforts made yesterday and today to secure information regarding Group Health Association Inc., through the District Medical Society, have not been very successful.

"Dr. Conklin is out of the city. A New Committee or Sub-committee was appointed consisting of Dr. Henry C. Macatee, Dr. R. Arthur Hooe, Dr. Thomas A. Groover and Dr. F. X. McGovern. Nearly all of these doctors are out of the city. I was able to speak to Dr. McGovern on the telephone, but he had no up-to-date information other than the fact that the Medical Society will hold another meeting on this particular subject on September 10th.

"On some independent investigation of my own, I learned that the clinic of this Association is to be located at the Evans Electrical Building. I called there, and observed that this is a small but attractive two store building owned and occupied by the O. H. Evans and Bro. Inc., dealers in electric fixtures and lamps, etc. This firm occupies the first floor and it has on hand and present in all directions a large supply of floor lamps, and fine merchandise of that character.

"I inquired for the offices of the Group Health Association and was informed that they have leased the second floor of this building. Thereupon I went to the second floor; there is no elevator. The second floor was entirely unoccupied. This entire floor is one enormous room, approximately 25 feet wide and possibly 70 or 80 feet long. At the present time it has no partitions, few if any electric lights; the walls and ceiling and floors require reconditioning. In my judgment it will require at least four or five weeks to put this second floor space in anything like working condition.

"This O. R. Evans and Bro. building is located at 1326 Eye St. N.W. If the affairs of the Group Health Association are to be conducted from these headquarters it is my opinion that they are starting in most modest and unassuming style.

"Thereupon, I returned to my office and called on the telephone the office of Mr. William F. Penniman, of the Home Owners' Loan Corporation. Incidentally, I observe, from the Congressional Directory, that he is Assistant General Manager for District No. 6, comprising the States of Arizona, California, Idaho, some other states and Hawaii and Alaska.

"I asked the young lady if she could supply me with any printed information regarding the Group Health Association. She referred me to the Home Owners Loan Corporation Publicity Man, Mr. Acton. Thereupon I went to Mr. Acton's office and was informed by him that no news matter had as yet been prepared by him; that such matter as had appeared in the local papers was premature and without official sanction.

"He stated that their clinic on Eye Street had not yet been started and that it would be several weeks before there would be any news to give out. He suggested that I call upon Mr. Penniman for further information. In view of the experience of the Committee of the District Medical Society at the luncheon given by Mr. Penniman to that group I considered it the part of wisdom to confer with Mr. Penniman at some remote time in the future.

"Dr. Conklin may return to Washington Saturday, and if so I will see him then and report further to you.

"Very truly yours,
John F. Hayes."

Mr. Lewin:—I will read from the minutes of the special meeting of the Executive Committee of the District Medical Society of the District of Columbia, held Wednesday evening, Sept. 8, 1937, 8 p. m.:—

U. S. EXHIBIT 37

"Dr. William Mercer Sprigg, Chairman, presiding.

"Present: Drs. E. G. Breeding, Charles B. Campbell, D. N. Chipman, William T. Gill Jr., A. C. Gray, R. Arthur Hooe, Henry C. Macatee, F. X. McGovern, Thomas E. Neill, John A. Reed, E. Hiram Reede, Sterling Ruffin, Henry R. Schreiber, Earl R. Templeton, R. Lomax Wells, C. B. Conklin; Thomas A. Groover, by invitation.

"The Chairman announced that the special meeting was called to hear a report of a Subcommittee of the Executive Committee, which had been appointed pursuant to action of the Society taken on the evening of July 29, 1937.

"The Secretary was called upon to make a report in the absence of the Chairman of the Subcommittee, Dr. H. C. Macatee. It was stated that during Dr. Macatee's absence from the city during the month of August, Dr. R. Arthur Hooe and committee members thought that owing to a clamor for action that had been set up by certain Society members, it was incumbent upon the committee to hold a meeting. At a meeting, which was held in the office of Dr. Thomas A. Groover, it was adopted that Dr. Thomas A. Groover and Dr. F. X. McGovern be duly appointed from the Society at large as members of the Subcommittee. It was conceived that the function of the committee was to consider the Group Health Association cooperative medical service movement, with view, if possible, to stating the Society's attitude and also, if possible, to offer plans for combat. The second meeting was held in Dr. Groover's office and a final meeting on this evening in the Society's office. The following is given as a statement of opinion of the committee at this time:

1. That the Group Health Association is unethical and that the participation in it by any member of the Medical Society of the District of Columbia would render him or her subject to disciplinary action by the Society.

2. Your committee at this time has no definite recommendation to make with respect to combating the activities of the Group Health Association other than is embodied by implication in the preceding paragraph.

3. It is the opinion of your committee that the Medical Society of the District of Columbia should maintain close contact through the chairman of this committee with the American Medical Association in an effort to formulate a suitable and an effective policy with respect to combating the activity of the Group Health Association.

"It was explained that Dr. Macatee had been duly notified of the committee's activities during his absence and also that it was the desire of the committee to hold a meeting just previous to the meeting of the Executive Committee on this evening. Dr. Macatee had stated over the telephone that his afternoon was very well taken up and it would be impossible for him to be present.

"Upon motion, duly seconded, the Executive Committee unanimously accepted the report of the Subcommittee.

"At this point Dr. R. Arthur Hooe called on Dr. F. X. McGovern to state his views.

"Dr. McGovern said that he looked upon this Group Health Association movement as an organization coming in and interfering with his business. He added that he expected to be in practice for some 20 years and he did not propose, if it could be avoided at all, to have an organization such as was proposed to interfere with his work and income. 'Just what are you fellows going to do about it?' He cited the instance of the musicians who had succeeded in preventing the Marine Band from cutting in on their business in playing before assemblies without cost to the sponsors. Through the organized musicians' activities not only was this Governmental agency, the Marine Band, stopped from so proceeding but an adequate salary had been obtained for each of the Marine Band musicians. The lawyers as a group had prevented inroads on their business. 'It just doesn't seem that we are active in preventing the National Government from entering the practice of medicine and interfering with our business. It should be demanded from the American Medical Association that they send a man down here now and see just what could be done.'

"Dr. T. A. Groover stated that he heard of no plan that was practical in opposing this group practice. 'If we would hire a lawyer, I doubt seriously whether it would do any good, as apparently there is nothing illegal in what is being contemplated. There is one other suggestion, that the Medical Society set up a health insurance program and should be thought that this would be a tremendous undertaking and should not be done without American Medical Association assistance. It should be recognized that what happened in England, along about 1910-1912, was that there were active certain prepaid insurance plans, the finances and management of which had gotten so chaotic that they

various groups literally begged the Government to take them over and run them. The members of the Society should know that most every large country has now some form of health insurance. The English profession supports their plan. Health insurance seems to work better in the Scandinavian countries. These countries are small and thrifty and have not been in a war for 100 years or more but have profited tremendously from the wars that have been carried on about them."

Mr. Lewin:—I will omit some there. (Continuing:)

"Dr. Sterling Ruffin stated that it was apparent that all were opposed to the activities of the group organization. He thought that the report, as submitted, should go back to the committee for revision; that the American Medical Association should be contacted, gaining assurance that they approved what would be the result of the subcommittee's deliberations. Dr. Ruffin made a motion to this effect."

Mr. Lewin:—I will omit the rest. That portion of it then deals with a contribution to the society and some other matters, and the minutes are signed by Dr. Conklin.

I now shall read Exhibit 190, which is a carbon copy of a letter from Dr. Woodward to the defendant Dr. Conklin, as Secretary of the District Medical Society, dated 1937, written in Chicago:

U. S. EXHIBIT 190

"Dear Doctor Conklin:

"Our Executive Committee and Board of Trustees meet in Chicago next week, September 15, 16, and 17. They are much interested in developments with respect to Group Health Association, particularly with respect to any activities and plans of the Medical Society of the District of Columbia in relation to it. If you drop me a line giving the latest information available, in time for me to have your letter mimeographed for the use of the Executive Committee and the Board, I shall appreciate it.

"Yours Truly,
Director."

Now I will read Exhibit 84, which is an original letter back from Dr. Conklin to Dr. Woodward, dated Sept. 13, 1937:

U. S. EXHIBIT 84

"Dear Doctor Woodward:

"In reference to your letter of inquiry under date of September 8, 1937, I would state that there have been no further developments of importance relative to the Group Health Association.

"There is a subcommittee of the Executive Committee, about which you may have information, constituted as follows:

Henry C. Macatee, Chairman
R. Arthur Hoove
Thomas A. Groover
Francis X. McGovern
Coursen B. Conklin

This committee reported at a special meeting of the Executive Committee that it had no substitute plan to offer at this time; and further, that in view of apparent violation of the Code of Ethics of the American Medical Association in that free choice of physician would not be allowed, and that contract practice was involved, no approval could be given to the movement. The general statement of the subcommittee, as imparted to the Executive Committee, was as follows:

"It is the opinion of your committee:

"1. That the Group Health Association is unethical and that the participation in it by any member of the Medical Society of the District of Columbia would render him or her subject to disciplinary action by the Society.

"2. Your committee at this time has no definite recommendation to make with respect to combating the activities of the Group Health Association other than is embodied by implication in the preceding paragraph.

"3. It is the opinion of your committee that the Medical Society of the District of Columbia should maintain close contact through the chairman of this committee with the American Medical Association in an effort to formulate a suitable and an effective policy with respect to combating the activity of the Group Health Association."

"The Subcommittee was instructed by the Executive Committee to prepare, for distribution to the members and the press, a detailed statement of attitude. This is now in formulation.

"Our recent information is that there has been no progress in the conversion of a second-floor building on Eye Street, between Thirteenth and Fourteenth streets, into clinic headquarters. The large barren room itself appears devoid of any accessories such as proper lighting, plumbing, etc., for the successful carrying on of their project.

"Very truly yours,
C. B. Conklin, M.D.,
Secretary."

Mr. Kelleher:

"Minutes of the regular meeting of the Executive Committee of the Medical Society of the District of Columbia, held Monday, September 27, 1937, 8 p. m.

"Dr. William Mereer Spriggs, Chairman, presiding.

"Present: Drs. A. B. Bennet, Daniel L. Borden, Charles B. Campbell, C. N. Chipman, Augustus C. Gray, Raymond T. Holden Jr., R. Arthur Hoove, H. C. Macatee, F. X. McGovern, Thomas E. Neill, John A. Reed, E. Miram Reece, Sterling Ruffin, Earl R. Templeton, R. Lomax Wells, and Coursen B. Conklin.

"The Chairman, at this point, called on Dr. H. C. Macatee, Chairman of a Subcommittee to consider the Group Health Association, Inc., for a report. The report was read, Dr. Macatee stating that there had been two meetings of the committee and that the committee recommended the following for presentation to the membership:

"At a special meeting of the Medical Society of the District of Columbia, held July 29, 1937, the membership was advised of all the facts that the Executive Committee had been able to gather respecting the purposes, proposed methods, and progress of a corporation, composed of employees of the Home Owners' Loan Corporation, now in process of organization, the object of which is to provide complete medical, surgical and hospital care for its members and their dependents, upon a prepayment plan of financial support through membership dues. The professional services offered by the corporation are to be supplied by a full-time, salaried staff of medical and other technical employees. The name of the organization is Group Health Association, Incorporated, of the Home Owners' Loan Corporation.

"The Executive Committee recommended at the special meeting that the Society authorize a further study of the subject by the Committee in order to enable it to report suitable recommendations to the Society looking to the formal adoption of an official attitude toward this proposed new type of medical practice, unfamiliar to this community. Such an expression of the Society's attitude is necessary for the guidance of our membership, both with respect to possible employment by the corporation and with respect to professional relationships to its medical and technical employees when and if it shall have begun to function.

"The Executive Committee finds: First, that employment by or professional relations with the Group Health Association, Incorporated, on the part of our members would be conditional upon approval of the organization by the Society as required by Chapter IX, Article III, Section 2, of the Constitution; that no application has been made by any member or by the organization itself for such approval; and that consequently there has been no submission of the data required for approval to the Compensation, Contract and Industrial Medicine Committee of the Society.

"The Committee finds: Second, that the conditions of rendering the medical and surgical service offered by Group Health Association, Incorporated, as set forth in such written promulgations of the organization the Committee has been able to see and as indicated verbally by officers of the corporation, appear to be inconsistent with the criteria for an acceptable form of contract practice as set forth in Chapter III, Article VI, Section 3, of the Principles of Medical Ethics of the American Medical Association, by which we are obliged to be guided. In particular it would appear that at least two of the criteria would necessarily be violated, viz.: '1. Where there is solicitation of patients, directly or indirectly'; and '5. When free choice of a physician is prevented.' In the first instance, it is obvious that the solicitation of employees of the H. O. L. C. to take membership in Group Health Association, Incorporated, is an effort to entice many away from medical relationships already formed to the medical personnel of the corporation. This effort would raise the question whether a further criterion of an acceptable contract is violated, viz.: '4. When there is interference with reasonable competition in a community.'

"However, the criteria above quoted must be applied in the light of experience, and we are required by the same Principles of Ethics to exercise prudence in forming opinions: 'Judgment should not be obscured by immediate, temporary or local results.' In any form or instance of contract practice 'The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole.'

"The Executive Committee, therefore, recommends the adoption of the following:

"Resolved, That a final expression of the attitude of the Medical Society toward the acceptability of any cooperative medical service organization as an approved agency for the employment of members is manifestly impossible without the submission of all related data as a basis of approval, and manifestly undesirable when information is lacking as to whether any such group will ever become operative; and

"Resolved, That the membership be reminded of the requirements of Chapter IX, Article III, Section 2 of the Constitution for their guidance with respect to Group Health Association, Incorporated, of the H. O. L. C.; and

"Resolved, That the Medical Society recognizes a growing desire in Washington for some feasible plan of cooperative group medical service on a prepayment basis; that it recognizes the value of such an arrangement for many people of limited incomes; and that, having already provided a means in the Health Security Administration, for the people without ready money to secure medical service on a postpayment plan, it is willing to collaborate with appropriate, responsible groups to devise methods for group prepaid medical service mutually acceptable to the two essential parties to such an agreement, viz.: the group needing and proposing to pay for the service and the group capable of furnishing it; and

"Resolved, That, if hereafter it shall appear necessary or desirable, the Board of Medical Supervisors of the District of Columbia be requested to determine, by judicial decision if necessary, whether the operating of Group Health Association, Incorporated, or any similar organization, is or will be in conformity with the Healing Arts Practice Act for the District of Columbia.

"Dr. Macatee, upon concluding reading, stated that THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION would publish in its issue of Oct. 2, 1937, a detailed analysis of the Group Health Association, Inc., pointing out weak points from a legal viewpoint. It began with the statement that Title 5, Chapter 5 of the District Code was taking advantage of, which had to do with the mutual welfare of individuals in organizations. It was clear that the Government was definitely embarking in the insurance business and that the check-off from the Government payroll would have all of the evil points that were included in checkoff in the factories for union dues. The American Medical Association's statement would cover four or five pages in THE JOURNAL. It was emphasized that this material was not for release until September 29. Dr. Macatee stated that it was his view that despite this article appearing in THE A. M. A. JOURNAL, there should be no hesitancy in adopting the report of the Subcommittee.

"Dr. Sterling Ruffin and others agreed with this view.

"Dr. F. X. McGovern was recognized. He stated that he thought the report was very good but rather weak. He thought conditional verbs should be eliminated and indicative mode used. For instance, it was stated certain things appeared to be. He thought a direct statement should be made here that there was definite violation of ethics and of the principles of good medical practice. It was his opinion that the Secretary should get sufficient reprints to supply the entire membership and that the prepare statement as presented by Dr. Macatee be withheld.

"The Secretary stated that he was present at the time of the preparation of the report submitted by Dr. Macatee. He was of the opinion, after hearing for the first time the American Medical Association's statement that certainly the third resolution, having to do with the idea that some prepayment plan taking care of individuals in Washington should be adopted and that there was a definite sentiment abroad for same, should be stricken out as it appeared to him that it would conflict with the American Medical Association's arrangement of the disapproval of the Government's prepayment plan. A demarcation should be drawn between the Government entering the practice of medicine with an insurance scheme and private firms in other states which were now apparently meeting with success in propagating health insurance.

"Although this view was supported by a few members present it was unanimously adopted that Dr. Macatee's report, as presented, be accepted with recommendation of adoption by the Society.

"Dr. Macatee made a motion that he thought might take care of some of the objections to the report, that the following resolution be added:

"Resolved, That the attention of the membership be directed to a critical analysis of Group Health Association, Incorporated, prepared by the Bureau of Legal Medicine and Legislation of the American Medical Association, to appear in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for Oct. 2, 1937; and that the membership be admonished to read the entire article for their information and guidance.

"This resolution was unanimously adopted."

Mr. Leahy:—Just read what Dr. Hooe stated.

"Dr. R. Arthur Hooe was especially strong in advocating the adoption of Dr. Macatee's presentation. He thought that the Medical Society might be accused of selfish motives if it eliminated any of it."

Mr. Kelleher:—I have nothing further to read from those minutes except a copy of a letter from Dr. Yater to Dr. Macatee dated Aug. 23, 1937, which is attached to the minutes.

"Georgetown University Hospital
"Aug. 23, 1937.

"Dr. Henry C. Macatee
26 Columbia Avenue
Rehoboth Beach, Del.

"Dear Dr. Macatee:

"I suppose you have heard that the Hospital Superintendents' Association has requested the Central Admitting Bureau to sever relations with the Medical-Dental Service Bureau and to act as a collecting agency itself on the accounts of patients aided by the Community Chest. This, of course, would be the death knell of the Medical-Dental Service Bureau.

"Personally, I can see no great advantage to be gained for the hospitals by making this change. The amount of saving possible would be relatively little since the Central Admitting Bureau would have to increase its staff, its space and equipment. So far as I can learn, no one has demonstrated that there would be any substantial saving.

"Furthermore, it was decided in the very beginning that the function of the Central Admitting Bureau was that of a clearing house and a disbursing agency and that it would have nothing to do with collections. Also it can be shown in black and white that the Medical-Dental Service Bureau has done an excellent job of collecting bills for hospitals considering the class of patients involved.

"If the business of the hospitals is withdrawn from the Medical-Dental Service Bureau, this change will cut the income of the Medical-Dental Service Bureau to approximately \$600 a month, which will be insufficient to do a good job with. Since it seems to have been forgotten, I would like to point out that the Medical-Dental Service Bureau has always paid more than its share toward the rent, phone service and upkeep of the Medical Security Building. This fact should certainly be pointed out to the hospital superintendents.

"Since it appears, therefore, that the proposed change would ruin the Medical-Dental Service Bureau, which was established by the organized medical and dental professions of the District of Columbia for the purpose of aiding the underprivileged sick, and since the change could not possibly bring about substantial saving to the hospitals, I believe a very strong appeal should be made to the hospital superintendents, preferably individually, to reconsider this request in the light of the above facts. The hospitals must take a more liberal attitude toward the Washington plan. We cannot afford to have it destroyed. The hospitals must be made diplomatically to see that they exist only for the purpose of making it possible for physicians to better care for sick people and that these physicians have developed and are administering the Washington plan. The hospitals cannot afford, in my opinion, to disregard the wishes of the medical profession, especially since the formation of the new Doctors' Hospital indicates dissatisfaction with the hospitals as they are now run.

"Although I am no longer officially connected with the Central Admitting Bureau nor the Medical-Dental Service Bureau, I feel so strongly about this matter that I am willing to do most anything to prevent destruction of a structure which we have all strived so hard to build up. I hope you will see it the same way that I do and will go to bat against the proposed change. Please let me know of what assistance I may be in the matter.

"With warm personal regards, I am,

"Very sincerely yours,
Wallace M. Yater, M.D."

Mr. Lewin:—I should like to read from Exhibit 189:

U. S. EXHIBIT 189

"American Medical Association,
"Bureau of Legal Medicine and Legislation,
"William C. Woodward, M.D., LL.M., Director.
Sept. 1, 1937

"To the Board of Trustees,
American Medical Association:

"At the meeting of the Executive Committee of the Board of Trustees of the American Medical Association, June 29, 1937, a resolution was adopted authorizing the Editor and the Secretary and General Manager to inform the medical profession of the country as to the efforts of the Home Owners' Loan Corporation to enter upon the practice of medicine and as to the present status of the proposal to organize cooperatives by the Government. In response to your request for information concerning the matter, I submit the following report.

"Respectfully,

William C. Woodward, M.D., LL.M.,
Director, Bureau of Legal
Medicine and Legislation.

"Memorandum for Dr. West and Dr. Fishbein:

"To avoid possible conflict on my part with the attached Canons of Professional Ethics of the American Bar Association, I am submitting the accompanying material to you in the form of a report. If you decide to publish it, I hope that my letter will be published along with it so as to make my status clear. If the letter should be addressed to you or to either of you, change can be made accordingly.

"The minutes of the meeting of the Executive Committee, June 29, 1937, show the adoption of the following resolution:

"Dr. Bloss moved that the Editor and the Secretary and General Manager be authorized to proceed to inform the profession of the country as to the efforts of the H. O. L. C. to enter into the practice of medicine and as to the present status of the proposal to organize cooperatives by the government. Dr. Hayden seconded the motion and it was carried."

"W. C. W."

And attached to that is a document entitled "Extract from Canons of Professional Ethics, American Bar Association," and an article entitled "Group Health Association, Incorporated. Unlicensed Health Insurance and Corporate Practice of Medicine under Federal Auspices."

I shall now read from Exhibit 484, which is a portion of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for Oct. 2, 1937, and which contains the article referred to in that report. Now, here again, Mr. Leahy, we would be satisfied to omit some of this article; I don't know whether you like it all or not.

Mr. Leahy:—What is the article?

Mr. Lewin:—It is an article that appeared in THE JOURNAL.

Mr. Leahy:—That is Exhibit 293.

Mr. Lewin:—It is very long. We have no objection to having it all in, but in the interest of saving time we can read only a portion of it.

Mr. Leahy:—Well, I think it all ought to be read, if your Honor please. It is an article by Dr. Woodward.

Mr. Lewin:—Yes. All right.

"Organization Section of the Journal of the American Medical Association.

"Devoted to the Organizational, Business, Economic and Social Aspects of Medical Practice.

"Saturday, Oct. 2, 1937."

Then follows the "Contents" of that section.

"Group Health Association, Incorporated.

"Health Insurance and Corporate Practice of Medicine Under Federal Auspices.

"Prepared by the Bureau of Legal Medicine and Legislation

"Unlicensed and unregulated health insurance and corporate practice of medicine in the District of Columbia, and wherever else in the world a civil officer or employee of the United States government may be found, are proposed in a certificate purporting to be a certificate of incorporation, filed on behalf of Group Health Association, Inc., in the office of the Recorder of Deeds, of the District of Columbia, Feb. 24, 1937. The certificate makes eligible for membership every employee of every branch of the United States government other than officers and enlisted men of the army and navy. It attempts to authorize the association—

"To provide, without profit to the corporation, for the service of physicians and other medical attention and any and all kinds of medical, surgical and hospital treatment to the members hereof and their dependents, and the construction and operation of a clinic and medical office building, and the construction and operation of a hospital in the manner permitted by law, for the members hereof and their dependents, and the operation of a drug store or pharmacy, and the providing of nurses and of drugs and remedies for the members hereof and their dependents, and the furnishing of all forms of hospital service and attention to the members hereof and their dependents, and in general the giving to the membership of this association and their dependents of all forms of care, treatment or attention that may be required by the sick or in the prevention of disease."

That was taken from the charter.

"The Federal Home Loan Bank Board, a fiscal agency of the United States government, is sponsoring Group Health Association morally and

through a contract of such a character that neither the Federal Home Loan Bank Board nor Group Health Association is willing to make it public.

"ORIGIN OF GROUP HEALTH ASSOCIATION"

"The development of a health insurance organization among employees of the federal government in the District of Columbia, to pay benefits to its members in the form of medical and hospital service and not in cash, was foreshadowed by an anonymous nineteen page prospectus, marked 'Confidential: For Private Circulation Only,' that came to light in the early part of the current year. It offered 'A Plan for a Cooperative Medical Service on a Periodic Payment Basis for Federal Employees and Their Families in Washington.' The prospectus said:

"The aim of this plan is to make available to Federal employees in Washington, and to their families, adequate medical care, both preventive and curative; to provide this care at moderate cost; and to place that cost on a regular, budgetable basis within the means of the group to be served. If Federal employees are typical of the general population with equivalent incomes, many do not now obtain adequate medical care, especially preventive service and care in chronic conditions, while many others incur disastrous debts each year because of sickness costs. The provision of better care should promote health and well being and reduce time lost from work because of illness. The plan should be of benefit not only to the employees and their families, but also to the Government they serve.

"The prospectus stated incidentally that 'federal employees lose approximately seven days a year from work because of illness,' but it did not purport to justify the proposed organization of a health insurance association on the basis of and study of the nature and extent of illness among federal employees and their dependents, nor on the cost of such illness to such employees or to the government. Later, however, after Group Health Association had been organized, its president, by way of justification or excuse, asserted that the association was the result of studies of health conditions among the employees of the Federal Home Loan Bank Board and its affiliated agencies. No report of any such studies, however, their methods and results, has ever been made public. Admittedly, too, even the secret study referred to did not include a parallel study of sickness among employees of the federal government other than those in the Home Owners' Loan Corporation, one of the affiliated agencies of the Federal Home Loan Bank Board.

"INCORPORATION OF GROUP HEALTH ASSOCIATION"

"The Code of the District of Columbia, 1929, title 5, chapter 7, section 179, provides—

"Every corporation, joint-stock company, or association not exempt herein, transacting business in the District of Columbia, which collects premiums, dues, or assessments from its members or from holders of its certificates or policies, and which provides for the payment of indemnity on account of sickness or accident, or a benefit in case of death, shall be known as 'health, accident, and life insurance companies or association.'

"Group Health Association comes clearly within the category described, for the fact that it pays its members indemnity, not in cash, but in the form of medical and hospital service, is not material. The association, however, was probably deterred from undertaking to operate under this section because it provides that—

"No such company or association shall transact business within the District of Columbia unless it shall have in assets or in capital stock fully paid up in cash, or in both together, not less than twenty-five thousand dollars as a capital or guaranty fund. . . .

"Presumably, the association, at the time of its organization, did not have in hand the required \$25,000.

"True, this section of the District Code, regulating the business of insurance in the District of Columbia, provides—

"That nothing contained herein shall apply to any relief association, not conducted for profit, composed solely of officers and enlisted men of the United States Army or Navy, or solely of employees of any other branch of the United States Government service, or solely of employees of any individual, company, firm, or corporation.

"But Group Health Association could not take advantage of this, for it is not a 'relief association' but an insurance association, and, moreover, under what purport to be the by-laws of the association, its membership is not to be made up solely of employees of the federal government. Members whose connections with the federal government have terminated are to have the right of continuous membership as long as they pay their dues and assessments. The association is to give no 'relief' within the legal meaning of that term; it is to do nothing more than discharge its legal obligations to its members under its membership agreement.

"Only by incorporation, however, could the promoters of Group Health Association avoid personal liability for the debts and torts of the association. Unable to qualify as a corporation carrying on the insurance business, and perhaps unwilling to submit to the supervision and control to which the insurance business is subjected, the organizers of Group Health Association, while still proposing to carry on the insurance business as defined in the District of Columbia Code, sought refuge under a provision of that code that has no relation to insurance. Group Health Association was therefore 'incorporated' under the provisions of the District of Columbia Code, 1929, title 5, chapter 3, authorizing the incorporation of benevolent, charitable, educational, literary, musical, scientific, religious and missionary organizations, including societies formed for mutual improvement or for the promotion of the arts. Nothing in the certificate of incorporation of Group Health Association suggests that it has any educational, literary, musical, scientific, religious or missionary aspirations or is intended for the promotion of the arts. It is difficult to discover any activity named in the certificate of incorporation of Group Health Association that by any possibility brings the organization within any other of the categories named. The association is not a benevolent or charitable organization; the poorest charwoman or laborer is to pay for the indemnity offered by the association against loss through illness

exactly the same dues or premiums that are to be paid by even the most wealthy officials and employees of the Federal Home Loan Bank Board and other government agencies, and nobody is to get anything whatever free under any circumstances. The association cannot successfully claim the right to incorporate as a corporation for 'mutual improvement' within the meaning of the code, for any construction of the provisions of the code that would permit such incorporation would leave the code wide open for all manner of abuse; such provisions then could be used for the organization of morally and financially irresponsible finance, banking, insurance, business and professional corporations of all kinds, each organized for the 'mutual improvement' of its members financially, through the exploitation of some other class or classes in the community, just as Group Health Association is. Such abuses would not be prevented by the fact that banking, insurance and many other forms of business activity and the professions are strictly regulated by law; for the business of insurance and the practice of medicine in which Group Health Association proposes to engage are likewise strictly regulated by law, and if through incorporation as an organization for 'mutual improvement' the association could defeat the laws regulating insurance and the practice of medicine, other persons, differently incorporated, could defeat the laws relating to banking, insurance and other businesses and the laws relating to the professions other than medicine.

"Aside from the obstacles in the way of the incorporation of Group Health Association pointed out, there is a further obstacle. An organization cannot be lawfully incorporated to effect unlawful ends, and the certificate of incorporation filed by Group Health Association indicates clearly that one of its purposes is insurance, which cannot be lawfully carried on under the provisions of the code under which the association professes to be incorporated, and its other purpose, the practice of medicine, is unlawful if carried on without a license such as the association does not possess and cannot obtain either in the District of Columbia or in any state in which the association proposes to practice.

"That Group Health Association does propose to engage in the insurance business is apparent from an examination of the District code, which provides that every corporation, joint stock company or association not specifically exempted, which collects dues or assessments from its members and which provides for the payment of indemnity on account of sickness or accident, shall be known as a health or accident insurance company or association and shall qualify accordingly. Under its certificate of incorporation, Group Health Association is to collect dues or assessments from its members. In event of their illness or injury, or the illness or injury of any of their dependents, it is to pay indemnity in the form of medical, hospital and other services. The fact that indemnity is paid in the form of services and not in the form of cash does not alter the situation. Without considering any of the legal principles by which this dictum may be supported, it must be clear even to any one that the payment of indemnity in services releases the insured member of the association from what otherwise would be his own obligation to pay in cash for such services and thus releases his own cash for whatever use he desires to make of it. The payment of indemnity in services is therefore the equivalent of cash payment.

"That Group Health Association proposes to practice medicine in the District of Columbia, Maryland, Virginia and possibly other states is shown by its certificate of incorporation and by its by-laws. Its certificate of incorporation is a feebly disguised attempt on the part of the organizers to obtain authority for the association, without liability on the part of its members, to treat its members and their dependents, through hired servants and agents of the association, for any and all manner of disease and injury, and its so-called by-laws elaborate on that plan. This certainly constitutes the practice of medicine by the association, notwithstanding the fact that the association is not and cannot be licensed so to practice. The United States District Attorney for the District of Columbia and the Corporation Counsel for the District have both held that a corporation cannot lawfully engage in the practice of medicine in the practice of a profession that requires licensure or registration as a condition precedent to lawful practice, even though the corporation undertakes to practice through licensed or registered agents. If and when Group Health Association begins to practice medicine as proposed in its certificate of incorporation and its by-laws, the United States District Attorney and the corporation counsel for the District, in pursuance of the duties of their respective offices that they have sworn to perform, will be bound to take action to enforce the law.

"From what has been said it is to be assumed that the attempt of the organizers of Group Health Association to incorporate is ineffective and that the members of the organization constitute only a voluntary association. If so, the members of the association will have a certain personal liability for its debts and torts, notwithstanding the disclaimer in the certificate of incorporation.

"FINANCIAL RELATIONS"

"The certificate filed by Group Health Association in the office of the Recorder of Deeds in the District of Columbia provides that the association is to have no capital stock and is to render to its members and their dependents the services described therein, 'without profit to the corporation' and without personal liability on the part of its members. The certificate is silent as to the sources from which the association obtained the money necessary for its organization and establishment. It is silent also with respect to the sources from which it is to derive its operating income, except that it refers to members who have paid their 'dues' and to members who have paid their 'dues and assessments, if any.' In the pamphlet containing what purports to be the by-laws of the association, but which contains nothing to show that the members of the association ever adopted them, provision is made for the payment of 'dues' and reference is made to the payment of 'assessments,' but the formula for levying assessments and the limitations on them, if any, do not appear. These supposed by-laws provide, however, that they may be amended by the board of trustees at any time,

and, if this attempt to vest in the board of trustees supreme control over the affairs of the association is effective, the board, at any 'regular meeting or at any special meeting when the proposed amendment has been set out in the notice of said meeting' can amend the by-laws so as specifically to authorize assessments and can even at that same meeting levy on the members of the association any assessment that it deems proper.

"FEDERAL HOME LOAN BANK BOARD

"The sources of the money necessary to promote the organization of Group Health Association in the first place, to organize it, to provide it with necessary quarters and equipment and to guarantee operating costs long enough to determine whether the association can or cannot become self supporting are secrets carefully guarded by the Federal Home Loan Bank Board and Group Health Association. Whether this is because there are private interests behind the association that are unwilling to have their connection with it disclosed, or because disclosure might uncover a precedent that would lead to embarrassing demands on the Federal Home Loan Bank Board by persons desirous of forming similar organizations in the field of medicine, dentistry, insurance or social work, or simply because disclosure would subject the board and the association to annoying criticism, is not known. One prominent officer of the Federal Home Loan Bank Board, of the Home Owners' Loan Corporation and of the Federal Savings and Loan Insurance Corporation, who is a member of Group Health Association and has given it his particular blessing, is listed also as one of the trustees of the Twentieth Century Fund, Inc., of which Edward A. Filene of Boston is listed as president and trustee; but perhaps this has no significance.

"Under what law does the Federal Home Loan Bank Board or any of its affiliated agencies finance by government loans private organizations such as Group Health Association? Even if there were such authority, good judgment would hardly justify the making of such loans in the entire absence of any likelihood of repayment. There would seem to be no likelihood of the repayment by Group Health Association of any loan made to it under its present setup. The dues of members of the association are so low that it is hardly likely that it will ever be able to pay even operating expenses—provided, of course, it undertakes to furnish its members and their dependents with really first class medical and hospital service. As far as any available record shows, provision has not been made by the association for the amortization of the initial costs of plant and equipment.

"Possibly the contract between the Federal Home Loan Bank Board and Group Health Association, made apparently without advertisement or competitive bidding and carefully concealed from the public, may provide for payments to the association by the board so greatly in excess of the cost of the service that the association is to render as to enable the association to repay such advances as have been made by private interests, to pay for necessary quarters and equipment, and to protect the association against loss from medical and hospital services rendered officers and employees of the board and its affiliated agencies, and the dependents of such officers and employees. In any event, it has been admitted that the Home Owners' Loan Corporation has already appropriated an initial sum to enable Group Health Association to render services of some kind, to somebody, somewhere, and according to newspaper reports the Federal Home Loan Bank Board has guaranteed an advance up to \$100,000 to get the association under way.

"DUES AND ASSESSMENTS

"Under the by-laws of the association, 'family membership' is available for 'married or single members with dependents,' at a cost of \$39.60 per annum payable in equal monthly instalments. No limit is placed on the number of dependents on whom a 'family member' can confer all benefits of the association under this class of membership. 'Individual membership' available for 'married or single members having no declared dependents' is now priced at \$26.40 a year, payable monthly. The amount of the dues can be changed at any time by the board of trustees. A 'dependent' is defined as a person 'totally dependent upon the member of the corporation for a livelihood at the time of such person's disability and before need of medical service.'"

"CHECK-OFF ON GOVERNMENT PAYROLL

"The form of application for membership provided by Group Health Association offers the member the option of paying his dues personally or of assigning to the association so much of his government salary as may be necessary for that purpose and requesting his 'employer,' the government of the United States, to deduct semimonthly the amount assigned and remit it to Group Health Association, Inc. As this assignment form is also an application for membership and obviously belongs to the files of the association, an additional assignment form has been provided, presumably to be filed with the paymaster of the Federal Home Loan Bank Board or the particular affiliate of the board by which the member of the association is employed. This form specifically assigns, sets over and directs the Home Owners' Loan Corporation and the Federal Savings and Loan Insurance Corporation to pay Group Health Association the amount due to that association, out of any salary or wages due or to become due to the member so long as membership continues. This establishes the check-off scheme sometimes employed to binder defections from the ranks of organizations that fear difficulty in maintaining membership and to impose on the employer the burden that properly belongs to the organization of providing a collection agency. Under the check-off system, a member who finds membership no longer advantageous cannot quietly and without explanation cause his membership to be terminated by the simple expedient of omitting payment of dues. He must take affirmative action and resign from the organization, with danger of loss of social standing among his fellows, and he must notify his employer that his membership has been terminated, with the possible loss of esteem by his superior officers if the organization happens to be a pet scheme that they are promoting.

"It is well established, however, that the assignment of government salaries is contrary to public policy. The assignment of any claim against the United States that has not yet been earned is forbidden by statute, and even after a claim has matured it can be legally assigned, if it can be assigned at all, only by conforming with the conditions laid down by statute, and the provisions of this statute have been held to apply to government salaries. So positive are the express and implied prohibitions against the assignment of federal salaries that, when it was deemed desirable that employees of the Department of Agriculture and of the Department of Commerce be permitted to assign their salaries, it was deemed necessary first to procure authority by act of Congress, and even then the authority granted for assignments by employees of the Department of Commerce was expressly limited to assignments made while absent from Washington and employed in the field.

"The check-off scheme planned by Group Health Association, with the apparent approval of the Federal Home Loan Bank Board and its affiliates, gives the premiums or dues that are payable to the association priority over every other claim, moral or legal, against the salary of every member of the association. The association does not undertake to indemnify its members in cash, which would help the member to provide himself and his dependents, in time of sickness and in time of health, with the necessities of life, including medical service, but to indemnify him only in medical and hospital services, and then only to the extent that the board of trustees of the association and its medical staff deem feasible in view of the resources of the association at the moment and of the condition and location of the patient. Dues or premiums under the check-off system must be paid. The insured may use only the remainder of his salary for such supplementary medical service as the association does not provide and for food, clothing, shelter and drugs and other medical and surgical supplies necessary for himself and his dependents. The hired physician of the association is to be assured his wages through the check-off system, even though food, medical and surgical supplies, and sometimes essential service, such as the use of radium and high voltage roentgen therapy, may have to be omitted because of the inability of the employee to provide them. This is in marked contrast with ordinary medical practice, in which the essentials of life and treatment for the patient and his dependents are obtained first, while the physician waits for his fee—and does so gladly when the circumstances of the patient so indicate.

"If Group Health Association succeeds in establishing the check-off system as a proper and lawful way of insuring the payment of the present and prospective debts of government employees, it will undoubtedly prove a boon to labor unions, finance corporations, merchants who do business on the instalment plan, landlords and others, who under the law cannot attach or garnish the salary of an employee of the federal government but who will be able to protect themselves in advance by demanding assignments of federal salaries as securities for debts. If Group Health Association is going to have the check-off system adopted by the federal government for its benefit, there is no reason why any and every other person, whether individual or corporate, may not claim the same privilege.

"MEMBERSHIP

"The original certificate filed by Group Health Association in the office of the Recorder of Deeds of the District of Columbia makes eligible for membership all 'employees of any branch of the United States Government Service other than officers and enlisted men of the United States Army and Navy.' It makes no discrimination on account of race or color. Such employees number 840,159 and are scattered throughout the entire civilized world. These employees and their dependents would probably number 2,500,000 and provide a rather extensive field of medical practice for Group Health Association. The organizers of the association, however, in what they call its by-laws, seek to handicap the civil employees of the federal government who are not employees of the Federal Home Loan Bank Board and its affiliated agencies, by providing that—"

"in case persons other than employees of the Federal Home Loan Bank Board and agencies under its direction shall be designated as eligible for membership, such action shall first have approval of a majority of the board of trustees and a majority of the members of the corporation present in person or by proxy at a regular or special meeting.

"But this restriction, like all others contained in the by-laws, is of little moment; the board of trustees can remove or modify it in any way it sees fit, at any time.

"Membership will be restricted geographically by the by-law by which members and their dependents, to be entitled to avail themselves of the medical services to be performed by the association, must be located in the District of Columbia or within ten miles of its boundaries or must come to the city of Washington for advice and treatment, although the medical director may provide for house calls at points not exceeding twenty miles distant. The potential membership of the association, however, even as thus geographically restricted, will be considerably more than 115,912. To determine the total load to be carried, the dependents of members must be added to the foregoing numbers, possibly an average of two dependents for each member.

"These figures show only the potential membership and load of Group Health Association. What the actual membership and load will be, no one can foretell. If, as has been alleged, there is an undue prevalence of illness among employees of the Federal Home Loan Bank Board or of some of its affiliated agencies, a fair number of the employees who are physically inferior may be expected to join the association.

"Employees, too, who now are deterred from claiming sick leave because of the expense of employing a physician to vouch for the sickness and to furnish the necessary certificate may join the association because it furnishes an easy way to obtain such certificates practically gratis. Illness among the dependents of employees, particularly among those with large families, will tend to swell the membership rolls.

"As affecting the size of the membership, the standards that Group Health Association adopts in determining who may and who may not be a member will be a determining factor. If persons suffering from all manner of chronic diseases and infirmities are readily accepted for mem-

bership, employees may postpone applying for membership until they or one or more of their dependents are manifestly in ill health. Only experience can determine the probable number of members of Group Health Association and of their dependents.

"The physicians employed by Group Health Association are primarily the servants and agents of the association. The records made by them as servants and agents of the association belong to the association. Their primary duty is to the association, not to the patient. They must abide by the terms of their contracts of employment, and those contracts presumably require conformity and compliance with the by-laws and rules of the association. The by-laws and rules of the association expressly provide that—

"The Medical Director shall render such reports as the Board of Trustees shall require.

"Obviously, under this provision of the by-laws, the board of trustees, which includes two representatives of the Federal Home Loan Bank Board, can call for any disclosure whatever concerning the activities of the medical director and physicians and nurses working under his direction, and use, free from any obligation to secrecy, the information thus obtained.

"A member of Group Health Association, as one of the conditions of membership, seems to waive, in favor of the association, his right to professional secrecy on the part of any physician-employee of the association who attends him, and implicitly his dependents, in accepting the services of such physician-employee, likewise waive their right to secrecy.

"AREA TO BE SERVED

"It is difficult to determine the future membership of Group Health Association, it is not so difficult to determine the extent of the area over which it plans to extend even its initial activities. The certificate of incorporation contemplates apparently world-wide service. The by-laws, however, propose to limit the area covered by providing that—" quote:

"To be able to avail themselves of medical and surgical service, the members or dependents must be located in or within ten miles of the District of Columbia line, or must come to the city of Washington, D. C., except that the Medical Director may provide for house calls not exceeding twenty miles.

"This area covers the entire District and considerable areas in Maryland and Virginia and is bisected by the Potomac River.

"The District of Columbia alone covers somewhat more than sixty square miles. An area including the District of Columbia and the territory within ten miles of its boundaries comprises approximately 750 square miles. The territory including the District of Columbia and the region within twenty miles of its boundaries covers approximately 1,950 square miles. It is obvious that to serve even the normal area, covering the District of Columbia and the territory within ten miles of its boundaries, about 750 square miles, will call for the establishment of clinical centers at various points and for liberal provisions for transportation of physicians and nurses and ambulance service. This is based on the announced plan of the association of operating through salaried full-time physicians and not through local physicians paid on a fee basis. The increased difficulties of the situation if a serious effort is to be made to cover the District of Columbia and an area within twenty miles of its boundaries is apparent.

"BENEFITS OR INDEMNITY OFFERED

"Group Health Association proposes to provide its members and their dependents with medical and hospital service. This is to be done through a salaried full-time medical staff, supplemented by a few part-time specialists, through contracts with hospitals, and through nurses when circumstances so require. The medical staff is normally to make home and hospital visits over an area of about 750 square miles and, at the discretion of the medical director, over an area of 1,950 square miles. Patients are to be encouraged, however, to present themselves at a central clinic for treatment. In such an ambitious, untried, project it is not surprising that the board of trustees should have reserved the right to itself and to its medical staff to limit the service rendered whenever either the board or the medical staff sees fit. The association has been careful not to obligate itself to furnish service of any definite kind or quantity. The so-called by-laws of the association expressly provide that—

"Section 4. The corporation will not assume responsibility for furnishing unlimited medical service to members but will do so only to the extent of its resources.

"Section 5. The Trustees shall have the right to determine and modify the extent of the service to be furnished to members at any time they may decide to do so upon written notice to the members to that effect given fifteen (15) days prior to any such change.

"To one familiar with the city of Washington and its environs, the question necessarily arises as to how Group Health Association has solved or proposes to solve the question of service to Negroes employed by the government. Certainly government officers and employees and their dependents cannot be denied membership in the government-financed Group Health Association simply because they are Negroes. The solution will be watched with interest.

"Before considering the service or indemnity that Group Health Association promises its members and their dependents—always subject to the will of the board of trustees and its medical staff—it will be well to consider definitely what it will not do or will do only conditionally. The association will not treat members who suffer from industrial accidents, nor will it perform any surgery on the brain or nervous system. It will not treat venereal diseases, except at the personal expense of the patient, at the rate of 50 cents per treatment. The association will not treat a member or any of his dependents if the medical director has recommended confinement to an institution for mental or tuberculous disease or drug or alcohol addiction. It will not provide its members with (1) dental treatment; (2) medicines; (3) surgical appliances, orthopedic devices, crutches, or artificial limbs; (4) eyeglasses or eyes [sic]; (5) hearing devices; (6) radium or high voltage roentgen treatment";

I don't know what that word is. What does it mean, Mr. Leahy?

Mr. Leahy:—X-ray. That is the name of the man that discovered the roentgen ray.

Mr. Levin:—Roentgen.

"(7) oxygen tanks and tents and materials; (8) blood transfusions; (9) special nursing service, unless ordered by the medical director; (10) treatment, services, supplies, and items of any kind prescribed or ordered by a physician not in the service of the association, or (11) any expense of hospitalization in excess of that allowed by the association. The association will, however, endeavor to procure such merchandise and services for members and their dependents at reduced rates. Additional limitations on any and all services and merchandise furnished by the association may be imposed by the board of trustees at any time on fifteen days' notice, and in any individual case the medical director or his representative is authorized to determine and prescribe the extent of the medical service to be rendered.

"Subject to all the limitations and qualifications stated, and such further limitations and qualifications as the board of trustees and the medical director and his representatives may impose, the association offers its members and their dependents in return for the fees paid—

"Medical and surgical examination and treatments, including examinations in special departments, such as refractions of eyes; laboratory test, x-ray examinations, surgical operations, confinement cases and professional consultations, nursing and ambulance facilities, house calls, and hospitalization in a semiprivate room (2 bed room) limited to a period not to exceed 21 days for any one illness. However, members desiring to occupy a private room may do so, in which case the corporation will contribute the sum of \$4 per day toward the expense of such room for such period. In all hospital cases, the corporation will pay for semiprivate room (2 bed room) service only, except in the case of infectious or contagious diseases, in which cases a maximum of \$4 per day will be paid for said period, not exceeding 21 days.

"As far as can be learned from the certificate filed by Group Health Association and from its by-laws, no member of the association and no dependent of a member is to have any freedom of choice of his physician. Obviously, this must be so, for with a limited salaried, full-time medical staff, operating over an area of 750 square miles or more, it would be impossible for each staff member to cover the entire area daily, to satisfy the desires of members scattered over the entire area. It is understood that the association will not object to a member or a dependent of a member being treated at his own expense by a physician not in the service of the association. As the members of the salaried staff of the association are likely to be looked on by the profession generally in the community as on the outer verge of ethical practice, if not altogether beyond the pale, it is not clear how they are to obtain qualified consultants or procure hospital service for their patients.

"Announcement has not been made at the present writing of the medical staff, beyond the appointment of Henry R. Brown, M.D., formerly of the Veterans' Administration, as medical director. Announcement has not been made of the hospitals in which the association proposes to provide accommodations for its members and their dependents. Quarters for a clinic or laboratory have been rented in the business district of Washington but are not yet equipped. The date originally proposed for inaugurating active medical and hospital service, September 1, has been set ahead indefinitely.

"CONCLUSIONS

"There is no reason to believe that Group Health Association, even if it could lawfully engage in the insurance business and the practice of medicine as it proposes to do, could materially reduce the absence rate among officers and employees of the Home Owners' Loan Corporation or its related agencies. Absences on account of illness might even be increased, for a medical certificate would cost nothing. A physician cannot always deny that a man has a disabling headache, or a woman a disabling menstrual period.

"Since there is no evidence to show that government employees are unable to pay for medical services, there is no reason to believe that the cheapening of medical service will make him more likely to seek medical aid. There is no reason to believe that the character of medical service under the Group Health Association plan can be kept at the same average level of quality as that prevailing in private practice. Especially would quality be likely to fail in times of epidemics and of any unusual prevalence of disease, when the limited medical staff of the association would be overworked and could find no relief. In any event, medical service under the association would be likely to be handicapped by difficulty likely to be experienced in obtaining the best consultant service and hospital accommodations. Physicians who sell their services to an organization like Group Health Association for resale to patients are certain to lose professional status.

"The probable results on the medical profession of the successful operation in the District of Columbia and vicinity even of a single organization such as Group Health Association cannot be estimated.

"Out of a total population of 486,869 in the District of Columbia, 115,912 are civil employees of the United States government, and, of these, 2,517 are employees of the Federal Home Loan Bank Board and its affiliated agencies. If to these persons, all of whom are eligible for membership in Group Health Association, their dependents are added, allowing an average of two dependents for each employee, a total of 347,736 persons is reached, out of a total population of 486,869 that the promoters of Group Health Association, according to their certificate of incorporation, seek to withdraw from the ordinary practice of medicine and to cover into a group health insurance contract practice system and treat through physicians hired for that purpose. The effect of the withdrawal from private practice of even one-half that number of persons, all of whom are able to pay for medical services, will materially disturb medical practice in the District of Columbia and react against public interest.

"Under the scheme proposed by Group Health Association, far greater benefits will accrue to the richer and more liberally paid employees of the Federal Home Loan Bank Board and its affiliates and of such other government agencies as may identify themselves with the scheme than to

"To justify this stand we have to recall and study what changes had been attempted up until now by different sources and what were our reaction to them.

"What we have done is very similar to that what happened over there. Meetings, committees, investigations, comprehensive and comparative studies one after the other all ended up with a protest against any change involving the present mode of practicing medicine thinking that the change of form will ruin the salient principles.

"We shall be very much mistaken if we believe that the mere protest and emphasis on the ethical principles will save them and will block or prevent a change. We may protest and lose the initiative and helm in making a new form of practice of medicine and finally the major part of organized medicine will have to give in and join and serve a scheme which will or may be made without us or against us.

"What organized medicine is concerned the American Medical Association; it took the stand of observation and so far has not proposed or offered a change, expecting a sound change to be evolved by some state or local societies. The Medical Society of the District of Columbia inaugurated what may be one of the noblest and sincerest experiments to tackle this growing problem. I refer to the Central Admitting Bureau and the Medical-Dental Service Bureau for the medical care of people with restricted means. The intentions in planning these institutions were very noble indeed and highly ethical, but seemingly they have no appeal to the masses maybe by lack of publicity or lack in advertising it widely enough. By this scheme we shall have just exceptional cases and not the masses who undoubtedly are seeking and are offered to get medical care in some form of insurance for themselves and their families. If we do not take and get the masses and their continuously inflowing money, laymen or the state are going to do it without us, and probably against us and pay us only crumbs from the lost bread (loaf).

"We do not like and object if physicians outside of our ranks make or try new forms, we despise if laymen do it and we think with abhorrence on socialized medicine installed by the state or politicians as we know that it will be not for the good of the sick as it will kill the ethical fundamentals of practicing medicine.

"Mr. President, we know all about that new scheme which is in the making under the name of Group Health Insurance of the Home Owners' Loan Corporation, which is, maybe, the last warning to us to be wise and to be our masters ourselves.

"Why shall we wait that some one else without our ranks shall make it for us or more probably against our will, against our taste and against our interest? Why not make it ourselves? Are we not as good social planners and businessmen as laymen or politicians?

"We must realize that no matter what extreme social system may replace the present one, the free practice of medicine of today always will remain to certain extent as it exists in countries where extreme socialization is general as there will be always people who will get money to pay the doctor whom they have confidence in.

"On the other hand we know that our chief aim and I may say duty must be to save the cherished principles of our profession and nobody else is going to do it for us. It is a very important issue of professional policy that we must change our tactics and we shall make a change in the way of practicing medicine to accommodate it to the present and continuously growing trend of social changes. Every one of us must know that we make these changes to save the fundamental ethical principles and not to give them up. Every one should know that this will be a political maneuver or a temporary show, if you want to put it up this way.

"Mr. President, the responsibility in this very important matter which every member should feel wholeheartedly makes me to raise my voice in the last hour to suggest and propose that we ourselves shall organize, set up and run a group health insurance type medical service through the Medical Society and in strict collaboration with the American Medical Association. I cannot submit an elaborate plan and I will not argue about details in this hour but I should like to put down the principles and some facts for consideration:

"1. The Group Health Insurance of Organized Medicine would provide for medical services to its members. Everybody may be eligible for membership, except the enlisted men of the United States Army and Navy, and employees with an annual income of \$3,000.00 or above. No discrimination is to be made on account of race or color.

"2. Membership dues are to be \$35 to \$45 yearly. Special family membership dues to be regulated according to the number of dependents.

"3. Medical services may be combined with Group Hospitalization, maybe in conjunction with some insurance companies who offer twenty-one days of hospitalization for 75 cents a month as you all know.

"4. No sick benefits of any kind to be contemplated at any time.

"5. The medical staff will consist of the members of the Medical Society of the District of Columbia. Any member may join the staff voluntarily by paying \$50 to \$100 of initiation fee to get the scheme started (under way). Of course, this service will not interfere with the private practices.

"6. Services to be rendered in the clinic to ambulant patients, to hospitalized patients and in the form of home calls. The Clinic should have a full-time staff and the home calls and hospital care be given by the rest of the staff keeping up the free choice of doctor so far as possible.

"7. The fees paid for these services may be only a fraction of the present fees now but will be and should be raised as the funds grow.

"8. Seventy-five (75) per cent of the Board of Trustees to be duly elected members from the Medical Society to be our master ourselves.

"9. The Central Admitting Bureau to be sustained for its present purpose and free medical service to be rendered to indigents in the free clinics in the various hospitals.

"10. It is understood that at least 15 per cent of the population will be exempted from this scheme and will be subjects of free private practice

with the usual fees, which number of patients will be increased by those who always will get the means and determination to select their own physician to get ideal individual care.

"This is a roughly outlined conception which I submit for your consideration.

"In summary, may I say this:

"(a) All socialized types of medical services heretofore inaugurated by private groups or states (abroad) were all instigated, organized and set up by laymen without us and usually against us. In these schemes laymen or the state were the rulers and the medical men hired and ruled. All of them competed with organized medicine, certainly not with equal and right means. In all of them the fundamental ethical principles of the practice of medicine were omitted or essentially curtailed against the good of the sick. The end was socialized medicine for organized medicine by hesitation and by other factors lost the initiative to offer some scheme itself to prevent this.

"(b) Socialized medicine is just before our doorstep and set up that way that it may spread all over the country like fire.

"(c) So far as I know nowhere and never did organized medicine work out or offer a group health insurance scheme to the public which was set up and governed by the medical man.

"(d) My planned thoughts which are many of yours, if it could be worked out and materialized quick enough, would enable us to create and control this organization ourselves and not be left at the mercy of politicians or racketeers. We shall gain the sympathy and confidence of the masses and if we succeed financially we shall make not only a decent living but also save the ethical fundamentals of our profession. I am sure we may prevent or at least lessen the dangers of socialized medicine under political bureaucracy. We shall have in this organization a more advanced and higher type of medical service than they abroad as it will be ethical and sincerely socially minded indeed.

"Mr. President, I move that this problem and proposition be sent to the Executive Committee for urgent study and be formulated, if accepted, by a special legal committee elected by the Society and brought to the floor as soon as possible.

"Furthermore, I move that this plan, if worked out, be communicated to the American Medical Association for urgent consideration with the suggestion that it be adapted and introduced all over the country under itsegis and direction as home office."

Mr. Kelleher:—Exhibit 111 is an original letter from C. B. Conklin, secretary of the Medical Society of the District of Columbia, to Dr. Olin West, Secretary of the American Medical Association, Chicago, dated Oct. 9, 1937:

U. S. EXHIBIT 111

"Dear Dr. West:

"I thank you for your letter of October 6, 1937.

"Personally I wish to express my pleasure and appreciation of learning your reaction to anything that may be proposed that would affect the doctor's best interests. I am happy to state that the Society, in session on the evening of October 6, adopted the following:

"WHEREAS, The Bureau of Legal Medicine and Legislation of the American Medical Association has prepared and published a comprehensive report on the activities of Group Health Association, Inc.; and

"WHEREAS, The Medical Society of the District of Columbia is in full accord with the content of said report, both as to the established facts set forth therein and the implications drawn therefrom; therefore, be it

"Resolved, That the Medical Society of the District of Columbia cause a copy of said report to be sent to each of its members as an indication of its future policies with respect to combating the activities of said Group Health Association and also with respect to the ethical responsibilities of the Medical Society of the District of Columbia and of its individual members.

"This appears to eliminate what might have an undesirable statement of policy.

"Sincerely yours,

"C. B. Conklin."

Exhibit 110 is a carbon copy of an original letter written by defendant West in Chicago to C. B. Conklin, dated Oct. 14, 1937:

U. S. EXHIBIT 110

"Dear Doctor Conklin:

"I am greatly obliged to you for your letter of October 9 in which you present the resolution adopted by the Medical Society of the District of Columbia at its meeting on October 6. I am, of course, greatly pleased at the decision of the society.

"I am looking forward with pleasure to seeing you here at the Annual Conference of Secretaries of Constituent State Medical societies on November 19 and 20.

"Sincerely yours,

"Olin West."

Mr. Lewin:—I shall read from the minutes of the Executive Committee of the Medical Society of the District of Columbia, held Oct. 11, 1937:

"Dr. William Mercer Sprigg, Chairman, presiding.

"Present: Drs. Daniel L. Borden, C. N. Chipman, A. C. Gray, Raymond T. Holden Jr., R. Arthur Hooe, H. C. Macatee, F. X. McGovern, Thomas E. Neill, John F. Preston, John A. Reed, E. Hiram Reede, Sterling Ruffin, Earl R. Templeton and C. B. Conklin.

U. S. EXHIBIT 37

"At the conclusion of the reading of the minutes of the preceding meeting, held September 27, 1937, Dr. Sterling Ruffin was recognized. He said he did not think that the Secretary had reported exactly what Dr. R. Arthur Hooe had in mind and would suggest that the minutes be changed to cover the situation. Dr. Ruffin added that Dr. Hooe proposed about the same thing some time previously before the Executive Committee as he did on the occasion for which the minutes were recorded. "The Secretary stated that he would change the minutes according to Dr. Hooe's intent."

Now, some other matters were taken up that are not germane to our case, and we turn to page 3:

(Reading):

"The next motion that Dr. Hooe had to make was that the Executive Committee recommend that the Secretary of the Society address a letter to every civilian hospital Board of Directors in the District of Columbia, informing them of the particular sections of the Constitution that had to do with approval of contracts and warn the hospitals that if they failed to cooperate in every way that they might not be on the approved list.

"Much discussion ensued, Dr. W. M. Sprigg reading a prepared letter that he had already arranged to send to the hospital directors relative to this matter.

"Finally, it was adopted to approve the letter as prepared by Dr. Sprigg with numerous amendments.

"Dr. Macatee thought that Chapter VII, Article 4, Section 4 of the Constitution should be drawn to the attention of the members in addition to Chapter IX, Article IV, Section 5.

"(Dr. Sprigg was asked by the Secretary for a copy of the letter. He said that he would take it home and revise the letter and later send it to the Society's office.)

"Dr. Hooe was again recognized. He stated that there were some 117 women physicians practicing in Washington and about 12 were members of the Medical Society of the District of Columbia; also there were large numbers of doctors in the city that were in practice and were not members of the Society. This statement was made particularly in rebuttal to a proposed recommendation that the hospitals approve for their courtesy staffs and their regular staffs only members of the Medical Society of the District of Columbia. Without the fold of the Society were a number of 'good doctors.'

"Dr. John A. Reed at this point was recognized."

Then follows some other matters:

(Reading):

"He stated in his opinion the American Medical Association should follow through and duly notify the District Attorney, Corporation Counsel, and other legal officials of the apparent violation of law that Group Health Association, Inc., would violate when and if they start to operate.

"Much discussion ensued.

"The recommendation was finally adopted that the American Medical Association authorities be communicated with and they be asked to send to the Insurance Commissioners, the Commission on Licensure, the District of Columbia Commissioners, the United States Attorney for the District of Columbia, and the Corporation Counsel, substances of the article that appeared in the October 2, 1937, issue of *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* (Organization Section, p. 39B), and that if the American Medical Association refused or would not comply, then the Secretary send a reprint of said article to each of these officials.

C. B. Conklin,
Secretary."

FEBRUARY 20, AFTERNOON

Mr. Kelleher:—I now read from the minutes:

U. S. EXHIBIT 37

"Minutes of the special meeting of the Medical Society of the District of Columbia held Friday evening, October 15, 1937, 8 p. m.

"Dr. Thomas E. Neill, President, presiding.

"Present: Drs. A. C. Christie, Harry F. Anderson, Claude Moore, Howard P. Parker, E. Kirby Smith, R. J. Jansen, Thomas A. Groover, E. A. Merritt, Edgar M. McPeak, F. X. McGovern, William P. Herbst Jr., Prentiss Willson, William H. Hough, W. Warren Sager, F. C. Fishback, C. N. Chipman, Charles B. Campbell, Joseph S. Wall, and other members to the number of about one hundred and fifty-five."

I will omit reading the first six and a half pages and begin on page 7:

"Dr. W. M. Sprigg asked consent to read a letter addressed to the Boards of Directors of the various hospitals in the city. Consent was granted.

"Dr. Sprigg read the following:

"October 15, 1937.

"Board of Directors of

..... Hospital,
Washington, D. C.

"Gentlemen:

"The Medical Society of the District of Columbia desires to call your attention to Chapter IX, Article IV, Section 5 of the Constitution, as follows:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group or individual, by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within 10 miles thereof, which has not been approved by the Society.

"The Executive Committee is authorized and directed to prepare an approved list of organizations, groups and individuals, by whatever

name called and however organized, engaged in the practice of medicine within the District of Columbia or within 10 miles thereof, and the same shall be kept in the office of the Secretary-Treasurer. Before any such organization, group or individual can be placed on the approved list of the Society, such organization, group or individual, or the member of the Society proposing professional relations therewith, shall submit to the Compensation, Contract and Industrial Medicine Committee such evidence as the Committee or the Society may require showing the character, activities, financial condition and ethical standards of said organization, group or individual, and after considering the same, said committee shall make a report of its investigation and findings to the Executive Committee for such action as it may deem necessary."

The letter continues:

"Also, Chapter IX, Article IV, Section 1, as follows:

"Members shall not accept appointment to or continue to serve upon the medical staff of any hospital or dispensary which is not approved by the Society. A list of approved hospitals and dispensaries shall be available in the Society's office."

"WHEREAS, The Medical Society is using its earnest efforts to give to the people of the District of Columbia the most advanced and best possible medical care, we, therefore, ask your cooperation by aiding us to carry out this principle.

"In view of the above Sections of the Constitution of the Medical Society of the District of Columbia, we hope that your board will see the advisability of making such regulations in your Hospital, so that they may be in accord with and support our efforts.

"Respectfully yours."

"Dr. Thomas A. Groover was recognized. He felt that this letter was important enough that each member of the Society should have an opportunity to study it rather carefully. He suggested that action be deferred until members of the Society had received copy through the Society's office. He made this in the form of a motion to the effect that copy be mailed to each member of the Society and be brought up at the next business meeting. Seconded and motion finally adopted."

I now go to the next page:

"Dr. W. J. Stanton would inquire if this attorney for the Society had passed on the advisability of sending this letter.

"Dr. Charles P. Cake would inquire what the purpose of this letter was; what is supposed to be accomplished by the letter?

"Dr. Sprigg replied that the letter was self evident, if one stops and thinks when he reads it. He pointed out that the Society has been trying to improve itself—to clear its own skirts. He called attention to the policy which had been established for years when hospitals allowed only those members to practice on their staff who were approved by the Board of Directors. He called attention to the differences with Columbia Hospital because the Board of Directors did not approve some member on its staff. It wasn't realized that the Board of Directors had the right to say who shall practice in their hospital. The members of the Society have a perfect right to say who shall be members of the Society. This letter was merely asking the hospitals to cooperate; nobody was being hit at. He called attention to the fact that one hospital in the city passed a resolution in its board stating that only members of the American Medical Association could practice in that hospital. Dr. Sprigg said the Society does not require that at all; merely that a man who practices in the District of Columbia must be approved by the Society. He pointed out that there are some in the district who are not members of this Society who are just as ethical as he or any one else. They are on the approved list but are not members of the Society. This letter does not keep those members out of the hospitals. He reiterated that all to be accomplished was to ask the cooperation of the hospitals to help keep the skirts of the Society clean.

"One member would inquire if it was meant that members of the Society would not be permitted to practice in a hospital that did not subscribe to an approved list; in other words if they attempt to practice in a hospital not approved by the Society the members of the Society would be duty bound to keep clear of that hospital?

"Dr. Sprigg answered that that was correct. He added, 'You have turned a man out of this Society; why? for good reasons. Now are you going to cooperate and consult with him?'

Mr. Kelleher:—Now I omit a portion.

Mr. Leahy:—Won't you get to the point of what the other members said about it?

Mr. Kelleher:

"Dr. Thomas A. Groover was recognized. He felt that this letter was important enough that each member of the Society should have an opportunity to study it rather carefully. He suggested that action be deferred until members of the Society had received copy through the Society's office. He made this in the form of a motion to the effect that copy be mailed to each member of the Society and be brought up at the next business meeting."

"Dr. Reed arose to a point of order, stating that Dr. Sprigg's discussion was irrelevant to Dr. Groover's motion.

"Another member said that if he received a copy of the letter tomorrow he would not know what the letter was meant to convey.

"Dr. William M. Ballinger pointed out that this letter was merely calling the attention of the hospitals to certain resolutions and constitutional provisions of the Society, asking their cooperation. To his mind it was simply a routine letter asking for cooperation. He could not understand why a copy should be sent to every member of the Society.

"Dr. Martin M. McLean would inquire who is going to help the hospitals interpret the letter; they may have the same questions arise in their minds.

"Dr. Daniel Davis favored Dr. Groover's motion, stating that he would be interested in seeing the letter before voting on it."

ORGANIZATION SECTION

Mr. Levin:—And the motion was finally adopted. Now I read from the last paragraph:

"Dr. W. M. Sprigg at this point read a recommendation from the Executive Committee to the effect that the American Medical Association authorities be communicated with and they be asked to send to the Insurance Commissioners, the Commission on Licensure, the District of Columbia Commissioners, the United States District Attorney for the District of Columbia, and the Corporation Council, substance of the article which appeared in the October 2, 1937, issue of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION (Organization Section, page 39B), and that if the American Medical Association refused or would not comply, then the Secretary send a reprint of said article to each of these officials."

"Dr. H. H. Schoenfeld called a point of order, stating that no notice of this business appeared on the announcement for this meeting. The Chair sustained the objection."

"I shall read from the minutes of the regular meeting of the Executive Committee of the Medical Society of the District of Columbia, held October 25, 1937, 8 p. m."

"Dr. E. Hiram Reede, Vice Chairman, presiding in the absence of Dr. W. M. Sprigg."

"Present: Drs. E. G. Breeding, A. C. Gray, R. Arthur Hooe, F. X. McGovern, Thomas E. Neill, John F. Preston, John A. Reed, E. Hiram Reede, Henry R. Schreiber, W. M. Sprigg, E. R. Templeton and C. B. Conklin."

"The minutes of the previous meeting, held October 11, were read and approved."

Then certain other matters were dealt with.

Mr. Leahy:—One of them might be interesting.

Mr. Levin:—Do you mean about the meeting for the purpose of witnessing "The Birth of a Baby"? Well, I won't go into that. There is a note of humor in it. Let's get along:

"At this point Dr. Thomas E. Neill addressed the committee, stating that he had received an invitation from the Home Owners' Loan Corporation Group Health Association in the form of a letter, with enclosed ticket, to a banquet to be held at the Mayflower Hotel on the evening of October 30. He spoke of his contacts with Mr. John Childress, who was very active in the group clinic affairs. Dr. Neill added that he had been Mr. Childress's family surgeon and had charged no fees since 1930. Mr. Childress offered him the position as surgeon in the present setup, which he had refused. Dr. Neill was interested in getting some instructions from the committee as to how he should answer the letter."

"It was finally thought advisable to have Dr. Neill's secretary answer the letter, using the third person, stating his inability to be present."

"It appeared that the banquet would be addressed by Dr. Richard Cabot, professor of clinical medicine at Harvard University. Dr. Neill stated that he knew Dr. Cabot when he was working in the Massachusetts General Hospital. From those contacts and from the editorials that had appeared in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, criticizing Dr. Cabot's views on various sociological problems, that the sending to Dr. Cabot of a statement of attitude of organized profession toward the Home Owners' Loan Corporation setup would be unavailing and inadvisable."

"Then certain other matters were dealt with."

Resolved, That the Chairman of the Executive Committee shall appoint a Subcommittee of the Executive Committee consisting of five members of the Executive Committee to study in detail the entire question of prepaid insurance medicine as conducted by or may be conducted by or controlled by reputable acceptable physicians, or by local, county or state societies."

"Further, The Committee so appointed shall investigate so far as possible the following points: the need of such practice, the legality in reference to our Society, workability in other localities, the sentiment of the American Medical Association in regard to medical Society controlled practice, formulation of a plan of prepaid insurance medicine to be used whenever in the future it might be deemed advisable or necessary to undertake such a practice, and such other problems pertaining to this practice or considered by the committee worthy of study."

"Further, The Secretary of the Society shall be a member of this subcommittee and act in the capacity of secretary to it."

"Further, That the facilities of the Secretary's Office be available for use by this committee."

"Further, This committee shall report to the Executive Committee when its work is complete or on call of the Executive Committee and not later than the last Executive Committee Meeting of the current Society year."

"In the discussion, the Secretary pointed out that the American Medical Association's attitude was very well known, that the headquarters was unalterably opposed to the development of any prepayment plan for the reason that tacit approval might be given to the United States Government or to any other setup to proceed in the organization of clinics. Further, experience showed that great rivalry developed when the organized profession in certain cities in the state of Washington started prepayment clinics. Prices were cut along with salaries of the physicians doing the work. Dr. Olin West, in telephone communication from Chicago, had stated definitely that he would not care to be in a position of influencing any action the Medical Society might want to take, but he offered adverse criticism of the development of any prepayment plan, particularly by the profession of Washington."

"Motion was made that the resolutions presented by Dr. Reed be adopted. Seconded."

"Dr. R. Arthur Hooe made a motion to amend the resolutions to include in this special committee membership the President of the Society and the Chairman of the Executive Committee. Seconded."

"Motion with amendment was duly adopted."

Mr. Kelleher:—Exhibit 203 is a telegram from John F. Hayes to Dr. William C. Woodward, dated Oct. 29, 1937:

U. S. EXHIBIT 203
"Group Health Association medical staff announced. Drs. Brown, Raymond E. Selders, Allan E. Lee, Edmond D. Wells, R. Stephen Hulbert, M. Scandiffio. Stop. Home Loan Bank Board has granted \$20,000 a year for two years to association."

Mr. Kelleher:—Exhibit 114 is a carbon copy of an original letter written by Dr. Olin West in Chicago and addressed to Dr. C. B. Conklin, Secretary, Medical Society of the District of Columbia, dated Oct. 29, 1937:

U. S. EXHIBIT 114

"Dear Dr. Conklin:
"I have just been informed that the Group Health Association has announced the names of the members of its professional staff, as follows: Dr. Brown; Dr. Raymond E. Selders; Dr. Allan E. Lee; Dr. Edmond D. Wells; Dr. R. Stephen Hulbert, and Dr. M. Scandiffio. Our records indicate that only two of these men are members of the American Medical Association, namely, Drs. Allan Edward L. Lee and Mario Victor Scandiffio. Both of these men have been reported as members in good standing in the Medical Society of the District of Columbia and Dr. Scandiffio has qualified as a Fellow of the American Medical Association."

"I am informed that the Home Loan Bank Board has agreed to provide \$20,000 a year for two years for the use of the Group Health Association."

"All of this makes it appear that both the Group Health Association and the Home Loan Bank Board have definitely determined to proceed with their plans in spite of all protests that have been lodged against such procedure."

Mr. Kelleher:—Exhibit 112 is a carbon copy of an original letter written by the defendant, Dr. West, to W. H. Tibbals, Executive Secretary, Utah State Medical Association, Salt Lake City, Utah, dated Oct. 29, 1937, reading as follows:

U. S. EXHIBIT 112

"Dear Mr. Tibbals:
"I have before me your letter of October 26.
"The American Medical Association has very actively opposed the plans of Group Health Association, Incorporated, as has the Medical Society of the District of Columbia, but, in spite of all the efforts that have been put forth, I have within the last thirty minutes received information from Washington to the effect that the Group Health Association, Incorporated, has announced the names of its medical staff and that the Home Loan Bank Board has agreed to provide \$20,000 a year for two years to finance that association. If you will be good enough to examine THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION for October 2, you will find an article dealing with this matter."

"We have taken the position that since the practice of medicine by corporations has been declared to be illegal by many states, no agency of the federal government is justified in using federal funds to finance a corporation that intends to engage in the practice of medicine. I understand that some of the promoters of Group Health Association, Incorporated, have taken the position that since licensed physicians are to be employed who will provide medical service for the members of that incorporation, the corporation can not be considered as practicing medicine. That contention has, of course, no merit whatever."

The last paragraph isn't important.
Exhibit 113 is a letter from Dr. West to Dr. Tibbals, written Nov. 6, 1937:

U. S. EXHIBIT 113

"Dear Mr. Tibbals:
"I am very glad indeed to have your letter of November 4.
"Since I wrote you last, the Group Health Association, Inc., has begun operations. The Home Loan Bank Board has agreed to finance the movement by providing \$20,000 a year from its funds for two years. The names of the medical staff, composed of six or seven men, have been announced. Only two are members of any component county medical society or any constituent state medical association. The American Medical Association and the Medical Society of the District of Columbia have opposed the movement to the fullest possible extent but without success."

It is signed by West.

Mr. Levin:—I will read from the minutes of the stated meeting of the Medical Society of the District of Columbia, held Nov. 3, 1937, 8 p. m.:

U. S. EXHIBIT 37
"Dr. Thomas E. Neill, President, presiding.
"Present: Drs. James A. Cannon, H. R. Schreiber, Albert P. Tibbels, Arch L. Riddick, Frank S. Horvath, H. S. Bernston, Henry B. Gwynn, A. Barklie Coulter, S. B. Muncester, Frank L. Willman, H. P. Ramsey, Fred A. J. Geier, J. H. McLeod, A. J. Connolly, Prentiss Willson, William P. Herbst, W. W. Chase, F. X. McGovern and other members to the number of about one hundred and sixty."

"The Minutes of the preceding meeting, held Oct. 27, 1937, were read and approved."

JOUR. A. M. A.
MARCH 8, 1941

Now, there were other matters taken up which I am going to omit, if it is satisfactory to counsel. All the first portion, until we get right down to the middle of page 5:

"Dr. Sprigg, in continuing, read the following:

"WHEREAS, The Bureau of Legal Medicine and Legislation of the American Medical Association has made a careful investigation and analysis of the Group Health Association, Inc., and published its report in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION under date of Oct. 2, 1937; and

"WHEREAS, The Medical Society of the District of Columbia is in full accord with the implications therein set forth; therefore, be it

"Resolved, That the Executive Committee of the Medical Society of the District of Columbia is hereby authorized and directed to take such steps as may be necessary, first, through the American Medical Association and if that fails, second, through its own initiative to inaugurate a program of information through the State Medical Associations and other sources of the dangers of lowering the standards of medical care to be given Government employees in the Home Owners' Loan Corporation organization and other Government agencies as found in the rules of the Group Health Association, Inc., and many other reasons why it is contrary to sound public policy.

"Dr. Sprigg reiterated that the only way to combat this thing would be through the aid and influence of the medical men all over the United States.

"Dr. Sprigg in continuing read further recommendations from the Executive Committee.

"Upon motion by Dr. Prentiss Willson, duly seconded, that the recommendations be considered seriatim. Adopted.

"Dr. Stanton was asked if he wished to withdraw his resolutions. He said he did not.

"Dr. Prentiss Willson said he wished to endorse Dr. Stanton's resolution and he hoped it would prevail. He thought there were three propositions which came before the Society which offer a way out of the wilderness, which he did not see in the elevation of the dues. He did not feel that an Executive Secretary would have any effect on the situation. He felt that it was common sense to find out where the Society stands legally in this matter. The thing is either legal or it is not legal. He thought the financial resources of the Society should be conserved so as to obtain that legal opinion. If the matter is illegal it should be ascertained how it may be successfully attacked in the courts. He thought that was common sense. Second, he was of the opinion that the Society should have some plan to offer whereby the public may be able to obtain better medical service. 'Certainly we can give them a better staff than the one published for the H. O. L. C.' The third thing had to do with the American Medical Association. The Home Owners' Loan Corporation plan was like an illegitimate child left on our doorstep. It is not necessary for us to board it for the rest of its life; the matter is for the public as a whole and the police in this situation should be the American Medical Association. He felt that the thing for the Society to do, tonight, would be to pass resolutions demanding that the American Medical Association do something about it. 'Then if the A. M. A. refuses there are ways to influence politicians, gentlemen—politicians listen to votes.' He cited the action of the House of Delegates of the A. M. A., 'if you do not accept our demand and do something we are going to approach directly every state medical association in the country and we are going to demand from them that they demand from you that you take action in this matter.' 'That in my opinion is the answer to the H. O. L. C. and not to put in a full-time executive secretary unless he might be a Farley, Roosevelt, etc.'

"Dr. R. Arthur Hooe would ask Dr. Willson a question: 'In the event that it is found to be legal would you tell us what you recommend?'

"Dr. Willson said that assuming that it is found to be legal then the only thing for the Society to do would be to adopt and give the public something very much better.

"Dr. Hooe, in continuing, stated that he wanted to support the preliminary remarks made by Dr. Stanton, support the remarks made by Dr. Vann and certain remarks made by Dr. Willson. The most important thing was to impress upon the minds of the members that this problem was a national problem. 'If there is something this Society can do and will do to impress that upon the American Medical Association it is of the greatest vital importance. Under new business it will be vitally important that I, as chairman of the C. C. & I. M. Committee, bring a matter to your attention involving the stepping in of that committee in a matter in connection with the H. O. L. C. In the meantime I sincerely trust that Dr. Stanton's resolution, as I have followed it carefully, will not carry.' He felt that it would be psychologically deadly for the Medical Society to step in and do the things suggested in Dr. Stanton's substitute. Public opinion would be that the members of the Society were failing to get funds in their pocketbooks. He thought it wise to wait a little while before stepping in; that it must be taken into consideration that the Society appearing as a complainant should realize that it is not consistent with the charter, which is created to incorporate the Society for the sole purpose of advancement of medical science. The charter would probably be taken away and the Society's property would immediately be attached. Therefore, Dr. Hooe was of the opinion that the Society must step cautiously. Dr. Hooe said the membership should not think for one moment that the Executive Committee was not busy with this matter. For months the Committee has worked diligently and will continue to do so.

"Dr. Stanton said he did not mean to give the impression that the committees were not busy.

"Dr. Philip A. Caulfield pointed out that concerted effort should be made to get within the membership of the Society some 600 or 800 members of the profession who are not on the rolls. Many of these men don't belong because of indifference and some feel that the Society does not offer them anything. It now so happens that their livelihood is jeopardized. He thought this was an opportune time to make a drive to get these men in the Society. He quoted a form letter that should be circulated to the prospective members stating the situation that has

arisen and urging these men to become members of the Society. 'Unless we take that action we are going to have a lot of men jumping over the fence when this thing gets too big for us.'

Now I will omit something and turn to the next page.

Mr. Leahy:—I think they have been talking so much about this resolution, the Stanton resolution on page 3, it might be well to go back to that.

Mr. Lewin:—Do you wish me to do that?

Mr. Leahy:—Please.

"Dr. William J. Stanton was recognized in the discussion. He offered the following substitute for the recommendation of the Executive Committee:

"WHEREAS, It is reported to the Medical Society of the District of Columbia that the Group Health Association, Inc., a corporation organized under the laws of the District of Columbia, proposes to and is now engaged in the practice of medicine in the District of Columbia, Maryland, Virginia and possibly other states; and

"WHEREAS, In THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION on Oct. 2, 1937, Volume 109, pages 39B to 46B, an article was published disclosing in substance that the said Group Health Association, Inc., cannot be licensed to practice medicine in the District of Columbia, and that the United States District Attorney for the District of Columbia and the Corporation Counsel for the District of Columbia have both held that a corporation cannot lawfully engage in the District of Columbia in the practice of a profession that requires licensure or registration as a condition precedent to the lawful practice thereof, even though the corporation undertakes to practice through licensed or registered agents; and

"WHEREAS, The Executive Committee of the Medical Society of the District of Columbia has made certain recommendations to the Medical Society for the District of Columbia regarding the said Group Health Association, Inc.; and

"WHEREAS, Said recommendations do not indicate that the said Executive Committee made a complete and thorough investigation of the purposes and activities of the Group Health Association, Inc.; and

"WHEREAS, Said recommendations do not disclose that the said Committee had or obtained the advice and assistance of counsel; and

"WHEREAS, The said article that appeared in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION makes no recommendations whatsoever as to what, if any, steps this association should take in the premises; therefore, be it

"Resolved, By the Medical Society of the District of Columbia at a meeting duly called on the 3d day of November, 1937, that the recommendations of the Executive Committee be recommitted to said committee, and that said Executive Committee is hereby authorized and directed to investigate and determine whether or not in its judgment the Group Health Association, Inc., is engaged in the unlawful practice of medicine in the District of Columbia as prohibited by Section 152 of the Code of the District of Columbia, 45 Stat. 1338, Chapter 352, Section 41, February 27, 1929; and that said Executive Committee is hereby authorized and directed to obtain the assistance and advice of counsel in its investigation of the said Group Health Association, Inc., and to institute and prosecute in the name of the Association and/or for its benefit, and/or for the benefit of the members thereof, and/or in the name of the said Committee, as such Committee in addition to the names of one or more individual members of the said committee, such actions as in their judgment and discretion may be deemed appropriate and proper for the suppression of the unauthorized practice of medicine in the District of Columbia; and be it further

"Resolved, That the said Executive Committee should be and is hereby instructed that in instituting and prosecuting such actions, no exceptions should be made as to any firm, person and group or class of business or occupation which such person, persons or organizations are alleged to engage in the unauthorized practice of medicine and in which the said Committee feels action should be instituted whether for declaratory judgment, injunction or other relief; and be it further

"Resolved, That for the purpose of prosecuting any such action or actions so instituted by said committee, the said committee shall continue in office as a Standing Committee of this association until the conclusion of such litigation, and that said committee shall be charged with the conduct of such litigation to a conclusion, and that the necessary expenses thereof shall be defrayed by this association; provided, that no member of said committee shall receive any remuneration for services in such connection.

"Motion was made that the foregoing resolutions be adopted. Seconded."

Mr. Lewin:—Now, turning back to page 8. Have you something, Mr. Richardson?

Mr. Richardson:—Yes, on page 3; it is not on the same page in your record. There is a notation that this resolution was withdrawn.

Mr. Lewin:—That is right. That is the reason I didn't read it. Anything else?

Mr. Richardson:—Yes. You had gotten to the point of what Dr. Caulfield said.

Mr. Lewin:—Yes. Do you want me to go along with that?

Mr. Richardson:—Yes, if you will.

Mr. Lewin:

"Dr. J. H. McLeod felt the Society should attempt to find out how much backing the H. O. L. C. has from the United States Government. Personally he was sure they had plenty of backing from the Government and when the Society fights this thing it is fighting the Government. He urged caution. They can very quickly make it legal.

"The operations of Group Health Association, Inc., began on Monday last. Two members who contracted with Group Health Association, Inc., were members of the Medical Society of the District of Columbia, and a third had sent in his application, which has been withdrawn within the past ten days. There is nothing to be done about this third member at the present time. The resignations of the other two were received by the Medical Society of the District of Columbia within the week. A letter was sent to each of them asking him to appear before the Compensation, Contract and Industrial Medicine Committee. They did not appear but the committee received a communication from one of them. The committee unanimously recommended to the executive committee of the Medical Society of the District of Columbia that disciplinary measures be taken.

"Dr. Woodward raised the question as to whether the notice to these members had told them of the charges that were to be preferred against them and stressed the necessity for following strictly the procedure as laid down in the constitution and by-laws of the Medical Society of the District of Columbia. Further discussion was deferred to a time when it could be gone into in detail by Dr. Woodward.

"Dr. Hooe: There is no use to go into the demerits of the H. O. L. C. health movement since the attitude of the Medical Society of the District of Columbia is known, but it is necessary to discuss the difficulties that confront the medical profession in Washington because of this movement, which is the entering wedge of socialized medicine in the United States.

"Dr. Hooe, in reply to Dr. West's statement that the inference in his statement has been that the American Medical Association has done pretty well as a scientific organization but has not concerned itself with more than scientific medicine, said that the statement was made in the broadest possible terms. Dr. West was not absolutely sure what the record will show, but he was inclined to think that the American Medical Association had been fighting H. O. L. C. before the Medical Society of the District of Columbia became actively interested.

"Dr. Hooe then presented figures to show that out of a total population of 619,000 in Washington, after certain deductions were made for government employees, Negroes, etc., there remained a total white population of only 189,127 including indigents and that all classified physicians of Washington numbered 2,100.

"Dr. Hooe: The people in Washington are without suffrage, the entire city, including prosecuting attorney and corporation counsel, being selected by the Administration, and it is reasonable to expect such appointees to cater to the desires of those to whom they turn for their bread and butter, so that this matter has to be gotten at through Congress. Who is best qualified to reach the man in Congress, the little state medical society at Washington or the doctor at home through the states? Who will suffer from the experiment? Will not the entire medical profession? It is quite clear what will happen to the medical profession at Washington.

"Dr. West: Dr. Hooe has not made one statement of any kind that the American Medical Association has not fully considered and acted on where possible.

"Dr. McGovern: Since the Group Health Association, Inc., has started, the medical profession in Washington has become acutely aroused and the question is What shall the Medical Society of the District of Columbia do? The resolution introduced before the Medical Society of the District of Columbia suggested immediate legal action, but some thought that possibly some other plan might be offered. The Medical Society of the District of Columbia is in a quandary to know what to do and is seeking guidance here.

"Dr. Hooe: Some young people in the Medical Society of the District of Columbia are very much aroused and one of them introduced a resolution which stated in substance that the Society should get busy and prosecute at once regardless of what happens. The resolution was withdrawn only on condition that two delegates be sent immediately to Chicago to confer with the American Medical Association to see what could be done about this.

"Dr. West: It is quite possible that the situation in the District of Columbia is no worse than that which may develop in some other places, as for instance in Denver. Denver has relatively as large a government population as Washington and, perhaps, larger. In some states work is being done in contacting individual members of Congress on this matter. An effort is being made to see if members of Congress can not be stimulated to oppose this movement.

Dr. McGovern presented a statement to indicate the uselessness of Washington men attempting to contact men in Congress.

"Dr. McGovern: It seems that the intelligent way to go about this thing is politically and it would seem the wisest thing to do would be for the parent organization to contact the private physician of every congressman and senator and carry on a campaign that way.

"Dr. West: Political attempts always bring reprisals.

"Within a few days there will be a conference of secretaries and editors of state medical associations and one of the things that will be discussed is this H. O. L. C. matter. The Board of Trustees has been considering this thing for a long time and has given instructions to oppose it.

"To Dr. Hooe's question as to whether or not the American Medical Association has exhausted all means of combating this thing, Dr. West replied that it certainly had not and had no idea of quitting.

"Dr. Hooe: Do you not believe that the press all over the country should be directed to state to the people in no uncertain terms the fact that the American Medical Association opposes such practice and why?

"Dr. West: A conference of capable newspapermen was held here a few days ago and this among many other subjects was discussed, but the principal interest of the newspapermen is the method of securing and publishing news. There are radicals among newspapermen as well as among congressmen and physicians. The Committee of Physicians, a self-constituted body, has secured signatures of about 400

—out of 106,000 members of the American Medical Association—physicians evidently to show that the policies of the American Medical Association do not represent the feeling of a large element of physicians. Newspapers are playing that up.

"Dr. McGovern: The Society feels very definitely that it should have some kind of expression from the American Medical Association as to what it might do or is doing or can do in relation to the national aspects of this thing.

"Dr. West: The American Medical Association tried to utilize the services of some of the most important people in Washington to get at the bottom of this thing when it was first started, before the Medical Society of the District of Columbia ever raised a finger about it, but we could not get a copy of the contract or information that was definite or authentic in spite of all efforts to do so. This isn't so easy that all that is necessary is for the American Medical Association to say something. The American Medical Association will do the best it can. Its views are thoroughly understood in official circles in Washington, but that doesn't seem to make any difference.

"Dr. Hooe: Their own legal bureau informs them it is entirely legal.

"Dr. Woodward: No question about the illegality of it.

"Dr. Hooe: Assuming that it is illegal, this Administration can very easily make it legal.

"Dr. Woodward and Dr. West did not agree that it would be so easy to legalize it.

"Dr. West: Nothing can be accomplished by a great public upheaval. A very considerable number of the newspapers of this country are more or less convinced that there will have to be some extremely radical changes in medical practice, including some form of insurance and some form of government insurance. The American Medical Association does not agree. It does not approve any compulsory sickness insurance and has great fear of voluntary sickness insurance because the history of compulsory sickness insurance shows that voluntary sickness insurance has been the forerunner.

"Dr. McGovern: Do you feel that the medical profession is rendering medical service to the people as well as it could or should?

"Dr. West: It is doing it better than any other profession on the face of the earth. The situation will never be ideal because many persons won't take medical service when it is easily available. Replies to a questionnaire sent out by the American Medical Association definitely disproved the statement to the effect that one third of the people of this country were not getting and could not get needed medical service.

"Dr. McGovern: Do you think that this country will eventually escape sickness insurance?

"Dr. West: I don't know, but I am quite certain that sickness insurance systems in older countries are not operating as satisfactorily as some would have us believe and I think that it is probably true that some of them are losing ground.

"Dr. McGovern read an abstract from a paper he had presented over four years ago as retiring president, showing the indifference of medical organizations.

"Dr. West: The only organization in this country that did not exhibit smug indifference to the trend toward centralized control of medicine was the American Medical Association.

"Dr. McGovern: Do you feel that everything is all right in American medicine today? Realizing that the United States is now the only large nation that has not some form of centralized control of medicine, what is behind it as far as the people are concerned? Why all these different types of practice springing up in the United States, if behind it there does not seem, in the minds of laymen and of some physicians, to be some need?

"Dr. West: The American Medical Association thinks there is 'a need.' There always has been and always will be as long as there are advances in medical knowledge. But the organized medical profession has tried hard to have the need met and has done very well under all the circumstances.

"Dr. McGovern: In Washington there is the Group Health Association and behind it, possibly, socialized medicine. Those two situations confront the physicians in Washington, who are determined to do something about the matter. How are they going to go about it? The advice and cooperation of the American Medical Association is solicited.

"Dr. West: The society has had the help of the American Medical Association and will continue to have it.

"Dr. McGovern: The question in the minds of some is as to whether it should be fought legally.

"Dr. West: It is my purely personal opinion that somebody has to fight it legally. If the American Medical Association does it, it may arouse forces that will make it more difficult.

"Dr. Hooe: Why not the Medical Society of the District of Columbia by the same token?

"Dr. Woodward: I suggest that you have competent legal counsel advise you. The primary move is clearly to see whether your district attorney or your corporation counsel or the commissioners or the board of licensure or the insurance commissioners will act. Whether or not they will act cannot be determined until the facts are formally laid before them.

"Dr. McGovern read from the Washington Evening Star an article concerning this matter. During the discussion that followed it was pointed out that Corporation Counsel Seal emphasizes the fact that he will not be concerned whether a corporation instead of an individual is engaged in medical practice. The article in the Washington Evening Star states that Mr. Seal will begin the study of the Group Health Association, Inc., to determine whether it is operating an insurance plan and whether it should be licensed by the District Insurance Department. The suggestion was offered that it may be the duty of the United States District Attorney or some other body to act. There followed discussion concerning the powers of the Medical Society of the District of Columbia and its right to institute proceedings. Dr. Woodward offered to furnish citations regarding corporations engaging in medical practice.

"Dr. McGovern: There is a great sentiment in the Medical Society of the District of Columbia to formulate some plan.

"Dr. West: I don't know whether or not you remember that I suggested, when in Washington some time ago, that you give that idea some consideration, but after thinking about it later, I decided that probably I shouldn't have offered that suggestion because you already formulated a plan and I am not convinced that that plan did not have something to do with the stimulation of this H. O. L. C. movement. A plan almost inevitably tends to create a sentiment for the formation of other similar plans.

"Dr. McGovern: There is a very definite sentiment to initiate some kind of plan. There are three or four different ones in the making now, and it is necessary to ask you gentlemen how far we may go along.

"Dr. West: If you go into the corporate practice of medicine, you are on the same ground as the H. O. L. C. scheme.

"In reply to Dr. McGovern's question as to whether or not the Medical and Dental Service Bureau is practicing corporate medicine, Dr. West stated that that scheme is supposed to help people meet bills. It is more concerned with payment of bills than with practice of medicine.

"Dr. Hooe: Let us assume now that the plans suggested thus far are not agreeable. What can be done to meet the situation?

"Dr. West: I can only tell you again that you should go to every official agency concerned in this thing and get them to look into it with a view not only as to whether or not it is an insurance scheme subject to an insurance law but also as to whether it is not definitely a corporation practicing medicine.

"Dr. West: There are medical societies in this country that have notified the people in their communities that the members of the society will take care of them and that if they can pay, all right, but if they can't pay, they will be taken care of anyhow.

"Dr. Hooe: In the matter of the H. O. L. C., what is your future program?

"Dr. West: It is just exactly the same as it has been all the time. We shall continue fighting it every way we can. We are going to get all the help we can get. We are at least going to keep on until we are instructed otherwise.

"Dr. Hooe: Executive Committee recommended that a letter be addressed to the medical boards of the various affiliated hospitals in Washington, calling attention to the H. O. L. C. health group, insisting that the hospitals take cognizance of it, and, among other things, calling attention to the fact that the physicians employed by such groups are not acceptable to the Medical Society of the District of Columbia.

"In reply to Dr. McGovern's question as to how far the Medical Society of the District of Columbia might go in controlling the hospitals, Dr. West expressed some doubt that the society can effect such control.

"Dr. Hooe: Is it not, in your opinion, most reasonable that the hospitals should acquiesce in this matter?

"Dr. West: It is reasonable that they should do it but as to whether or not they will, that's another question. Suppose they don't?

"Dr. Woodward: You would be absolutely certain to elicit at least an attempt at legislation in Congress that would prevent your doing what you propose.

"Dr. Hooe: At a meeting of a group of the Medical Society of the District of Columbia last Sunday night it was brought out that all the civilian hospitals in Washington except, probably, one had fallen right into line, which was very gratifying.

"Dr. McGovern: Is there any objection if the Medical Society of the District of Columbia goes ahead and carries on a campaign throughout the states?

"Dr. West: In thirteen days there will be a conference of secretaries and editors of constituent state medical associations at which many other officers of constituent state and of some component county societies will be present. The whole story of the H. O. L. C. movement will be brought before the Conference and the point of view of the members of the Conference can be obtained and presented better than by spending money in written material. The members of the Conference will be given the entire picture, and Dr. Conklin and Dr. Yater, members of Conference, will be given full opportunity to say anything they want to say.

"Dr. Hooe: What do you anticipate the reaction of the members of the Conference will be?

"Dr. West: Opposed to the H. O. L. C. scheme. They will be asked definitely to carry on.

"Dr. Hooe: What do you think their carrying on will consist of?

"Dr. West: I am going to ask that they get into contact with their congressmen to make them understand what is involved. Some of them are already doing that.

"Dr. Hooe: You are going to try to get the Board of Trustees to agree that some definite campaign must be waged through Congress?

"Dr. West: A campaign does not get you any place. It simply redoubles the effort of every agency opposed to you. I think that the Medical Society of the District of Columbia may not have put its position in the papers in Washington as clearly as it should have done. It should be very clearly stated in words everybody can understand that the interest of medicine in this thing is actually the interest of the public. The promotion of the H. O. L. C. scheme will actually tend to destroy the private practice of medicine and the people will pay the penalty.

"Dr. Hooe: Can we say we have the backing of the American Medical Association in that?

"Dr. West: You can say so very definitely, as that is absolutely in keeping with the policies of the organized medical profession in this country.

"It was again urged that this matter be presented to the proper officials in Washington so that they take up the question of a corporation practicing medicine. Mention was again made of the desirability of contacting the proper government officials through physicians, who should, of course, know the facts and the argument to apply."

Mr. Kelleher:—I shall now read from Exhibit 136, which is a portion of the proceedings of the board of trustees of the American Medical Association for November 18 and 19.

Mr. Kelleher:

"Group Health Association, Inc.: As has been previously explained, the Federal Home Owners' Loan Corporation has granted \$20,000 a year for two years to the Group Health Association, Inc., to aid it in getting started and to help provide the expensive modern equipment which will be used in the clinic. Thus, the federal government has provided funds to finance a corporation that is to engage in the practice of medicine, in spite of the fact that corporation practice has been declared to be illegal in numerous court decisions, including decisions handed down by federal courts.

"Doctor West reported that a committee of the Medical Society of the District of Columbia had visited the headquarters office early in the month for the purpose of conferring with him, Doctor Woodward and Doctor Leland with respect to the Group Health Association, Inc.; that the committee brought what apparently amounted to a demand to the Association to devise further means and ways of opposing the continued operation of the Group Health Association, Inc., and that it was intimated that the American Medical Association had not concerned itself with anything but scientific matters, in spite of the fact that he and Doctor Woodward had conferred with the District Society in Washington on instruction from the Board; that a write-up had appeared in THE JOURNAL concerning the matter; that diligent efforts had been made to develop information concerning the Group Health Association, Inc., and to procure a copy of its contract, and in spite of the fact that the headquarters office, on instruction of the Board of Trustees, had done everything it could to combat the movement on the basis of the fact that it is contrary to the policies of the House of Delegates.

"In this connection, Doctor West presented a newspaper account of a meeting held at the Mayflower Hotel on October 30, to usher in the Group Health Association, Inc., which, it was stated, would open its clinic on the following day for members of the Federal Home Loan Bank Board and Affiliated Agencies. The newspaper contained a statement given out by Dr. Richard C. Cabot, lauding group medical practice and criticising the medical profession. This matter, he stated, was referred to the Judicial Council, which had requested him to contact Doctor Cabot to ascertain whether or not he was incorrectly quoted in the newspaper item. A letter has been written to Doctor Cabot but thus far no reply has been received.

"Dr. Cullen moved that Doctor West be requested to explain the whole matter of the activities of the Group Health Association, Inc., before the Conference of Secretaries of Constituent State Medical Associations and Editors of State Medical Journals on Friday. Doctor Hayden seconded the motion and it was carried."

Exhibit 137 is a photostatic copy of the minutes of the Judicial Council of the American Medical Association, Nov. 12, 1937.

Mr. Kelleher:—On page 3 appears the following:

"Dr. Richard C. Cabot and the Group Health Association, Inc.: Several letters of complaint against Dr. Richard C. Cabot, Boston, Mass., were presented to the Council. These complaints had to do with Doctor Cabot's address under the auspices of the Home Loan Bank Board's new Group Health Association as reported in newspapers.

"After consideration of the matter, it was moved by Doctor Burns, seconded and carried, that the Secretary of the Judicial Council be requested to bring the matter to the attention of the Massachusetts Medical Society through its secretary and to write Doctor Cabot that, before the Judicial Council considers any action in the matter, it would like to know whether or not he said the things he is reported in newspapers to have said in his address at the meeting held under the auspices of the Home Loan Bank Board."

Exhibit 119 was a letter from the defendant West to Dr. Joseph S. Wall, 1864 Wyoming Avenue, Washington, D. C., dated Nov. 9, 1937:

U. S. EXHIBIT 119

"Dear Doctor Wall:

"I am sorry that I have not had opportunity until now to reply to one particular paragraph in your letter addressed to Doctor Woodward under date of November 1.

"We have received several letters protesting against the utterances of Dr. Richard C. Cabot at the time of his participation in the meeting held at the Mayflower Hotel under the auspices of the Home Loan Bank Board and the Group Health Association, Inc. It is my purpose to submit all of these communications to the Judicial Council of the American Medical Association at its meeting to be held within a few days.

"The diatribe delivered by Dr. Richard C. Cabot at the Mayflower Hotel was strictly in keeping with the record he has made during the last few years. Doctor Cabot does not, apparently, have as many opportunities as were formerly offered to him to deliver himself of his peculiar views. Doctor Cabot is a member and a Fellow of the American Medical Association and it is because of his Fellowship that I am in position to submit to the Judicial Council the several communications we have received. Original jurisdiction over his membership lies with the district medical society of the Massachusetts Medical Society of which he is a member.

"We had a very pleasant visit from Doctors Hooe and McGovern and went over very fully the situation that has developed in Washington. As a matter of fact, official representatives of the American Medical Association have done all that they could to oppose the movement whereby a corporation financed by an agency of the federal government has been put into the practice of medicine in Washington, and it is our purpose to continue these efforts.

"With my sincere good wishes, I am

"Very truly yours,
"Olin West."

Exhibit 156 is a letter from Joseph S. Wall to Dr. Olin West, dated Nov. 11, 1937:

ORGANIZATION SECTION

"Dear Dr. West: U. S. EXHIBIT 156

"I want to thank you very much for your letter of November 9th relating to the action of Dr. Richard C. Cabot in lending comfort to the enemy by a remarkable address he made in Washington.
"I do trust the Judicial Council will take suitable disciplinary action in the promises as it would seem richly deserved.
"The situation in Washington is now very acute and is fraught with most serious implications. Nearly all of our accredited hospitals have in force a ruling that members of the staff and courtesy staff must be in good standing as members of the American Medical Association and this rule has been repeatedly enforced since a legal ruling upholding the right of a hospital to exclude a physician was promulgated by the local Court in the case of Cox versus the Emergency Hospital.
"Forty-eight hours ago, on the eve of a Community Chest drive, the threat was held over the head of the Chest officials that the Home Owners' Loan Corporation would exercise its influence to prevent all contributions by Government employees unless the hospitals admitted their paid Hessian practitioners. I understand that at a meeting of the Hospital Superintendents with the Chest officials the sentiment seemed to be that the hospitals would admit the patients of Group Health Association but that the privilege of physicians in attendance would be governed by the Hospital rules.
"We sincerely hope that the American Medical Association will uphold our hands in an effort to check this dangerous innovation under quasi-government auspices.
"Again with thanks, believe me,

"Sincerely yours,
"Joseph S. Wall, M.D."

Exhibit 155 is a carbon copy of defendant West's reply to Dr. Joseph S. Wall, dated Nov. 16, 1937:

"Dear Doctor Wall: U. S. EXHIBIT 155

"I am very glad indeed to have your letter of November 11. I fully agree, of course, with the views expressed in your letter with respect to the situation that has developed in Washington.
"The American Medical Association has done everything that it could to oppose the institution of the plan that has been placed in operation under the auspices of a federal agency in Washington, its efforts having been initiated months ago. A report on this matter was submitted to the Board of Trustees at Atlantic City, and instructions issued by the Board be persisted in until such time as the Board of Trustees or the House of Delegates of the American Medical Association may issue new instructions.
"It seems perfectly apparent that the Group Health movement in Washington is receiving very powerful support, some of which, perhaps, has not yet come into the open.
"With my sincere good wishes, I am

"Very truly yours,
"Olin West."

Mr. Lewin:—I shall read from the minutes of the meeting of the Medical Society of the District of Columbia held Wednesday evening, Nov. 10, 1937, at 8 p. m.

"Dr. Thomas E. Neill, President, presiding." (Reading) Present: Drs. Calkins, Chipman, White, Speer, Ellison, Horgan, Williman, Dowling, Herbst, Neumann, Leffer, Minor, Mason, Brumbaugh, Trible, Murphy, Thompson, Schreiber and other members and guests to the number of about ninety.
"The minutes of the preceding meeting of the Society, held November 3, 1937, were read and approved.

"The Secretary read a communication that had been received from the National Homeopathic Hospital, as follows:
"November 9, 1937.
"Dr. C. B. Conklin, Secretary,
The Medical Society of the District of Columbia,
Washington, D. C.

"Dear Dr. Conklin:
"As the attitude of the National Homeopathic Hospital toward the Group Health Association is apparently not clear to various members of the District Medical Society, I am enclosing a copy of a letter sent today to their president, Mr. Penniman, by Dr. J. B. Gregg Custis, Executive Officer of our Board of Trustees.

"(Enclosure):
"November 9, 1937.
"Mr. William F. Penniman,
Group Health Association, Inc.,
1328 Eye Street, N. W.,
Washington, D. C.

"My dear Mr. Penniman:
"At a Board of Trustees meeting held on November 4, 1937, it was voted that until the Group Health Association, Inc., was approved by the Medical Society of the District of Columbia, the National Homeopathic Hospital could not make any contract or enter into any agreement with it.
"Very truly yours,
"J. B. Gregg Custis, M.D.,
"Executive Officer, Board of Trustees."

I shall now read from the minutes of a special meeting of the Medical Society of the District of Columbia held Thursday evening, Nov. 11, 1937, at 8 p. m.:

"Dr. Thomas E. Neill, President, presiding: (Reading) Present: Drs. Gannon, Warner, Mallory, John Reed, Sterling Ruffin, Schreiber, Cajigas, Calkins, Mundell, Cummings, Thomas A. Groover, Marlbury, Reichelderfer, Wall, Leech, Smith, Parker, Hyde, Thomas, and other members to the number of about three hundred.
"Dr. Neill announced that the meeting was called to bear a report from the committee of two which was sent to Chicago to confer with representatives of the American Medical Association regarding the problem confronting the local profession, viz., the Group Health Association, Inc. He called on Dr. R. Arthur Hooe.

"Dr. R. Arthur Hooe said he would make his remarks as brief as possible during which he would deal more or less in generalities. His remarks would be followed by a report from Dr. F. X. McGovern. Dr. Hooe stated: 'You would naturally want to know something of the trip which we made to Chicago. We arrived in Chicago on Saturday morning at 9 o'clock. About 5 minutes before 10 we arrived at the American Medical Association headquarters on North Dearborn Street, where we received a very, very cordial welcome at the hands of Dr. Olin West, W. C. Woodward and R. G. Leland. Our conference very promptly began at 10 a. m. and lasted for three hours, at the end of which the other two gentlemen seemed to be in a hurry—Dr. Woodward in some hurry to catch the afternoon train for Washington, Dr. Leland being in a hurry—Dr. West took us in ebarge to the University Club where he lunched us. We had a delightful visit with them. At the conclusion of the luncheon a taxi was furnished to take me to the Pennsylvania Station and a taxi furnished to take Dr. McGovern to the New York Central from which he left for New York.'

"Early in the conference it was quite apparent, very promptly developed, that we were dealing with a problem in common, in which the American Medical Association and we were the victims—we of the states, particularly we of Washington, and perhaps no less those of Denver, Colorado. This being true, the conference throughout was entirely advisory in character, in no way whatsoever controversial. We were early assured by these gentlemen that not only do they view but they have always viewed it as a National problem. They furthermore assured us that they heartily endorsed the attitude of the Medical Society of the District of Columbia and hoped and expected to endorse its future policies in regard to this matter, assuming, of course, that that course will be wisely and carefully mapped out. They recognized the fact that the Medical Society of the District of Columbia constituted the guinea pig inoculation in this case. We have their sympathy and we have their assurance of their cooperation whenever and wherever possible. Discussing ways and means and the best ways and means by which the problem can be approached, they themselves have recognized the seriousness of this thing. They felt long before we did and they have been very diligent in their efforts to combat it. Many things have been done by these gentlemen which have never been brought to our attention and as in all organizations—in our own many times, obviously confidential. Be assured that they have left no stone unturned nor will they in the future. They gave us very sincere advice in the matter and you will later have the pleasure of being addressed by Dr. Woodward and I hope Dr. Woodward and Dr. McGovern may cover anything I may inadvertently omit. They feel the Medical Society of the District of Columbia, if possible, at this time should not play the role of the complainant in the case, if that can be avoided. They feel, however, that unless some other profession, such as the District Bar Association—and we are advised that that is being attacked as well, or some other institution or individual, will not complain that we then, in that case, they advised that after reasonable time and with most careful legal guidance that we proceed if no one else will and show the Corporation Counsel and the District Attorney wherein this practice is illegal according to the Medical Practice Act and the Insurance Laws and if they refuse to act, complain to the Commissioners.

"They feel also, I believe, it is our conclusion—it is our feeling, that they feel from what they said to us, the many things that were read—that the best way to attack this problem is through the powers that be, that the powers higher up. They realize that we have no suffrage in Washington and they realize that it constitutes a great problem because of that fact. They feel that the Senators and Congressmen, as we do, should be approached by the voters back home. We, who have no vote, may have a little say—receive promises and little action.
"On the 18th of this month the Board of Trustees of the American Medical Association will meet in Chicago, at which time we have assurance that this issue will be the one foremost to be considered by that group. We feel also that the expression of these three gentlemen to us is but a reflection of what that committee, that Board of Trustees, will do or suggest. It is known to them that two of our members, namely Drs. C. B. Conklin and W. M. Yater will be in Chicago upon that occasion. They look forward to their coming. The floor will be free to them and it is hoped by them and by us that these gentlemen will speak as freely as we tried to do. It is also hoped that these gentlemen will be able to bring us back or we will soon obtain some report as to those deliberations and their decision.

"I have stressed or have tried to stress the fact, ladies and gentlemen, that we feel they feel that we could accomplish more if by some means we can reach through the proper channel the powers that be on Capitol Hill. There were many things said about it and it constitutes quite a problem. They are hoping that the Medical Society, as said before, will proceed after due careful deliberation, proceed wisely, in the matter, and they hope that it will be able to accomplish something along these lines.
"They have stressed the fact that whatever plan may be arrived at by you, by which to accomplish this or to make the effort, the average doctor who is asked to contact a representative or senator should be coached carefully. In order that he may have well in mind the subject matter of that interview in order that he may be prepared to debate it with that gentleman and throw light upon it, at least that gentleman has to have a way of doing some things, taking him over, it is a very very important point.

JOUR. A. M. A.
MARCH 8, 1941

"In conclusion, I personally hope that by some means the Medical Society of the District of Columbia will find some way by which its members may be coached and may be able to contact as many of these men in Washington as possible for the good that may come of it. But more important than that, it would seem that the State Societies should be contacted as early as possible and those men reached through the states if it is possible to do that. Finally, in that same connection, it seems to me, as we all sit here and discuss our problems, and often never seem to get anywhere, I wondered myself if that cannot best be done by the means of some committee by its subcommittees to get together and iron out the problems.

"I will now retire and hear Dr. McGovern tell more specifically of the conference, at the close of which I will close with a few words; if not, we will then have the pleasure of hearing Dr. Woodward."

"Dr. F. X. McGovern was recognized. He said that in view of the fact that there may be some members present who were not in attendance at the last business meeting, he would read, for their information, the resolutions which were adopted, authorizing the sending to Chicago of two members of the Society, and another resolution that had directly to do with the American Medical Association."

THE COURT:—You have read those?

Mr. Lewin:—Did you say something, your Honor?

THE COURT:—I said you could omit those.

Mr. Lewin:—Yes. (Reading):

"Dr. McGovern said he would read some questions and answers that were involved in the conference in Chicago, in order that the membership may be apprised of the proper reactions, thereby being able to deduce their own conclusions. (Questions and answers read by Dr. McGovern appended hereto.)"

The question and answers read by Dr. McGovern are appended thereto. And of course I will omit those. They have already been read by my colleague.

(Reading:) "Dr. Woodward"—

Mr. Leahy:—Wasn't there one you omitted there? You omitted the question and answers, but there was one you omitted: "Dr. McGovern then read a statement of his own personal conclusions."

Mr. Lewin:—I will read that. (Reading):

"Dr. McGovern then read a statement of his own personal conclusions. He emphasized the fact that the American Medical Association is very definitely and strongly of the opinion that the Group Health Association, Inc."

Do you want a little time?

Mr. Leahy:—Just a weensy bit.

Mr. Lewin:—Do you want to go over it again?

THE COURT:—Does it say what "illegal" is?

Mr. Leahy:—Doesn't say.

THE COURT:—We will leave it to them.

Mr. Lewin:—We will get one of his legal opinions. Do you want Dr. Arthur Hooe's remarks again?

Mr. Leahy:—No. Go ahead.

Mr. Lewin. (Reading):

"Dr. W. C. Woodward, in addressing the Society, said he felt very much at home in this Society, although he noted a lot of new faces. He said that Drs. Hooe and McGovern had stated the situation very clearly in so far as it relates to the American Medical Association. He stated that the problem is not a local problem. According to the articles of incorporation of the Group Health Association membership in the organization is not limited to members of the Home Owners' Loan Corporation and its affiliates, and is not limited to employees of the Federal Government in the District of Columbia. Every employee of the Federal Government, anywhere, except commissioned officers of the Army and Navy, and enlisted men in the Army and Navy are eligible for the benefits of the organization, such as they are. The fact that at the present time the activities of the organization are limited to the District of Columbia is the result, he thought, of the failure of the organization to enroll enough men outside, or to procure enough money to carry on outside of the Home Owners' Loan Corporation in order to put the program over. He stated that we all recognize it as a national organization and that at the present time it is centered in the District of Columbia. He felt there was one thing that the members of the Medical Society ought to bear in mind and that is that the organization that they have to fight is not the Home Owners' Loan Corporation—it is Group Health Association, Inc., which is merely a private corporation. If the five men who have organized Group Health Association have the right to organize and hire doctors and to sell the services of those doctors, whether for profit or not, any five men or women in the District of Columbia can do the same thing, retaining all the time control over the activities of the employees. He hoped the members realized that that is an intolerable situation. The courts have so regarded it—it has been held that a corporation cannot practice medicine even though every employee of the corporation is a licensed practitioner.

"Dr. Woodward said the question has arisen with respect to practice of corporations. He cited one case in which an individual undertook to hire a doctor, the individual pocketing the profits. The court in that particular case ruled that unless the individual financial backer was a licensed practitioner he could not practice medicine in that way. The number of decisions to the contrary have been negligible. He recalled two decisions by the Supreme Court of one state in that amounted to the same case to the contrary—Nebraska. Decisions everywhere else have held that a corporation cannot practice medicine as the Group Health Association is practicing medicine. If they do it is a criminal offense. Anybody can prefer charges if they are willing to swear out a warrant.

Any organization, such as the Society, hires its own prosecutor. It pays the man to proceed for them. It swears him in. Today, Dr. Woodward added, the Society has as its servants the United States District Attorney for the District of Columbia and the Corporation Counsel for the District of Columbia. If the Society lays before them the evidence that these persons are violating the law they have no lawful option but to prosecute. That, of course, relates to the practice of medicine. As he recalled the Healing Arts Practice Act he believed it was the duty of the Superintendent of Police to get evidence with view to prosecution.

"Dr. Woodward said there was another approach to this question—that the organization is conducting an insurance business unlawfully, and in that case it is the business of the insurance commissioners to gather the information and prosecute. In both cases, both as to the unlawful practice of medicine by a corporation and with respect to the corporation engaged in insurance business, Dr. Woodward said these questions had come before the corporation counsel and he has decided in the case of insurance that such a corporation cannot engage in that business and he has come to practically the same conclusion when it comes to the practice of medicine. The United States District Attorney has ruled that a corporation cannot practice any profession that requires a license to permit one lawfully to engage in such practice. Dr. Woodward stated that those approaches are open. Other approaches that are not nearly so open are available, i. e., quo warranto proceedings, which are a bit more difficult because the authority of some officer in the District of Columbia who corresponds to the Attorney General of the state must be obtained to institute proceedings. Further, to recover from the Group Health Association money that has been granted it by the Federal Home Loan Bank Board—if that money has been unlawfully paid—a suit to recover must be at the instance of some government official.

"When it comes to the check-off system, Dr. Woodward stated, which again is contrary to public policy, while not a penal offense, any effort to continue would be something that would require action by some government officer, not by a private official. He said that it has been frankly admitted that the Federal Home Loan Bank Board has granted, or committed itself to give this organization \$20,000 a year for two years. That, he said, is 'your money and mine.' If the Board can give to a private corporation of this character he thought we could look for some authority for the gift. It is alleged that there has been undue amount of sickness among employees of the Home Owners' Loan Corporation and that this grant is to reduce the amount of sickness, but if there is any undue amount of sickness no evidence has been furnished. Certainly men in the organization, many of them, are able to pay and they should not find it necessary to grant \$20,000 a year to operate a corporation. These men, earning from \$4,000 to \$8,000 a year, are enabled to get from this organization medical services at \$2.20 for a single person, \$3.30 for a man and his family. It should be recognized that these services could not be granted without a subsidy. It is admitted that the organization has been granted \$20,000; how much more no one knows, Dr. Woodward said. He added that it had been stated to be \$100,000. No one can say that is true or not true, but he had never seen it denied.

"Dr. Woodward said further that the contract that was made between the Home Owners' Loan Corporation and the Group Health Association is a profound secret. 'One way to subsidize and operate a corporation is to hire it to render certain services. What those services are no one knows. I was told that the medical director of the Group Health Association was to be made superintendent of what he termed the Emergency Rooms of the Home Owners' Loan Corporation throughout the entire United States. There are in those offices, emergency rooms, retiring rooms that have nurses and they are to take their orders from the medical director of the private corporation. What corporation was not stated. The contract is still a profound secret and very definite and positive efforts have been made by men of influence to obtain a copy. No one has been able to see it.

"Dr. Woodward, continuing, stated that the Society has before it what is clearly a legal problem. A group of men such as the Society, not familiar with methods of law, is hardly in a position to handle the problem itself. He was of the opinion that it would wear them out. He felt that the Society must have competent counsel that will guide the matter for it; counsel in which the Society has confidence, in order that the members may go about their practice confident that their interests are being taken care of. He said Mr. Fenning could advise the Society with respect to counsel. He felt it was important that the best legal counsel he obtained. He added that the American Medical Association would cooperate in every way.

"In conclusion, Dr. Woodward said that the plan outlined of laying the evidence before the Corporation Counsel and District Attorney, showing them it is their duty to act, to counsel them to act and if they will not act, appeal to Congress, is the only course. 'My own judgment is that with the law as clear as it is you will have no difficulty in having proceedings instituted for the unlawful practice of medicine by a corporation, and engaged in the business of insurance without having properly qualified.'"

I should now like to turn to page 9. (Reading):

"Dr. J. Ogle Warfield Jr., Chairman of the Hospital Committee, was recognized. He submitted the following report, pursuant to resolution which was adopted by the Society on the evening of November 3:

"In view of the Resolution adopted by the Medical Society of the District of Columbia on the evening of Nov. 3, 1937, the Hospital Committee held a meeting, at my office, on the evening of Nov. 9, 1937, and recommends that the Medical Society of the District of Columbia send the following resolution to the Medical Boards of the various local hospitals for interpretation to the Boards of Directors of those hospitals:

"That the hospitals accept patients from Group Health Association, Inc., provided that Group Health Association, Inc., is responsible for their financial obligations;

"That these patients only be treated by the attending, associate, assistant and courtesy staff physicians of the respective local hospitals.

"J. Ogle Warfield Jr.,
Chairman, Hospital Committee."

"Motion was made and seconded that the recommendation contained in the report of the Hospital Committee be adopted.

"Dr. Worth B. Daniels, in the discussion, said he was of the opinion that members of the local medical staffs of hospitals were required to be

members of the Medical Society of the District of Columbia. He would inquire if any members of the staff of Group Health Association were now members of the Society.

"The Chair stated that two members on the staff of Group Health Association at the present time are members and they have tendered their resignation from the Society. Another member of the staff had applied for membership in the Society but withdrew his application. The two aforementioned members are still members of the Society and are on the courtesy staff of hospitals at the present time.

"Dr. Yater was of the opinion that the hospitals should be contacted and assurance should be given that no member would be allowed to practice there if he is a member of the staff of Group Health Association.

"Dr. E. J. Gunning would inquire how many members are on the courtesy staff of the various hospitals.

"Dr. Yater made a motion to the effect that the recommendation of the Hospital Committee be recommitted to the committee on the grounds that there seems to be no assurance that members of the staff of Group Health Association are not already and might not become members of the staffs of the local hospitals. Seconded and finally adopted.

"Discussion was participated in by Drs. John H. Trinder, H. S. Bern-ton, Claude Moore, Charles P. Cake, E. M. Pickford, John D. Thomas."

And I will turn to the edge of that minute, page 12:

"Dr. Thomas E. Mattingly called attention to the fact that each member of the Society had been supplied with a reprint from the October 2, 1937, issue of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, outlining in detail the situation concerning Group Health Association. He said he thought all the members had to do was to read this reprint to get all the information needed."

Mr. Leahy:—Now, would you read the bottom of page 11?

Mr. Lewin:—Yes. Dr. Woodward or Dr. Willson?

Mr. Leahy:—Dr. Woodward.

Mr. Lewin:—(Reading):

"Dr. W. C. Woodward was called upon. He pointed out that the Society voted to employ counsel to look after the interests of the Society. He advised strongly that no further steps be taken until the Society has the advice of that counsel. He felt sure Mr. Fenning would agree with him when he expresses the opinion that it is not desirable to try a case in the newspaper. He said the Society should be guided by the wishes of counsel even if the resolutions are delayed."

Mr. Richardson:—Yes. On the preceding page will you read the part about Dr. Willson?

Mr. Lewin:—All right (reading):

(Reading):

"Dr. Prentiss Willson was recognized. He pointed out that the Community Chest is now campaigning for funds for the various hospitals, and institutions for the year 1938. He thought the occasion was right for a formal and very carefully thought out statement to be published in the press. He called attention to the fact that there is undoubtedly a concerted movement in the Agriculture Department and by other employees of the government interested in this insurance plan to hold a club over the Community Chest in its present drive, to the extent that they will not contribute to the Chest unless the hospitals agree to admit patients from the Group Health Association for treatment. In some ways that would seem to be a very serious situation. He thought that possibly a committee could be appointed to draft a statement for publication. He did not think it was necessary to insert it in the press as a paid advertisement; if it was he thought it would be well worth the money involved.

"The Chair said he had been contacted by several members in the different departments of the government, also."

Anything further?

Mr. Richardson:—Follow that on through.

Mr. Lewin:—All right (reading):

"Dr. R. Arthur Hooe would call attention to remarks made earlier in the evening—that if possible the Medical Society should not appear as complainant. He wondered if it might not be unwise for the Society as such to proceed in this manner.

"Dr. Willson was asked to put his remarks in the form of a motion so that the Society could act upon them.

"Dr. Willson said he jotted down some notes in the last few minutes; after observing from the remarks of the delegates, that it was strongly suggested that this Society should make a statement. He felt the attitude of the Society had not been carefully put before the public. He made the following motion:

"That a committee be appointed to draft a statement for publication by the Medical Society covering the following points:

1. That the Society is not opposed to any proper method for increasing the amount, bettering the quality and lessening the cost of medical and hospital care for persons in the lower-income groups.

2. It is opposed, however, to schemes of doubtful legality that, while making no provision for adequate care for the indigent, are able to offer their benefits to those amply able to pay proper fees for the same only because the less privileged are made to carry their share of the cost through the discredited tontine system of insurance.

3. It is also unequivocally opposed to any scheme denying the patient the right to the services of the physician of his choice.

4. With respect to the reported activity of some who are interested in a local scheme of medical and hospital insurance in attempting to coerce the Community Chest by threatening to withhold contributions to it unless the hospital beneficiaries of the Chest open their doors to the patients of physicians employed by it, who attempt to practice with the dubious ethical and legal status, the Medical Society points out that

the sum contributed annually by the local profession in services to the indigent, even when valued at the most minimum fees, amounts to more than the annual monetary contribution of all other charitably disposed persons in the community, a contribution, however, to which they also give their proportionate share in cash.

5. The Society is willing that this record be contrasted by the public with that of Group Health Association, Inc., in attempting to jeopardize the Community Chest Drive to attain its own objectives.

6. It asks that the public withhold judgment until such time as its present investigations, undertaken before Group Health Association, Inc., was even contemplated, may reach a point where it feels justified in offering its own solution of these problems, of which it is acutely aware, for the consideration of the public.

"Dr. Willson made a motion that the foregoing motion be referred to the Committee on Public Information for consideration in relation with the Public Relations Counsel. Seconded."

Is it passed? No. (Reading):

"Dr. Willson withdraw his motion and resolutions."

Mr. Kelleher:—I now read from the minutes of the meeting of the Medical Society of the District of Columbia held Wednesday, Nov. 17, 1937, 8 p. m. (reading):

"Dr. Thomas E. Neill, President, presiding.

"Present: Drs. A. L. Stavely, John B. Nichols, Frank Leech, Lyle M. Mason, John Minor, R. Lomax Wells, Thomas E. Mattingly, A. P. Tibbets, H. R. Schreiber, A. B. Bennett, Thomas A. Groover, James T. Wolfe, William C. Gwynn, James G. Cumming, Charles S. White, Tomas Cajigas, C. N. Chipman, F. X. McGovern, Joseph Horgan, Virgil B. Jackson, W. M. Sprigg, and other members to the number of about one hundred and fifty."

In order not to slight Mr. Leahy I will read this:

"The Chair announced that he appointed the following attorneys to consult with the Society's Attorney, in accordance with resolution adopted at the meeting of the Society on November 11, pertaining to Group Health Association, Inc.:

"George P. Hoover
William E. Leahy."

I have nothing further to read from that, Mr. Leahy.

Mr. Leahy:—Is that all you wanted to read?

Mr. Kelleher:—I want you to get full credit. You will get more, too.

Mr. Lewin:—I will go ahead with December 1.

Mr. Kelleher:—Will you consider whether you are going to object to that, Mr. Leahy?

Mr. Leahy:—Are you going to read the whole thing?

Mr. Kelleher:—Not now, no.

Mr. Leahy:—When?

Mr. Kelleher:—Well, from time to time. Your Honor, we would now like a ruling on the transcript of the Lee and Scandifio hearing, the four volumes which were offered. We want to read a portion from the minutes at this time.

Mr. Richardson:—I think The Court ought to take a look at this alleged transcript. It is a very large transcript.

THE COURT:—I have already had a look at it at a distance. That is enough.

I will let the jury go until tomorrow morning at 10 o'clock. You will be excused.

(At this point there was long argument of attorneys before The Court on the question of admitting in evidence four volumes of proceedings in the hearings on the cases of Drs. Lee and Scandifio before the District of Columbia Medical Society.)

(Thereupon, at 4:20 o'clock p. m. an adjournment was taken until tomorrow, Friday, Feb. 21, 1941, at 10 o'clock a. m.)

FEBRUARY 21, MORNING

PROCEEDINGS

U. S. EXHIBIT 65

C. B. Conklin, Washington, D. C., Oct. 29, 1937:

"Dear Doctor:

"I hereby tender my resignation as a member of the Medical Society of the District of Columbia.

"This is to take place immediately.

"Very truly yours,
"M. Scandifio."

Exhibit 41, original letter from Allan E. Lee to Dr. C. B. Conklin, Secretary, D. C. Medical Society, dated Oct. 30, 1937:

U. S. EXHIBIT 41

"Dear Doctor Conklin:

"I hereby submit and tender my resignation as a member of the medical society, to take effect at once.

"Respectfully,
"Allen E. Lee."

Exhibit 39, letter from the defendant Hooe to Dr. Allan E. Lee, dated Nov. 2, 1937:

U. S. EXHIBIT 39

"Dear Doctor Lee:

"You are hereby directed to appear before the Compensation, Contract and Industrial Medicine Committee, which will be in session on Thursday evening, Nov. 4, 1937, at 8 p. m., in the Medical Society Building, 1718 M Street N.W.

"Very truly yours,
"R. Arthur Hooe."

Exhibit 62, an identical letter from the defendant Hooe to Dr. Mario Scandiffo. On November 4, Dr. Lee replied to Dr. Hooe's letter, stating that he had already resigned from the society.

Exhibit 43 is an original letter from Allan E. Lee to Dr. Thomas E. Neill, President, District Medical Society, Washington, D. C., dated Nov. 11, 1937:

U. S. EXHIBIT 43

"My Dear Doctor Neill:

"On Oct. 30, 1937, I tendered my resignation as a member of the District Medical Society. I did so with considerable reluctance and only because of my desire to maintain my professional dignity since I had received, from unofficial sources, information which led me to believe that unfavorable action would be taken against me by the Society because of my affiliation with the Group Health Association, Inc.

"My acceptance of the opportunity to identify myself with this organization was made only after the most careful consideration on my part.

"I have been reliably informed that no action has been taken on my resignation. Relying upon the broadminded and well considered judgment of the officers and members of the District Medical Society, I now wish to withdraw my resignation and trust that my membership in the Society will be continued.

"With very sincere regards, I am

"Yours very truly,
"Allan E. Lee, M.D."

Exhibit 64 is a letter from M. Scandiffo to Dr. Thomas E. Neill, dated Nov. 11, 1937, identical with the letter just read. In this letter Dr. Scandiffo withdraws his resignation from the society.

Exhibit 42 is an original letter from the defendant Neill to Dr. Allan E. Lee, dated Nov. 18, 1937:

U. S. EXHIBIT 42

"Dear Doctor Lee:

"I acknowledge your letter of November 11th, in which you state you desire to withdraw your resignation, tendered by you on Oct. 30, 1937, as a member of the District of Columbia Medical Society.

"Inasmuch as your resignation has not been acted upon by the Society, I am returning it to you. In doing so I wish you to understand that my action in returning the resignation to you, unacted upon, is in nowise to be considered as passing upon the motives which actuated you in tendering your resignation, as stated by you, or its withdrawal or your continuance as a member of the Society.

"Very truly yours,
"Thomas E. Neill."

Mr. Kelleher:—Exhibit 63, a letter identical with the one just read. It is from Thomas E. Neill to Dr. Mario Scandiffo, dated Nov. 18, 1937.

Exhibit 44, a letter from the defendant Hooe to the Executive Committee of the Medical Society of the District of Columbia, dated Nov. 22, 1937. In Exhibit 44 the defendant Hooe quotes the following letter, which was addressed under date of November 10 to Drs. Lee and Scandiffo, and the letter reads as follows:

U. S. EXHIBIT 44

"Under date of Nov. 2, 1937, and by registered mail, you were directed to appear before the Compensation, Contract and Industrial Medicine Committee of the Medical Society of the District of Columbia, Medical Society Building, 1718 M. Street N.W. at 8 p. m., Nov. 4, 1937. You failed to appear. The committee now, therefore, charges you of having violated Chapter IX, Article III, Sections 1 and 2 of the Constitution of the Society, reading as follows:

"1. 'It is unprofessional for a physician to dispose of his services under conditions that make it impossible to render adequate service to his patient or which interfere with reasonable competition among the physicians of a community. To do this is detrimental to the public and to the individual physician, and lowers the dignity of the profession.'"

"No member of the Society shall enter into a written, verbal, or implied contract or agreement of employment with any person, firm, corporation, association, club, lodge, or other similar organization, including the Federal and/or District Government, the terms of which contract or agreement are in violation of the principles herein expressed. The customary professional relationship of a physician to his patients, upon the basis of individual fees for services rendered, shall not be regarded as a contract within the meaning of this section."

"2. Every member of the Society before entering into a contract or agreement to render professional services shall submit a copy of his contract, if written, or a true declaration of the terms of the agreement, in writing, to the Committee on Compensation, Contract and Industrial

Medicine for approval. In the event that the committee disapproves the contract, a member may appeal to the Executive Committee."

"And again, Chapter IX, Article IV, Section 5, of the Constitution of the Society, reading as follows:

"No member of the Society shall engage in any professional capacity whatsoever with any organization, group or individual, by whatever name called or however organized, engaged in the practice of medicine within the District of Columbia or within 10 miles thereof, which has not been approved by the Society."

"Should you desire to defend in this matter and will so advise within ten days, a hearing by the Committee will be arranged.

"Very truly yours,
"R. Arthur Hooe, M.D.
"Chairman, C. C. & I. M. Committee."

Exhibit 56 is Dr. Allan E. Lee's reply to Dr. R. Arthur Hooe, dated Nov. 19, 1937:

U. S. EXHIBIT 56

"Dear Doctor Hooe:

"In response to your letter of the 10th instant, wherein I have been charged by your Committee with having violated the provisions of Sections 1 and 2 of Article III of Chapter IX and Section 5 of Article IV of Chapter IX of the Constitution of the Society, you are advised as follows:

"1. Your letter or notice of Nov. 4, 1937, was disregarded because of the fact that, prior to that date, I had sent to the Society my resignation from membership; consequently I considered further response unnecessary.

"2. Since that time, however, I have withdrawn my said resignation, and, considering myself in good standing in the Society, I have intended and do intend to comply fully with the rules of the body. No formal contract has been entered into with the Group Health Association, but when the terms of the contract are finally agreed upon and reduced to writing, I fully intend to submit same for approval under the rules of Medical Society.

"While it is not my thought that I have, either in letter or spirit, violated any of the rules of the Society, and believing that charges thereof are premature, I hereby request a full and complete hearing, in accordance with your letter of November 10, on the charges made, to the end that I may have ample opportunity, in person and by counsel, to defend against all charges so made. It is my request that said hearing be fixed at a date not earlier than fifteen (15) days hence in order that ample opportunity may be had for a full and complete presentation of the matter.

"Respectfully,
"Allan E. Lee, M.D."

Exhibit 55 is the defendant Hooe's reply to the letter of Dr. Allan E. Lee just read. It is dated Nov. 22, 1937:

U. S. EXHIBIT 55

"Dear Dr. Lee:

"In acknowledgment of your letter of Nov. 19, 1937, may I say that a report, in the entire matter, is being forwarded to the Executive Committee. Further reply to your communication will doubtless follow within a few days from the chairman of that body.

"Very truly yours,
"R. Arthur Hooe, M.D.
"Chairman, C. C. & I. M. Committee."

Exhibit 68 is identical with Exhibit 55 except that it is Hooe's reply to Mario Scandiffo, same date as Exhibit 55.

Exhibit 44, a letter from R. Arthur Hooe to the Executive Committee of the Medical Society of the District of Columbia, Washington, D. C., Nov. 22, 1937. In that letter he reviews the correspondence which has ensued between him and Drs. Scandiffo and Lee, and then concludes with this paragraph:

U. S. EXHIBIT 44

"After careful consideration the committee is unanimously of the opinion that these members are guilty of violation of Section 1, Article III, Chapter IX, and Section 5, Article IV, Chapter IX, of the Constitution of the Medical Society of the District of Columbia, and recommends that they be expelled.

"Very truly yours,
"R. Arthur Hooe, M.D.
"Chairman, C. C. & I. M. Committee."

Exhibit 57, a carbon copy of an original letter from William Mercer Sprigg to Dr. Allan E. Lee, dated Nov. 24, 1937:

U. S. EXHIBIT 57

"Dear Doctor Lee:

"In reply to your letter of Nov. 19, 1937, requesting a time for hearing 'not earlier than fifteen days after the above date,' I am informing you that Dec. 6, 1937, at 8 p. m., is the date and hour fixed when we will expect you to appear before the Executive Committee of the Medical Society of the District of Columbia for hearing, at the Medical Society Building, 1718 M Street N.W. You, of course, know that you are entitled to be represented by counsel.

"Very truly yours,
Signed by the defendant Sprigg.

Exhibit 69 identical with the exhibit just read, except that it is addressed to Dr. Mario Scandiffo. It is dated Nov. 24, 1937, and is signed by the defendant Sprigg.

DR. HIGGINS

R. E. B. Medical College

32649

ORGANIZATION SECTION

Exhibit 58 is an original letter from Allan E. Lee, M.D., to R. Arthur Hooe, M.D., Dec. 3, 1937:

"Dear Dr. Hooe:

U. S. EXHIBIT 58

"Enclosed herewith is . . . a written agreement to be executed hereafter by and between myself and Group Health Association, Incorporated, of Washington, D. C. The original contract has not been executed by the parties thereto.

"I am forwarding a copy of said proposed contract in accordance with the constitution and by-laws of the Medical Society of the District of Columbia, to you as Chairman of the Committee on Compensation, Contract and Industrial Medicine for the consideration and approval of said proposed contract by said Committee. Please submit the proposed contract to said Committee and notify me when the approval of said Committee thereto is had and obtained.

"I am informed by the Group Health Association that it will be only too glad to submit to your Committee any information which your Committee might feel necessary in consideration of said contract, explaining the purpose, objects and accomplishments of said Association.

"Very truly yours,
Allan E. Lee."

The copy of Dr. Allan E. Lee's contract is not attached to the letter of December 3, but Exhibit 70 is identical with Exhibit 58, except that it is a letter from Scandiffo to the defendant Hooe, dated Dec. 3, 1937, and attached to that letter is the form of contract between Dr. Scandiffo and Group Health Association, which is submitted for the approval of the society.

Mr. Lewin:—I should like to read from the minutes of the business meeting of the Medical Society of the District of Columbia held Dec. 1, 1937, at 8 p. m.:

"Dr. Daniel B. Moffett, First Vice President, presiding."

"Present: Drs. Gwynn—that's Henry Gwynn, William Gwynn, Rensch, Trinder, Jacobs, Nichols, Cumming, Seckinger, Mason, Stavelly, Kirtledge, Geier, Gilbert, McGovern, Wells, and other members to the number of about seventy-five.

"The minutes of meetings held November 17 and 24 were read and approved.

"Dr. J. Ogle Warfield Jr., Chairman of the Hospital Committee, stated that his committee studied the local question with advice of legal counsel, but as yet was not ready to make a final report. He submitted the following resolution as a recommendation from his committee:

"Resolved, That as a matter of educational policy the Medical Society of the District of Columbia strongly recommends that all hospitals engaged in the teaching and training of residents, interns, and nurses, where possible, follow the recommendation of the American Medical Association regarding the constitution of their entire Medical Staffs, namely, that each appointee be a member of the Medical Society of the District of Columbia or a local Medical Society in this immediate neighborhood and a member of the American Medical Association.

"Dr. Warfield made a motion that the resolution be adopted and that a copy be sent to each of the local hospitals. Seconded and adopted.

"The Secretary would inquire whether the Hospital Committee was ready to report on hospitals approved, in accordance with the Constitution of the Society.

"Dr. Warfield said that the Hospital Committee realized they should report and revise the hospital list, but that all the members of the committee as well as Mr. Feunung, the Society's Legal Counsel, felt it was wise to postpone that report."

The minutes are signed by the defendant, C. B. Conklin.

Minutes of the adjourned special meeting of the Executive Committee of the Medical Society of the District of Columbia, held Dec. 10, 1937, at 8 p. m.:

"Dr. Sprigg, Chairman, presiding.

Present: Drs. Borden, Breeding, Chipman, Fowler, Holden, Hooe, Macatee, McGovern, John Reed, Hiram Reede, Ruffin, Schreiber, Wells, and Conklin. (By invitation: Dr. Margaret M. Nicholson.)

"Announcement was made by Dr. R. Arthur Hooe, Chairman of the Compensation, Contract and Industrial Medicine Committee, that Dr. Allan E. Lee submitted his resignation on December 10, to take effect immediately, as a member of the staff of Group Health Association, Incorporated. This letter was read. Acting upon the submission of this letter the Compensation, Contract and Industrial Medicine Committee drew up the following for presentation to the Executive Committee:

"December 10, 1937.

"The Executive Committee.

"On Nov. 22, 1937, our committee addressed a communication to you advising you of our investigation concerning Drs. Allan E. Lee and M. Scandiffo, and recommended that they be expelled as members of the Society because of their violation of Section 1, Article III, Chapter 9, and Section 5, Article IV, Chapter 9, of the Constitution of the Medical Society of the District of Columbia.

"Our committee is today in receipt of a letter from Dr. Allan E. Lee, advising us that he has resigned from the staff of Group Health Association. Inasmuch as our recommendation respecting Dr. Lee was based upon the fact that he had entered into a contract with Group Health Association and that contract has now been terminated by him, we feel that no further action should be taken with respect to Dr. Lee.

"We therefore, respectfully request that the charges and recommendations against Dr. Lee, embodied in our communication of Nov. 22, 1937, be withdrawn and that appropriate action be taken by your committee thereon.

"R. Arthur Hooe,
Chairman."

JOUR. A. M. A.
MARCH 8, 1941

"When it was ascertained definitely that Dr. Allan E. Lee was in fact no longer a member of the Group Health Association Staff, Dr. F. X. McGovern, for the Executive Committee, moved that all charges that had been filed by the Compensation, Contract and Industrial Medicine Committee, be dropped forthwith. This was duly seconded and adopted.

"Mr. George P. Hoover, Attorney, interposed that Dr. Hooe's committee address a letter to Dr. Lee, stating in effect that his resignation would end the prosecution in so far as his committee is concerned.

"Dr. W. M. Sprigg stated that inasmuch as Dr. E. Hiram Reede had already presided at the previous meeting, he was of the opinion that Dr. Reede should continue. This arrangement was agreed to.

"Dr. E. Hiram Reede, Vice Chairman, now presiding.

"At this point Dr. Mario Scandiffo and the attorneys for the Group Health Association, Inc., and Dr. W. F. Penniman, filed into the room. The stenographer retained by Mr. Hoover and the attorneys for the Society then proceeded to take down verbatim the proceedings."

Signed "C. B. Conklin, Secretary."

Exhibit 59 original letter from Allan Lee to Dr. R. Arthur Hooe, Chairman, Committee of C. C. & I. M., District Medical Society, 1718 M Street N. W., Washington, D. C., dated Dec. 10, 1937:

"Dear Doctor Hooe:

U. S. EXHIBIT 59

"Enclosed please find a copy of a letter of resignation from the staff of Group Health Clinic, as you requested. You will please inform the members of the committee of my course of action as you have outlined.

"Sincerely,

"Allan Lee, M.D."

Attached to this is a letter dated Dec. 10, 1937, Allan E. Lee to Dr. E. Brown, Medical Director, Group Health Association, Inc., Washington, D. C.

U. S. EXHIBIT 60

"My dear Doctor Brown:

"Upon reconsideration of all facts involved, I am forced to resign as a member of your staff of the clinic.

"Sincerely,

"Allan E. Lee, M.D."

Exhibit 47 original letter from the defendant Hooe to the Executive Committee, dated December 10, notifying the Executive Committee that Dr. Lee had resigned from the staff of Group Health Association, and requesting the Executive Committee to withdraw the charges against Dr. Lee.

Exhibit 61 is a letter from the defendant Hooe to Dr. Allan E. Lee, dated Dec. 21, 1937:

"Dear Doctor Lee:

U. S. EXHIBIT 61

"In acknowledgment of your letter of December 10, in which you enclose a copy of your resignation as a member of the medical staff of Group Health Association, Inc., may I say that upon receipt of same the Compensation, Contract and Industrial Medicine Committee appeared before the Executive Committee and requested a withdrawal of its charges against you, which request was granted. Such action places your status as that of a member now in good standing.

"Very truly yours,"

the defendant Hooe.

Exhibit 120, a carbon copy of a letter from the defendant Olin West, Secretary and General Manager of the A. M. A., Cal Faculty of the State of Maryland, Baltimore. It is dated Nov. 16, 1937:

"Dear Doctor Wise:

U. S. EXHIBIT 120

"While I am delighted to have your letter of November 12, I am sorry indeed that you will not be with us at the Annual Conference of Secretaries of Constituent State Medical Associations. I think that some of the matters that will be discussed at the Conference are of tremendous importance and, in some particulars, are probably more important than any other matters that have ever been considered at similar meetings.

"We have done all that we could to oppose the Group Health Association, Inc., in Washington, but in spite of our best efforts the scheme has gone into operation. We have worked as closely as possible with the Medical Society of the District of Columbia. As a matter of fact, our efforts began before the Medical Society of the District of Columbia became very active. It is my purely personal opinion that it is an outrage that an agency of the Federal Government should finance a corporation that is to engage in the practice of medicine in the face of the fact that the laws of most of the states specifically declare corporate practice of medicine to be illegal.

"I respectfully suggest that the Medical and Chirurgical Faculty of the State of Maryland make proper representations to the members of Congress from Maryland with respect to this matter.

"With my sincere good wishes, I am

"Very truly yours,
Olin West."

A letter from R. B. Poling, Secretary of the Mahoning County Medical Society of Ohio. It is Exhibit 158, a letter from Dr. Poling to Dr. Olin West, Secretary of the A. M. A., dated Nov. 24, 1937:

U. S. EXHIBIT 158

"My dear Dr. West:

"The Mahoning County Medical Society received a communication relative to the Clinic in Washington, D. C. financed and equipped by money from the United States Government (H. O. L. C.).

"Action was taken by the Council of this society at its meeting of Nov. 22, 1937. This problem was turned over to the chairman of the Legislative Committee and Allied Professions for action. They are authorized to send resolutions to various influential men relative to this situation, asking for their cooperation. Council sent a letter of confidence to Dr. Thomas E. Neill, President of the District Medical Society.

"Therefore, the Council of the Mahoning County Medical Society is hereby informing you of its action on this timely matter.

"With kind regards, I remain

"Yours fraternally,
"R. B. Poling,
Secretary."

Exhibit 157, letter from the defendant Olin West to Dr. Poling, dated Dec. 1, 1937:

U. S. EXHIBIT 157

"Dear Doctor Poling:

"I am greatly obliged to you for your letter of November 24 informing me of the action taken by the Mahoning County Medical Society with respect to the Group Health Association, Inc., which has recently entered into the practice of medicine in the District of Columbia.

"The American Medical Association has done all that it could to oppose this movement. The Group Health Association has received a charter and is actually an incorporated body. The Home Loan Bank Board, a federal agency, has agreed to provide the sum of \$20,000 a year for two years for the purpose of financing the Group Health Association, Inc., in the face of the fact that the laws of practically all of the states of the Union specifically declare the practice of medicine by a corporation to be illegal. Membership in the Group Health Association, Inc., is open to all government employees other than those of the Army and Navy, although it is claimed in Washington that the membership is now limited to employees of the Home Owners' Loan Corporation and its affiliated agents.

"I am very sure that the Medical Society of the District of Columbia will appreciate the support of the Mahoning County Medical Society in its efforts to combat the corporation practice of medicine, which in the District of Columbia threatens to have a far reaching and deleterious effect on the private practice of medicine.

"With most cordial good wishes, I am

"Very truly yours,
"Olin West."

Exhibit 159, another letter from the defendant Olin West to Dr. Poling, Youngstown, Ohio, dated Dec. 4, 1937:

U. S. EXHIBIT 159

"Dear Dr. Poling:

"Your letter of November 30 has just come to hand. The American Medical Association has done everything that it could do to oppose the organization and operation of the Group Health Association, Inc., in the District of Columbia. I think I am safe in saying that the American Medical Association became active in this matter before the Medical Society of the District of Columbia began its efforts in opposition.

"The Group Health Association, Inc., secured a charter in the District of Columbia. The Home Loan Bank Board, which I understand is an affiliate of the Home Owners' Loan Corporation, has, according to our information, agreed to finance the Group Health Association, Inc., to the extent of \$100,000 if that sum is thought to be necessary, and has taken action whereby \$20,000 a year for two years has been set aside for the use of the Group Health Association, Inc. We have done all that we could to oppose this movement on the ground that the corporate practice of medicine is illegal and altogether undesirable, as well as because of a realization of the fact that if all government employees in the District of Columbia who are eligible for membership in the Group Health Association become members, the private practice of medicine in the city of Washington will be largely destroyed. In spite of the fact that representatives of the American Medical Association have sought and have secured the assistance of persons in high official position in Washington, we have never until this good day been able to secure copies of the contract offered by the Group Health Association, Inc., to those who become members.

"Senator McCarran has demanded an investigation of this whole movement and has raised the question on the floor of the Senate concerning the right of an agency of the federal government to appropriate money for such purposes as those for which the Home Loan Bank Board has already made definite commitments.

"We were informed by persons connected with the Home Owners' Loan Corporation that the Group Health Association, Inc., was organized for the benefit of employees of the HOLC and its affiliated bodies, but the fact is that under the provisions of the charter and the by-laws of this organization all employees of the federal government outside of the Army and Navy are eligible to apply for membership.

"The matter is one of concern not only in the City of Washington but also in other centers in the United States where considerable numbers of government employees reside. To my mind, it is difficult to understand just how an official agency of the federal government can agree to finance an organization that is to engage in the corporate practice of medicine in the face of the fact that in practically all states practice by corporations is illegal. The Medical Society of the District of Columbia, according to my latest information, has employed counsel

and is seeking to secure rulings from legally constituted officers of the federal government and of the District of Columbia as to the legality of the incorporation and the proposed activities of the Group Health Association, Inc.

"With most cordial good wishes, I am
"Very truly yours,
"Olin West."

Exhibit 161 carbon copy of a letter from the defendant West to Dr. S. Adolphus Knopf, K-n-o-p-f, 16 West Ninety-Fifth Street, Nov. 8, 1937:

U. S. EXHIBIT 161

"Dear Dr. Knopf:

"I am greatly pleased to have your letter of November 3 to which is attached a copy of a letter addressed by you to Mr. Robert L. Hill, a charter member of the Group Health Association, Incorporated, in Washington. I am, of course, greatly pleased that you approve the official attitude of the American Medical Association toward such movements as the Group Health Association, Incorporated.

"When one considers the facts with respect to the number of government employees in Washington and in one or two other centers in the United States, one is compelled to wonder what will become of the private practice of medicine in those centers if the government is to subsidize cut-rate medical schemes under which corporations are to engage in the practice of medicine in spite of the fact that practice of medicine by corporations has been repeatedly declared to be illegal in one state after another. Even in the city of Washington, at least one opinion has been submitted by a duly appointed public official clearly indicating a definite view to the effect that such decisions as have been handed down by a number of courts in various parts of the United States to the effect that practice of medicine by a corporation is illegal are in accord with the law. In so far as I know no public legal authority in Washington has definitely expressed an official opinion concerning the legality or illegality of the practice of medicine by a corporation, but I am specifically informed that the principle involved has been fully covered in a legal opinion uttered by an official of the government of the District of Columbia or an official of the federal government in Washington.

"However all this may be, it is nevertheless a fact that the Group Health Association, Incorporated, has begun operations, and that under the provisions of its by-laws and of its charter, government officials who are paid such salaries as to remove them entirely from the category of the low income group are in position to receive medical service to be provided for them on a cut-rate basis by a corporation engaged in the practice of medicine and actually subsidized by an official agency of the federal government."

The last two paragraphs are not important.

"Very truly yours,
"Olin West."

Exhibit 195 is a carbon copy of a letter of the defendant Woodward to Dr. G. F. Simpson, President, Medical Society of Virginia, Purcellville, Va., Dec. 8, 1937:

U. S. EXHIBIT 195

"Dear Dr. Simpson:

"I do not know whether the Medical Society of the District of Columbia has or has not requested the cooperation of the Medical Society of Virginia in the contest with Group Health Association, Inc., in which the Medical Society of the District of Columbia is now engaged. If your attention has already been called to the situation, no harm will be done by this letter. If it has not, possibly you will see your way clear to take an active part in the contest. Certainly there is every reason why you should do so, not only from the standpoint of national interest, but from the standpoint of local interest, for Group Health Association, Inc., a private lay corporation subsidized by the Home Owners' Loan Corporation or its affiliates, plans to furnish medical, hospital, and nursing service to all employees of the Home Owners' Loan Corporation and its affiliates, and possibly to other employees of the Federal Government, and all 'dependents' of all such employees, who identify themselves with the Association, not only in the District of Columbia, but within ten miles of the District, and possibly even within twenty miles. Such an area will cover a very substantial space in the State of Virginia. The By-Laws of Group Health Association, Inc., provide:"

And it quotes:

"To be able to avail themselves of medical and surgical service, the members or dependents must be located in, or within ten miles of the District of Columbia line, or must come to the City of Washington, D. C., except that the Medical Director may provide for house calls not exceeding twenty miles."

"I am sending you a few reprints of our article on Group Health Association, Inc., that you may find interesting, if you overlooked the article when it was published in THE JOURNAL, and which may be useful in any cooperative work you may undertake.

"I enclose also a clipping from The Evening Star (Washington, D. C.), Nov. 30, 1937, indicating the interest of Senator McCarran of Nevada in the matter. It has occurred to me that possibly you might enlist the interest of your two Virginia Senators, Glass and Byrd, for certainly they are among the most able of all members of the Senate. Senator Byrd is interested, too, in government reorganization, and the maladministration indicated in connection with the activities of the Home Owners' Loan Corporation in the present instance ought to arouse his interest. Senator Glass, as chairman of the Senate Committee on Appropriations, will probably be interested in the fact that the Home Owners' Loan Corporation or some of its affiliates has 'granted' \$40,000 of public money to this private lay corporation, organized with the approval of the Corporation and its affiliates, to enable Group Health Association to furnish medical, hospital, and nursing services, not only to employees of the Home Owners Loan Corporation and its affiliates, but to their dependents, and to employees of other branches

of the Federal Government, at supposedly bargain prices. The movement represents, it seems to me, a rank kind of unauthorized medical practice, and the fact that it is to extend into the State of Virginia should be of interest to you.

"No one in the House of Representatives has as yet manifested any active interest in this matter, and possibly your Representative Woodrum, a member of the House of Representatives Committee on Appropriations might be interested. There is, of course, no reason why other members of the Virginia delegation should not be appealed to, but Representative Woodrum is in a better strategic position to inquire into the situation, without the formality of a congressional investigation, when the Committee on Appropriations of which he is a member is called on to consider the grant by the Home Owners' Loan Corporation or its affiliates.

"According to the Washington Post, December 4, an H. O. L. C. official undertook to justify the grant of \$40,000 of the taxpayers' money to this private corporation as follows:

"Our board of directors decided—" and he is quoting—"that it was legal to make a two-year \$40,000 investment in the health of our employees. We have no intention of continuing the subsidy, as the G. H. A. is expected to become self-supporting. We look upon this investment as similar to departmental installation of air-conditioning—and there's no objection to that!"

And the letter continues:

"Of course, any such attempt at justification is ridiculous.

"In the first place, there is no evidence that the investment made by the H. O. L. C. in air-conditioning was not illegal. If the investment was made with funds that were not appropriated for that purpose, it clearly was illegal. More particularly, however, if the investment was made in air-conditioning the homes of employees of the H. O. L. C. and its affiliates, the operation was clearly illegal, and the present activities of the H. O. L. C. and its affiliates extend into the homes of employees within the District of Columbia and within an area of from ten to twenty miles from the boundaries of the District, for the proposal is to furnish medical, hospital, and nursing service not only to employees of the government, but also to their dependents."

"The attempt at justification is moreover silly, in that the present grant was made without competitive bidding and although intended, allegedly, to provide medical, hospital, and nursing services, it was made to a lay body having no special knowledge of any of such services and possessing at the time of the grant no such services to sell. So far as I am informed, it has . . . under its contract or agreement, and of course, since the \$40,000 is to be a grant, and not a loan, it has given no security for the return of the money.

"All of these matters should actively interest your senators and representatives, and you might even interest them in the competition with independent medical practices in the State of Virginia that will be set up by this federal subsidy of a lay organization to buy and sell medical services for patients in the State.

"Incidentally, I should have mentioned above the fact that Senator King of Utah had announced his interest in the granting of the taxpayers' money to this private lay corporation for furnishing professional services at bargain prices to government employees and their dependents.

"Yours truly,
"W. C. Woodward."

Exhibit 196, carbon copy of a letter from the defendant Woodward to Dr. Thomas E. Neill, President, Medical Society of the District of Columbia, Washington, D. C., Dec. 15, 1937:

U. S. EXHIBIT 196

"Dear Dr. Neill:

"I have just seen a copy of the letter sent by the Chairman of the Federal Home Loan Bank Board, John H. Fahey, to Senator McCarran, under date of December 3, undertaking to justify the expenditure of money collected from the taxpayers of the United States generally for the purpose of subsidizing a lay medical and hospital service for the benefit of the children, wives, and other dependents of such employees of the United States Government, including the Chairman himself, as may identify themselves with Group Health Association, Inc. I have been wondering if any effective answer has been made to the Chairman's letter? Certainly, in view of the publicity that has been given to the letter an answer should be made and given equal or greater publicity, so that at least a reasonable number of the Senators and Representatives in Washington will see it. A devastating answer can be prepared without great difficulty.

"This leads me to inquire as to just who is leading the force of the Medical Society of the District of Columbia in their fight on the federally subsidized practice of medicine and insurance by lay groups in the District of Columbia and adjacent states. Incidentally, will you not let me know if a contest is or is not being waged by the medical profession of the State of Maryland and the State of Virginia against such subsidized lay practice within their respective jurisdictions—for the subsidized Group Health Association, Inc., proposes to carry on its activities anywhere in either of the states named within twenty miles of the boundaries of the District of Columbia, an area much larger than the District of Columbia itself.

"Yours truly,
"William C. Woodward."

An original letter from the defendant Neill to the defendant William C. Woodward in Chicago, dated Dec. 17, 1937:

U. S. EXHIBIT 197

"My dear Dr. Woodward:

"I have your letter of December 15th asking who is leading the fight of the Medical Society of the District of Columbia against socialized medicine. The fight is being led by our Public Relations Counsel, Mr. Fulton Lewis Jr., under a Steering Committee, consisting of Doctors McGovern, Yater, Schreiber and myself, ex-officio member of the committee, together with counsel for the Medical Society, and additional counsel, Mr. George Hoover and Mr. William Leahy.

"We have felt all along that in the case of the H. O. L. C. there was a misappropriation of funds, and I enclose herewith the latest press news dealing with the subject.

"As yet we have not been advised by the Corporation Counsel whether or not this organization is practicing medicine illegally, although the briefs have been presented to him some time ago. I feel that we will be able to break this organization entirely, but I do not feel that the fight ends there, as the socialistic tendency of the present administration is so strong that attempt may be made to pass a bill making these illegal acts legal. Maryland and Virginia, both, due to their proximity to the District of Columbia, are getting interested in this matter, and we feel that every state society in the country should be interested if we are to be the ultimate winners.

"Very sincerely yours,
"Thomas E. Neill."

Exhibit 204, carbon copy of a letter from the defendant Woodward to the defendant Neill, dated Dec. 22, 1937:

U. S. EXHIBIT 204

"Dear Dr. Neill:

"I thank you for your letter of December 17, relative to Group Health Association, Inc.

"Frankly, I cannot conceive of any public relations counsel for a state medical society, unless he is a member of the society and well up in its ranks, leading such fight as you have on your hands. I cannot conceive of its being the function of any public relations counsel to do so unless he is a member of the organization and high up in its rank. For a medical organization to employ a layman to lead such a fight strikes me as an anomaly.

"Of course, your counsel must lead the fight in so far as involves its legal factors. Your public relations counsel may lead the fight in so far as refers to publicity and relative matters. But the whole leadership must devolve on officers and agents of the Medical Society of the District of Columbia, who in the end must be responsible to the Society even for the activities of counsel and public relations counsel.

"You write that your Public Relations Counsel, Mr. Fulton Lewis Jr., is leading the fight under a Steering Committee, consisting of Doctors MacGovern, Yater, Schreiber and myself (yourself), ex-officio member of the committee, together with counsel for the Medical Society, and additional counsel, Mr. George Hoover and Mr. William Leahy. Certainly, however, it seems to me that some one member of the Medical Society of the District of Columbia ought to be personally responsible for what goes on, although with the advice of a committee, of course.

"You write that Maryland and Virginia are getting interested. Yes, I called the attention of the proper officers of the State medical organizations of those two jurisdictions to the situation and suggested that there was something for them to do. It seems to me, however, that it is for you to get into touch with the medical societies of the counties immediately adjacent to the District of Columbia and to get them interested. The members of those organizations have votes; the members of the Medical Society of the District of Columbia have not. Moreover the members of the medical societies in the counties immediately adjacent to the District have an active personal interest in the matter that physicians in Maryland and Virginia in more remote parts of the states have not, and therefore your neighboring medical societies offer a better chance of arousing interest than exists through any other method of approach.

"Yours truly,
"William C. Woodward,
Director."

The minutes of the stated meeting of the Medical Society of the District of Columbia, held Wednesday, Jan. 5, 1938, at 8 p. m.:

"Dr. Thomas E. Neill, President, presiding." (Reading): Present: Drs. Alfaro, Murray, Elward, Thompson, Vaughan, Jacobs, Hiram Reede, Leech, William Gerry Morgan, F. X. McGovern, McChesney, Reichelderfer, H. C. Macatee, Ellison, Coulter, Bernton, Pendexter, Davis, Connolly, Herbst, Chipman, Bennett, and others to the number of about 300.

"The minutes of the previous meeting, held Dec. 16, 1937, were read and approved."

Turning to page 11, and read the last paragraph on that page.

"Dr. R. Arthur Hooe said the forum idea sounds good and he hoped it would lead to something constructive. He felt there was one thing that the medical profession should look squarely in the face and that was that the problem was by no means a one-sided one. There has been a crying demand for years and that demand has not been met by the medical profession. He felt that two things were very important: (1) Organized medicine to stand solidly together; (2) that some time in the near future there should be appointed a committee to ask for a hearing before the various boards of directors of various civil hospitals in Washington, and that the committee should very definitely ask a decision from the boards as to what their hospitals will do in the matter. "Dr. Hooe added that it seems sure that the hospitals will stand by the Society. In regard to Dr. McGovern's suggestion for the Sunday meeting, Dr. Hooe felt that the Medical Society's Auditorium would not accommodate all those who should be invited. He wondered what would be accomplished by such a meeting, in view of the fact that the Society has not at yet adopted any policy."

And the minutes are signed by the defendant C. B. Conklin.

Mr. Leahy:—Will you read beginning on the bottom of page 10, Mr. Lewin, please? That brings up this forum that Dr. Hooe just spoke about.

Mr. Lewin:

"The Secretary thought there might be a combination of forces in these forums. He said there might be a misunderstanding if proper publicity is not given to the Sunday meeting—it might seem

as though the Society was on the defensive. He thought the public forum idea was an excellent plan. He thought there should be some way in which Drs. Christie and Yater could state the position of organized medicine in the present situation along with the advocates of full-time health people."

"Dr. C. N. Chipman was of the opinion that the proposition involved public policy and should be referred to the Executive Committee and the membership should be notified.

"Dr. William P. Herbst Jr., stated that the Society has been on the defensive all along and should present its position to the public so it will not be on the defensive. He thought the more influential men participating in the forum, the more would be accomplished. He felt that it was time for the Society to come out from behind and just say nothing and be constantly attacked by all different sources both sincere and insincere."

"Dr. V. R. Alfaro called attention to the provisions for a Steering Committee and to an article which appeared in the Sunday Post, Jan. 2, 1938, the last paragraphs of which read as follows:"

"That the Society is in no mood for compromise and plans to fight Group Health Association to the end was indicated last night by one of its highest officers.

"Neither the H. O. L. C. plan nor any other prepayment plan is tolerable to the Society," he said. "People who wish to budget their medical expenses are invited to use the Medical-Dental Service Bureau, where fees are reasonably adjusted and payment can be extended over many months."

"Dr. Alfaro pointed out that to his knowledge the Society had not authorized any official to commit the Society and had not gone on record either way. It is at the present time studying the matter. He felt that this type of misinformation to the public should be investigated immediately.

"Dr. Prentiss Willson made a motion that the matter of the newspaper article be referred to the Committee of Censors with instructions that an attempt be made to find out who was responsible for this statement and to take appropriate action. Seconded by Dr. R. A. Hooe. Duly Adopted."

"Dr. Cavanagh restated his motion:

"1. That the Medical Society of the District of Columbia approve in principle the Public Health Forum of Georgetown University.

"Dr. Prentiss Willson offered an amendment, duly seconded and adopted, to the effect that it be added that the Society does not commit itself to any views expressed.

"2. That the subject matter for the current week's program be included in the regular announcements of the Society.

"Upon motion, duly seconded, Dr. Cavanagh's motion, as amended by Dr. Willson, was duly adopted."

Minutes of the business meeting of the Medical Society of the District of Columbia held Feb. 2, 1938, at 8 p. m.:

"Dr. Thomas E. Neill, President, presiding." (Reading): Present: Drs. Gwynn, Mallory, Cavigas, Wall, Yater, Schoenfeld, Mattingly, Herbst, Horgan, Calk, J. Rogers, Young, Trinder, Alfaro, Bolton, Pickford, Mundell, Bernton, Nicholson, and other members to the number of about 90.

"The minutes of the preceding meetings held Jan. 5, Jan. 12, Jan. 19, and Jan. 26, were read and approved."

I would start reading from this meeting on page 11, near the bottom of the page.

"Dr. Thomas E. Mattingly was recognized. He said that a couple of weeks ago a member of the Executive Committee made a statement that Sibley Hospital was wide open for Group Health Association, Inc. He said he wanted to say that the organized profession has not got a stauncher, firmer friend in Washington than Dr. Lewis H. Taylor, and that Dr. Taylor authorized him to say that at no time has H. O. L. C. Group Health Association had a patient in Sibley Hospital, known to be such. He added that not many months ago Dr. Sellers made application to practice in Sibley Hospital, asking for privileges in general medicine, major and minor gynecology, major and minor obstetrics, and major and minor surgery. The gentleman's application was turned down.

"Dr. Mattingly offered the following motions:

"1. That the proper agency of the Medical Society be instructed to present at our next stated meeting the facts relating to the present status of Group Health physicians at the various Washington Hospitals preliminary to appropriate disciplinary action, in event any hospital has ignored the Medical Society's wishes in the premises.

"2. That the proper agency of the Society take immediate measures to ascertain if any member or members of the Society are party to secret understandings and unethical arrangements with Group Health Association, Inc., whereby Group Health patients are admitted to Washington Hospitals and treated under the service or supervision of Medical Society members possessing hospital privileges.

"Upon motion by the Secretary, duly seconded, it was adopted that these motions be referred to the Executive Committee for consideration."

"Dr. R. Arthur Hooe would inquire of Dr. Mattingly whether his name was mentioned in regard to the alleged statement concerning Sibley Hospital.

"Dr. Mattingly answered that it was Dr. Hooe, and the statement was that Sibley Hospital was wide open to Group Health Association, Inc.

"Dr. Hooe said he wished to assure Dr. Mattingly that there never was such a statement made by him nor any other member of the Executive Committee. At the last meeting of the Executive Committee, as a vote of warning, I called the committee's attention to the fact that I had been told in my office but a few days before that Sibley Hospital was admitting one, the surgeon of H. O. L. C. That is a vastly different statement from the aspersion that Sibley Hospital is wide open to H. O. L. C. doctors. My statement was that I had been informed

that one of them was being admitted to practice in Sibley Hospital," Dr. Hooe, therefore asked Dr. Mattingly to convey the message to Dr. Taylor.

"Dr. Mattingly apologized and stated that in all probability he was guilty of a misquotation.

"Dr. Hooe said in that event his message to Dr. Taylor was not necessary.

"C. B. Conklin, Secretary."

Mr. Leahy:—Well, would you read on page 8, please, what the counsel for H. O. L. C. is doing with regard to briefs, beginning on, I think it is, paragraph 8?

"A memorandum of telephone conversation held between the office of Mr. George Hoover and the President of the Society, relative to the present status of Group Health Association, Inc.:

"February 2, 1938.

"Mr. George Hoover phoned me this morning to acquaint me with the facts of what is going on in the Legal Department in regard to the H. O. L. C.

"Mr. Fenning, Mr. Hoover and Mr. Leahy have had consultations and Mr. Fenning had an interview with Mr. Underwood, of the District Attorney's office, and the attorney for the H. O. L. C. had filed a brief which Mr. Hoover and Mr. Leahy thought did not present all the facts and therefore was not the proper brief to present to the judges.

"After Mr. Fenning went away Mr. Hoover has been in touch with Mr. Underwood and as the matter now stands the attorney for the H. O. L. C. has been given until February 16 to comply with the request that they file a brief which is acceptable to all attorneys concerned as the previous one had omitted some very important items. Should the attorney for the H. O. L. C. not comply with this request, Mr. Hoover feels that we should file injunction proceedings as the next step. This requires the names of four members of the Medical Society practicing medicine in the District of Columbia as individuals. I have talked with four gentlemen who are willing to have the Society use their names, Joseph S. Wall, Loren B. T. Johnson, J. W. Burke, and Sterling Ruffin."

"(Memorandum submitted by the president, Dr. Neill.)"

Exhibit 48 is a carbon copy of a letter from the defendant Conklin to the defendant Hooe, chairman, Compensation, Contract and Industrial Medicine Committee, Medical Society of the District of Columbia, Washington, D. C., Feb. 25, 1938:

U. S. EXHIBIT 48

Dear Dr. Hooe:—

"Pursuant to action of the Executive Committee in session on the evening of February 21, 1938, the enclosed resolution submitted to the Society on Feb. 2, 1938, is referred to your committee.

"Very truly yours,
"C. B. Conklin."

Mr. Kelleher:—The resolution is as follows:

"That the proper agency of the Society take immediate measures to ascertain if any member or members of the Society are party to secret understandings and unethical arrangements with Group Health Association, Inc., whereby Group Health patients are admitted to Washington hospitals and treated under the service or supervision of Medical Society members possessing hospital privileges."

Minutes of the Executive Committee of the Medical Society of the District of Columbia held Monday, Feb. 21, 1938, at 8 p. m.:

Defendant Sprigg, chairman, presiding.

(Reading) Present: Drs. Borden, Claud, Gray, Holden, Hooe, McGovern, Neill, John Reed, Hiram Reed, C. B. Conklin, Mr. Charles S. Baker, Acting Counsel, by invitation.

"The minutes of the Executive Session of the committee, held Dec. 10, and meetings of Dec. 27 and Jan. 24 were read and approved."

Now, to turn to page 3:

"The matter of Dr. Mario Scandiffo's trial and the proper action that should be taken at this time by the Executive Committee was now up for discussion.

"Dr. R. Arthur Hooe emphasized that in his conversation with Mr. George P. Hoover there were no legal aspects to the trial and that there were no repercussions that might take place should the Society take action previous to the obtaining of a declaratory judgment which was now before the courts. The court would not be influenced at all.

"Upon motion, duly seconded, it was found, upon ballot, that Dr. Scandiffo was guilty as charged. Seven ballots were in the affirmative; two members not voting.

"Dr. Hooe, at this point, said that Dr. Sterling Ruffin was unable to be present but it was his opinion that Dr. Scandiffo should be expelled from the Society.

"Upon further motion it was recommended to the Society that Dr. Mario Scandiffo be expelled. (Report, finding and recommendation appended.)"

"THE MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA

"In the Matter of Mario Scandiffo, M.D.

"Whereas, the Compensation, Contract and Industrial Medicine Committee, by its Chairman, R. Arthur Hooe, M.D., under date of Nov. 22, 1937, did submit in writing to the Executive Committee charges against Mario Scandiffo, M.D., a member of the Medical Society of the District of Columbia, specifically charging him with having violated Chapter IX, Article III, Sections 1 and 2, and Chapter IX, Article IV, Section 5, of the Constitution of the Society.

"And whereas, after due notice to the said Mario Scandiffo, M.D., the Executive Committee did hold hearings at which the said Mario Scandiffo, M.D., with his counsel, did appear, did testify in his own behalf, did produce witnesses in his defense, and was accorded full and fair hearing in response to said charges; the said charges were fully and impartially investigated, and at the conclusion of the said hearings, arguments, both oral and written, were submitted by counsel for said Mario Scandiffo, M.D.

"Thereafter, all of the evidence adduced at the said hearings was duly considered by the Executive Committee, and upon consideration thereof, the said Executive Committee, by more than a two-thirds vote, finds the said Mario Scandiffo, M.D., guilty of violating Chapter IX, Article III, sections 1 and 2, and Chapter IX, Article IV, Section 5, of the Constitution of the Medical Society of the District of Columbia, as charged by the Compensation, Contract and Industrial Medicine Committee, and recommends that he be expelled from said Society.

"And it is further ordered, that the report, findings and recommendation of the Executive Committee be submitted in writing to the Medical Society of the District of Columbia at its next regular business meeting for such action as may be deemed proper pursuant to its Constitution."

"William Mercer Sprigg."

I turn back to page 4 of the minutes:

"Relative to certain resolutions that had been prepared by Dr. Thomas E. Mattingly at the meeting of the Society, held Feb. 2, 1938, it was, upon motion, adopted that resolution (a) be referred to the Hospital Committee for consideration and early report, and resolution (b) be referred to the Compensation, Contract and Industrial Medicine Committee.

"At this point Dr. R. Arthur Hooe addressed the meeting, stating that he was in a dilemma as to how to proceed. His telephone rang frequently, telling him of alleged work that had been done by various members of the Society for Group Health Association, Inc.

"Dr. Thomas E. Neill turned over to Dr. Hooe a written statement at this time which would tend to show that two members of the Society were guilty of working for the Group Health Association. This statement had come from Dr. M. F. Kennedy and the information was based upon prescriptions for glasses that had reached Teunis, Opticians."

Dropping down to the bottom of the page:

"The Secretary also spoke of a letter from Dr. W. C. Woodward which he had allowed Dr. F. X. McGovern to read, in which Dr. Woodward's interest was expressed in resolutions that had been prepared by the Secretary, decrying the attitude as expressed in an editorial of the New England Journal of Medicine at Jan. 20, 1938.

"The Secretary was instructed to furnish Dr. McGovern and his Committee on Public Relations with copy of Dr. Woodward's letter, so that his committee could take the proper action relative to the Secretary's resolutions."

"C. B. Conklin, Secretary."

Exhibit 83, an original letter from C. B. Conklin, Secretary of the Medical Society of the District of Columbia to Dr. J. Ogle Warfield Jr., Chairman of the Committee on Hospitals of the Medical Society of the District of Columbia, dated Feb. 25, 1938:

(Reading):

U. S. EXHIBIT 83

"Dear Dr. Warfield:

"Pursuant to action of the Executive Committee, in session on the evening of Feb. 21, 1938, the enclosed resolution, which was presented to the Society at the Business Meeting in February, was ordered referred to the Hospital Committee for consideration and report.

"Very truly yours,

"C. B. Conklin, M.D."

The enclosed resolution is as follows:

(Reading):

"That the proper agency of the Medical Society be instructed to present at our next stated meeting the facts relating to the present status of Group Health physicians at the various Washington hospitals preliminary to appropriate disciplinary action, in event any hospital has ignored the Medical Society's wishes in the premises."

(In the absence of the jury counsel argued over the admission of various documents.)

Exhibits 312, 314, 315, 316, 317, 318, 319, 320 and 321; and 313 is admitted without the handwritten notation at the bottom (handing papers to the Court).

(Document entitled "Committee on Hospitals, 1937-38" heretofore marked Government Exhibit 312 for identification was thereupon offered in evidence.)

(Letter from J. Ogle Warfield, M.D., to Dr. W. Warren Sager, dated Feb. 3, 1938, heretofore marked Government Exhibit 313 for identification was thereupon offered in evidence, without the handwritten notation on the bottom thereof.)

(Document heretofore marked Government Exhibit 314 for identification was thereupon offered in evidence.)

(Document heretofore marked Government Exhibit 315 for identification was thereupon offered in evidence.)

(Document heretofore marked Government Exhibit 316 for identification was thereupon offered in evidence.)

(Document heretofore marked Government Exhibit 317 for identification was thereupon offered in evidence.)

(Document heretofore marked Government Exhibit 318 for identification was thereupon offered in evidence.)

(Letter on letterhead of National Homeopathic Hospital signed Frances Whitlock Hall, Superintendent heretofore marked Government Exhibit 319 for identification, was thereupon offered in evidence.)

(Letter from Columbia Hospital for Women to Dr. J. Ogle Warfield, heretofore marked Government Exhibit 320 for identification was thereupon offered in evidence.)

(Letter from Earle G. Breeding, M.D., to Dr. John H. Trinder, dated Feb. 8, 1938, heretofore marked Government Exhibit 321 for identification was thereupon offered in evidence.)

(After extended argument over the admission of documents:)

(Rough draft of resolution heretofore marked Government Exhibit 324 for identification, was thereupon received in evidence.)

FEBRUARY 21, AFTERNOON

(After extended argument on the admission of various documents:)

(The documents heretofore marked Government's Exhibits 295, to and including 311 for identification, were received, as indicated, in evidence.)

TESTIMONY OF WILLIAM FREDERICK PENNIMAN

RE-DIRECT EXAMINATION

By Mr. Kelleher:

Q.—Mr. Penniman, I believe you told us when you were on the stand before you saw Dr. Allan E. Lee, Friday, December 10; is that correct?

A.—That is correct.

Q.—Where did you see him?

A.—Well, I saw him twice. I saw him in my office the afternoon of Friday and on about 4 o'clock, I think, or 4:30.

Q.—Now, will you tell us what occurred at that meeting with him?

A.—Well, he was very much perturbed—

Mr. Leahy:—I object, if your Honor please; move that be stricken.

THE COURT:—Pardon me. I was occupied with something else for a moment. Whom are we speaking about here?

Mr. Kelleher:—Dr. Allan E. Lee.

Mr. Leahy:—He asked what occurred, and the witness started in to make a description of the attitude of Dr. Lee.

THE COURT:—Yes. In substance tell us what was said.

The Witness:—Dr. Lee told me he didn't see—

Mr. Leahy:—I object to what was said.

Mr. Lewin:—Well, he has been asked what he said by his Honor.

Mr. Leahy:—I am objecting to what he said.

THE COURT:—I was not passing on it. I did not realize there was an objection.

Mr. Richardson:—It is pure hearsay.

Mr. Magee:—It is pure hearsay.

Mr. Lewin:—Your Honor, this was the matter you reserved before until our proof reached this position. Now we submit that the proof has reached such a point where we are entitled to take the statements that Dr. Allan E. Lee made to this witness. The proof so far has shown what happened to Dr. Lee, who was a doctor of Group Health, and that he was resigning from Group Health under these circumstances.

THE COURT:—Well, you want to show through this gentleman why he resigned?

Mr. Lewin:—We want to show what Dr. Lee told him, as an admission.

Mr. Richardson:—Against whom?

Mr. Kelleher:—Against everybody.

Mr. Lewin:—Against everybody who has been connected up with the case so far.

Mr. Kelleher:—Your Honor, may I make this further observation? We intend to show that by the time he talked with Mr. Penniman he had taken steps which would connect him up.

THE COURT:—Connect whom up?

Mr. Kelleher:—Connect Lee up with the alleged conspiracy.

Mr. Leahy:—In other words, Dr. Lee is a conspirator now.

Mr. Lewin:—Well, now, you know what the legal term is.

THE COURT:—Well, just a minute. We won't argue about it.

Mr. Leahy:—Another contention.

THE COURT:—I sustain the objection. It is obviously hearsay, and there is nothing here to make him a conspirator at the present time. The whole theory of the case has been otherwise up to this moment.

Mr. Kelleher:—Your Honor, we just have to explain. If we could explain this to your Honor at the bench, I think you might—

THE COURT:—Well, I am just stating my reasons. I sustain the objection.

By Mr. Kelleher:

Q.—Mr. Penniman, when you were on the stand before you had testified that you had received a letter from the defendant Custis addressed to you, which is now in evidence. After you had received that letter did you talk with Colonel Randall?

A.—I did.

Q.—Who is Colonel Randall?

A.—Colonel Randall is the president of the Homeopathic Hospital.

Q.—And when did you talk with him?

A.—Well, I first talked with Colonel Randall at the night of the dinner.

Q.—Now, but I want your conversation only after you had received the letter. Was that after the clinic had opened?

A.—Yes. Yes, that was after the clinic had opened.

Q.—Now, will you tell us what occurred at that meeting with Colonel Randall?

A.—Well, Colonel Randall was very much impressed with the—

Mr. Leahy:—I object again, if your Honor please.

By Mr. Kelleher:

Q.—Tell us what he said, Mr. Penniman.

A.—He said that he was—

Mr. Leahy:—I object to what he said.

THE COURT:—Just a minute. What is the ground of your objection, Mr. Leahy?

Mr. Leahy:—Hearsay, if your Honor please, what Colonel Randall said to him.

Mr. Kelleher:—Your Honor.

THE COURT:—What is your ground for its admission?

Mr. Kelleher:—The ground for the admission is that the hospital has already notified Mr. Penniman that Group Health Association doctors will not be admitted on the staff. Colonel Randall was acting for the hospital in contacting Mr. Penniman after this letter was written.

THE COURT:—Well, do you claim that the proof shows him to be a conspirator?

Mr. Lewin:—Not Colonel Randall personally. The hospital for which he was acting, the National Homeopathic Hospital. It is so alleged in the indictment.

THE COURT:—That is what you allege?

Mr. Kelleher:—Yes, your Honor. We contend that a prima facie case has now been established against Homeopathic, and that Colonel Randall was acting for the hospital.

Mr. Leahy:—Does your Honor care to hear from me?

THE COURT:—I should like to, please.

Mr. Leahy:—This is a most unusual ground which is urged for admission of testimony of this character. All there is here in the evidence at this time is that Homeopathic Hospital, which is a hospital which has the right to admit or refuse any one on any one of its staffs, which is a private institution governed by a board of trustees, notified the Group Health—I think that is the letter over Dr. Custis—that until a contract was approved, as I remember the letter, that this particular institution, G. H. A., or words to that effect, would not be admitted to the hospital.

Now, that is all there is in this case to show that they joined this conspiracy which took about 14 or 15 pages to talk about, had about three or four hundred doctors, which is introduced here; and just because Homeopathic Hospital didn't want to admit the G. H. A., with no reasons expressed for it, other than stated, they now say that that hospital is a conspirator. Well, now, surely everybody who did anything which G. H. A. criticizes isn't made a conspirator. You have got to go further and show more in evidence than that before they can ever show Homeopathic is a conspirator. And even if it was what Colonel Randall said, I don't know what Colonel Randall is.

Mr. Lewin:—It has been testified to.

Mr. Leahy:—There is no proof of his authority to speak for the hospital, and having an idle conversation with the witness, everything that Colonel Randall said is to be admitted by way of hearsay. If your Honor please, there are no grounds in the testimony up to this time to admit conversations which are clear hearsay, on the tenuous theory that, because one letter is written, therefore the hospital is a conspirator and anybody who acts for the hospital is likewise a conspirator, so his statement may be treated as an admission and made admissible.

Mr. Lewin:—May I reply? May it please the Court, I am sure that Mr. Leahy wanted to be accurate, but I don't think he was. Your Honor will remember, in the first place, the great amount of evidence that came from the District Medical Society itself concerning the participation of the hospitals, the attempt to bring them in, and the success that attended their efforts. That is the participation. That is the point admitted in evidence; elaborate procedure under which the hospital committee chairman was able to report complete success.

Now he says there is nothing else in the case against the National Homeopathic, which shut its doors to Group Health Association, except its own individual choice, as an individual corporation. That is the claim he makes before your Honor.

Now, let us see if that is true. Here is the letter from the executive officer of the board of trustees of the National Homeopathic Hospital. J. B. Gregg Custis, a defendant in this case, writes to this gentleman on the stand, Mr. Penniman—this is in evidence—Nov. 9, 1937:

"At a board of trustees meeting held on November 4, 1937, it was voted that until the Group Health Association was approved by the Medical Society of the District of Columbia, the National Homeopathic could not make any contract or enter into any agreement with it."

Is that individual action of an individual corporation, or is that positive proof that the District Medical Society had taken the little independent National Homeopathic into camp to work against a group of doctors because these defendants frowned on those doctors?

Now, I ask if there is some more evidence in this case to correct my dear friend Mr. Leahy. Here is some evidence that your Honor just admitted, and it is over the signature of the superintendent of the National Homeopathic Hospital, and it is an answer to a questionnaire that the defendant Warfield, the chairman of the hospital committee of the District Medical Society, wrote to each one of the hospitals, including National Homeopathic, and these are the questions that he asked, and these are the answers that the superintendent of that hospital sent back to him:

"Questionnaire. What communication has your hospital had from Group Health Association, Inc.?" And the answer:

"Received circular letter dated November 8,—"

Mr. Kelleher:—In evidence.

Mr. Lewin:—And that is in evidence.—"asking for admission for the Group Health patients and the Group Health doctors."

"What reply has your hospital made to Group Health Association, Inc.?"

And here is the answer: No action would be taken until Group Health Association was approved. By the hospital? No. Acting independently, as my brother says? No. Approved by the District Medical Society, this powerful outside organization.

"Question: Which, if any, of the following doctors are now members of your medical staff in any capacity or have privileges to practice in your hospital?"

And here come the Group Health doctors:

"Henry Rolf Brown?"

"Answer: No.

"Allan E. Lee?"

"Answer: Yes.

"Mario Scandiffo?"

"Answer: Yes.

"R. Stephen Holbert?"

"No.

"Raymond E. Selders?"

"No.

"Edmund C. Wells?"

"No."

Now, here is written on the side of it in this hospital response: "Courtesy staff: Lee, obstetrics; Scandiffo, pediatrics. Both have had patients in the hospital formerly. Future action regarding them awaits the action taken by the District Medical Society."

I will ask you if that bears out the representations that were made by my brother.

THE COURT:—I think I am able to rule, if you will step here a moment. I should like to know just what the nature of the proof is.

(Here came extended discussion out of hearing of the jury.)

Mr. Kelleher:—Exhibit 17, which has been identified as a carbon copy of a letter from William F. Penniman to Sister Rosa, Superintendent, Providence Hospital, dated Nov. 8, 1937.

Mr. Kelleher:—Exhibit 17 is a carbon copy of a letter from Penniman to Sister Rosa, Superintendent, Providence Hospital, Second and D Streets, Southeast, Washington, D. C., Nov. 8, 1937:

U. S. EXHIBIT 17

"Dear Sister Rosa:

"For your information, I am attaching hereto a copy of a letter addressed to the Providence Hospital, requesting permission to admit patients who are members of the Group Health Association to the hospital upon the request of the Medical Director.

"Also, a request to permit Dr. Raymond E. Selders, Surgeon, who is attached to the staff of the Group Health Association, to attend these patients while hospitalized.

"For your further information, there is attached a record of Dr. Selders' education, training and experience.

"Your assistance in obtaining prompt and favorable action will be very much appreciated.

"Very truly yours,
William F. Penniman,
President."

Exhibit 326 is Sister Rosa's reply, as acting superintendent of Providence Hospital. It is dated Nov. 9, 1937. It is addressed to William F. Penniman, President, Group Health Association, 1328 Eye Street, Northwest, Washington, D. C.:

U. S. EXHIBIT 326

"Dear Sir:

"We acknowledge receipt of your letter of November 8th. In reply wish to state that we will accept members of the Group Health Association as patients in Providence Hospital, according to the rules and regulations of our Hospital, at the customary rates for a period not to exceed twenty-one days.

"We are enclosing an application form requesting Surgical privileges, to be filled out by Dr. Selders, and on receipt of same will be pleased to place it before our Medical Board for its approval, which is our usual procedure.

"Very truly yours,
Providence Hospital,
per Sister Rosa,
Acting Superintendent."

Mr. Kelleher:—Exhibit 327 is Mr. Penniman's reply to Sister Rosa, dated Nov. 11, 1937:

U. S. EXHIBIT 327

"Dear Sister Rosa:

"Please accept our thanks for your very prompt and courteous reply to our letter addressed to the Providence Hospital, under date of November 8th.

"We note with pleasure that the Providence Hospital will accept Members of the Group Health Association as patients, according to the rules and regulations of your hospital, at the customary rates. The Group Health Association will be responsible for the payment of the costs of hospitalization at customary rates, in each case for a period limited to 21 days for any one illness, for each patient admitted upon the request of the Medical Director.

"Dr. Raymond E. Selders, Surgeon, attached to the staff of the Group Health Association, has filled out and signed the application form requesting surgical privileges which you enclosed and the same is being returned to you herewith. Dr. Selders has asked me to say to you that upon approval of his application he will be happy to extend to the Providence Hospital the fullest cooperation in all matters where it is felt that he would be useful. It would be much appreciated if early consideration of Dr. Selders' application could be made.

"Again thanking you, I am

"Very sincerely yours,
William F. Penniman,
President."

Q.—Will you tell, will you explain, what you meant when you said this: "Dr. Selders has asked me to say to you that on approval of his application he will be happy to extend to the Providence Hospital the fullest cooperation in all matters where it is felt that he would be useful?"

A.—Well, it was intended to mean that Dr. Selders, if he were there attending a Group Health patient, and an accident, an emergency case, or anything came in, Dr. Selders would be glad to lend his assistance in connection with the work in the hospital—do anything there that they would ask of him, cooperatively.

Mr. Kelleher:—Exhibit 328 is a letter from C. C. Caylor, Secretary, Providence Hospital, to Mr. William F. Penniman, President, Group Health Association, Inc., 1328 Eye Street, Northwest, Washington, D. C., dated Nov. 18, 1937:

U. S. EXHIBIT 328

"Dear Mr. Penniman:

"The application of Dr. Raymond E. Selders for surgical, gynecological and obstetrical privileges in Providence Hospital was presented to the Executive Staff of the Hospital today. The application was referred to the committee on Surgical Privileges for consideration and report which procedure is in accordance with our established custom.

"Dr. Selders will be notified promptly upon the Committee's report.

"Sincerely yours,
C. C. Caylor, M.D.,
Secretary."

Exhibit 329 is a carbon copy of another letter of Mr. Penniman's, addressed to C. C. Caylor, Secretary, Providence Hospital, dated Dec. 14, 1937:

U. S. EXHIBIT 329

"Dear Dr. Caylor:

"On November 18th you informed us that the application of Dr. Raymond E. Selders for surgical, gynecological and obstetrical privileges in Providence Hospital had been referred to the Committee on Surgical Privileges for consideration.

"The purpose of my letter at this time is to inquire if this committee has as yet had an opportunity to complete its investigation and whether Dr. Selders' application has been approved.

"Your prompt reply will be appreciated.

"Yours very truly,
William F. Penniman,
President."

Exhibit 18, identified as a carbon copy of a letter from Mr. Penniman to Captain Chester Wells, President, Board of Trustees, Columbia Hospital, dated Nov. 8, 1937.

Mr. Kelleher:—Exhibits 330, 331, 332, 333 and 334.

Exhibit 18 is a carbon copy of a letter written by Mr. Penniman to Captain Chester Wells, President, Board of Trustees, Columbia Hospital, Colorado Building, Washington, D. C., Nov. 8, 1937:

U. S. EXHIBIT 18

"Dear Captain Wells:

"For your information I am attaching hereto a copy of a letter addressed to the Columbia Hospital, requesting permission to admit patients who are members of the Group Health Association to the hospital upon the request of the Medical Director.

"Also, a request to permit Dr. Raymond E. Selders, Surgeon, who is attached to the staff of the Group Health Association, to attend these patients while hospitalized.

"For your further information, there is attached a record of Dr. Selders' education, training and experience.

"Your assistance in obtaining prompt and favorable action will be very much appreciated.

"Very truly yours,
William F. Penniman,
President."

Exhibit 330, an original letter from P. M. Ashburn, Superintendent, Columbia Hospital for Women, dated Nov. 9, 1937, addressed to William F. Penniman, Group Health Association, Inc.:

U. S. EXHIBIT 330

"Dear Sir:

"I acknowledge receipt this morning of your letter of November 8th, requesting Columbia Hospital to admit members of the Group Health Association for customary hospital service upon the request of its Medical Director, Dr. Henry Rolf Brown, and also that Dr. Raymond E. Selders be allowed to attend these patients while hospitalized.

"I have no doubt that the Executive Committee of the Board of Directors, to which I shall submit this matter at its meeting on Monday, November 15th, will be glad to agree to accept members of your organization for customary hospital service upon the request of its Medical Director.

"As for the request that Dr. Selders be allowed to treat these patients while they are in the hospital, I must inform you that nobody is allowed to treat patients in the hospital except physicians who have been appointed to either the regular or the courtesy staff by the Board of Directors. Dr. Selders has not been so appointed, nor has he made application for appointment. I therefore take pleasure in forwarding herewith a form of application and a letter of information and instructions in regard to such application. I would add that applications received from medical men desiring courtesy privileges are uniformly referred to the Medical Board of the hospital which considers and makes recommendations in regard to them to the Board of Directors. So far as my experience and observation go, the Board of Directors has always accepted the Medical Board's recommendations.

"The next meeting of the Medical Board will be on the evening of Tuesday, November 23rd, and I recommend that Dr. Selders' application be submitted before that date.

"Yours very truly,
P. M. Ashburn,
Superintendent."

And attached to Colonel Ashburn's letter is a form notice to the doctor, headed, "Dear Doctor"; and instructing him on the steps to be taken by him to obtain courtesy privileges.

Exhibit 331 is a letter from William F. Penniman, President, to Columbia Hospital for Women, Twenty-Fifth and L Streets, N. W., Washington, D. C., dated Nov. 11, 1937:

U. S. EXHIBIT 331

"Gentlemen:

"Please accept our thanks for your very prompt and courteous reply to our letter addressed to the Columbia Hospital for Women, under date of November 8th.

"We note with pleasure your statement that you have no doubt that the Executive Committee of the Board of Directors, to which you will submit this matter, at its meeting on Monday, November 15th, will be glad to accept members of the Group Health Association for customary hospital service, upon the request of the Medical Director.

"With reference to our request to permit Dr. Raymond E. Selders, Surgeon, attached to the staff of the Group Health Association, to attend

these patients while so hospitalized, we have had Dr. Selders complete the application, which you enclosed with your letter, and the same is being returned to you herewith.

"Dr. Selders has asked me to say to you that upon approval of his application he will be happy to extend to the Columbia Hospital for Women the fullest cooperation in all matters where it is felt that he would be useful.

"An early reply from you will be appreciated.

"Very sincerely yours,
William F. Penniman,
President."

Mr. Kelleher:—Exhibit 332 is a letter from Penniman to Captain Chester Wells, President, Board of Trustees, Columbia Hospital for Women, dated Nov. 18, 1937:

U. S. EXHIBIT 332

"Dear Captain Wells:

"Please accept my very sincere thanks for your very prompt and courteous reply to my letter of November 8th, requesting the admission of members of the Group Health Association for customary hospital service upon the request of its Medical Director, Dr. Henry Rolf Brown, also to permit Dr. Raymond E. Selders, Surgeon, attached to the staff of the Group Health Association, to attend these patients while hospitalized.

"Colonel Ashburn, your Medical Superintendent, wrote us very promptly, stating that he had no doubt that the Executive Committee of the Board of Directors, to which he would submit this matter at its meeting on Monday, November 15th, would be glad to agree to accept members of our organization for customary hospital service upon the request of its Medical Director.

"With respect to our request concerning Dr. Selders, Colonel Ashburn enclosed a form on which he could make application, together with a letter of information and instructions with regard to preparing such application. The application form was promptly filled out by Dr. Selders and returned to the Columbia Hospital for Women, addressed to the attention of Colonel Ashburn, under date of November 11th.

"Because of the extreme urgency of this matter, we are hopeful of a prompt and favorable reply.

"With very regards, I am

"Sincerely yours,
William F. Penniman, President."

Mr. Kelleher:—Exhibit 333 is a letter from Penniman to Colonel Ashburn, dated Dec. 14, 1937:

U. S. EXHIBIT 333

"Dear Colonel Ashburn:

"You will recall our letter written to you under date of November 11th in response to your letter of November 9th concerning our request to have the Columbia Hospital for Women admit members of the Group Health Association for customary medical service and to permit Dr. Raymond E. Selders, Surgeon, attached to the staff of the Group Health Association to attend these patients while hospitalized.

"We would deeply appreciate knowing whether or not the Executive Committee of the Board of Directors has as yet had an opportunity to act on Dr. Selders' application which was submitted to you with our letter of November 11th.

"Your prompt reply will be very much appreciated.

"Yours very truly,
William F. Penniman,
President."

And Exhibit 334 is Colonel Ashburn's reply to Mr. Penniman dated Dec. 15, 1937:

U. S. EXHIBIT 334

"My Dear Mr. Penniman:

"Replying to your note of yesterday, I have the honor to inform you that Dr. Selders' application for courtesy privileges has not yet gone from the Medical Board to the Board of Directors or its Executive Committee.

"The Medical Board will hold its next meeting on December 28th, and it may then make a recommendation, but I cannot know that it will.

"Very truly yours,
P. M. Ashburn,
Superintendent."

Exhibit 335 is an original letter from Sister Mary Rodriguez, Superintendent, Georgetown University Hospital, dated Nov. 18, 1937, addressed to Mr. Penniman:

U. S. EXHIBIT 335

"My Dear Mr. Penniman:

"I have referred your letter of November 8th, to the Executive Staff for their consideration.

"I shall be pleased to communicate with you concerning their decision.

"Sincerely yours,
Sister Mary Rodriguez."

Exhibit 336 is a carbon copy of a letter from Penniman to Sister Mary Rodriguez, dated Dec. 14, 1937; Sister Mary Rodriguez of Georgetown University Hospital:

U. S. EXHIBIT 336

"Dear Sister Rodriguez:

"On November 18th, you acknowledged receipt of our letter dated November 8th stating that it had been referred to the Executive Staff for their consideration. You will recall that our letter requested the George-

town University Hospital to admit members of the Group Health Association for customary hospital service upon the request of its Medical Director, Dr. Henry Rolf Brown, and to permit Dr. Raymond E. Selders, attached to the staff of the Group Health Association to attend these patients while hospitalized.

"Would you be good enough to inform us whether or not the Executive Staff has as yet had an opportunity to take action on our request.

"Your prompt reply will be appreciated.

"Yours very truly,
William F. Penniman,
President."

Exhibit 337 is Sister Mary Rodriguez's reply to Mr. Penniman, dated Dec. 16, 1937—Sister Mary Rodriguez, Superintendent at Georgetown University Hospital:

U. S. EXHIBIT 337

"My Dear Mr. Penniman:

"Your letter dated November 8, was referred to the Executive Staff at its last regular meeting, Dec. 13, 1937.

"I have been instructed to inform you that the hospital will be glad to admit patients from the Group Health Association.

"It is however, and has been for some time, a regulation of this institution that no physicians or surgeons shall be permitted to treat patients within the hospital except those whose formal applications have been approved by the Credential Committee.

"To this date we have not received a formal application from Dr. Selders for privileges to practice in the Georgetown University Hospital.

"With every good wish, I remain

"Sincerely yours,
Sister Mary Rodriguez."

Exhibit 338 is Mr. Penniman's reply to Sister Mary Rodriguez:

U. S. EXHIBIT 338

"My dear Sister Rodriguez:

"I acknowledge with pleasure the receipt of your letter of December 16th, in which you advise that you have been instructed to inform us that the Georgetown University Hospital will be glad to admit patients who are members of the Group Health Association.

"I am aware of the regulations of the various hospitals with respect to the requirement of having Dr. Selders' application approved by the Committee on Credentials, before he is permitted to treat patients while so hospitalized. Each of the hospitals, however, have their own application blanks which they forwarded for completion by Dr. Selders. I assume that the Georgetown University Hospital likewise has an application blank of this type. If you would be good enough to forward a blank, Dr. Selders will be happy to immediately fill it out and return it to you.

"Pending such investigation as is found to be necessary, some of the hospitals have been good enough to grant permission to Dr. Selders to treat emergency cases, explaining that this is a customary privilege extended to physicians and surgeons who are duly licensed to practice in the District of Columbia. If this temporary courtesy could be extended to Dr. Selders in the interim period, it would be greatly appreciated.

"Thanking you, I am

"Very sincerely yours,
William F. Penniman,
President."

Mr. Kelleher:—Government Exhibit 340 is a letter dated Dec. 28, 1937, addressed to Sister Mary Rodriguez:

U. S. EXHIBIT 340

"Dear Sister Mary Rodriguez:

"I wish to apply for admission to the courtesy staff of the Georgetown University Hospital, and will appreciate it very much if you will kindly forward me the necessary application blanks.

"Very respectfully,
Raymond E. Selders, M.D.,
Surgeon."

(Here there was extended discussion of the documents out of hearing of the Jury.)

Mr. Kelleher:—I now offer in evidence Exhibit 21, which has been identified as a carbon copy of a letter from William F. Penniman to Garfield Hospital, dated Nov. 8, 1937; and Exhibit 22, which is a carbon copy of a letter from William F. Penniman to Mr. Aspinwall, Garfield Hospital, dated Nov. 8, 1937, attached to which is a carbon copy of the qualifications of Dr. Raymond E. Selders.

Q.—I show you Government Exhibit 341 and ask you whether that is the reply which you received from Dr. Francis J. Eisenman, Superintendent of Garfield Memorial Hospital, to your letter of November 8.

Now similar series of letters were offered covering correspondence between G. H. A., and the superintendents and chiefs of the staffs of all Washington hospitals:

(To be continued)

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Change in Status.—H. R. 2112 has been reported to the Senate, authorizing the Secretary of the Navy to appoint in time of war or national emergency declared by the President to exist, for temporary service, such acting assistant surgeons as the exigencies of the service may require. H. R. 3204 has passed the House and Senate, making additional appropriations for the fiscal year 1941 urgently required for the Work Projects Administration and certain other federal agencies. Among other things, this bill provides for the remaining four months of the fiscal year 1941 an appropriation of \$525,000 to enable the Surgeon General of the Public Health Service to assist states and local health authorities in health and sanitation activities (1) in areas adjoining military and naval reservations, (2) in areas where there are concentrations of military and naval forces, (3) in areas adjoining government and private industrial plants engaged in defense work and (4) in private industrial plants engaged in defense work. This appropriation will be available too to provide emergency health and sanitation services in government industrial plants engaged in defense work and in areas adjoining United States military and naval reservations outside the United States. According to the report of the House Committee on Appropriations, the over-all purpose of this appropriation is to enable the Public Health Service to employ doctors, nurses, public health engineers, bacteriologists and supplemental personnel to coordinate the public health work between the military authorities of the reservations and the local health authorities on the outside. This cooperation, the committee reports, will extend to such problems as water supply, milk supply, sanitation, communicable diseases and other health situations which arise in areas where there are large concentrations of military and civilian personnel in connection with the intensified defense effort.

Bills Introduced.—S. 955, introduced by Senator Guffey, Pennsylvania, proposes to authorize the Secretary of the Interior to make certain inspections and investigations in coal mines to obtain information relating to health and safety conditions, accidents and occupational diseases therein. H. R. 161, introduced by Representative Voorhis, California, proposes to amend the Social Security Act to provide aid to states for care of transients. The bill proposes a federal appropriation for the fiscal year ending June 30, 1942 of \$10,000,000 and thereafter such sums as may be necessary to enable each state to furnish financial assistance, or other assistance, including but not limited to medical, dental and mental aid, as far as practicable, to needy transients. H. R. 3571, introduced by Representative McCormack, Massachusetts, provides that no individual who is licensed to practice medicine under the laws of any state, territory or the District of Columbia shall be ineligible for appointment, or for examination for appointment, as a medical officer in the active or reserve components of the military or naval forces of the United States solely by reason of any rating or classification of the medical school from which such individual was graduated. H. R. 3534, introduced by Representative May, Kentucky, provides for the continuation in the service of the Army, Navy, Marine Corps and Coast Guard of the United States beyond the term of their enlistment those suffering from disease or injury incident to service and not due to misconduct, and in need of medical care or hospitalization. H. R. 3484, introduced by Representative Byron, Maryland, provides for retirement pay and hospital benefits to certain Reserve officers, Army of the United States, disabled while on active duty. S. 970, introduced by Senator Gurney, South Dakota, proposes an appropriation of \$1,000,000 to construct a veterans' hospital and diagnostic center in the First Congressional District of South Dakota.

DISTRICT OF COLUMBIA

Bill Introduced.—H. R. 3506, introduced by Representative Smith, Virginia, proposes to direct the Commission on Licensure to Practice the Healing Art to issue a license to practice chiropractic in the District of Columbia to J. A. Brown.

STATE MEDICAL LEGISLATION

Arizona

Bill Introduced.—H. 164 proposes to enact a separate chiroprody practice act and to create a board of chiroprody examiners to examine and license applicants for licenses to practice chiroprody. "Chiroprody," states the bill, "means diagnosis or medical, surgical, mechanical, manipulative, or electrical treatment of ailments of the human foot and leg, but does not include amputation of foot, toe, or leg nor administration of an anesthetic other than local."

Arkansas

Bills Introduced.—S. 210 proposes that, within three years after the license of any physician has been revoked, the licentiate shall be granted a probationary reinstatement for one year and if during the probationary period, the licentiate has not been proved guilty of violating any law or the ethics of his profession, his license shall be fully restored. H. 409 proposes to condition the issuance of a license to marry on the presentation by the male of a physician's certificate that within fifteen days prior to the date of the application he has examined the male to determine whether or not he is afflicted with any venereal disease or is idiotic, feeble-minded, imbecilic, epileptic or insane and that in his opinion the male is free from the aforementioned diseases and conditions as nearly as can be determined by a thorough physical examination and such standard microscopic and serologic tests as are necessary for the discovery of venereal diseases. H. 448 proposes that whenever a physician is convicted of any crime involving moral turpitude, in addition to any other criminal penalty or penalties which may be imposed on him, the court trying the case may suspend or revoke his or her license to practice in the state. However, if sentence is suspended, or the convicted physician is placed on probation or is not made to suffer the penalty prescribed in the judgment of conviction, that fact shall not prevent the board from revoking his license, provided however that, if the court before whom such convicted physician was tried declines to suspend or revoke his license, then the board shall not have the power to suspend or revoke his license. H. 472 proposes that in the trial of any defendant charged with (1) having committed negligent homicide while under the influence of intoxicating liquor or (2) driving a vehicle under the influence of intoxicating liquor, the court shall admit evidence of the amount of alcohol in the defendant's blood at the time of the alleged driving, as shown by chemical analysis of his breath, urine or other bodily substances.

Connecticut

Bills Introduced.—S. 225 and H. 1325 propose to authorize the maintenance, within or apart from the state sanatoriums, of facilities and personnel for the detection of tuberculosis in its early stages and for the rehabilitation of the tuberculous. S. 227 and H. 1327 propose to create a Commission on the Care of the Chronically Sick and Infirm to study the extent of the needs for the care of the chronically ill in the state and to report its findings and recommendations to the governor before Jan. 1, 1943. S. 776 and H. 2144 propose that each state employee shall be given a physical examination by the state every six months "if such employee during the performance of his duties comes in contact with any contagious disease." S. 1057 and H. 2425 propose that "No person shall be employed by the state until he shall have [been] examined by a licensed physician in the employ of the state and shall have been certified to be in sufficiently good physical condition to make it seem probable that he will be able to efficiently discharge the work of the position to which he is to be appointed and that he has no physical weakness which is likely to result in a sickness or disability expense to the state." H. 185 and S. 388 propose to require every physician attending a pregnant woman during gestation to take or cause to be taken a sample of her blood within thirty days from the date of the first examination and to submit the sample to an approved laboratory for a standard serologic test for syphilis. H. 662 and S. 1563 propose that, whenever in a civil or criminal proceeding issues arise on which

the court deems expert evidence desirable, the court, on its motion or on the motion of either party, may appoint one or more experts, not exceeding three on each issue, to testify at the trial. H. 933 and S. 1809 propose to authorize boards of education to require each pupil enrolled in the public schools to have a health examination either by a legally qualified practitioner of medicine or by the school medical adviser at least once in each three year interval.

Delaware

Bill Introduced.—S. 15 proposes to enact a uniform state act concerning liens for money due physicians, dentists, nurses, hospitals and others for services rendered for the relief and cure of injuries caused by the fault and neglect of persons other than the injured person.

Georgia

Bills Introduced.—S. 119 proposes to prohibit physicians, dentists, osteopaths, chiropractors, chiropodists, optometrists or pharmacists from using before their name the prefix "Dr." or "Doctor" on letterheads, signs, directories, cards or in any form of advertisement and to require such persons to designate after their names on such material the particular profession they practice. S. 120, to amend the medical practice act, proposes to require applicants for licenses to have graduated from a medical school or college of good standing which, as a minimum preliminary educational requirement, requires the completion of an accredited high school course. The present law requires graduation from a medical school in good standing which has a minimum preliminary educational requirement of a two year premedical college course. H. 310 proposes to permit cities and counties or one or more counties to form public bodies corporate and politic to be known as hospital authorities, which may construct, operate and maintain projects embracing hospitals, sanatoriums, clinics, dormitories, housing accommodations or other public buildings in connection with hospital projects and utilities. H. 402 proposes so to amend the osteopathic practice act as to require applicants for licenses to practice osteopathy to have completed not less than two years of college work in an approved college of arts and sciences, to have obtained a diploma from some reputable school of osteopathy requiring a course of study of at least four terms of nine months each, and to pass examinations in anatomy, physiology, chemistry, toxicology, pathology, diagnosis, hygiene, obstetrics, gynecology, surgery, medical jurisprudence, principles of osteopathy, bacteriology and such other subjects as the board may require. The bill proposes that "Osteopaths in this state are hereby, and shall hereafter be, authorized to practice as taught and practiced in the legally incorporated and reputable colleges of osteopathy, as is now and has been since 1909 provided for and prescribed in the licenses issued to them by the officials of this state." The bill also proposes so to amend the optometry practice act and the narcotic drug act as to provide that the term "physician," as used in both of those acts, shall include an osteopath.

Idaho

Bills Introduced.—S. 153 proposes to prohibit the retail sale and distribution of amytal, luminal, veronal, barbital, acid diethylbarbituric, para-amino-benzene sulfonamide, sulfanilamid, sulfamidyl, prontylin, prontosil, neo prontosil, neo prontylin, edimalin, sulfonamid or any salts, derivatives or compounds of any of the foregoing substances, except on the written prescription of a licensed physician, dentist or veterinarian. H. 156 proposes to enact a separate massage practice act and to require the Department of Law Enforcement to appoint a board of examiners of not less than three licensed professional masseurs to examine applicants for licenses to practice "Professional Massage."

Illinois

Bills Introduced.—H. 149, to amend the law conditioning the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate as to freedom from venereal disease, proposes that the person whose name is set forth in the physician's certificate shall sign the certificate in the presence of the physician before the certificate is filed in the office of the county clerk. H. 168 proposes to

authorize the establishment and operation of two state hospitals for the care of persons afflicted with certain incurable maladies. H. 231 proposes to enact a separate naprapathic practice act and to require the Department of Registration and Education to appoint an examining committee of "qualified Naprapaths" to examine applicants for licenses to practice naprapathy. The bill defines naprapathy as "a method and system of practical and scientific treatment of the human body for remedial and hygienic purposes, without the use of medicine or operative surgery." Naprapaths, the bill proposes, are to be permitted, among other things, to apply heat and electricity and to "use of modern therapeutic appliances, such as the use of infra-red, ultra-violet rays, short wave electric currents, and diathermy treatment."

Indiana

Bills Introduced.—S. 118 proposes that every board of education and school trustee shall require a physical examination for tuberculosis, including adequate laboratory tests and x-rays, of all school employees at least once in three years. "Such examinations, tests and x-rays shall be made only by duly licensed doctors of medicine." H. 561 proposes to prohibit the retail sale and distribution of barbital except on the prescription of a licensed physician, dentist or veterinarian. The bill states that "barbital" means "Barbital and any derivative thereof; diethylbarbituric acid; any alkyl, aryl, metallic halogenated derivative of barbituric acid; veronal (barbitone); propanal; ipral; dial; neonal (soneryl); sandoptal, amytal; phenobarbital (luminal); phandorn; noctal; allonal (which contains allylisopropyl-barbituric acid in combination with amidopyrine); medinal; any preparation, mixture or other substance containing any of the foregoing substances." This bill was reported favorably to the house, February 19.

Kansas

Bills Introduced.—S. 214 proposes to authorize the organization and operation of mutual nonprofit corporations to operate hospital service plans for their members. S. 223 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. The bill proposes to define naturopathy as "the diagnosis and treatment of diseases, injuries, and deformities of human beings by means of water, light, heat, electricity, diet, air, massage, vegetables, fruits, grains or combinations of these, together with exercise. These agencies are known as hydrotherapy, phototherapy, thermotherapy, electrotherapy, dietetics and phytotherapy." Naturopathic licentiates are not to administer or prescribe drugs, practice surgery, osteopathy, chiropractic, optometry or Christian science. H. 265 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party had been given a physical examination, including a standard serologic test as may be necessary for the discovery of syphilis, made not more than thirty days prior to the date of issuance of the license, and that in the opinion of the physician the party either is not infected with syphilis or, if so infected, is not in a stage or condition of that disease which is or may become communicable to the marital partner or to any issue.

Maine

Bill Introduced.—S. 411 proposes to authorize the department of health to make investigations concerning cancer and the prevention and treatment thereof and to take such action as it may deem will assist in bringing about a reduction in mortality.

Maryland

Bills Introduced.—H. 367 proposes that "Whenever any physician, pharmacist, dentist, hospital or nurse treats any person in Somerset County for any injury which was caused by or shows evidence of having been caused by an automobile accident or by a lethal weapon he or she, or in the case of a hospital, the individual then in charge thereof, shall, as soon as practicable, notify the Sheriff of Somerset County and the State Police of such fact, giving such person's name and address, if known, a description of the injury, and any other facts concerning the affair which might assist in the detection of crime." H. 374 proposes to condition the issue of a license to marry on

the presentation by each party to the proposed marriage of a physician's certificate that the party has been given such examination, including a standard serologic test, as may be necessary for the discovery of syphilis, made on a day not more than the twentieth prior to that on which the license is applied for, and that in the opinion of the physician the party is not infected with syphilis or, if so infected, is not in a stage of that disease whereby it may become communicable.

Massachusetts

Bills Introduced.—S. 502 proposes to enact a separate osteopathic practice act and to create an independent board of osteopathic examination and registration to examine and license applicants for licenses to practice osteopathy. H. 1222 proposes to enact a separate chiropractic practice act and to create an independent board of registration of chiropractors to examine and license applicants for licenses to practice chiropractic. The practice of chiropractic is defined by the bill as the "science of locating, and removing, by hand only, interference with the transmission or expression of nerve force in the human body, where such interference is indicated or misalignment or subluxations of the vertebral column appear. It excludes operative surgery, prescription or use of drugs or medicine, or the practice of obstetrics, except that the x-ray may be used solely for the purposes of examination." H. 1232 proposes to prohibit the operation of a hospital unless licensed by the department of public health.

Michigan

Bill Introduced.—H. 190 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. The bill proposes to define naturopathy as the art, science and philosophy of natural healing.

Minnesota

Bill Introduced.—S. 627 proposes to make it unlawful for any hospital or institution receiving all or any part of its financial support from state or local taxes to deny to any licensed practitioner of any of the healing arts the privilege of practicing within its confines.

Missouri

Bills Introduced.—S. 37 proposes to condition the issue of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party is free from venereal diseases as nearly as can be determined by thorough physical examinations. Each such certificate must have attached thereto a private or public health laboratory report of the blood Wassermann test or the Kahn test for syphilis or such other serologic tests as shall be approved by the state board of health. H. 78 proposes to enact a separate naturopathic practice act and to create a board of naturopathic examiners.

Montana

Bills Introduced.—Senate Committee Substitute for S. 78 proposes that "Any institution of higher learning in the state of Montana or any accredited hospital school of nursing affiliated therewith, may apply to the State Board of Examiners of the State of Montana for the procurement of unclaimed human dead bodies for the purpose of teaching and demonstration of anatomical science by professional instructors." The bill proposes to authorize the "State Board of Examiners" to permit the delivery by any of the state custodial institutions of any unclaimed human dead body to any institution of higher learning in the state or any affiliated accredited school of nursing for the purposes stated. H. 184 proposes to require every applicant for a license to practice the healing art, as a condition precedent to examination and licensure by his respective professional examining board, to pass examinations in anatomy, physiology, chemistry, bacteriology and pathology to be given by a state board of basic sciences. The board is to consist of a professor of bacteriology of the State University of Montana, a professor of chemistry of the State School of Mines, a professor of biology of the State College at Bozeman, the secretary of the Montana State Board of Health, and a pathologist holding a certificate from the American Board of Pathology. H. 220 proposes to require every licensed physician to report annually on October 1 the names

and addresses of all persons 18 years of age and under whom he has examined in the past year and whom he has found to have defective hearing or vision to an extent that it would make attendance at public schools difficult. H. 183 proposes to enact an entire new medical practice act differing in many important particulars from the provisions of the present medical practice act. The bill proposes that the board of medical examiners is to be appointed by the governor from a list certified to him by the Montana State Medical Association. Applicants for licenses to practice, in addition to present qualifications, must be bona fide citizens of the United States. The board is to be given the power to suspend, as well as to refuse to grant or to revoke, licenses. Licentiates are to be required to register annually with the board and at that time to pay a registration fee of \$5. The board is to be given the right in its discretion to license without examination diplomates of the National Board of Medical Examiners. The bill also proposes to authorize courts to enjoin the unlawful practice of medicine or surgery.

Nebraska

Bills Introduced.—Bill 380 proposes that whenever in a civil or criminal proceeding issues arise on which the court deems expert evidence desirable the court, on its own motion or on the motion of either party, may appoint one or more experts, not exceeding three on each issue, to testify at the trial. Bill 430 authorizes the organization of nonprofit corporations to operate nonprofit hospital service plans whereby hospital service may be provided by a hospital or group of hospitals with which such corporations have contracts to such of the public as become subscribers to said corporations under contracts which entitle the subscribers to certain hospital care.

Nevada

Bills Introduced.—S. 50 proposes to authorize the board of county commissioners of any county operating a county hospital to permit the admittance to such county hospitals of pay patients. A. 95 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners to examine and license applicants for licenses to practice naturopathy. A license to practice naturopathy is to entitle its holder "to diagnose and treat human beings using natural and constructive methods according to the tenets and teachings of chartered and approved standard naturopathic colleges, schools or institutes."

New Jersey

Bill Introduced.—A. 60, to amend the laws relating to the practice of chiropody, proposes among other things (1) to create an independent board of chiropody examiners which, instead of the board of medical examiners, is to examine and license applicants for licenses to practice chiropody and (2) to define chiropody as "the examination, diagnosis, and the local medical, mechanical, surgical, manipulative, and physio-therapeutic treatment of any ailment of the human foot and leg; not including, however, the treatment of recognized osteomyelitis, recognized malignancies, tendon transplantations, amputation of the foot or leg, or the administration of anesthetics other than local."

New Mexico

Bill Introduced.—H. 183 proposes to make it "unlawful for any hospital where surgical operations are performed, and which is exempted or claims exemption from taxation, in whole or in part, on the grounds of being a charitable or nonprofit institution, to refuse to render promptly the necessary medical treatment to any person in case of accident or injury, or in case of any diseased, infected, or abnormal physical condition, which is likely to cause death or severe injury." H. 254 proposes to require each applicant for a license to practice any form of the healing art, as a condition precedent to examination and licensure by his respective professional board, to present a certificate of eligibility and creditability from a state board of medical licensures, which the bill proposes to create. The State Board of Medical Licensures is to consist of a member from each of the legally constituted and existing branches, professions or organizations of the healing arts in the state. The bill proposes that the function of the board shall be to receive, consider,

investigate, approve or disapprove all applications for healing art licenses in the state whether by reciprocity or by written examination. No written examination testing the medical or professional knowledge of the applicant is to be given by the board, but the board is to confine its examination and investigation of the applicant to his moral character, fulfillment of the educational requisites provided by the statutes governing the branch of the healing arts for which the applicant requests a license to practice and of such other facts and matters as the board may deem necessary to determine the fitness and qualifications of the candidate, exclusive of written examination.

New York

Bill Introduced.—A. 1114 proposes, in effect, to permit a relief client to select his own licensed physician to provide medical care, at public expense, whenever such care is necessary.

North Carolina

Bills Introduced.—S. 128 proposes to authorize the organization and operation of corporations to operate nonprofit hospital service plans whereby hospital care may be provided by the corporation or by hospitals with which they have contracts for such care to such persons who become subscribers to such plans under contracts which entitle each subscriber to certain hospital care. H. 365 proposes so to amend the definition of "narcotic drug" as used in the uniform narcotic drug act to include also "barbituric acid, which includes luminal, phenobarbital, nembutal, and all barbituric products."

Ohio

Bills Introduced.—S. 141 and S. 189 propose to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a statement signed by a licensed physician that the party has submitted to an examination to determine the existence or nonexistence of syphilis, which examination has included a standard serologic test or tests for syphilis, and that in the opinion of the physician the party is not infected with syphilis or, if so infected, is not in a stage of that disease which is communicable or likely to become communicable. S. 244 proposes to grant to a hospital treating an injured person a lien for the reasonable charges for hospital care, treatment, maintenance on all causes of actions, suits, claims, counterclaims or demands accruing to the injured person by reason of his injuries.

Pennsylvania

Bills Introduced.—H. 420 proposes to authorize the compulsory sexual sterilization of inmates of state institutions who are mentally defective. H. 472 proposes to appropriate \$20,000 to the department of health for the use of the Land Grant College of Pennsylvania in advancing research in human nutrition for children.

South Carolina

Bills Introduced.—H. 131 proposes that every person contracting a venereal disease shall within twenty-four hours after knowledge of the fact report the fact to the state board of health. H. 149 proposes to make it unlawful to employ any food handler or person whose employment will consist of washing dishes or utensils used in cooking or serving unless the person possesses a health card showing that within ten days prior to the employment he or she has been physically examined by a reputable physician and that in the opinion of the physician is free from contagious or infectious diseases.

South Dakota

Bills Introduced.—S. 279 proposes that municipalities of the third class, in addition to other powers granted, shall have the power to establish, construct and maintain hospitals and medical dispensaries. S. 322 proposes to require hospitals to be provided with an approved fire extinguisher on each floor.

Vermont

Bill Passed.—S. 52 passed the senate, February 24, proposing so to amend the law authorizing the formation and operation of medical service plan corporations as to permit also the operation of similar corporations with respect to optometric service plans.

Bills Introduced.—H. 160 proposes to require every applicant for a license to practice any form of the healing art, as a condition precedent to examination and licensure by his respective professional board, to pass examinations in anatomy, physiology, chemistry, bacteriology and pathology to be given by a state board of examiners in the basic sciences. The board is to consist of five members, appointed by the governor, each member to be a professor, or an assistant or associate professor or an instructor on the faculty of a university or college in Vermont, except that no member shall be a member of the faculty of any college or university which confers degrees in the healing art. H. 168, to amend the osteopathic practice act, proposes, among other things, to require applicants for licenses to practice osteopathy to be graduates of recognized schools of osteopathy requiring a four year course of at least nine months in each year. Under the present law, applicants need be graduates only of schools of osteopathy requiring a three year course of at least nine months in each year.

Washington

Bills Introduced.—S. 247 proposes to establish a system of compulsory health insurance, the benefits of which are to consist of cash and all forms of medical, dental and hospital service. S. 269, to amend the law relating to the care at public expense of needy persons, proposes that in addition to any assistance granted by the state to any applicant there shall be provided to relief clients medical, dental, surgical, optical, hospital and nursing care by county hospitals, where available, and, where not available, by a doctor of the relief client's own choosing.

West Virginia

Bills Introduced.—S. 94 proposes to prohibit the operation of a hospital except by virtue of a license issued by the state committee on hospitals, which the bill proposes to create as a division of the state department of health. S. 108, to amend the medical practice act, proposes, in effect, to except the practice of Christian science from the provisions of the act.

Wisconsin

Bill Introduced.—A. 312, to amend the basic science act, proposes that applicants for licenses to practice chiropractic when being examined in the basic sciences shall be examined and the examination papers shall be graded by chiropractors appointed by the basic science board.

OFFICIAL NOTES

THE CLEVELAND SESSION

Hotels in Cleveland

A list of hotels in Cleveland together with the rates for rooms may be found on page 14 of this issue of THE JOURNAL.

The form printed in the advertising pages may be clipped and when it has been properly filled in should be sent at once to Dr. Edward F. Kieger, Chairman, Subcommittee on Hotels of the Local Committee on Arrangements, Cleveland Convention and Visitors' Bureau, Incorporated, 1604 Terminal Tower, Cleveland, Ohio.

RADIO BROADCASTS

"Doctors at Work" is the title of the sixth annual series of dramatized radio programs being presented by the American Medical Association and the National Broadcasting Company.

Tickets are available for each broadcast. Address the Bureau of Health Education, American Medical Association, 535 North Dearborn Street, Chicago. Tickets are free, but a stamped, self-addressed envelop should accompany requests.

The next three programs to be broadcast, together with their dates and titles, are as follows:

- March 12. Brain Surgeon.
- March 19. First Line of Defense.
- March 26. Health for the Workman.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

ALABAMA

Course for Practicing Physicians.—Members of the staff of Tulane University of Louisiana School of Medicine, New Orleans, conducted a course for physicians of Mobile and vicinity early in February. The lecturers included:

- Dr. Howard R. Mahorner, Common Surgical Lesions of the Abdomen; Goiter.
- Dr. Arthur Neal Owens, Burns, Wounds and Skin Cancer.
- Dr. Michael E. DeBakey, Peripheral Vascular Diseases; Carcinoma of the Breast.
- Dr. Conrad G. Collins, Leukorrhea and Pruritus; Uterine Bleeding.
- Dr. Edward Perry Thomas, Causes of Lower Abdominal Pain and Discomfort; Uterine Cancer.
- Dr. Warren H. J. Hebert, Anal Infections; Hemorrhoids.

ARKANSAS

Youth Health Program.—The National Youth Administration has inaugurated a youth health program in Arkansas as a part of the defense movement. The plan, as outlined by the youth administration, has been approved by the Arkansas Medical Society and the Arkansas Dental Association and an advisory committee appointed to cooperate in the movement, comprising Dr. Sidney J. Wolfermann, Fort Smith, for the state medical society; I. M. Sternberg, D.D.S., Fort Smith, for the dental association, and Dr. William B. Grayson, Little Rock, for the state board of health. A state health supervisor, advised by a physician as health consultant, will direct the program. Physical examinations will be made by local physicians in cooperation with the county medical societies.

CALIFORNIA

Society News.—The San Francisco County Medical Society was addressed, February 11, by Drs. Douglas W. Montgomery and Langley Porter, San Francisco, on "Development of the Teaching of Dermatology in San Francisco" and "Development of Pediatrics in the West" respectively. The Los Angeles Surgical Society was addressed, February 14, among others, by Drs. Albert J. Scholl on "Gunshot Wounds of the Kidney" and Rupert B. Raney, "Low Back Pain in Relation to Organic Neurologic Causes." At a meeting of the Los Angeles Heart Association and the internal medicine section of the county medical association on February 5 Dr. Emanuel Libman, New York, discussed "Varieties of Endocarditis and Their Clinical Interpretation."

GEORGIA

The Block Memorial Lecture.—Dr. John Farquhar Fulton, Sterling professor of physiology, Yale University School of Medicine, New Haven, delivered the annual E. Bates Block Memorial Lecture before the Fulton County Medical Society, Atlanta, February 27. His subject was "Neurologic Developments in the Present War."

ILLINOIS

Society News.—Dr. Chauncey C. Maher, Chicago, discussed "Valvular Disease of the Heart" before the Adams County Medical Society in Quincy, February 10. Dr. Bert I. Beverly, Chicago, addressed the Edgar County Medical Society in Paris, February 27, on "Behavior Problems in Children." The Kane County Medical Society was addressed in Elgin, February 12, by Dr. Jacob P. Greenhill, Chicago, on "Recent Advances in Gynecologic Endocrinology."

Chicago

Dr. Walters to Deliver McArthur Lecture.—Dr. Walterman Walters, Rochester, Minn., will deliver the seventeenth Lewis Linn McArthur Lecture of the Frank Billings Foundation of the Institute of Medicine of Chicago, March 28, at the Palmer House. His subject will be "Pathologic Physiology of the Common Bile Duct."

Medical Symposium.—Northwestern University Medical School marked the fiftieth anniversary of Zeta Chapter of Nu Sigma Nu with the following program in Thorne Hall, February 19:

- Dr. Edward Stanley Ryerson, Toronto, Canada, Philosophy of Health and Medical Practice.
- Dr. Esmond R. Long, Philadelphia, Recent Trends in Pathology.
- Dr. Reginald Fitz, Boston, The Advancement of Medicine and Internship Problems.
- Dr. Dallas B. Phemister, Chicago, Modern Trends in Surgery.
- Dr. Morris Fishbein, Editor of THE JOURNAL, Medicine and the Preparedness Program.

LOUISIANA

New Professor of Pediatrics.—Dr. Chester A. Stewart, clinical professor of pediatrics, University of Minnesota Medical School, Minneapolis, has been appointed professor and head of the department of pediatrics, Louisiana State University School of Medicine, New Orleans, effective July 1. Dr. Stewart received his degree in medicine at Minnesota in 1919. He has been a member of the faculty since 1913, having served for several years as instructor in anatomy and later in pathology. Other changes in the Louisiana medical school include the following on a part time basis:

- Dr. Charles A. Bahn, professor of ophthalmology.
- Dr. Isidore Cohn, professor of surgery.
- Dr. Samuel Karlin, clinical assistant in surgery.
- Dr. Eleazar R. Bowie, clinical professor of radiology and director of the department of radiology.
- Dr. Frederick King Vaughan, assistant professor of obstetrics and gynecology.

State Board of Health Reorganized.—The Louisiana State Board of Health has been reorganized with Dr. John H. Musser, professor of medicine, Tulane University of Louisiana School of Medicine, New Orleans, as state health director. Under the new setup, the director of health will not be a member of the board, which is to be made up of nine members. Eight have already been named: Dr. Eugene B. Vickery, New Orleans, chairman; Dr. Joseph E. Knighton, Shreveport, vice chairman; Leo J. Schoeny, D.D.S., New Orleans, secretary; Mr. Monte M. Lemann, New Orleans; Mr. V. C. Cupp, Ruston; Mrs. Charles R. Cline, Lake Charles; Dr. Paul King Rand, Alexandria, and Mr. A. Bruce Mouton, Maurice. According to the newspapers, boards which will remain in existence but function under the supervision of the new health department are the board of health, the state tuberculosis commission, the board of medical examiners, the board of dentistry, the board of optometry examiners, the nurses' board of examiners and the board of pharmacy. Dr. Robert H. Onstott, U. S. Public Health Service, who has been serving as full time executive officer of the board, will continue in this capacity under the direction of Dr. Musser. Dr. Ford S. Williams, director of the division of venereal diseases under the old board, is now assistant director of the state board. Dr. Joseph A. O'Hara was president and executive officer of the board from 1928 until his resignation Sept. 1, 1940.

MICHIGAN

Fellowship Awarded.—The Edward and Susan Lowe medical fellowship for 1941 was awarded to Dr. M. Mozart Marrin, staff surgeon of Butterworth Hospital, Grand Rapids, January 13. Dr. Marrin is the first surgeon to receive the award since it was established in 1939. The award is designed for a young member of the hospital staff who shall not have been a member of the senior division of the staff for more than three years. Dr. Marrin graduated at the University of Michigan Medical School, Ann Arbor, in 1932.

Society News.—William W. Greulich, Ph.D., Cleveland, discussed "Physical Growth and Development of Adolescent Children" before the Detroit Physiological Society, January 16. Dr. James Barrett Brown, St. Louis, discussed "Limitations and Possibilities in Reconstructive Surgery" before the Wayne County Medical Society, February 24, in Detroit. Dr. Frank D. Johnson addressed the Genesee County Medical Society in Flint, February 18, on "Mucous Colitis." Dr. Richard H. Freyberg, Ann Arbor, delivered the third annual Crane Memorial Lecture before the Kalamazoo Academy of Medicine, February 18, on "Newer Treatments for Arthritis." Dr. Frederick Collier, Ann Arbor, discussed "Surgical Treatment of Peptic Ulcer" before the academy January 21.

Changes in Health Personnel.—Dr. Paul A. Lindquist, Ann Arbor, has been named medical administrator of the Mason-Manistee-Benzie health unit, with offices in Manistee. He succeeds Dr. Frank J. Hill, who resigned. Dr. Thomas

E. Camper, formerly of Stambaugh, has been appointed director of the Shiawassee County health unit, with offices in Corunna, newspapers reported. He has been succeeded as director of the Iron County health department by Dr. Lorin E. Kerr Jr., Mason.—Dr. Buell H. Van Leuven, Menominee, has been made director of the Grand Traverse County health department, succeeding Dr. John K. Altland. Dr. Van Leuven has been acting director of the Menominee County health unit. He once served as mayor of Petoskey for six years.—Dr. Cletus J. Golinvaux has been placed in charge of the Monroe County health department with offices in Monroe.

MINNESOTA

Special Lectures.—Dr. Paul D. White, Boston, presented a special lecture at the University of Minnesota Medical School, Minneapolis, in the auditorium of the Museum of Natural History, February 28. His subject was "Enlargement of the Heart." Prof. Henrik Dam, Biochemical Institute, University of Copenhagen, lectured in the medical school on February 24. Dr. Dam's lecture was entitled "Vitamin K—Biochemistry and Clinical Application."—Dr. Andrew C. Ivy, Chicago, gave a Mayo Foundation lecture in Rochester, January 16, on "Bile Salt Metabolism as Related to Therapy."

Society News.—The Minnesota Society for the Control of Cancer filed articles of incorporation, Dec. 12, 1940. Officers include Dr. William A. O'Brien, St. Paul, president; Dr. Max W. Alberts, St. Paul, vice president; Mrs. S. L. Carr, Minneapolis, secretary, and Louis W. Hill Jr., St. Paul, treasurer.—Dr. Jacob A. Johnson, St. Paul, delivered the presidential address before the Minnesota Academy of Medicine in St. Paul January 8 on "Diverticula of the Alimentary Canal."—Dr. Carl Eggers, New York, discussed "Carcinoma of the Breast" at the annual meeting of the Minneapolis Surgical Society, February 6.—Wendell M. Stanley, Sc.D., Rockefeller Institute for Medical Research, Princeton, N. J., discussed "Chemical, Medical and Philosophical Aspects of Viruses" before the Minnesota Pathological Society, Minneapolis, January 21.

NEW JERSEY

Course in Tuberculosis.—A lecture and demonstration course in tuberculosis covering bacteriology, epidemiology, pathology, diagnosis and treatment of adult and childhood tuberculosis will be given at the Newark City Hospital, April 3 to May 10, under the auspices of the committee on postgraduate instruction of the Medical Society of New Jersey, the Essex County Medical Society and New York University. The program may be obtained from the Dean, New York University College of Medicine, 477 First Avenue, New York.

Society News.—The New Jersey Gastroenterological Society presented a symposium on lesions of the stomach, duodenum and jejunum at a meeting, February 3, in Newark. The speakers were Drs. William T. Lemmon, Karl Kornblum, Isidor S. Ravdin and Charles L. Brown, Philadelphia; Burrill B. Crohn and John H. Garlock, New York. Dr. Hyman I. Goldstein, Camden, was elected president.—The Medical Society of Cape May County held a meeting in honor of Dr. Watson B. Morris, Springfield, president of the Medical Society of New Jersey, on January 14 at the Ocean City Golf Club, Somers Point. The speakers were Drs. Morris; LeRoy A. Wilkes, executive officer of the state society, Trenton; Aldrich C. Crowe, Ocean City, president of the county society, and Warren D. Robbins, Cape May. Dr. David B. Allman, Atlantic City, presented a paper entitled "A Potpourri of Surgery."

NEW YORK

Society News.—Dr. William Osler Abbott, Philadelphia, addressed the Medical Society of the County of Westchester, White Plains, February 18, on "Clinical Uses of Long Intestinal Tubes." The society met jointly with the Westchester Society of Gastroenterology.

New York City

Sixth Harvey Lecture.—Walter J. Meek, Ph.D., professor of physiology and assistant dean of the University of Wisconsin Medical School, Madison, will deliver the sixth Harvey Society Lecture of the current series at the New York Academy of Medicine, March 20. His subject will be "Cardiac Effects of the Inhalant Anesthetics and the Sympathomimetic Amines."

Personal.—Dr. Leonard J. Goldwater has recently been promoted to be assistant professor of medicine at New York University College of Medicine.—Dr. Edward S. Rimer has been elected president of the Society of Alumni of Bellevue Hospital.—Harold C. Urey, Ph.D., professor of chemistry, Columbia University, received the Davy Medal of the Royal Society of England in recognition of his isolation of deuterium, the heavy hydrogen isotope, and for his work on the use of this and other isotopes in following the detailed course of chemical reactions, according to *Science*.—Dr. George M. Wheatley, recently principal pediatrician in charge of the school health service of the New York City Department of Health, has been appointed an assistant medical director for the Metropolitan Life Insurance Company.—Dr. Alexis Carrel sailed, February 2, on the *Siboney* to study the effects of malnutrition and cold on war victims. He went first to Spain and later was to visit France and Belgium.—Dr. Franklin M. Foote, chief of the division of local health administration in the Connecticut State Health Department, Hartford, has been appointed district health officer for the Kips Bay-Yorkville Health and Teaching Center. He succeeds Dr. Leona Baumgartner, now acting director of the bureau of child hygiene of the city health department.—Dr. Emil Altman, for twenty-two years a member of the medical division of the board of education and for the past seventeen years its chief examiner, has applied for retirement, effective immediately.

OHIO

Changes in Health Officers.—Dr. Harry G. Southard, Marysville, has been appointed health commissioner of Hocking County.—Dr. Wilbert W. Lawrence, Norwalk, has been appointed health officer of Huron County to succeed Dr. Robert P. Scott Jr., who has left for military service.—Dr. Alexander S. Mack, Oak Harbor, has been appointed health officer of Ottawa County to serve during the absence of Dr. Cyrus R. Wood, Port Clinton, who is in military service.

Society News.—Dr. Spencer Braden, Cleveland, addressed the Lorain County Medical Society, Elyria, January 14, on "Neurosurgical Management of Cranial and Intracranial Injuries."—Dr. Peter A. Rosi, Chicago, addressed the Clark County Medical Society, Springfield, January 15, on "Surgical Treatment of Peptic Ulcer."—Dr. Joseph A. Muenzer, Toledo, discussed "Silicosis and Related Chest Conditions" before the Seneca County Medical Association, Tiffin, January 9.—Dr. Claire L. Straith, Detroit, addressed the Academy of Medicine of Lima and Allen County, January 21, on plastic surgery.—Dr. Max T. C. Schnitker, Toledo, addressed the Henry County Medical Society, Napoleon, January 14, on "Treatment of Acute Head Injuries."

PENNSYLVANIA

Dr. Donaldson Appointed Editor.—Dr. Walter F. Donaldson, Pittsburgh, secretary of the Medical Society of the State of Pennsylvania, has been appointed editor of the *Pennsylvania Medical Journal*, succeeding Dr. Frank C. Hammond, Philadelphia, who is now editor emeritus. Dr. Hammond was appointed editor of the *Atlantic Medical Journal*, predecessor of the present state journal, in 1925. He was for many years dean of Temple University School of Medicine and recently retired as professor of gynecology.

Philadelphia

Dr. Stadie to Receive Phillips Award.—Dr. William Christopher Stadie, associate professor of research medicine, University of Pennsylvania School of Medicine, will receive the John Phillips Memorial Medal for 1941 at the annual meeting of the American College of Physicians in Boston, April 21-25. The award goes to Dr. Stadie in recognition of his "significant contributions to the knowledge of anoxia, cyanosis and the physical chemistry of hemoglobin and more especially for his recent studies on the subject of fat metabolism in diabetes mellitus." Dr. Stadie has been associate professor of research medicine at Pennsylvania since 1925.

Dr. Macfarlane Honored.—Dr. Catharine Macfarlane, professor of gynecology at the Woman's Medical College of Pennsylvania, recently received the annual Gimbel Award of an embossed scroll and \$1,000 in recognition of her clinical research on the control of cancer in women. This award is conferred each year on an outstanding woman living in the Philadelphia area. Dr. Macfarlane is the first in the field of science to receive it. In accepting the check from Mr. Ellis A. Gimbel, the donor, Dr. Macfarlane announced that one half of the money would be used for cancer control work and the

other half would be donated to the Woman's Medical College Hospital in honor of the late Mrs. Fridolyn Gimbel, mother of Mr. Gimbel. Dr. Macfarlane graduated from the Woman's Medical College in 1898 and has been professor of gynecology there since 1922. She is the author of a "Textbook of Gynecology for Nurses."

Pittsburgh

Society News.—At a meeting of the Allegheny County Medical Society, February 18, the speakers were Drs. Leo D. O'Donnell, "Biliary Tract Disease and Its Treatments"; John R. Simpson, "Acute Laryngotracheobronchitis," and Theodore O. Elterich and Joseph A. Gilmartin, "Modern Concepts on the Management of Infantile Diarrhea."

Pittsburgh Has a Health Show.—The Allegheny County Medical Society, the General Health Council of Allegheny County and the Pittsburgh Department of Health are sponsoring a health show at the Buhl Planetarium and Institute of Popular Science. Exhibits from the Hall of Man at the Medicine and Public Health Building at the New York World's Fair, with the addition of exhibits showing the work of numerous local agencies and organizations, make up the show, which opened on February 21 and will continue six weeks. Many of the exhibits feature demonstrations at regular hours, with trained lecturers giving the demonstrations.

TENNESSEE

Hospital News.—W. Harvey Reaves, Greenville, has presented to the East Tennessee Tuberculosis Association a sanatorium valued at \$40,000, fully equipped. The gift was made in memory of Mr. Reaves' daughter, who died five years ago of tuberculosis. The new institution, located near Greenville, has been named the Learline Reaves Sanatorium.

Personal.—Oren A. Oliver, D.D.S., Nashville, and Dr. John R. Thompson Jr., Jackson, were recently appointed members of the state public health council for three year terms, according to a newspaper report.—Dr. James P. Moon, Dyersburg, health officer of Dyer County, has been appointed health officer of Franklin County to succeed the late Dr. Victor J. Ganey.

TEXAS

Society News.—Dr. Walter Grady Reddick, Dallas, addressed the Jefferson County Medical Society, Beaumont, January 13, on "Treatment of Pneumonias." Dr. Edward L. King, New Orleans, addressed the society recently on "Use of Analgesics in Obstetrics."—Dr. Edwin L. Rippey, Dallas, was the guest speaker before the Hunt-Rockwall-Rains Counties Medical Society, Greenville, January 14, on treatment of pneumonia and Dr. Harry Milton Bradford, Greenville, discussed diagnosis and treatment of pellagra.—A program on pneumonia was presented before the Dallas County Medical Society, February 13, by Drs. Henry M. Winans, Robert R. Shaw, Warren E. Massey and Asa E. Seeds. All are of Dallas.

WASHINGTON

Hospital News.—Pierce County Hospital, Tacoma, has received a grant of \$13,400 for installation of a physical therapy department for the treatment of infantile paralysis victims. Two respirators have been presented to the hospital by the Lumber and Sawmill Workers' Union.

Society News.—Dr. Frederick A. Slyfield, Seattle, addressed the Walla Walla Valley Medical Society, Walla Walla, February 13, on diseases of the chest, with special emphasis on modern treatment of pneumonia.—Dr. Troy Moore, Colfax, discussed headaches at a meeting of the Whitman County Medical Society, Colfax, February 6.—Drs. John H. Fitzgibbon and Willard F. Hollenbeck, Portland, addressed the Cowlitz County Medical Society, Longview, January 15, on "Treatment of Peptic Ulcer" and "Treatment of Chronic Ulcerative Colitis" respectively.—Dr. Henry H. Dixon, Portland, spoke on "The Scientific Approach and Treatment of the Nervous Tension State" at a meeting of the Yakima County Medical Society, Yakima, January 13.—Drs. Frederick A. Slyfield, Seattle, and Charles M. Jessico, Fort Steila-coom, addressed the Pierce County Medical Society, Tacoma, January 14, on "Diseases of the Chest" and "The Myelographic Diagnosis of Intramedullary Spinal Cord Tumors" respectively.

WISCONSIN

Joint Meeting of Special Groups.—Members of the Chicago Laryngological and Otolological Society will be the guests of the Milwaukee Oto-Ophthalmic Society at a meeting in Milwaukee, March 11. The speakers will include Drs. John

R. Lindsay on "Carcinoma of the Esophagus"; Howard C. Ballenger, "Chronic Mastoiditis"; Paul H. Holinger, who will present a color motion picture of the larynx, and Samuel Salinger, who will report a case of congenital angioma of the nose and forehead, with cure by radium and surgery. All are from Chicago.

Annual Clinic Meeting.—The Racine County Medical Society held its annual clinic meeting in conjunction with the staff of St. Luke's Hospital, Racine, January 15, at the Racine Country Club. Speakers on an afternoon program were:

Dr. Newell C. Gilbert, Chicago, Reflex Vasoconstriction of the Coronary Arteries.

Dr. William S. Middleton, Madison, Pneumonia, Its Treatment and Complications.

Dr. Charles H. Slocumb, Rochester, Minn., Diagnosis of Arthritis.

Dr. Ralph M. Waters, Madison, Anoxia in Relation to Nonvital Pain-Relieving Drugs and Anesthesia.

Dr. Erich M. Uhlmann, Chicago, Tumors of the Female Organs.

Dr. Slocumb and Dr. Uhlmann spoke at a dinner meeting on "Industrial Aspects of Arthritis" and "Modern Concepts of Malignancy and Its Therapy" respectively.

Dr. Sevringhaus on Travel Grant to South America.—Dr. Elmer L. Sevringhaus, professor of medicine, University of Wisconsin Medical School, Madison, has received a government travel grant to visit South America, under the provisions of the Second Deficiency Appropriation Act of 1940, which provided funds for the exchange of distinguished cultural, professional and artistic leaders between the United States and the other American republics. Dr. Sevringhaus was to leave from Miami by plane February 20, going to Buenos Aires by way of Santiago, Chile. He was to attend the Pan American Congress of Endocrinology in Montevideo, Uruguay, March 5-8, and deliver lectures there. From March 13 to 18 he will lecture in Buenos Aires and will return to the United States about March 23.

GENERAL

Health in Civilian Conservation Corps.—Among the 254,925 enrollees on duty in the Civilian Conservation Corps during October 1940 the admission rate to sick report, calculated on an annual basis, was 836 per thousand, an increase over the rate for the previous month, 743. The rate for the respiratory group of diseases increased to 203.8 from 170.6 for the previous month; practically all other diseases showed a decrease. There were 12 cases of rheumatic fever, 4 of cerebrospinal meningitis, 1 of poliomyelitis and 1 of tularemia during the period. Forty-six deaths occurred during the month, 17 due to disease and 29 due to injury; of the former, 2 were caused by cerebrospinal meningitis, 2 by appendicitis, 1 by pneumonia, 1 by arteriosclerosis, 4 by diseases of the coronary arteries, 18 by automobile accidents and 5 by truck accidents.

Motor Vehicle Deaths Increase.—Motor vehicle deaths in one hundred and fifty-eight cities reporting to the U. S. Bureau of the Census increased 3.4 per cent over the number for the previous year, the bureau has reported. There were 8,441 deaths reported in 1940 and 8,162 in 1939, according to preliminary reports. Seventy-six cities showed increases; seventy-one showed decreases and eleven reported the same number of deaths. Eight of the cities having populations of 500,000 or more in 1940 showed increases as follows: New York 1 per cent, Detroit 13.5, Los Angeles 12, Baltimore 2.4, St. Louis 91.5, Boston 7.1, Pittsburgh 11.6 and Milwaukee 25. Five large cities showed decreases: Chicago 4.4 per cent, Cincinnati 13, Washington, D. C., 24.4, San Francisco 13.2 and Buffalo 22.9. The report is a summary of the provisional figures published weekly during the year.

Training in Medical Librarianship.—The Orleans Parish Medical Society, New Orleans, announces a residency in medical library work. Requisite qualifications for appointment include college and library school training and an evidence of fitness for this type of work by personality and aptitude. The appointment carries a salary and is for a term of one year, subject to temporary extension by mutual consent. The work will be done in the library of the Orleans Parish Medical Society and the Rudolph Matas Medical Library of Tulane University, comprising a collection of more than sixty thousand volumes. The course is personally directed by the librarian in charge of the two libraries and proposes to cover a study of medical library administration used in these libraries and a comparison with varying methods used elsewhere. Any one wishing further information about the new residency should address the Librarian, Orleans Parish Medical Society, 1430 Tulane Avenue, New Orleans.

The Indictment of the American Surgical Trade Association.—The following statement is sent by Mr. Fred B. Hovey, secretary of the American Surgical Trade Association:

An Associated Press release to the newspapers of the country on Wednesday, February 19, announced the indictment of the American Surgical Trade Association, certain of its officers and certain member firms. This release contained the following statement as to the indictment:

The defendants are charged specifically with conspiring to limit and prevent the production and sale of surgical supplies that were imitations or copies. This was accomplished, the indictments allege, by adopting a registration plan under which any member of the association could register any article that was first produced by a member. Then they agreed, the indictments added, that no other member would produce or sell this item or any imitation for five years.

The indictments also charge that the association boycotted any articles produced elsewhere, thus giving the association a five year monopoly.

A study of the indictment discloses that the press release has correctly summarized the charge.

From the indictment it appears that the government considers that the Association's activity of registering new articles was a violation of the Federal Anti-Trust Laws. If the Association's activity was conducted as the government charges there might be some basis for such a charge; but, as probably every member familiar with the Association's registration activity knows, the facts as stated in the press release are not correct.

In view of the fact that this activity of the Association is now charged by the Government to be illegal, it seems advisable to give the following brief history of the development of the Association's registration activity and its operation.

A study of old issues of the A. S. T. A. journal discloses that, at least as early as 1922, members of the Association, largely dealers, advocated the establishment of a registration bureau by the Association.

At least two laudable objectives, to be accomplished by the establishment of a registration bureau, were discussed.

One was that by the establishment of a registration bureau the surgical trade could be informed as to where a newly devised surgical item could be obtained that faithfully followed the originator's design. This was particularly important in the case of surgical instruments where comparatively small variations from the approved pattern might destroy the usefulness of the instrument.

The second objective may be considered as a logical consequence of the first objective. At the time the registration activity was first considered American makers of surgical instruments could not produce as cheaply as foreign makers (about 90 per cent of surgical instruments sold in the United States were made in Germany) and if the American maker was not known as the producer of the correct design of instrument and the only competition between the American originator of an article and a foreign copyist was on a price basis the American producer of the original article could not hope to successfully compete with the foreign copyist.

The fact that American manufacturers of surgical goods who brought out a new article that proved popular were unable to meet foreign competition strongly tended to dissuade American makers of surgical articles from going to the very substantial expense of cooperating with a surgeon who had an idea for a new surgical article in producing the numerous hand made models usually necessary before a satisfactory pattern was evolved and it was believed that registering new articles would stimulate their production.

The American instrument maker was faced with a condition that might be characterized as "Heads you win, tails I lose" because if the article that he developed in cooperation with the surgeon did not prove popular few would buy it and he would lose the money he had spent in developing it; if it proved popular and there was a substantial demand, the foreign surgical instrument manufacturer could produce the article cheaper and drive him out of the market.

The plan was not designed to include staple items and the proportion of registered articles sold in the surgical trade to total sales in the surgical trade during any year was probably not greater than 0.0001 to 1 (one hundredth of one per cent).

The idea of a registration bureau was considered for about four years before such a bureau was established. Before the decision by the Association to register new articles was made, the Attorney General of the United States was asked to give an opinion as to the legality of the activity, which he refused; and very eminent independent counsel was employed to pass on the activity and gave an opinion, to which he still adheres, that the activity was legal. Further, Alfred Littauer, known to all the older men in the surgical trade, who was one of the fathers of the plan, consulted eminent counsel in New York City who gave as his opinion that the plan was lawful.

The plan was put in operation. It was purely informative. No agreement was asked for or accepted from members that they would give registered articles a preference. Members did from time to time buy copies of registered articles from others than the original manufacturer and no member was boycotted for doing so. The plan did not produce all the results hoped for by those who first conceived it, as is evidenced by the fact that more articles were registered during the first seven years during which the plan was in operation than during the second seven years.

After the registration of new articles was undertaken by the Association, the activity was carried on openly, current registrations being published almost every month in the A. S. T. A. journal.

For many years after the Association began its registration activity, no question was raised as to its legality; and in recent years at least two trade organizations, i. e. Fashion Originators' Guild and Millinery Creators' Guild, were organized for the specific purpose of protecting their members against the "piracy" of their original designs.

The registration activity of the Fashion Originators' Guild included requiring purchasers from members of the Guild to sign an agreement that they would not buy imitations ("piracies") of registered articles and the boycotting of those who would not enter into such agreements; and yet this registration plan when first considered by a court was held legal by the United States District Court of Massachusetts in 1936, and this decision was upheld by the United States Circuit Court of Appeals for the First District. Later in 1940 the plan was held illegal by the Circuit Court of Appeals for the Second Circuit and the legality of that plan is now before the Supreme Court of the United States.

That the registration plan of the A. S. T. A. was devised only to stimulate production of new articles is evidenced by the facts, previously mentioned, that staple articles were not registered, that probably not more than 1/100th of one per cent of total sales in the surgical trade were of registered articles, and that the use of the plan during the years it was in existence lessened instead of increased. It is inconceivable if the plan was operated to enable the producers of registered articles to increase their prices that the use of the plan would not have grown.

It is possible that the decision by the Supreme Court of the United States in the pending case involving registration activities may clarify the law as to registration activities of the Association; otherwise the legality of the Association's registration activity which involved neither the obtaining of any agreements from members with reference to registered articles nor boycotting of those who bought copies of registered articles from others than the registrants will probably have to be decided by the courts.

LATIN AMERICA

New Journals of Ophthalmology.—A new ophthalmologic journal has recently appeared in Brazil under the direction of Dr. Moacyr E. Alvaro, São Paulo, *Ophthalmologia Ibero Americana*. The journal is to be published quarterly and contains, besides original articles, a section of abstracts, society proceedings, book reviews, news and other notes.—The first issue of the *Boletín del Hospital Oftalmológico de Nuestra Señora de la Luz*, Mexico City, recently appeared. The bulletin will publish papers and case reports from members of the staff. The first issue gave a history of the hospital, the first special hospital for diseases of the eye in Mexico.

Postgraduate Lectures.—A series of postgraduate lectures for physicians of the Republic of Panama was presented recently at the Gorgas Memorial Laboratory and the Hospital Santo Tomas in Panama. Dr. Oswald S. Lowsley, New York, gave a four weeks course of lectures and demonstrations in urology. Dr. Maxwell M. Wintrobe, Baltimore, lectured on hematology and Dr. Charles Murray Gratz, New York, on orthopedic surgery. It is planned to make the courses an annual event.—Dr. Joseph Jordan Eller, New York, gave a series of lectures on "Tumors of the Skin" at the Faculty of Medicine of Costa Rica, San José, in November.

New Venezuelan Societies.—Organization of the Venezuelan Society of Microbiology, Parasitology and Tropical Medicine in Caracas was recently reported. Dr. A. L. Briceno Rossi was elected secretary for bacteriology and Dr. David R. Iriarte secretary for parasitology and tropical pathology.—The recently organized Venezuelan Urological Association has elected the following physicians to be corresponding members: Drs. Hugh H. Young, Baltimore; William F. Braasch, Rochester, Minn.; Terry M. Townsend, Oswald S. Lowsley and J. Bentley Squier, New York.

Planning Committee Appointed by the British Medical Association

A medical planning committee has been appointed by the British Medical Association to study wartime developments and their effects on the country's medical services, both present and future. It will consist of sixty-eight physicians representing all branches of the profession under the presidency of Col. Thomas Fraser, consulting physician to the Aberdeen Royal Infirmary. The commission will meet from time to time to debate large questions of principle. The detailed work will be undertaken in committees and subcommittees, whose recommendations will come for discussion before the commission itself. It is believed that any disadvantage which may be due to the size of the commission will be more than offset by the advantage of its fully representative character. Commenting on the project, the *British Medical Journal* states that the commission has a great opportunity and an equally great responsibility. It has among its members men of all shades of medical experience. "War has thrown into sharp relief the deficiencies of our peacetime system of administering relief to the sick and of promoting and maintaining the health of the people. The British Medical Association now proposes to prepare for the return of peace so that medicine may be ready to meet its responsibilities in a world in which many values will be changed, fresh conceptions of society will be formed, and in which new stresses and strains will appear in the moral, material and economic fabric of the democracy we hold to be our rightful heritage."

The Bread Controversy

Bread used to be made from wholemeal flour, which, even when most refined, contained most of the germ and much finely ground bran. But about the middle of the nineteenth century stone grinders gave place to steel rollers, which removed the whole of the germ and practically all the bran. The white bread produced was regarded as a more refined article and became popular. The craze for whiteness was still not satisfied. The pale cream color, due to traces of the natural yellow pigment, one of which is carotene, the precursor of vitamin A, was removed by bleaching, which destroyed all the carotene. Other detrimental effects were loss of vitamins A and B and of minerals (calcium, phosphorus and iron). But the use of this degraded flour became general, and only in recent years has much attention been paid to the loss. Indeed, there are still dietitians who do not regard it as important, saying that it can be made good by other foods. This is no doubt true for persons who can obtain a liberal diet. In the case of others, ill effects are not easy to trace in our complex civilized life. However, in their recent important book "The Englishman's Food," Prof. J. C. Drummond and Anne Wilbraham give as results chronic diseases of the stomach and intestine and the appallingly prevalent dental caries. The production of caries in natives who previously had excellent teeth on abandoning their natural unrefined food for a civilized diet, of which the most important item is white flour, is well attested.

London Hospitals Carry on During Air Raids

The London hospitals have now received much damage from air raids, but their work has gone on. In a recent raid seven hospitals were damaged. These included a large general hospital and a hospital for women. Six wards of one hospital were wrecked when four bombs struck the building, causing the death from shock of some elderly patients. At another hospital

two blocks were completely wrecked and four porters were buried in the ruins. One was quickly rescued, but the others were still trapped at the time of the report. Many hospitals have had their roofs ripped off, their windows shattered and their walls reduced to a pile of rubble. One hospital endured four direct hits on four successive nights. But despite the worst the raiders can do the hospitals carry on. Thus at a well known hospital the medical superintendent, the medical staff, the matron and the nurses all showed unflinching bravery through a grueling seven hour ordeal. Their calm comment when the "all clear" signal was given was "Well we didn't lose a single patient."

Grave Food Scarcity in Belgium

News has been received that during December the scarcity of food in Belgium became acute. The weekly amounts now allowed are only as follows: margarine 1½ ounces, butter 1½ ounces, meat, including 20 per cent bone, 4 ounces, bread 3½ pounds, coffee or coffee substitute 2¼ ounces, rice 1½ ounces, sugar ¾ ounce, honey, jam or syrup less than 4 ounces, potatoes 7½ pounds, oil 1¾ ounces, skimmed milk 6½ pints. But, according to a Belgian newspaper published under German censorship, even these rationed quantities are often unobtainable. The goods of all Belgian clothing and shoe shops have also been severely rationed for some time, even for German soldiers.

Medical Help from America

The government has decided that all requests to the British Red Cross which concern assistance from the United States in providing hospital and medical supplies or in sending to Britain doctors and nurses or complete hospital establishments shall in future be directed solely through the British Red Cross to the American Red Cross. It is felt that this unification will avoid overlapping and insure that American supplies will be regulated according to the urgency of need. It is understood that the American Red Cross is taking steps to cooperate with other American organizations which are helping Britain with gifts of hospital supplies and of medical and surgical equipment. With the American Red Cross they have already made a great contribution, which the British government deeply appreciates.

Consideration for Expectant Mothers in Bombed Areas

Postponement of liability for military service may be granted to a man if his wife resides in a place on which enemy bombs have been dropped causing injury and death, which has adversely affected her nervous system, and she has no relatives or friends in an area not subjected to air raids with whom she could reside. The Ministry of Labor and National Service has announced this decision by the umpire on a husband's application for a postponement certificate.

BUENOS AIRES

(From Our Regular Correspondent)

Nov. 22, 1940.

Control of Preventable Noises

The municipal council of Buenos Aires recently adopted new regulations to control preventable nuisances. With few exceptions, motor vehicles must hereafter be supplied with rubber or pneumatic tires. Drivers of extra-urban vehicles which are not so equipped must secure a permit. This is good for a week of a current month. All vehicles must also be equipped with noiseless exhausts and horns that do not exceed a specified pitch. These may not be sounded between the hours of 1 and 7 a. m. Violation of the regulation is punishable by cancellation of the license for thirty days.

The anti-noise regulation has been extended to apply to the abuse of loud speakers. Great improvement has been noted, for which Argentine automobile clubs are also to be credited.

Previous regulations against noxious gases (THE JOURNAL, April 20, 1940, p. 1570) directed against the use of heavy fuel oil by omnibuses and other public conveyances are now being rigorously enforced.

Argentine Congress of Surgeons

In October the twelfth Argentine Congress of Surgeons met in Buenos Aires under the chairmanship of Prof. Alberto Baraldi of Rosario. There were delegates from Bolivia, Brazil, Chile and Uruguay. Bolivia was represented by Dr. Abelardo Ibañez Benavente, minister of public health. The leading subjects discussed were the treatment of postoperative eventration, cholecystitis and chronic nontuberculous arthropathies of the coxae. Dr. Vicente Gutiérrez distinguished between spontaneous, congenital and traumatic eventration. Spontaneous eventration may be due to excessive or repeated distentions of the abdominal wall or to distentions caused by destructive diseases. Congenital cases are due to aplasia or hypoplasia of the normal elements of the abdominal wall. Traumatic eventration is caused by accidents or occurs postoperatively. He discussed the surgical problems involved and indicated the measures necessary to prevent eventration. These include avoidance as much as possible of surgical intervention at pathologic sites in cachectic, obese and aged subjects. He recommended good drainage at points distant from the surgical wound. Suturing should be done with materials which do not permit absorption and with utilization of the aponeurosis, as indicated by Mayo. The patient should remain in bed for two weeks.

Dr. Ricardo E. Donovan, discussing cholecystitis, pointed out that the pathologic process affecting the wall of the gallbladder is not recessive but progressive. Infections of the gallbladder wall disappear only on extirpation. They recur when the bladder begins to function again. A large number of cases of cholecystitis are associated with parietal infection, which become intensified by irritation due to foreign bodies. The bladder itself is then transformed into a septic foreign body. The symptomatology of cholecystitis often corresponds to that of hepatocellular lesions. Hepatic sensitivity needs to be determined, by means of various tests, in order to avoid hepatic crises and allergic reactions.

Dr. Julio Díez presented the paper on chronic nontuberculous arthropathies of the coxae. In acute early forms of osteochondritis deformans continuous extensions should be employed, which in certain cases would require immobilization by plaster bandages. Surgical methods were still in the tentative stage. Tunnelizing of the epiphysis through the trochanter magnus is now being replaced by multiple tunnelization, which accelerates healing and promptly assuages pain. Traumatic necrosis of the head of the femur can be observed as secondary to traumatic luxation, also as secondary to the reduction of congenital luxation, to epiphysiolysis, to fractures of the femoral neck and to certain surgical acts. An interval of from four to twelve months occurs between the accident and the manifestation of the lesions. In the terminal stage of the disease the head of the femur is partly reconstructed. However, it evolves into arthritis deformans in the course of the years. He pointed out that acetabuloplasty, originated in 1936, did not yield the results that had been expected. Best results are obtained by arthroplastic resection, especially by the reconstructive operation of Whitman. Only in certain forms of the disease is the operation indicated. Molds made of vitallium, announced last year by Smith-Petersen, need to be studied further.

Leading subjects announced for 1941 are traumatic lesions of lateral and crucial ligaments and of the menisci of the knees, hernial relapses and subphrenic abscesses. Subjects for 1942 so far announced are acute pancreatitis and lesions of the thorax.

Number of Physicians and Hospitals in Argentina

In 1939, 11,807 physicians were listed in Argentina. There were 426 hospitals, forty-two of which were national, 114 municipal, fifty provincial, 187 owned by welfare organizations and sixteen belonging to foreign colonies. There were 293 dispensaries, thirteen first aid stations, 873 services of a general sanitary nature and 709 services for venereal treatment. There were 47,371 beds for general diseases, 23,608 beds for special diseases. There were 5,391 physicians and thirty-seven hospitals (four national, nineteen municipal, seven belonging to welfare societies, seven belonging to foreign colonies) in Buenos Aires; likewise twenty-four dispensaries, sixty-one general sanitary services, fifty-six for venereal diseases, 13,217 beds for general use and 4,466 beds for special diseases.

Control of Venereal Diseases in Chile

Dr. Salvador Allende, minister of public health in Chile, recently submitted data in connection with the planning of legislation aiming at venereal control. Though incomplete, they disclose that 10 per cent of Chile's population of 4,600,000 suffer from some form of venereal disease. Of these 460,000 persons, 80 per cent are afflicted with syphilis. Sixty per cent of the 5,000 inmates in hospitals for mental diseases have been confined because of the effects of syphilis. The new legislative bills seek to combine and centralize the control of venereal diseases. The treatments are to be given only by physicians, nurses and other authorized persons. Those refusing to be treated are subject to confinement. Persistent resistance to medication must be reported by the physician. Drugs may be furnished only on prescription. The advertising of these drugs is officially controlled. Marriages can be contracted only on presentation of a certificate attesting freedom from venereal disease. Special provisions deal with penalties of those who spread infection. Persons infecting others must defray the expenses of their treatment. For purposes of coordinating the various antiveneral services conducted by the state, by public welfare associations and so on, a special organization has been created, the Consejo técnico de lucha antivenérea.

Marriages

NORMAN LEO CRESSY, Beverly, Mass., to Miss Harriet Lillian Northrop of Pleasantville, N. Y., in New Haven, Conn., Dec. 12, 1940.

GERALD WINBERRY SINNOTT, Tarrytown, N. Y., to Miss Roberta Lillian Glenn of Scarsdale, Nov. 30, 1940.

NORMAN G. SCHNEEBERG, Philadelphia, to Miss Helen C. Bassen of St. John, N. B., Canada, Nov. 3, 1940.

MAULDIN J. BOGGS JR., Liberty, S. C., to Miss Mary Wiley Balentine in East Point, Ga., Nov. 28, 1940.

LEWIS McCURDY JONES, Opelika, Ala., to Miss Ouida Etheridge Fort of Tuskegee, Dec. 10, 1940.

COLIN ALEXANDER MUNROE to Miss Frances Foreman Crum, both of Durham, N. C., Dec. 7, 1940.

JOHN BURMAN BOWEN, Augusta, Ga., to Miss Anna Furgueron of McCormick, S. C., Dec. 19, 1940.

ROBERT M. OLIVER JR. to Miss Elizabeth Baker Gardner, both of Miami, Fla., Nov. 14, 1940.

CHARLES RAYMOND ARP to Miss Coribel Mason, both of Atlanta, Ga., Nov. 30, 1940.

JOHN E. SUTTON JR., to Miss Mary Louise Boomer, both of New York, Dec. 21, 1940.

IRVING HELFERT, New York, to Miss Sylvia O. Dinhofer of Brooklyn, Dec. 14, 1940.

MICOLLUS NOEL STOW, Jesup, Ga., to Miss L. Pauline Snyder of Atlanta, Nov. 16, 1940.

CLYDE L. WELSH to Miss Vivian Henger, both of Seattle, Nov. 1, 1940.

FRED A. BUTLER to Miss Betty Lindsey, both of Quincy, Fla., Dec. 7, 1940.

Deaths

Sir Frederick Grant Banting, Toronto, Ont., Canada, co-discoverer of insulin and co-winner of the Nobel Prize in medicine in 1923, was killed, February 21, in an airplane accident near Musgrave Harbor on Newfoundland's east coast on his way to England. Dr. Banting was born in Alliston, Ont., Nov. 14, 1892, and graduated from the University of Toronto Faculty of Medicine in 1916. During the year 1920-1921 he was affiliated with the Western University Faculty of Medicine, London, Ont., as part time assistant in the department of physiology. While there he conceived the idea of preparing an active extract of the islets of Langerhans. In 1921 he began research on this problem in the department of physiology at the University of Toronto, in which department were Drs. J. J. R. MacLeod, director, and Charles H. Best and James B. Collip, research assistants, all of whom were closely associated in the early work on insulin. Sir Frederick was a lecturer on pharmacology at Toronto in 1921-1922 and senior demonstrator in medicine in 1922-1923. Since 1923 he has been professor of medical research in the Banting and Best Department of Medical Research, a chair which was established by the University of Toronto in recognition of his work on insulin. It was proposed in 1923 that a \$1,000,000 Banting Medical Research Foundation be established. Dr. Banting was the first contributor to the fund, donating \$10,000, a portion of his share of the Nobel Prize. In 1930 the Banting Institute was opened; the cost of the building was contributed by the provincial government, the university and the Banting Research Foundation, which raised funds by popular subscription. Dr. Banting was honorary consulting physician at the Toronto General and Toronto Western hospitals.

In 1922 he was awarded the Starr Gold Medal and the George Armstrong Peters Prize and in 1923 the Charles Mickle Fellowship and the Reeve Prize, all of the University of Toronto. In 1923 he shared the Nobel Prize with Dr. J. J. R. MacLeod. This they divided with Drs. Best and Collip. In the same year he was awarded the John Scott Medal by the city of Philadelphia and received a life annuity of \$7,500 from the parliament of Canada; in 1924 he was awarded the Rosenberger Gold Medal by the University of Chicago; in 1927 the Cameron Prize by the University of Edinburgh; in 1931 the Flavelle Medal by the Royal Society of Canada; in 1934 the Apothecaries' Medal of London; in 1936 the F. N. G. Starr Gold Medal by the Canadian Medical Association.

Dr. Banting was knighted a Commander of the Civil Division of the Order of the British Empire in 1934. He was a licentiate of the Royal College of Physicians, member of the Royal College of Surgeons, fellow of the American College of Physicians, fellow of the Royal College of Surgeons of England, fellow of the Royal College of Surgeons of London, fellow of the Royal College of Surgeons of Canada, fellow of the Royal Society and fellow of the Royal College of Physicians. He was an honorary fellow of the Academy of Medicine of Toronto and of the New York Academy of Medicine; honorary member of the Norwegian Medical Society in Oslo; foreign correspondent, Académie royale de médecine de Belgique; La Società medico-chirurgia de Bologna; corresponding member of the Royal Medical Society of Budapest; member of the Canadian Medical Association, American Society for Pharmacology and Experimental Therapeutics, British Physiological Society, Association of American Physicians, Canadian Chemical Association, American Association for Cancer Research and the Imperial German Academy of Natural Sciences.

For three years during the World War, Dr. Banting served with the Canadian Army Medical Corps, and he was again

serving as a major in the medical corps of the Canadian Army at the time of his death. In 1918 he was awarded the Military Cross. He held honorary degrees from the University of Toronto, Queen's University, University of Western Ontario, Yale University and the University of the State of New York. At the very moment of his death he was en route to England to convey, it is reported, the results of recent research with military significance.

William Niles Wishard Sr., ☉ professor emeritus of genitourinary surgery at the Indiana University School of Medicine, died, January 22, at his home in Indianapolis of coronary infarct and acute endocarditis at the age of 89. Dr. Wishard was born in Greenwood, Ind., Oct. 10, 1851. He graduated from the Indiana Medical College in 1874 and in 1876 from the Miami Medical College, Cincinnati, which later became what is now known as the University of Cincinnati College of Medicine. He became a deputy coroner of Marion County in 1876 and served until 1879. From 1887 to 1936 he was professor and chairman of the department of genitourinary surgery, which department he founded and served for forty-nine years, at the Indiana University School of Medicine. In 1894 he was president of the

Marion County Medical Society, in 1895 president of the Mississippi Valley Medical Association and in 1905 president of the American Urological Association. In 1898 he was president of the Indiana State Medical Association and served in various capacities, holding the chairmanship of the council from 1903 to 1913. As chairman of the committee on public policy and legislation from 1896 to 1922, he wrote the medical practice act and worked for its enactment. Since 1922 he had been chairman of the bureau of publicity of the association. He was First Vice President of the American Medical Association, 1918-1919, and a member of its House of Delegates from 1902 to 1910. He was a member of the state board of health from 1900 to 1911 and president in the latter year. Dr. Wishard was a member of the American Association of Genito-Urinary Surgeons and a fellow of the American College of Surgeons. He was a charter member of the American Board of Urology and a member of the French Urologic Society. From 1879 to 1887 he was superintendent of the Indianapolis City Hospital; and attending genitourinary surgeon, from 1887 to 1915; attending genitourinary surgeon at St. Vincent's Hospital from 1895 to 1915, the Deaconess Hospital from 1892 to 1912 and the Methodist Hospital from 1912 to

FREDERICK GRANT BANTING, M.D.
1892-1941

1941. From 1890 to 1893 he was Surgeon General of Indiana with the rank of lieutenant colonel. Honorary degrees were conferred on him by Wabash College in 1890, College of Wooster in 1919, Indiana University in 1924, De Pauw University in 1928 and Hanover in 1933.

Paul Brandon Barringer, Charlottesville, Va.; University of Virginia Department of Medicine, Charlottesville, 1877; University of the City of New York Medical Department, New York, 1878; member and past president of the Medical Society of Virginia; formerly member of the state board of health and of the state board of agriculture; formerly professor of physiology and materia medica and chairman of the faculty of the University of Virginia; was president of the Virginia Polytechnic Institute; at one time in charge of the University of Virginia Hospital; aged 83; died, January 9, of a cerebrovascular accident and arteriosclerosis.

James Packard Mann, Philadelphia; Jefferson Medical College of Philadelphia, 1887; member of the Medical Society of the State of Pennsylvania; clinical professor of orthopedics, Medico-Chirurgical College of Philadelphia, from 1890 to 1907, professor of orthopedics from 1907 to 1917; professor of orthopedics at the Graduate School of the University of Pennsylvania from 1917 to 1919; for many years on the staff of the Phila-

delpia General Hospital and St. Agnes Hospital; aged 77; died, Dec. 29, 1940, of coronary thrombosis.

Charles Louis Janssen ☉ New York; Université Libre de Bruxelles Faculté de Médecine, Belgium, 1911; assistant professor of clinical surgery, Columbia University College of Physicians and Surgeons; associate attending surgeon, Presbyterian Hospital and Vanderbilt Clinic; served with the Belgian ambulance service during the World War; fellow of the American College of Surgeons; aged 54; died, January 22, in the Harkness Pavilion, Columbia-Presbyterian Medical Center, of carcinoma of the lung with metastases.

Charles Edwards Parsons, Boston; Johns Hopkins University School of Medicine, Baltimore, 1919; member of the Medical Society of the State of New York; fellow of the American College of Surgeons; at one time on the courtesy staff of the Benedictine Hospital and Kingston Hospital, Kingston, N. Y., and on the staff of the New York Hospital, New York; superintendent of the Washingtonian Hospital; aged 48; was found dead, Dec. 31, 1940, in a hotel at Philadelphia of coronary thrombosis.

Louis C. Boisliniere ☉ St. Louis; St. Louis Medical College, 1882; an Affiliate Fellow of the American Medical Association; member of the American College of Chest Physicians; instructor in medicine, St. Louis University School of Medicine from 1909 to 1911, assistant professor from 1911 to 1926 and since 1926 associate professor of internal medicine; chief of staff, Mount St. Rose Sanitarium, since 1908; physician, St. Mary's Group of Hospitals; aged 79; died, January 11, of laryngeal carcinoma.

Sibley Gage Morrill, Concord, N. H.; Harvard Medical School, Boston, 1898; member of the New Hampshire Medical Society; member of the state board of health from 1917 to 1931; was president of the staff of the Margaret Pillsbury General Hospital; consultant at the New Hampshire Memorial Hospital, Concord, and the Pembroke Sanatorium, Pembroke; aged 67; died, Dec. 29, 1940, of bronchopneumonia, syringomyelia and spastic paraplegia.

Charles Leo Moran ☉ Passed Assistant Surgeon, Lieutenant Commander, United States Navy, retired, Boston; Harvard Medical School, Boston, 1905; entered the medical corps of the navy on Feb. 10, 1908; served during the World War and was awarded the Victory Medal; was retired for physical disability on Dec. 31, 1918; aged 61; died, Nov. 15, 1940, of chronic myocarditis.

Frederick Augustus Rhodes, Culver City, Calif.; Western Pennsylvania Medical College, Pittsburgh, 1900; member of the American Psychiatric Association; professor of physiology at his alma mater from 1905 to 1910; author of "Applied Physiology"; aged 67; died, Dec. 29, 1940, of hypertensive cardiorenal vascular disease.

Alois Lawrence Ziliak ☉ Princeton, Ind.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1898; fellow of the American College of Surgeons; on the staff of the Methodist Episcopal Hospital; aged 67; died in December 1940 in Bay City, Mich., of cerebral hemorrhage.

William Austin Tripp, Easley, S. C.; Atlanta (Ga.) Medical College, 1894; member of the South Carolina Medical Association; chairman of the board of trustees of the Medical College of the State of South Carolina, Charleston; aged 74; died, Dec. 21, 1940, of coronary thrombosis.

James Erwin Reed, Baguio, Philippine Islands; Cornell University Medical College, New York, 1906; member of the Philippine Medical Association; served during the World War; aged 58; died, Nov. 24, 1940, in San Diego of carcinoma of the colon.

Richard A. Anderson, Vincennes, Ind.; St. Louis University School of Medicine, 1906; served during the World War; on the staff of the Good Samaritan Hospital; aged 60; died, January 22, of coronary occlusion.

Herbert Kent Porter, Escondido, Calif.; Miami Medical College, Cincinnati, 1888; College of Physicians and Surgeons, medical department of Columbia College, New York, 1889; aged 73; died, Nov. 17, 1940.

Welcome Niles Powell, San Francisco; Jefferson Medical College of Philadelphia, 1882; veteran of the Spanish-American and World wars; aged 79; died, Dec. 24, 1940, in the Dante Hospital of pneumonia.

Rosario J. Page, Fort Kent, Maine; School of Medicine and Surgery of Montreal, Faculty of Medicine of the University of Laval at Montreal, 1902; aged 60; died, Dec. 22, 1940, of coronary thrombosis.

John Arthur Peters, Springfield, Neb., Omaha Medical College, 1902; served during the World War; aged 67; died, Dec. 15, 1940, in a hospital at Omaha of bronchopneumonia and cerebral thrombosis.

Fred Gullette, Portland, Ore.; University of Oregon Medical School, Portland, 1895; member of the Oregon State Medical Society; served during the World War; aged 68; died, Dec. 22, 1940, of pneumonia.

Allan Carithers Banner ☉ Greensboro, N. C.; Jefferson Medical College of Philadelphia, 1920; fellow of the American College of Surgeons; aged 44; died, January 11, of coronary thrombosis.

Henry Middleton Pittman ☉ Perryville, Ky.; Hospital College of Medicine, Louisville, 1894; aged 73; died, Dec. 16, 1940, of pulmonary edema and chronic myocarditis.

Aaron Friedman ☉ San Francisco; University of California Medical School, San Francisco, 1915; aged 50; died, Nov. 29, 1940, in the Dante Hospital of coronary occlusion.

Thomas Moore Pinson, Kerrville, Texas; Arkansas Industrial University Medical Department, Little Rock, 1880; aged 82; died, Dec. 2, 1940, of heart block.

Frank Halstead Brown, Roselle Park, N. J.; Hahnemann Medical College and Hospital of Philadelphia, 1902; aged 60; died, January 18, of pneumonia.

Takeo Yanagawa, El Paso, Texas; Japan Medical College, Hongo, Tokyo, Japan, 1912; aged 49; died, Dec. 21, 1940, in Chiba, Japan, of heart disease.

George William Miser, Des Moines, Iowa; Chicago Homeopathic Medical College, 1898; aged 68; died, Nov. 1, 1940, in Knoxville of uremia.

Newell Patterson, East St. Louis, Ill.; Medical College of Ohio, Cincinnati, 1870; Civil War veteran; aged 102; died, Dec. 30, 1940, of pneumonia.

Perry W. Weeks, Livingston, Texas; College of Physicians and Surgeons, Dallas, 1907; aged 62; was found dead, Dec. 24, 1940, of asphyxiation.

Edgar Arthur Way, Deer Park, Wash.; Bellevue Hospital Medical College, New York, 1896; aged 70; died, Dec. 20, 1940, of heart disease.

Robert E. Aymett, Pisgah, Tenn.; Hospital College of Medicine, Louisville, Ky., 1880; aged 83; died, Dec. 28, 1940, of pneumonia.

Mary Evangeline Gaffney, Boston; Tufts College Medical School, Boston, 1907; aged 66; died, Dec. 5, 1940, of aortic regurgitation.

John Atcherley, Honolulu, Hawaii; L.R.C.P., London and M.R.C.S., England, 1892; aged 75; died, Nov. 20, 1940, of chronic myocarditis.

Anna Grover Kaufman, Goshen, Ind.; American Medical College, St. Louis, 1890; aged 82; died, Dec. 8, 1940, of chronic myocarditis.

Charles M. Moore, Clifton, Texas; Louisville (Ky.) Medical College, 1894; aged 74; died, Dec. 4, 1940, of coronary thrombosis.

Harriette Emilie Cady, New York; Eclectic Medical College of the City of New York, 1872; aged 92; died, January 3, of senility.

Harry Alden Adams, Indianapolis; Chicago Homeopathic Medical College, 1895; aged 70; died, January 19, of coronary occlusion.

John C. Ash, La Harpe, Ill.; Rush Medical College, Chicago, 1899; aged 72; died, Dec. 29, 1940, of arteriosclerosis and nephritis.

William A. Byal, Findlay, Ohio; Columbus Medical College, 1878; also a lawyer; aged 90; died, January 5, of arteriosclerosis.

Richard William O'Bannon, Hollister, Calif.; St. Louis College of Physicians and Surgeons, 1890; aged 71; died, Nov. 27, 1940.

Charles Edward Harris, Los Angeles; Louisville (Ky.) Medical College, 1897; aged 64; died, Dec. 24, 1940, of myocarditis.

Christopher C. Risher, Laurel, Miss.; Mississippi Medical College, Meridian, 1910; aged 56; died, Dec. 28, 1940, of heart disease.

Henry Lincoln L. Parish, Calistoga, Calif.; Cooper Medical College, San Francisco, 1890; aged 75; died, Nov. 12, 1940.

Charles Larkin Wright, Los Angeles; Iowa Medical College, Des Moines, 1885; aged 76; died, Nov. 1, 1940.

Correspondence

SCLERODERMA

To the Editor:—In *THE JOURNAL*, February 8, there appeared the report of a case of scleroderma with pulmonary fibrosis by Drs. Murphy, Krainin and Gerson of New York in which they draw attention to the fact that the pathologic changes in scleroderma are not confined to the skin and subcutaneous tissue alone but may involve the connective tissue system throughout the entire body. Their case presented pulmonary fibrosis or sclerosis as a clinical manifestation of the disease.

The authors state that "a search of the literature of scleroderma has brought to light no other case in which the pulmonary manifestations of the disease were visualized by roentgenographic study." However, in the *New England Journal of Medicine* (216:188 [Jan. 28] 1937) Dr. Harry Linenthal of Boston reported two cases in which pulmonary fibrosis occurred associated with Raynaud's disease and scleroderma. Dr. Linenthal concluded that changes in the pulmonary arterial tree with fibrotic changes in the lung may occur in this disease and are clinically demonstrable.

ROBERT TALKOV, M.D., Boston.

ABBREVIATION AND MEANINGLESS DICTION IN MEDICINE

To the Editor:—I cannot resist the impulse to endorse the views expressed by Dr. Ramsay Spillman in *THE JOURNAL* of January 18. He is confused by perplexing abbreviations and meaningless diction employed in his own specialty, and I am sure many of us in all departments of medicine could furnish samples of the same sort.

Medical terminology in the United States (and probably elsewhere) is in a woful state. Scores of words and expressions and their short-cut forms in common use not only violate the principles of philology and defy their derivations but also confound scientific precision and offend one's sense of accuracy. It is just as easy to be right as to be wrong, and much more becoming.

The most flagrant example of twisted derivation is the use of "clinic" as applied to a place for the reception and examination of patients, formerly called a dispensary or outpatient department. The word "klinē" in Greek means a bed. Today clinic means a place where there are no beds. This appellation was initiated by certain illustrious members of the medical profession whose common sense was profound but whose philologic knowledge was murky. No wonder lesser lights followed suit.

I am not one of those who believe that usage is the only, or even the best, basis on which language should be built. Several solecisms come to mind. When one says "the patient has no temperature" then, of course, he is dead. When the doctor (or the nurse) reports that "the pulse are 120," who shall correct him? A surgeon coming down in the elevator, on being asked what he had done that day, replied "I just had an appendix." One wonders who had it and who took it out. As for such terms as "acute ab'-domen" (wrong both in concept and in accent), "traumatic injuries" (terrible tautology, literally "injuries due to injury") and "operated a case" (the cognate accusative applied to a nonperceptible entity)—as for these vulgarisms, let us purge them from our nomenclature.

Fourteen years ago (*THE JOURNAL*, Feb. 29, 1927) I suggested, by way of addition instead of subtraction, the substitution of "internalist" for "internist"; but I have had not one

responsive nibble. I still think that the former term would express more clearly the practitioner of internal medicine, while the latter is too closely allied to the word "intern."

Some of us continue to hammer away, but apparently our knocks make few dents. If constant crusading in the interest of a more exact medical vocabulary indicts me as a persistent purist, I plead guilty.

Always I have loved Victor Hugo for this: "An idea is a baln; a word may be a dressing for wounds."

HUBERT A. ROYSTER, M.D., Raleigh, N. C.

PREVENTIVE MEDICINE FOR THE TRAVELER

To the Editor:—The wayfarer of old encountered many seen and unseen dangers as he wandered about the country, not the least of which were opportunities to acquire contagious diseases and infections. The factors of fatigue, exposure to cold and dampness and lack of knowledge and facilities for hygiene enhanced his opportunity of acquiring illness when traveling.

The modern traveler probably considers himself adequately protected from these hazards of travel, but is he actually protected? A recent journey, chiefly in coaches on five large railroads having terminals in Chicago, revealed a number of hazards still awaiting the traveler, not the least of which was the current epidemic of coryza and "influenza." Confinement in a railway coach with passengers, old and young, who apparently know no better than to cough and sneeze frequently at their fellow travelers is no minor hazard. The inadequacy of present attempts to teach others, through the medium of the printed page and the radio, to cover the nose and mouth with a handkerchief when coughing and sneezing was apparent everywhere. Would it therefore not be more effective if each person who wished to protect himself from the dangers of acquiring respiratory infections made it his policy on encountering the careless sneezer or cougher to place over his own nose and mouth a gauze mask such as physicians and nurses wear to protect their patients? The psychologic jolt that most persons would experience under such circumstances would be more effective than any other means of teaching hygiene, or even than an ordinance forbidding careless coughing. It has been pointed out how reluctant one would be to cough carelessly if the droplets of infected mucus were colored a vivid purple, in which case it would be only too apparent that our hands, our faces, our handkerchiefs, our clothes, our cordial handshakes and everything we touched became tinged with purple and indicated infection. That this droplet infection is actually not purple makes it no less real and dangerous.

The danger of acquiring an infection of the respiratory tract when one is traveling on trains is enhanced by drafts and by overheating or underheating of coaches. By means of thermostats and swinging inner vestibule doors, drafts and excessive changes of temperature were minimized on two of the trains.

Cleanliness of the toilets and washrooms provided for coach passengers for the most part suffered greatly when compared with that of the modern filling station rest room. One railroad inexcusably did not furnish either soap or towels in its wash room except as one purchased them from a nickel slot machine!

Another hazard of travel encountered on this brief journey was the vicious cold of the dining car steward who alternately blew his nose in his handkerchief and coughed over the dining passengers while resetting tables with plates, napkins and silverware. Only for the sake of completeness do I mention

the busy chef at the small lunch counter on one of the trains whose forte was dipping his fingers into the heating vegetables, as one might use a finger bowl, apparently to test whether the temperature was just right for the next diner.

LOUIS E. PRICKMAN, M.D., Rochester, Minn.

Medical Examinations and Licensure

COMING EXAMINATIONS

BOARDS OF MEDICAL EXAMINERS BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in *THE JOURNAL*, March 1, page 891.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, June 23-25. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: Oral. Part II, Cleveland, May 31-June 1. Final date for filing application is April 1. Sec., Dr. Paul M. Wood, 745 Fifth Ave., New York.

AMERICAN BOARD OF INTERNAL MEDICINE: Oral. April, in advance of the meeting of the American College of Physicians, and June, in advance of the meeting of the American Medical Association. *Written*, Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: Oral. Philadelphia, June 6-7. Sec., Dr. R. Glen Spurling, 404 Brown Bldg., Louisville, Ky.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: Part II, Groups A and B, Cleveland, May 28-June 1. Final date for filing application is March 15. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: Oral. Cleveland, May or June. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF PATHOLOGY: Oral and *Written*. Cleveland, June 2-3. Final date for filing application is May 1. Sec., Dr. F. W. Hartman, Henry Ford Hospital, Detroit.

AMERICAN BOARD OF PEDIATRICS: Chicago, May 18, following the Region III meeting of the American Academy of Pediatrics. Boston, Oct. 12, immediately following the annual meeting of the American Academy of Pediatrics. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

AMERICAN BOARD OF RADIOLOGY. Oral. Cleveland, May 30-June 1. Final date for filing application is April 15. Sec., Dr. Byrl R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Part I. Various centers, April 2. Sec., Dr. J. Stewart Rodman, 225 South Fifteenth St., Philadelphia.

Nebraska November Report

Mrs. Clark Perkins, director, Bureau of Examining Boards, reports the written examination for medical licensure held at Lincoln, Nov. 7-9, 1940. The examination covered 10 subjects and included 100 questions. An average of 75 per cent was required to pass. Two candidates were examined, both of whom passed. Five physicians were licensed to practice medicine by reciprocity. The following schools were represented:

School	PASSED	Year Grad.	Number Passed
Creighton University School of Medicine.....		(1940)	1
University of Nebraska College of Medicine.....		(1937)	1
School	LICENSED BY RECIPROCITY	Year Grad.	Reciprocity with
College of Medical Evangelists.....		(1939)	California
University of Kansas School of Medicine.....		(1932)	Kansas
University of Minnesota Medical School.....		(1930)	Minnesota
Columbia Univ. College of Physicians and Surgeons.....		(1935)	New York
Western Reserve University School of Medicine.....		(1925)	W. Virginia

Rhode Island October Report

Dr. Robert M. Lord, secretary, Division of Examiners, reports the oral, written and practical examination for medical licensure held at Providence, Oct. 3-4, 1940. The examination covered 8 subjects and included 50 questions. An average of 80 per cent was required to pass. Two candidates were examined, both of whom passed. Two physicians were licensed to practice medicine by endorsement. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Cornell University Medical College.....		(1939)	87
University of Oregon Medical School.....		(1935)	88
School	LICENSED BY ENDORSEMENT	Year Grad.	Endorsement of
Georgetown University School of Medicine.....		(1938)	N. B. M. Ex.
Tufts College Medical School.....		(1935)	N. B. M. Ex.

MEDICOLEGAL ABSTRACTS

Malpractice: Roentgen Therapy for Pelvic Tumor Allegedly Incorrectly Diagnosed as Malignant; Necessity for Expert Testimony.—About six months after giving birth to a child, the plaintiff, accompanied by her attending physician and her mother, consulted the defendant physician for diagnosis and treatment of an abdominal condition. On Sept. 7, 1936 the defendant performed an operation on the plaintiff's abdomen but was unable to remove the pelvic mass which he found. At the time of the operation he took specimens of the tumor mass for biopsy and on the basis of his operative findings and the laboratory report of microscopic examinations of the tissue he diagnosed the plaintiff's condition as a malignant tumor, and so he caused roentgen ray treatments to be administered. Peritonitis developed necessitating the performance of two operations by other physicians, the last operation being performed in January 1937 to relieve a serious bowel condition, apparently an intestinal obstruction. Subsequent to her discharge from the hospital for this last operation she consulted two osteopaths. She later sued the defendant physician for malpractice, alleging that he had not used approved methods in diagnosing her condition, had incorrectly diagnosed her condition as a malignant growth or sarcoma and had improperly caused roentgen ray treatments to be administered to her, and that as a result of his negligence she had sustained great impairment of health and permanent physical injury. From a judgment of the trial court overruling the defendant's demurrer and overruling his motion for a directed verdict in his favor, the defendant appealed to the Supreme Court of Kansas.

According to the testimony of the plaintiff, she and her attending physician informed the defendant that she had been running an elevated temperature, had been having continuous pain in her left side for about three weeks and had nausea and vomiting. She testified that the defendant did not take her temperature or her blood pressure but did take her pulse and examined her abdomen, both internally through the vagina and externally, which examination revealed the presence in her pelvis of a tumor mass about the size of a small grapefruit. The plaintiff's mother testified that the defendant did not make a blood count or take roentgenograms. She further testified that prior to the first operation he informed her that he believed her daughter had a "tumor on the ovary"; that after the operation he told her that her daughter had a sarcoma and had but a few months to live; that three days later he informed her that he still believed the plaintiff had such a malignant tumor even though the laboratory report of the microscopic examinations did not positively show a sarcoma; that roentgen ray treatments would have to be administered in order to retard the growth, and that he assured her daughter that such treatment would have no effect on her ability to bear children. According to the mother's testimony, shortly after the first operation the defendant ceased to treat the plaintiff personally but placed her under the care of other physicians whom he recommended and apparently instructed as to treatment. She claimed that he did not withdraw from the case until March 1937. The record of the hospital at which the defendant operated on the plaintiff was introduced in evidence and showed that the defendant's preoperative diagnosis had been "tubo-ovarian abscess" and his postoperative diagnosis: "Retroperitoneal sarcoma. Adhesions to iliac vessels, ureter, etc., are so dense as to make removal impossible." The report of Dr. Hellwig, the physician who microscopically examined the biopsy specimens, was also introduced in evidence, in which he gave as his pathologic diagnosis "cellular neurofibroma." An osteopath, who described himself as a specialist in roentgenologic diagnosis and in radiology and claimed that the "authoritative technic in the use of X-ray in the Allopathic and the Osteopathic schools are the same," testified that roentgenograms taken on March 8, 1937, about six months after the first operation and subsequent to the roentgen ray

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Resuscitation of Asphyxiated Newborn Infants.—Russ and Strong review the various resuscitation methods for asphyxiated infants and incorporate the best part of each into a routine which is easy to apply and does not require an expert for its performance. Certain antepartum and delivery features that contribute to the asphyxia must be known. Some of the ante-

partum factors that have a considerable effect on asphyxia are toxemias of pregnancy, heart disease with congestive failure, anemias and the causes of premature delivery. Antepartum analgesia, anesthesia, type of delivery and labor have a bearing as well. Of one thousand two hundred newborn infants resuscitation of one hundred and ninety-six was necessary. This did not include infants who breathed spontaneously and maintained respiration thereafter. The routine adopted was as follows: A table 3 feet wide and 4 feet long, with a 4 inch protective edge, covered with a sterile sheet and warmed blankets, is always in readiness. On it are sterile towels, an intratracheal catheter with a glass saliva trap, hypodermic syringes containing $\frac{1}{20}$ grain (3 mg.) of alpha lobeline and 15 minims (1 cc.) of a 25 per cent solution of nikethamide, scissors, cord clamps and dressings. By the side of the table is an Easton and Johnson resuscitator, which is checked daily. The infant is immediately wrapped in the warm cover and the skin is gently but rapidly rubbed for a few seconds. The fingers of the pediatrician's left hand are placed beneath the neck of the child, and the head is hyperextended. The nostrils, mouth, pharynx and nasopharynx are aspirated of mucus, amniotic fluid, blood or meconium. The warmth, cutaneous friction and aspiration are usually sufficient to initiate respiration in mildly asphyxiated infants. If respiration does start, plain oxygen is administered through the face mask until respirations are regular in volume and rate or until the baby cries. If it does not start, alpha lobeline is administered via the umbilical vein, and the trachea and upper bronchi are gently aspirated with the intratracheal catheter until they are clear, and then from five to ten gentle mouth to mouth inspirations and expirations are made, while the amount of expansion is observed. Often the limp pharynx begins to tighten and to show some muscle tone, indicating that respiration will soon start. If respiration has started, as is usual in moderately asphyxiated infants, oxygen is administered by face mask until respiration is normal in volume and rate or until the baby cries. In more severely asphyxiated infants, when respiration will not start, the catheter is withdrawn, the head is again hyperextended and the face mask is adjusted. The mouth must be opened wide while the mask is in place. The alternate pressure and suction mechanism is started; plain oxygen at a rate of thirty to thirty-six cycles per minute is used at first. Nikethamide in doses of 2 minims (0.12 cc.) is administered subcutaneously at intervals of ten minutes until respiration is established; 2 minims of epinephrine is given subcutaneously if the heart beat flags. This is done until spontaneous respiration at a rate of at least eight to ten respirations per minute is attempted by the infant. At this time the pressure suction apparatus is switched to the continuous flow of oxygen at a pressure of 13 mm. of mercury, and 5 per cent carbon dioxide and 95 per cent oxygen is substituted for the pure oxygen. If respiration continues and becomes regular, nikethamide is stopped, the face mask is removed and if any irregularities of respiration occur oxygen is resumed immediately. If, while oxygen is being administered continuously, spontaneous respiration ceases, the alternate pressure and suction mechanism is switched on until spontaneous efforts are resumed. If after two to three hours the heart still beats but spontaneous attempts at respiration are not made, the baby is placed in a Drinker respirator with an oxygen tent over his head. If the baby's heart stops beating, no harm can be done and occasional benefit may be derived by the use of epinephrine intracardially. Of their 196 cases the authors initiated respiration in 76 in less than five minutes, in 46 in from five to ten minutes, in 31 in from ten to fifteen minutes, in 18 within half an hour and among the remaining 25 infants in from thirty minutes to five hours. There were 8 deaths among the series; 3 from intracranial hemorrhage, 3 from atelectasis and 2 because of prematurity. The authors do not advise the use of morphine four hours and pentobarbital sodium six hours prior to delivery. Greater reliance may be placed on other barbiturates. Ether causes definite narcosis in the child but it is easily overcome. Alpha lobeline via the umbilical vein is advised, with nikethamide or metrazol subcutaneously as a respiratory and circulatory aid thereafter.

Toxic Factor in Stools of Patients with Poliomyelitis.—Toomey and Takacs endeavored to determine whether the addition of the toxic factor present in the stools and urines of

patients with poliomyelitis to poliomyelitis virus might sufficiently activate the latter to produce the disease in guinea pigs. Their studies give further support to the theory that the toxic factor is present in stools and that it may be produced as a result of stasis of the intestinal contents or from a combination of this stasis and the virus itself. The experiments suggest that convalescent poliomyelitis serum may have the ability to neutralize not only poliomyelitis virus but also the toxic factor present in the gastrointestinal tract. The fact that the agglutinin titer against enteric organisms rises as the experimental animal with poliomyelitis gets better makes this probable.

Amebiasis in Infants and Children.—Howell and Knoll state that amebiasis is definitely not rare in children. They have encountered several undernourished children with abdominal symptoms simulating appendicitis in which *Endamoeba* was proved to be the etiologic agent and the patients improved promptly after therapy for amebiasis was instituted. Between 1929 to 1940 they encountered 18 children with a diagnosis of amebiasis. Thirteen of these children, among a total of 408, were admitted during 1937, 1938 and 1939 for which complete records were available. This gives an incidence of 3.18 per cent as compared to 5.2 per cent among 1,044 adult patients examined. The stools of the adults and the children were examined by the same workers and therefore the percentages should be comparable. The ages of the 18 children varied from 8 months to 13 years. The first child with amebiasis treated at the Sarah Morris Hospital was admitted in 1929, followed by 1 in 1931, 1 in 1934, 2 in 1936, 5 in 1937, 3 in 1938 and 5 in 1939. Twelve of the children were boys and 6 were girls. This is in accord with the experience of other investigators, who have found a higher incidence of infection among male than female patients. The 18 children were admitted to the hospital with various complaints—"colitis," repeated intestinal upsets, acute abdominal pains, nausea and fever—and others had no gastrointestinal symptoms but were admitted for other reasons. The history and physical examination almost always revealed that the patient had had acute abdominal pain—usually cramplike—nausea, vomiting and intermittent attacks of diarrhea of varying severity. Several of the children had symptoms so typical of acute appendicitis that only the early isolation of active amebas prevented operation. The majority of the children did not appear acutely ill, but they were nervous, anemic and undernourished. Their physical development was retarded, and the mental development of some was below par. The temperatures ranged from 99 to 101 F. The blood picture confirmed the impression of anemia. The leukocyte counts were within normal limits. When the infection was uncomplicated, urinalysis was normal. The stools were typical: dark brown and unformed. In the diarrheal state pus, blood and occasionally mucus appeared. Under treatment the symptoms of amebiasis cleared up quickly in all the children. The first 2 patients were treated with emetine hydrochloride, the others with carbarsone. A few children were admitted to the hospital several times during the eleven years, sometimes with symptoms of amebiasis and sometimes with totally different symptoms. As no child who harbored *Endamoeba histolytica* was discharged before there was marked clinical improvement and successive fecal specimens were negative for all forms of the ameba, and as there was a lapse of time between admissions it seems probable that reinfection occurred, especially as other members of some of the families were ameba carriers. The readmissions suggest that the children had neither a natural immunity to *Endamoeba histolytica* nor an acquired one from their first infection. There were more readmissions among the clinic group than among children under the care of private physicians, indicating that the better standards of health of the latter tended to increase resistance and lessened their chances of coming in contact with the parasites. A survey for amebiasis in a Chicago orphanage disclosed an incidence of 4.8 per cent (5 children) among 105 specimens examined. This percentage bears out the general observation that the incidence of amebiasis in institutionalized groups is higher than in other groups.

Intradermal Immunization for Scarlet Fever.—Fisher and Van Gelder investigated the question of proper dosage for intradermal injection with the view of producing a high per-

centage of negative Dick reactions and reducing the number of injections and the severity of constitutional reactions. Of 120 children with positive Dick reactions given intradermal injections of scarlatinal streptococcus toxin, 60 received 1,600, 3,200 and 8,000, and another 60 received 800, 1,600 and 3,200 skin test doses of the toxin. Constitutional reactions were encountered among the first group, although they were no more severe or frequent than those following the subcutaneous method. Most of the reactions followed the first dose and the children who had the more severe reactions to the initial dose frequently had reactions to the second and third doses. Temperatures ranging from 99 to 103 F. developed twenty-one times, vomiting occurred eighteen times, headache developed thirteen times and a scarlatiniform rash appeared three times. Twenty-nine of the 60 children had some constitutional complaint following at least one injection. None of the reactions were alarming and most of them were minor. All urinalyses were negative after immunization. No abscesses were seen at the site of injection and no tenderness occurred in the regional glands. Six months after immunization 4 children still had positive reactions to the control test material. However, all the Dick tests were read as negative, as the children who showed erythematous reactions to the Dick test toxin had identical reactions to the control test material. Systemic reactions were also encountered among the other 60 children. They were minor and occurred only about half as frequently as those of the first group. The highest percentage of reactions followed the first dose. Headache was complained of eleven times, temperatures between 99 and 102 F. appeared nine times, and emesis occurred nine times. A scarlatiniform rash was seen three times but in no instance persisted for more than twenty-four hours. Thirteen had some constitutional complaint from at least one injection, although only three could be classed as moderately severe. All urine examinations after immunization were negative. No local complications were observed. Six months after immunization all the children had negative reactions to the Dick test, although 2 continued to have positive reactions to the control test. The authors report a case of acute toxic nephritis following subcutaneous injection of scarlatinal streptococcus toxin. They conclude that the optimal dose intradermally is 800, 1,600 and 3,200 skin test doses, administered on the outer aspect of the upper part of the arm at intervals of two and four weeks respectively. Epinephrine should be available whenever the toxin is being administered so as to control anaphylactic reactions. Inoculation with tuberculin protein has no influence on the reaction to the protein of scarlatinal streptococcus toxin.

Chromoblastomycosis.—Weidman and Rosenthal call attention to the rapid geographic spread of chromoblastomycosis and discuss its increasing morbid anatomic changes. The known tissue changes had remained almost entirely those of verrucous dermatitis of the legs, but during the last seven years data accumulated from a number of cases show that the dermatologic features of the disease are not uniform and simple. As the range in gross tissue reaction may eventually compare with that of tuberculosis, syphilis and other specific infectious diseases, the possibilities of this disease should be considered when clinically doubtful atypical granulomatous conditions are encountered. Ten years ago da Fonseca and de Arêa Leão collected only 18 cases, 17 of them from Brazil. Now 110 cases are available for analysis: 41 from North America, 58 from South America, 3 from Europe, 2 from Africa, 3 from Asia and 3 from Sumatra and Java. The authors' case is the fifth reported from the continental United States. It was observed in Philadelphia and was due to *Fonsecaea pedrosoi*. There are 2 unreported cases, making the total 7. Chromoblastomycosis is no longer a disease solely of the leg; the face, neck, buttock, hands and forearms can also be involved. The lesions may be simply infiltrative or they may be verrucous, ulcerative and eicitricial. Dermatologists should be prepared to diagnose chromoblastomycosis when verrucous features are absent. They were lacking in 2 of the continental United States cases when observed by the dermatologist. Thus far chromoblastomycosis has not been identified except microscopically, unless possibly in the endemic area in

Brazil. However, there is promise that differential diagnostic features may be established which will suggest chromoblastomycosis on clinical grounds alone. Two items which promise to have value in differential diagnosis are the margins of infiltration, which are sharply and abruptly elevated, perhaps precipitously, and the development of satellite lesions which suggest that they have developed by autoinoculation, i. e. after convection of infectious material over the cutaneous surface. At least two, and possibly six, species of fungi have been claimed to be causative. These species appear in human skin as characteristic large, brown, sclerotic cells. They are so conspicuous and distinctive that microscopic examination easily results in an unqualified diagnosis. An "incrusting" mantle appears around the fungus cells which stains pink in sections. When cultures cannot be secured from pus or scrapings, bits of tissue should be obtained. Colonies in vitro are not inhibited by a 5 per cent solution of formaldehyde U. S. P. Apparently the parasite is a highly resistant one. Particular "species" of chromoblastomycosis fungi do not induce a uniform and invariable lesion. The first line of defense is complete destruction of the lesions by electrocoagulation or excision. Roentgen irradiation may be of some value. Treatment with iodides by mouth is also promising but alone cannot be relied on. The disease is slowly progressive, with periods of quiescence, and lasts up to forty years. A fatality is yet to be recorded, except when complicated by tuberculosis or leishmaniasis.

Sulfanilamide and Sulfapyridine for Laryngotracheobronchitis.—MacGregor points out that the highly fatal disease laryngotracheobronchitis has been ignored by the general practitioner. Of the scant literature on the subject 90 per cent

emanates from the otolaryngologist. He believes that there is a period between the time when obstructive symptoms appear and the necessity for tracheotomy when medical treatment, sulfanilamide or sulfapyridine, will produce a cure. To make this possible, early diagnosis and prompt treatment are imperative. Heretofore, until the cases became obstructive emergencies most of them were considered cases of simple croup. The condition usually begins as a simple infection of the upper part of the respiratory tract or what appears to be simple croup. Cases present symptoms of croup early in the condition, with croupy cough and moderate elevation of temperature. At this stage the parents may not consider the child sufficiently ill to call a physician. In from six to twenty-four hours the disease becomes more serious, with laryngeal and obstructive symptoms as outstanding features. The breathing becomes rapid and labored. The temperature mounts to from 102 to 105 F. There is a persistent croupy metallic cough; when the child cries or speaks, the voice is hoarse and slightly muted. On inspiration a stridor is heard and often a wheezing sound on expiration. As the disease advances, a slight degree of cyanosis appears and the child assumes a tired and toxic gray look. Unless the condition is relieved at this stage the cough reflex becomes benumbed or absent and the patient sinks into a relaxed state, the temperature mounts and death from a rapidly failing circulation ensues. The author reports 13 such cases, 9 of which he has treated with sulfanilamide and 4 with sulfapyridine, using the usual standard dosage. As an adjunct, blood transfusion was given on admission to the hospital and the child was maintained in an atmosphere of intense humidity, and for a few children the oxygen tent was utilized. Of the 13 children 2 died, 1 in the admitting room. The other child, ill for three days, was moribund on admission and died in three hours; the parents refused to have a tracheotomy performed. While the condition passes quickly from an apparently noncritical stage to one of extreme seriousness, most patients may be saved without surgical intervention if treatment is given when persistent obstructive symptoms appear. Medical instructors and writers should give more attention to this serious disease of childhood.

Cerebral Tumors in Children.—Bucy and Haverfield believe that cerebral tumors are not appreciated sufficiently, especially among children. A recent study of 100 consecutive verified cases in children 15 years of age or younger demonstrated that such tumors are by no means rare or hopeless, as is often thought. The three most frequent periods during which cerebral tumors appear are between 7 and 8, 30 to 32 and 45 and 47 years of age. In children benign meningiomas, pituitary adenomas and cerebral gliomas are distinctly rare. The most common tumors at this age are cerebellar astrocytomas, malignant tumors of the posterior midline of the cerebellum, ependymomas of the fourth ventricle, and gliomas of the pons and in and about the third ventricle. The majority (66) of the tumors

of the authors' series were situated in the cerebellar fossa, and of those located above the tentorium (34) most of them were in and about the third ventricle. Whenever a brain tumor is suspected in a child it should be treated as though benign and removable until that supposition has been definitely disproved. Delays may be fatal to either life or vision, especially to vision, as in cerebellar astrocytomas. All too often a victim of cerebellar astrocytoma has been saved only to pass the remainder of an otherwise normal life in a black world. The recognition of other tumors is largely of importance as it bears on the problem of cerebellar astrocytomas. These tumors constitute one fourth of all the cerebral tumors of children. All but the astrocytomas generally present a discouraging therapeutic problem and a bad prognosis. Cerebellar astrocytomas are benign and can be removed with a low surgical mortality rate (5 per cent in the authors' clinic) with almost a certainty that if removed they will not recur. Their chief problem lies with the parents and the family physician. To the alert physician aware of their existence, signs, symptoms and accustomed use of the ophthalmoscope their early recognition presents little difficulty. However, if the physician is prone to attribute the early morning vomiting, which gradually increases in frequency and severity, to so-called "psychic" vomiting or to gastrointestinal disturbances and the progressive headaches to refractive errors, eyestrain and sinus disease, valuable time may be lost. As the disease progresses, papilledema gives way to optic atrophy and vision fails. Unfortunately, sight once lost as a result of secondary optic atrophy is not regained.

Immunization of Human Beings Against Typhoid and Brucellosis.—On the basis of the protective results obtained in animals, Kolmer and his co-workers determined the effect of a heat-killed vaccine carrying a dose of 1,000 million *Bacillus typhosus*, 1,000 million *Alcaligenes abortus* and 1,000 million *Alcaligenes melitensis* organisms per cubic centimeter. The vaccine was administered subcutaneously to 29 normal adult volunteers in doses of 0.5, 1 and 1 cc. at weekly intervals. The vaccine was well borne; the reactions were comparable

to those following typhoid-paratyphoid vaccine. About 96 per cent of the subjects showed agglutinins in their serums for *Bacillus typhosus* and all for *Alcaligenes abortus*. All the subjects showed the production of immune opsonin for *Alcaligenes abortus*. The serums of 40 per cent showed the presence of some protective antibody for *Bacillus typhosus* before immunization, while these protective antibodies were present in 83 per cent after immunization. The serums of about 17 per cent showed some protective antibody for *Alcaligenes abortus* before immunization compared to 79 per cent after immunization. Likewise for *Alcaligenes melitensis* before immunization the serums of about 14 per cent had some protective antibody as against 100 per cent after immunization. Immunization with the vaccine did not appear to produce allergic cutaneous sensitization to brucellergen. It appears that vaccination of human beings with mixed heat-killed 'typhoid-*Brucella* vaccine (as a substitute for the usual typhoid-paratyphoid vaccine) for simultaneous immunization against typhoid and undulant fevers is worth while.

Pigmented Nevi and Origin of Nevus Cells.—Montgomery and Kernohan present clinical, pathologic and microscopic data on 460 nevi removed from 406 patients from 4 to 70 years of age. Most of the nevi were excised for cosmetic reasons and the rest because of a recent increase in size or pigmentation. Nevus cells were present in all the nevi. The study concerned itself especially with the neuroepithelial origin of nevus cells. Various special nerve trichrome, pigment and reticulum fiber stains were employed for studying the cells. Lames foliacées (equivalent to Meisner tactile corpuscles) were evident in 51, or 11 per cent, of the 460 nevi. That the nevus cells originated from the epidermis was demonstrated in a majority of the cases. In many instances the nevi apparently arose from pure cellules but in others from basal or dendritic cells. The microscopic evidence would support Unna's conception of the epidermal origin against Masson's conception of the neuroepithelial origin of the nevus cell. The superficial flat nevi and lentiginos in which nevus cells are present on microscopic study and in which there is no increase in cutaneous nerves or nevus cells deeper in the cutis would tend to refute the neuroepithelial origin. This is especially true if the pure cellules are regarded as melanoblastic cells rather than modified tactile cells of Merkle-Ranvier. A nerve origin can be admitted for the cases in which lames foliacées are present. Just as multiple nevi are seen in the same patient, so multiple points for its origin might be expected. Superficial nevi, in which collections of malignant-looking nevus cells are limited to the upper portions of the cutis or occur as intraepidermal nests and which are suspected microscopically of being early melanoeptelioma, usually offer a good prognosis. These nevi should be distinguished from frank melanoepteliomas, in which the prognosis is usually serious, especially when there is microscopic evidence of lymphatic invasion by the tumor cells. Pigmented nevi should not be confused with blue nevus or senile verruca. Pigmented nevi, whether superficial or deep, papillomatous or verrucous or slightly to deeply pigmented, need not be removed except for cosmetic reasons unless subject to repeated trauma. Surgical excision is the method of choice. Partial removal by superficial fulguration, electrolysis, solid carbon dioxide or caustics, although apparently satisfactory in the hands of many dermatologists, has the potential danger of the subsequent development of malignant epithelioma in a few cases. The remaining scar tissue can act as a constant irritant to the nevus cells left behind. Radium and roentgen therapy are condemned.

The Contraceptive Safe Period.—Fleck and his colleagues report the work of the Rhythm Clinic at the Free Hospital for Women (Brookline, Mass.) covering a period of forty-five months during which time 225 women applied for contraceptive advice. The authors' conception of the theory of the safe period is as follows: The sixteenth to twelfth days inclusive before the first day of the next menstruation constitute the period during which ovulation occurs. An admittedly generous allowance of three days before and after this period is made for viability of spermatozoa and susceptibility of ova, respectively. The postulated fertile period therefore extends from and including the nineteenth day before the earliest likely menstruation up to and including the ninth day before the latest likely menstruation. Of the 225 patients who applied for treatment 12 were rejected because of irregular periods and 6 because they were pregnant at the time of their first visit. Of the 207 accepted patients, 57 were observed for from six months to one year and 63 for longer than one year. Among the 207 patients actually cared for there were 24 pregnancies. Three of these were planned; 14 of the undesired pregnancies were due to failure of the patients to follow instructions, 4 because of coitus one or more times during the fertile period and 1 patient became pregnant after miscalculation of her rhythm in the clinic. Deducting these 15 from the 21 pregnancies there are only 6 actual failures among 207 patients. These 6 patients became pregnant despite the fact that they had followed instructions of the clinic. Treatment was discontinued for a variety of reasons by 95 women, evidently because of dissatisfaction. The cycles of some of these patients were irregular. The mean deviation from the average cycle among the closed cases was only two and one-tenth and

two and nine-tenths days for the 88 patients still active as of March 1940. From the 120 women observed for more than six months valuable data as regards the cyclic aspects of ovarian physiology are had and allow the following conclusions as to the merits of the safe period theory in practice: Pregnancy rates expressed as number of pregnancies per hundred person-exposure years were 90 for the patients before treatment as contrasted to 11 under clinic supervision. The corrected rate for the true failures was only 4 pregnancies per hundred person-exposure years. These rates compare favorably with those compiled for other contraceptive methods. It has been found advantageous to maintain a close contact, preferably by mail, with all patients, since errors in application were common, even among intelligent women and among those under treatment for long periods. The safe period method constitutes a workable form of contraception for a selected group of women, and it is doubtful whether it is reliable enough for individual patients for whom contraception is an essential safeguard of health.

Diagnostic Significance of Serous Fluids in Disease.—Paddock compared the clinical records with more than 1,300 serous fluids, accepting only those in which there was no doubt as to the diagnosis of the disease. He summarizes the data as follows: The customary division of transudates from exudates at the specific gravity of 1.016 was found to be true only in certain diseases. In pleural effusions 90 per cent of cardiac fluids have a specific gravity of 1.016 or less and 90 per cent of tuberculous fluids have a specific gravity of 1.016 or more. In ascites, 95 per cent of cirrhotic effusions are in the transudative range. No cases of tuberculous peritonitis were found in which the specific gravity was typical of transudates. In nontuberculous infected pleural fluids 31 per cent have a specific gravity of 1.016 or less and 34 per cent of cardiac peritoneal effusions have a specific gravity of 1.016 or more. Neoplastic fluids from both the pleural and peritoneal cavities are about evenly divided between the exudative and transudative specific gravities. Nephrotic fluids have a uniformly low specific gravity in the pleural and peritoneal cavities. The specific gravity of cardiac peritoneal fluids was usually higher than that of cardiac pleural fluids. The temperature of a fluid may change its specific gravity by as much as from 0.008 to 0.01. The underlying disease of twelve chylous fluids was cirrhosis in five, neoplasm in three, nephrosis in two and subacute bacterial endocarditis and volvulus one each. The diagnosis of chylous effusion may occasionally be made on roentgen examination, since the fluid, owing to its unusually high fat content, does not hinder the passage of the rays as do other effusions. All but three of fourteen eosinophilic fluids were bloody. Six of them were apparently due to a benign pleurisy of unknown cause, four were associated with neoplasm, two with cardiac decompensation and two with empyema. Only occasionally did the circulating blood show an eosinophilia. Charcot-Leyden crystals were found in one of the fluids, the diagnosis being cardiac decompensation. Two mucinous effusions were found, one from a patient with peritoneal carcinomatosis and one from a patient apparently suffering from carcinoma of the ovary metastatic to the peritoneum and pleura. In the eight rheumatic effusions in which the specific gravity was noted, it was 1.017 or more in four. The leukocyte count ranged from 370 to 33,600 and the erythrocyte count from 77 to 45,000. The specific gravity of three tuberculous pericardial effusions was 1.018 or more, the erythrocyte count exceeding 10,000. Bloody pericardial fluid may be found in a variety of conditions; rupture of the coronary vessels, tumors of the heart and pericardium, chronic nephritis and nontuberculous pericardial infections. Clotting of these fluids occurs only when they are withdrawn shortly after their appearance. The total leukocyte count is above 1,000 per cubic millimeter three times as frequently in infected as in noninfected fluids from both the pleural and peritoneal cavities. Neoplastic fluids have a leukocyte count above 1,000 in 50 per cent of the cases. The protein content of effusions contributes no more than does the specific gravity to the diagnosis. The differential leukocyte count is of little diagnostic value except in differentiating nontuberculous infections.

Subacute Bacterial Endocarditis.—Solomon used sulfapyridine and typhoparatyphoid vaccine for the treatment of 8 patients with subacute bacterial endocarditis. The drug was given orally, and the vaccine was injected intravenously. The author believes that by combining foreign protein shock therapy with the sulfonamides, the effectiveness of the drug is enhanced not only by the hyperpyrexia produced, which renders the drug bactericidal instead of bacteriostatic, but also by the addition of immunity factors (some of which are not clearly understood), which are activated at the same time. Seven of the 8 cases of subacute bacterial endocarditis were due to *Streptococcus viridans* and 1 to the nonhemolytic streptococcus. There were adequate criteria for a diagnosis of active bacterial endocarditis with at least one positive blood culture in each case. Five of the patients are well, 1 for eighteen, 1 for fifteen, 1 for three and 2 for more than two months. One patient died of agranulocytosis one month after leaving the hospital, but there was no clinical or bacteriologic evidence that the original infection had recurred. The treatment failed in 2 cases, although a temporary improvement did occur; in 1 of these the infection existed for more than four months and was probably superimposed on a congenital defect of the interventricular septum, and in the other 1 the disease had been present for more than six months and at necropsy firm, flat vegetations were extensive over the endocardium. Both of these patients had received a great deal of sulfonamide chemotherapy for a long time before the combined form of treatment was instituted. This suggests bacterial resistance to the drug. However, 1 of the cases reported illustrates that the combined therapy may prove effective even after prolonged sulfonamide therapy alone has failed. The method of therapy was as follows: Two Gm. of sulfapyridine was given every four hours for two doses and then reduced to 1 Gm. every four hours. On the night of the second day of sulfapyridine therapy an intravenous injection of $\frac{1}{2}$ minim of typhoparatyphoid vaccine was given and repeated in one or two hours if necessary to maintain the temperature above 104 F. for at least three consecutive hours. The vaccine was given every night for from seven to ten days, the amount being increased as required to produce the degree and duration of hyperpyrexia. The injections were given several hours after the last meal of the day so as not to interfere with the patient's nourishment. Accessory measures were all utilized as indicated. Blood and urine examinations to follow the concentration of the drug in the blood and to discover any toxic effects early were carried out routinely. Sulfapyridine was usually given for a week or less after the vaccine was discontinued.

Transfusion of Reconstituted Dried Human Serum.—Brown and Mollison state that the dried serum emanating from the Medical Research Council's serum drying unit at Cambridge is not only safe but efficacious. The process consists essentially in drying after it is passed through a Seitz filter from the frozen state in vacuo. Ninety-one transfusions of this serum, usually in four times normal concentration, have been given. Because of its high viscosity it must be given under pressure. Approximately half of the patients treated had had a recent hemorrhage or were in shock. The serum was usually given at approximately room temperature. A rapid increase in blood pressure occurred after the transfusions; often 80 per cent of the maximal rise took place within from five to ten minutes of the transfusion. The rises varied but on the whole were higher with the larger doses. The blood pressure readings of twenty-three of forty-one injections showed a rise of 15 mm. of mercury or more systolic within thirty minutes of transfusion. There was no instance of a fall in pressure. The pulse rate was taken after forty injections; it decreased after sixteen, rose in four and did not change significantly in twenty. Evidence of hemodilution was obtained in most of the cases so studied. Unequivocal evidence of clinical improvement was found in twenty-eight of forty-four transfusions. The results are better when larger doses are given. The authors suggest that the initial transfusion be not less than the equivalent of 400 cc. of normal serum. Larger quantities will be required in severe cases. There were seven febrile reactions after ninety-one transfusions, six instances of vomiting, two of urticaria and three of severe lumbar pain. The reactions were mild. The lumbar pain was of short duration and was not followed by further symptoms. The serum was all of group AB or A. There was no reason to suspect a hemolytic reaction. Yet direct matching tests between the serum given and the corpuscles of the 3 patients with lumbar pain

showed no agglutination. There was no hemoglobinuria in any of them. Because of the occurrence of lumbar pain and of difficulties in administering the concentrated serum, it might be better to give it in lower concentration. A further contraindication to using four times normal serum is the rather frequent accident of thrombosis in the vein injected. Twice normal serum will flow easily by gravity through the ordinary needle used for injection.

Journal of Mental Science, London

86:1065-1176 (Nov.) 1940

Paleophrenia: Reevaluation of Concept of Schizophrenia. R. L. Osborne.—p. 1078.
Compensatory Enlargement of Posterior Communicating Artery Following Arteriosclerotic Changes of Posterior Cerebral Artery. R. Klein.—p. 1086.

Significance of Endocrines in Melancholia.—Hemphill and Reiss studied 30 women with symptoms of depressive disorders in an effort to determine whether and to what measures involutional changes contribute to mental illness. The symptoms of the 30 women varied in severity, with certain individual differences; they were associated with the menopause or involutional state and seemed to present the clinical picture of involutional melancholia. Only 4 women had a history of previous attacks of depression. Therefore the other 26 could not be regarded as belonging to the manic-depressive psychosis and in these the menopause may have been the chief factor of influence. The present depression of the 4 women seemed to be so closely associated with the menopause that the menopause could be regarded as etiologic. The same symptoms of endocrine dysfunction were not prominent in every patient. The most salient features of 11 women seemed to be purely hypo-ovarian, of 4 hypo-ovarian combined with hypothyroidism, of 7 hypo-ovarian combined with hyperthyroidism and of 8 hypo-ovarian combined with hypoadrenalism. Fifteen of the 30 women had never borne children. This suggests that childbearing was not an important etiologic factor. However, of the four types of patients 9 of the 11 with the pure hypo-ovarian type had never borne children, 1 of the 4 patients with the hypo-ovarian with hypothyroidism and 1 of the 7 patients with the hypo-ovarian with hyperthyroidism type of disorder had never borne children, and of the 8 patients of the hypo-ovarian with hypoadrenalism type of disorder 5 had never borne children. It is striking that of the pure hypo-ovarian type as high a proportion as 9 out of 11 had never borne children, while of the hypo-ovarian with increased thyroid activity 6 of 7 patients had borne children. The excretion of gonadotropic substance was studied before and after treatment, as the authors believed that some correlation might exist between the gonadotropic action of the anterior lobe of the pituitary and features of the mental illness. Increased gonadotropic substance was more commonly found in the first and third types of illness. When increased excretion of gonadotropic substance occurred before treatment, with one exception it disappeared after treatment with estrogen. The authors cannot say definitely how far the estimation of gonadotropic substance in the urine can constitute a guide for the diagnosis or the treatment of involutional melancholia. Nineteen patients were selected for treatment with estrogen, and in 10 the symptoms either completely or partially disappeared. The improvement was observed only among the patients belonging to the first and third types: hypo-ovarian type and hypo-ovarian combined with hyperthyroidism. The estrogen tended to aggravate the symptoms of patients in whom the thyroid function was diminished. This may indicate that estrogen can inhibit still further an already insufficient thyroid mechanism. Failure of the pituitary to supply corticotropic hormone may be responsible for adrenal insufficiency observed among the fourth group of patients. Under certain conditions it may be possible to correct this insufficiency by administering corticotropic substance, as a remarkable change in the physical and mental state occurred in 1 such patient. The authors are of the opinion that, with increasing knowledge of the functions of the anterior lobe of the pituitary, many of the difficulties of this problem will be solved. Until this is done the hormones for the treatment of complex glandular disturbances arising out of the menopause should be chosen cautiously.

Chemotherapy of Blennorrhea of Newborn.—Bruens reports on treatment of gonorrheal infection of the conjunctiva in the newborn with sulfanilamide derivatives to the exclusion of all other local and general measures. After several attempts with uliron (dimethyl-disulfanilamide) he changed to the more effective albucid (acetylsulfanilamide). He found that oral administration of acetylsulfanilamide caused disappearance of gonococci from the conjunctiva within a few days, but it also produced symptoms of intoxication such as cyanosis, vomiting and changes in the blood picture. To avoid these effects he resorted to local application. He found the following method effective: 1. During the first twenty-four hours the conjunctival sac is irrigated every fifteen minutes with physiologic solution of sodium chloride. Pseudomembranes are removed before the irrigation. 2. A 10 per cent solution of acetylsulfanilamide is instilled into the conjunctival sac at intervals of thirty minutes. Care is taken that the solution enters all conjunctival folds and pockets. The instillation is continued for twelve hours. 3. If twenty-four hours after treatment the conjunctival sac is not free from gonococci, the same procedure is repeated with a more concentrated solution. The concentration should not exceed 20 per cent. 4. The after-treatment of the sterile conjunctiva consists in irrigations with physiologic solution of sodium chloride at intervals of from one to three hours, depending on the amount of secretion. The author reports 7 cases in which he resorted to this treatment. The efficacy of local application of acetylsulfanilamide suggests that the substance does not have to pass through the patient's body in order to be effective.

- Importance of Vitamin C for Workers Coming in Contact with Benzene. O. Libowitzky and H. Seyfried.—p. 543.

Chemotherapy of Encephalitis.—According to Sás, encephalitis is usually a sequel to acute infectious disease, particularly influenza. Since a number of acute infectious diseases are influenced favorably by chemotherapy there seemed to be justification to try this treatment in encephalitis. The author regards sodium salicylate as the best drug in encephalitis. He employed it successfully in treating 24 patients. All of the patients recovered and no sequels remained. Adults were given 5 Gm. of sodium salicylate daily. This quantity was divided into five doses of 1 Gm. each, one of which was administered during the night. The individual dose was dissolved in a spoon of water. For children the doses were reduced. In case of gastric disorders, or in unmanageable children, the drug can be given by rectum. If the pulse becomes irregular, or the patient develops a moderate fever, digitalis is administered. Antipyretic treatment is advisable for high fever. The author suggests that vitamin B preparations might prove helpful. He stresses that encephalitis occurs also in nurslings, particularly at a time when influenza is prevalent. They should likewise be treated with sodium salicylate. Individual doses of from 0.14 to 0.18 Gm. should be given four times during the day and once at night. Singultus is often the only apparent symptom of encephalitis. This symptom may persist for several days and may make food taking impossible because the first act of swallowing elicits the hiccup. The author found sodium salicylate helpful in the treatment of the hiccup as well.

- Investigations on Blood Group Q. S. Ishizawa.—p. 701.
- *Blood Groups Determined by Human Meconium. H. Sekimoto.—p. 745.

Blood Groups Determined by Human Saliva.—Ishizawa and his co-workers examined blood groups and blood types, together with their subdivisions, of 200 human subjects. Various agglutination methods were employed, using A-B agglutinogens and a-b agglutinins, M-N testing fluids, Q serum after absorption with Aq, Bq red cells, as well as serums derived from animals (ox, goat, dog and eel), but particularly human saliva. The results of extensive agglutination tests in various combinations of testing fluids and red cell suspensions indicate great variations according to particular combinations used, the most constant relationships having been demonstrated between A-B groups and various secretions of the body. The classification of blood groups and types according to other methods, such as the S system, requires further investigations.

Classification of Human Serums with Eel Erythrocytes.—Nonaka prepared a 2 per cent suspension of eel erythrocytes for use in testing human serums, with special reference to the classification and heredity of the latter. According to his observations the classification of human serums based on their reaction with eel erythrocyte suspensions is independent of any known blood groups or of any properties of iso-agglutinins. Hetero-agglutinins as demonstrated by eel red cells follow in serums of various members of the same family a certain hereditary law, but no definite conclusions can as yet be drawn from the small series studied.

Blood Groups of Human Meconium.—Researches of various investigators have demonstrated the secretion of group-specific substances for all blood groups except the O group; the amount of such substances secreted determines the classification of saliva into the secretory and nonsecretory types. In the case of the O group a similar classification has been attempted on the basis of the amount of inhibitory substance in the agglutination of the species-specific erythrocytes. Using the meconium obtained during the first twenty-four hours of postnatal life, Sekimoto prepared a diluted meconium filtrate which was then tested against the washed A and B erythrocytes. The standard serum was prepared from normal O group persons with high agglutinin titers. The results of these observations were based on the degree of agglutination of A and B red cells when mixed with a stated amount of dilute meconium, using the standard O serum as a control. By testing 90 specimens of meconium, the author found that group-specific substances are present in the human meconium of both A and B, while those of the AB group contained both A and B factors, but that in those from the O group no specific substance was discovered.

Uratic Arthritis and Uric Acid Excretion After Hematemesis and Melena.—Ewertsen and Meulengracht report four cases of gout following hematemesis and melena. A predisposition to such attacks is considered probable. In 7 patients who had hematemesis and melena they found increased excretion of uric acid in the urine after the hemorrhage and attribute it to an increased endogenous production of uric acid which occurs simultaneously with the reticulocyte reaction at the start of the period of regeneration and seems proportional to it. This increased excretion is believed to be related to the increased regeneration of the blood and the increased liberation and disintegration of normoblast nuclei, the nucleoproteins of which constitute increased material for the production of uric acid.

Book Notices

The Treatment of Diabetes Mellitus. By Elliott P. Joslin, A.M., M.D., Sc.D., Medical Director, George F. Baker Clinic, New England Deaconess Hospital, Boston, Howard F. Root, M.D., Physician, New England Deaconess Hospital, Priscilla White, M.D., Physician, New England Deaconess Hospital, and Alexander Marble, A.M., M.D., Physician, New England Deaconess Hospital. Seventh edition. Cloth Price, \$7.50. Pp. 783, with 9 illustrations. Philadelphia: Lea & Febiger, 1940.

The newest revised edition of Joslin's standard textbook on diabetes for physicians, probably the best known and most authentic modern work in the world, is improved by the addition as major authors of three of Dr. Joslin's associates, Drs. Root, White and Marble, and by the inclusion of thoroughly precise reviews by these authors of the contemporary experimental literature on related subjects. Fully 70 per cent of the volume now has been rewritten or has been subjected to major revision by the associates of the great clinician.

Still clinging to the well known statistical approach and colorful style for which the senior author is noted, this new edition has been thoroughly sifted and augmented, chiefly by the refreshing supplements by the junior authors. Joslin's thoughtful and conscientious experience with some thirteen thousand diabetic patients over a period of more than forty years provides breadth and depth for an authoritative and exact reference volume. Undoubtedly no other person has ever seen so many patients, studied them so carefully and made such extensive use of modern refinements of treatment. For this reason alone, no internist should fail to own and use this volume.

New chapters have been added on allergy and on syphilis in diabetes by McDaniel, and on hypoglycemia by Marble. Of greater importance however, are thoroughly comprehensive reviews of the pertinent physiologic and pathologic literature by Marble and Root and reports by White on recent progress, largely due to her studies, in understanding hereditary influences in diabetes, progress of diabetic children and greater success in pregnancy among diabetic mothers. Using the Smith technic of control, White has successfully corrected a large percentage of toxemias in pregnant diabetic women, has obtained fetal mortality rates as low as in mothers free from toxemia, and has suggested a new conception and an exact and useful method of studying and perhaps controlling similar complications in non-diabetic pregnancies.

Joslin's interesting study of diabetes in Arizona, the subject of his recent Billings lecture, is new in this volume. The study is unique and the philosophy stimulated by it is convincing, namely that, contrary to superficial reports, the discrepancies in diabetic experience in Arizona are only apparent. With proper analysis and corrections for known differences, diabetes occurs and behaves there just as it does elsewhere; thus the dictum "the universality of diabetes."

Root's discussion of the changing morbidity and mortality in diabetes adequately emphasizes the shift away from true diabetic complications toward those due to associated vascular disease so obvious since the advent of insulin in treatment. This well studied large series of cases brings out forcefully the striking reduction in deaths due to acidosis and the associated great increase in deaths due to cardiovascular disease, the latter replacing the former statistically as a cause of death in the last twenty-five years, as more diabetes is discovered and more diabetic patients live long enough for arterial degeneration to occur.

Other students of diabetes who are freer from the influence of Joslin's beliefs will be disappointed to learn that in his clinic there still exists the assumption that diabetes is directly responsible for the frequently associated vascular disease. There still is no sign of proper recognition of the importance of age in this respect, of the fairly common incidence of arteriosclerosis in non-diabetic patients of comparable ages, of other possibilities which might account for the common association of the two disorders, or of the beliefs of other competent observers such as Woodyatt and Wilder. The tacit assumption that diabetes causes arteriosclerosis is widely accepted, largely because of the prominence given to it by this group of authors. On account of this, progress in understanding the problem may be retarded. This criticism is the only serious one which could be aimed at an otherwise splendid and immortal collection of knowledge.

The Social Relations of Science. By J. G. Crowther. Cloth. Price, \$3.50. Pp. 665. New York: Macmillan Company, 1941.

The thesis set forth is that "modern science has been associated with freedom because it arose out of the activities of the craftsman." The great thinkers of Greece made small contributions in the application of science because of the separation of the thinking class from the remainder of society, which was based on slavery. This caused Greek science to lose itself in speculations. The single exception to this was medicine, which produced the first balanced science. "The hippocratean writings contain the first description of scientific method which contains all its elements." But the facts of human physiology are too complicated and difficult subjects of research to prove a good foundation of science. Aristotle, a son of a doctor, made his greatest contributions through the study of biologic material. Alexandrian science was in closer touch with craftsmanship but was still handicapped by widespread slavery. The contributions of Egyptian science were large, but the fact that science became the instrument of a ruling class laid the foundation of a dictatorship which lasted for thousands of years. Roman slavery separated thinkers from the mass of society and made even the handling of the instruments necessary for experiment degrading. Even medical research came to depend more and more on verbal knowledge and less on the experimental facts of anatomy. Muslim civilization made its great contribution because of its close association with commerce and industry. With the building of cathedrals and the development of commerce and industry following the Renaissance, modern science began to make its appearance. The growth of universities, the necessity of accurate divisions of time, the development of trade which brought about the introduction of money and accounting, and above all the growth of craftsmanship and the greater social recognition given to industry and manual labor released the forces responsible for the great growth of science in modern times. If scientists fail to recognize their social obligations and opportunities, they may easily become the instruments for a new totalitarian tyranny that will destroy science. If they do put their abilities at the service of society, they may retain their freedom and contribute to the development of a society in which the achievements of science may make possible greater well-being for all. It is an inspiring work of a type that is urgently needed at the present moment.

Special Surgery in Wartime. By D. W. C. Northfield, M.S., F.R.C.S., and others. Published by The Practitioner. Cloth. Price, 6s. Pp. 74. London: Eyre & Spottiswoode, 1940.

This, the latest addition to the *Practitioner* booklet series, contains contributions by five authors dealing with new problems brought about by air raid casualties and other wartime emergencies. The aim of the publication is to assist the general practitioner in solving the acute problems of the diagnosis and treatment of injuries to the head, chest, spinal cord and abdomen. The subjects are treated in a brief, authoritative and preeminently practical manner. The information offered embraces the experiences of recent years. In the treatment of head injuries Northfield recommends that all compound fractures of the cranium be immediately hospitalized. The wound itself is treated by debridement, suture and the administration of sulfonamide derivatives. The incidence of posttraumatic epilepsy may be diminished by the administration of small doses of phenobarbital or bromide for three years after the injury. In the treatment of spinal cord injuries McAlpine urges immediate administration of morphine, transportation to a hospital and the passage of a soft rubber catheter under strict aseptic precautions if signs of paralysis are present. After reduction of the fracture the patient is treated in a plaster of paris cast. The urinary bladder is to be catheterized every six hours. In a chapter on abdominal injury Cope points out that the main symptoms of visceral injury are due to one or more of three conditions: shock, hemorrhage and peritonitis. The existence of intracavitary bleeding is recognized by a gradual rise in the pulse rate, while the development of peritonitis is characterized by vomiting, persistent local rigidity tending to extend, gradually rising pulse rate and deep local tenderness with shallow respiration. Every penetrating wound caused by a sharp instrument needs exploration under an anesthetic. The same holds true of all cases in which the abdominal wall is ruptured by

blunt violence. Nearly every case in which penetrating missiles have caused serious hemorrhage or symptoms of peritonitis require operation. One should be on the lookout for multiple injuries. The early treatment of chest injuries resolves into the treatment of severe shock and dyspnea and demands warmth and morphine. In a chapter on the treatment of burns, Wallace stresses the importance of treatment of the primary shock before undertaking the local treatment. Preliminary cleaning is most important and must be done under general anesthesia, preferably nitrous oxide and oxygen. If the burn is extensive an infusion of plasma or acacia-saline solution must be given intravenously by the drip method as a precautionary measure before or immediately after the onset of secondary shock and before local treatment is instituted. Wallace favors the use of 20 per cent tannic acid or 10 per cent silver nitrate in the local treatment of burns. For cases seen forty-eight to seventy-two hours after the burn and obviously septic, large doses of sulfanilamide are to be administered. Since the introduction of the sulfonamide group of drugs the incidence of serious infection has considerably diminished. In the presence of toxemia, circulatory failure is to be prevented or combated by intravenous infusion of plasma along with desoxycorticosterone acetate. Recent information available on the application of chemotherapy to war injuries is given in a special appendix. The booklet is admirably calculated to meet the urgent demands of the present hour.

Index-Catalogue of the Library of the Surgeon General's Office, United States Army (Army Medical Library). Authors and Subjects. Fourth Series. Vol. V: Eager-Fyfe. Cloth. Price, \$2.75. Pp. 1,220. Washington, D. C.: Supt. of Documents, Government Printing Office, 1940.

The fifth volume of this noteworthy contribution to medical bibliography proceeds from Richard Eager, who wrote a book for probation of nurses in mental hospitals, to John William Fyfe, who published in 1903 a work on materia medica. The Army Medical Library now includes approximately 413,725 volumes and 598,002 pamphlets of all sorts, including letters, broadsides and medical theses. This represents, according to Col. Harold W. Jones, now librarian, about one half of the total medical literary production of the world from the beginning of printing until today. Efforts are being made by the library to obtain the other half. During the current year several extraordinary works were purchased, dating back to 1548 and other works in the sixteenth century. There was added also a rare broadside, illustrating Siamese twins, which was printed in 1512. The library now receives approximately two thousand, two hundred periodicals. This index is one of the most important fundamental works of reference in the field of medicine—a work which must perforce be in every medical library to make it complete.

Who Walk Alone. By Perry Burgess. Cloth. Price, \$2.75. Pp. 312, with 14 illustrations. New York: Henry Holt & Company, 1940.

For fifteen years the author of this book has been national director of the Leonard Wood Memorial, which is a foundation devoted to leprosy. Almost in the form of a novel there is told here the story of a young man who discovered that he had leprosy after an experience in the Philippine Islands during the Spanish American War. A preface indicates that some 30 American soldiers became patients at the great leper colonies after the war.

The "explanation," which is in the form of a foreword to the book, says that it is the actual story of the soldier whose name was not Ned Langford but who actually experienced what is said of Ned in this account. A few other experiences have been added by the author merely to obscure the identity of the man whom the book describes. Many of the names in the book are fictitious, but there are others that are actually those of people who worked for and with the lepers in Cullion, Cebu and Carville.

A brief appendix to the volume gives many facts concerning leprosy and corrects many false impressions and superstitions which today hamper necessary work against this disease. The volume has many fine illustrations and a good index.

This account should not be confused with the ordinary scientific story. It has the thrill of a novel. It is written with sympathy and insight. It cannot but inspire every reader to do what he can for those who suffer from this disease. It required great courage for Ned Langford to reject suicide as an escape

and to break with his past for a career in a leper colony. He found life well worth the living for the friends that he made and the service that he was able to give. Thus this book should inspire many another person to face lesser difficulties with more composure than many exhibit in the face of minor difficulties.

Unresting Cells. By R. W. Gerard, Associate Professor of Physiology, University of Chicago, Chicago. Cloth. Price, \$3. Pp. 439, with 173 illustrations. New York & London: Harper & Brothers, 1940.

The theme of this modern natural philosophy is borrowed from John Masefield:

What am I, Life? a thing of watery salt,
Held in cohesion by unresting cells . . . ?

The author has described in nontechnical language the organization of cells, the nature and functions of enzymes, the exchange of energy, and the phenomena of irritability and behavior. The earlier chapters lay the basis for presenting current knowledge and theories concerning immunity, growth, reproduction, aging, embryogeny and heredity. He has successfully analyzed and described how creatures work, "a formidable task . . . for the analysis soon leads to the microscopic cell, submicroscopic particles and films, complicated molecules and forces—phenomena far beyond the comfortable familiarity we all have with cats and caterpillars and crayfish." The book commends itself to the physician who would refresh his memory of the elementary aspects of biology and learn of recent developments in this field. He will find it entertaining, instructive and authoritative. It has handsome illustrations, many of which are original, planned by the author and Mrs. Elizabeth Newhall and executed by her. One group of these cleverly depicts such varied scenes as the orderly weddings and divorces of molecules and the antics of Maxwell's demon.

Fifty Years in Medicine. By Joseph C. Beck, M.D. Cloth. Price, \$3. Pp. 329, with 20 illustrations. Chicago: McDonough & Company, 1940.

Dr. "Joe" Beck thought vaguely for some time about writing the story of his life, and then one day he decided to do it. His book is different in that it reflects far more of the great men with whom he came in contact than of the intimate details of his own career. Indeed it begins with brief sketches of medical masters known particularly to the Chicago area. His modesty leads him to have his boyhood days described by his wife. This is perhaps one of the best chapters in the book. It is followed by a chapter on his medical life and an account of his family and his travels. Then come studies of various well known otolaryngologists and of organizations in the field of otolaryngology, in which Dr. Beck was associated. Here is a different type of autobiography—a veritable guide to otolaryngology in the Midwest. It is colloquial in its tone and therefore pleasant to read.

Las meningitis tuberculosas del adulto. Por Armando Sarno, Raul A. Piaggio Blanco y Alejandro Artagaveytia. Paper. Pp. 312, with illustrations. Montevideo: Imprenta "El Siglo Ilustrado," 1940.

This book is the result of epidemiologic and anatomoclinical studies carried on for several years by the authors in their character of director and active members of the Uruguayan antituberculosis crusades. It deals with the general conceptions and importance of primary, postprimary, secondary and tertiary tuberculosis and their relations with the various anatomoclinical types of tuberculous meningitis in adults, symptoms and clinical course of the disease, pressure, aspect, cytology, chemistry and bacteriology of the cerebrospinal fluid, differential diagnosis, evolution, prognosis, prevention and treatment of the disease in adults, pathologic anatomy and experimental tuberculous meningitis. There are 24 pages of bibliography. The book is of value, especially in the clinical and antiepidemiologic fields.

A Textbook of Clinical Pathology. Edited by Roy R. Kracke and Francis P. Parker. Second edition. Cloth. Price, \$6. Pp. 780, with 257 illustrations, including 34 colored plates. Baltimore: William Wood & Company, 1940.

The second edition of this book appears only two years after the first. The fourteen contributors are well qualified in their respective fields. The diagnostic procedures and special tests are adequately covered for most purposes. The book is authoritative and should be available as a reference book to all who are engaged in clinical laboratory work.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

PROTECTIVE PREPARATIONS AGAINST SUNLIGHT

To the Editor:—Can you supply me with a formula for the prevention of freckles on the face due to exposure to the summer sun? I have read somewhere, but cannot recall where, of some compound which successfully prevents actinic rays from reaching the skin. Also anything new in the treatment of freckles.

Adolph Spiro, M.D., Detroit.

To the Editor:—A chemical has been mentioned which has the ability to filter out the actinic rays of the sun. I would appreciate it if you will be good enough to give the name of such a chemical or manufactured product.

Charles F. Good, M.D., Cleveland.

ANSWER:—In answer to a similar query disodium naphthol sulfonate 5 per cent in alcohol or ointment was suggested (*THE JOURNAL*, March 31, 1934, p. 1103). More recently Bachem and Fantus (Evaluation of Skin Protection Against Ultraviolet Rays, *Arch. Phys. Therapy* 20:69 [Feb.] 1939) made a thorough spectrographic study of the effect of various ointment bases and other substances as protectants against light. They found that of the bases studied wool fat, yellow petrolatum and diachylon ointment give the best protection. The yellow petrolatum is much better than the white. A cream made of 1 part wool fat and 3 parts yellow petrolatum and emulsified with 50 per cent water cut off the ultraviolet rays quite well. Ichthammol in 2 per cent strength was also effective. Esculin and methyl salicylate were shown to be more efficient than quinine oleate.

Opaque powders produced the greatest shielding, and of these titanium dioxide was most effective, excelling calamine powder. They recommend the cuticolor powder advocated by Fantus and Dynewicz (Cuticolor Preparations, *J. Am. Pharm. A.* 27:878, 1938) consisting of:

	Gm. or Cc.
Red ferrous oxide.....	6.0
Yellow ferrous oxide.....	8.0
Titanium dioxide	86.0

This they call cuticolor titanium dioxide; it can be made up into a lotion as follows:

	Gm. or Cc.
Cuticolor titanium dioxide.....	15.0
Bentonite	2.5
Stronger rose water to make.....	100.0

Or a cream salve may be made:

	Gm. or Cc.
Cuticolor titanium dioxide.....	30.0
Glycerin	1.5
Vanishing cream	70.0

A number of other suggestions are given. Tests of these against proprietary preparations on the market showed the Bachem and Fantus preparations greatly superior.

POSSIBLE SYMPTOMS OF INTOXICATION FROM PYRENE EXTINGUISHER

To the Editor:—In a recent case of "drunken driver" a question of differential diagnosis arose between the effects of pyrene liquid as used in fire extinguishers and acute alcoholic intoxication. The judge has reserved decision pending some information on the action of pyrene. Will you please inform me as to the pharmacology, physiology and toxicity of pyrene?

B. L. Steinberg, M.D., Singac, N. J.

ANSWER:—It is believed that pyrene is likely to consist of approximately 90 per cent carbon tetrachloride with the addition of some anticorrosing agent such as dichloromethane or trichloromethane and, on order, a telltale dye such as "Oil Red O."

In mild acute carbon tetrachloride poisoning there may arise such symptoms as headache, nausea, vomiting, sleepiness, mental confusion, depressed intellectual faculties, abdominal pain and distaste for food. Some of these symptoms are similar to those from ethyl alcohol, and the total picture of early acute carbon tetrachloride poisoning may simulate that from alcoholic intoxication. Since carbon tetrachloride enters the body through inhalation or through the skin and almost entirely leaves through exhalations as such, the odor of the breath is of some significance

in detecting the presence of carbon tetrachloride. More accurately quantitative determinations of alcohol might have been made at the time of the "abnormal" state through appropriate examination of the blood, urine or exhaled air. The late effects of carbon tetrachloride action are ordinarily dissimilar to those of the action of alcohol, so that difficulty should not arise in differential diagnosis. After some or all of the manifestations earlier mentioned there may appear diarrhea, bloody stools and other evidences of gastroenteritis; jaundice, bile in urine and other evidences of hepatic damage; symptoms of acute nephritis and, all considered, the general picture of guanidine poisoning.

Additional information may be found in the following citations, which are representative of a large bibliography:

DERMATITIS FROM POLLEN OR LIGHT SENSITIVITY

To the Editor:—A woman aged 38 is troubled with an intolerable eczema that begins in the spring and lasts for about three or four months. The eruptions have never occurred in the winter and seem to be much worse during the extremely hot weather. This rash started when the patient was 14 years old and she has had it every summer since then. At times there has been a swelling of the hands and eyes. Cutaneous tests were made for practically everything two years ago and all were negative. Different climates have been tried but the patient states that she has noticed little difference in the eruption. The eruption starts in the form of blisters which break and form blisters elsewhere. Then they form scales and dry weeping patches as of a typical eczema. The itching is intolerable and does not seem to be favorably affected by any form of treatment. The sites of predilection for the eruption are the head, face, neck, extensor and flexor surfaces of the forearm and between the fingers. The previous history includes an appendectomy at 22 years of age, tonsillectomy at 24, cholecystectomy at 31 and thyroidectomy at 36. The basal metabolic rate is -12 and there is evidence of slight estrogenic deficiency. Aside from her slight overweight the physical examination is negative. I would appreciate anything that you may have to offer in form of diagnosis and therapy. I have considered a possible allergy to heat or fungous infection.

M.D., Texas.

ANSWER:—The description of this case suggests two possibilities, pollen sensitization and hypersensitiveness to light. With regard to the first of these, the statement that cutaneous tests have been made usually means that many scratch tests have been made without reaction. This, in the case under discussion, is not enough to rule out the possibility that sensitization to the suspected substances is present. Intracutaneous and inhalation tests and patch tests with the oleoresins of the indigenous and cultivated plants are necessary before such a conclusion can be reached. The fact that the eruption is much worse during hot weather may mean that there is an additional sensitization to light or heat or only that perspiration adds irritation to that already present. Persistence of the eruption after the season of pollination or after removal to another region with a different flora may mean only the hangover so often noted in sensitization cases. The real test would be to move to another region in the spring before the eruption appears and see whether in that way the dermatitis can be avoided.

Light sensitization may manifest itself on the skin as eczema solare or as hydroa aestivale or vacciniforme. The statement that the eruption resembles eczema and itches intensely favors the first of these; but the differentiation should be made by a dermatologist. Hydroa in girls is said to tend to begin later, about puberty, to continue longer in each attack, to itch more and to persist, while the vacciniform type in boys often clears up in early adult life. Light sensitization can be tested for by exposure of small areas of skin to sunlight or artificial ultraviolet light. The fact must be kept in mind that in some of these cases, as mentioned by W. H. Goeckerman, A. E. Osterberg and Charles Sheard (Eczema Solare in a Case of Hematoporphyria, *Arch. Dermat. & Syph.* 20:501 [Oct.] 1929), only certain parts of the skin show the special sensitivity, reacting with an eczematoid eruption, while the rest of the skin reacts under a much larger dose with the usual erythema. Hydroa, whether of the estival or the scarring vacciniform type, occurs in attacks lasting usually a few weeks; but these may occur so frequently that the series seems like one long attack. Between these attacks the skin may react normally to light. There are cases reported in which other forms of irritation, trauma, cold or heat were necessary in addition to light before a reaction could be elicited.

Both eczema solare and hydroa are at times accompanied by an excess of porphyrin in the urine. F. E. Senechal and H. W.

Fink found that this was true in 17 per cent of the cases reviewed by them and suspected that a more careful study would have revealed it in a larger proportion (*Hydroa Vacciniforme seu Aestivale, Arch. Dermat. & Syph.* 7:145 [Jan.] 1923). Formerly considered of possible etiologic significance because artificially produced porphyrins injected into animals intravenously cause hypersensitivity to light, the tendency now is to consider the porphyrin excess a product of the exposure to light, possibly produced in the cells of the skin. Goeckerman and O'Leary found two and a half times as much porphyrin in the urine of one of their subjects after a general ultraviolet exposure. W. J. Turner and M. E. Obermayer (Studies on Porphyrin: II. *Arch. Dermat. & Syph.* 37:549 [April] 1938) believe that porphyria is due to a prenatal error of metabolism of the pyrroles and not to a disturbance of liver metabolism as advocated some years ago. Liver therapy has been tried without any consistent results and in their case seemed to have a bad effect, while a diet containing a large amount of citrus fruit seemed to be helpful. Desensitization has not been successful in cases of porphyria, though it has been tried with copper and zinc and with calcium. The same is true of attempts to reduce the sensitivity to light. The only practical method of treatment is protection from light. This is best done by large hats, veils and gloves and by the use of opaque ointments such as zinc paste. Made with the cuticolor powder advocated by Bernard Fantus and H. A. Dynewicz (Cuticolor Preparations, *J. Am. Pharm. A.* 27:878 [Oct.] 1938) it can be made inconspicuous.

This patient should be thoroughly studied, and if the diagnosis is light sensitization a careful search for porphyria should be made. In connection with this, Turner and Obermayer suggest a study of the function of the bone marrow because there is a "remarkable similarity to that in pernicious anemia."

GASTRIC DISTURBANCES WITH EVENTRATION OF DIAPHRAGM

To the Editor:—Following an attack of trichinosis, a man aged 43 started to complain of gas in his stomach, which was eliminated only by lying on his left side and putting his finger down his throat, causing him to gag. Fluoroscopic survey of the chest showed elevation of the left leaf of the diaphragm, which produced an obliteration of the costophrenic angle and a displacement of the heart and mediastinum toward the right side. The left leaf of the diaphragm moved only slightly with deep expiration and inspiration. Barium sulfate passed slowly into the stomach and the emptying time was normal, but the cardiac portion of the stomach was elevated and rotated so that a trap was produced. The splenic flexure was displaced upward along the side of the stomach, being at the level of the fourth rib anteriorly. The advancing column of barium had reached this point at the end of four hours. This was the status of the patient in 1937 and it has remained the same. His only complaint is that he cannot eat away from home because he has to lie down and gag to relieve himself, and during the past year he has had to do this several times a day between meals. Assuming that this is an eventration of the diaphragm due to trichinosis, is there anything one could do to control the formation of gas in the stomach? Examination of the gallbladder after oral administration of dye showed a normal functioning gallbladder.

M.D., Ohio.

ANSWER.—Gastric disturbances associated with eventration of the diaphragm are attributable to visceral displacement and dysfunction. Under such circumstances the outlook for relief or cure is not a bright one, as surgical intervention is contraindicated and medical and dietetic measures usually are not effective. As eventration is frequently confused with diaphragmatic hernia, it is essential to exclude the latter, as it lends itself to operative treatment with successful issue in a majority of cases. Granting the undeniable presence of eventration, it does not necessarily follow that trichinosis was the causative factor, although it could have been the precipitating one. In the absence of injury to the phrenic nerve on the affected side, most authorities consider the condition a congenital or developmental defect. The onset of symptoms may be delayed in cases of eventration proved to be congenital by pathologic study.

If the following measures have not already been employed, one could suggest a diet of a bland, moderately low residue, high vitamin nature. Carninatives, such as compound mixture of rhubarb (N. F.) with or without tincture of belladonna, in appropriate doses, might prove helpful. Any tendency to aerophagia, constipation and obesity should be avoided.

ACUTE LARYNGOTRACHEITIS

To the Editor:—A girl aged 5 years became suddenly ill with a sore throat and mild laryngitis. Immediate examination revealed a reddened pharynx (no membrane). The temperature was 102 F. She was given 2 grains (0.13 Gm.) of acetylsalicylic acid and put to bed. Six hours later she had severe tracheitis and was subsequently removed to a hospital. She was then started on sulfanilamide 5 grains (0.32 Gm.) every four hours for three days. However, she vomited each dose. Eighteen hours later there was so much edema that a tracheotomy was necessary. Twenty-four hours after this tracheotomy she was given 30 grains (2 Gm.) of sulfanilamide over a four hour period subcutaneously. Forty-eight hours later she was given 30 grains of sulfanilamide over a ten hour period subcutaneously. On the third day she was treated the same way. (The dosage was 30 grains each time subcutaneously.) No cultures for diphtheria were taken because no membrane was present. 1. If sulfanilamide was given twenty-four hours before the tracheotomy was performed by some route other than by mouth would it have lessened the chances for a tracheotomy? 2. Should one start the patient on sulfanilamide immediately after the surgical operation or wait twenty-four hours? 3. Can diphtheria occur in the larynx without producing a membrane? 4. Would diphtheria antitoxin have harmed the child if given post-operatively? 5. Do you believe that sulfanilamide should be given in one large dose or in repeated doses i.e., every four hours straight? 6. How long would you have left this patient on sulfanilamide? She did not receive any more drug seventy-two hours after the tracheotomy, even though her temperature was 100.6 F. and the tracheal cannula was still in place. The white count on the fourth day was 14,000.

M.D., Indiana.

ANSWER.—1. Probably not.

2. There would seem to be no advantage in waiting.

3. Such an occurrence is not at all likely.

4. Not unless the child was especially sensitive to horse serum.

5. After a large initial dose, it is preferable to give sulfanilamide in repeated doses, usually at intervals of about four hours.

6. The duration of sulfanilamide treatment should depend on the concentration of the drug in the blood and on the clinical condition of the patient.

From the facts cited, one might believe that the patient suffered from a laryngotracheitis of streptococcal origin with edema about the glottis rather than from laryngeal diphtheria.

THE MODERATOR NERVES

To the Editor:—In the editorial in *The Journal*, Nov. 2, 1940, "Experimental Hypertension" occurs the term "moderator nerves." Further on, mention is made of the carotid sinus and aortic depressor nerve mechanisms. Are these terms synonymous or are there other moderator nerves? In the literature are records of extirpation of the carotid gland for epilepsy. Anatomically the gland has abundant sympathetic nerve fibers. Are these connected with the sinus nerve mechanism and are the epileptic prone to high blood pressure? What is the present status of the moderator nerve mechanisms in relation to essential hypertension and their modification of renal hypertension?

Thomas I. O'Drain, M.D., Philadelphia.

ANSWER.—The term "moderator nerves" refers to the aortic and carotid sinus nerves. For instance, Heymans and Bouckaert (*Proc. Soc. Exper. Biol. & Med.* 39:94, 1938) say "In a series of dogs, the four moderator nerves (two aortic and two carotid sinus nerves) were cut."

It would seem that the nerve fibers of the carotid gland referred to in the inquiry may well assume a role in the sinus nerve mechanism. Apparently the epileptic are not especially prone to high blood pressure.

The following excerpt from Blalock's review (*Physiol. Rev.* 20:163, 1940) may be cited in answer to the question regarding the present status of the moderator nerve mechanisms: "The question arises as to whether this type of experimental hypertension induced by removal of the moderator nerves is related in any manner to hypertension as observed in patients. If there is a relationship, it is with essential hypertension rather than the nephropathic variety. It is known that intense vasoconstriction is present in essential hypertension and in experimental hypertension due to removal of the moderator nerves. However, it does not follow necessarily that essential hypertension is due to an abnormality of the carotid sinus or aortic depressor nerve mechanisms. . . . The similarity in the end result rather than the cause."

VAGINAL EXAMINATIONS IN PREGNANCY

To the Editor:—Referring to "Rectal versus Vaginal Examination" in *Queries and Minor Notes* (*The Journal*, January 11, p. 177), I feel that the comment lacks the necessary forcefulness to encourage this young man to stand on his training. May I point out that too frequently medical students are taught the rules of safe obstetric conduct in grade A schools to be ridiculed and disillusioned in private practice. If we are to maintain high standards of obstetric practice we must demand compliance with accepted teachings. Hospitals that countenance procedures as reported should be thoroughly censured.

George C. Finola, M.D., Chicago.
